"Mademoiselle may mock all she likes, but I cannot suppose she really wants a modification," said Marie Constance, very distantly. And I realized that she was thinking to herself that it would be far more fitting to change a mere nose than to make a poor compromise with perfection.

As I continued to look doubtfully in the mirror I became conscious at last of the small shadow face reflected behind my own. The pale image, all sharpened and wan, that stared there, indomitably, at the creation of its night vigils gave me a sudden pang. It was inconceivable that so frail and dainty a creature should be leading this hard, this implacable life. I could not help asking her why she had chosen to be a milliner.

"But it's a beautiful trade, Mademoiselle—an artist's calling!" she cried, sparkling and revived again, and heart and soul for her work, as every Frenchwoman is. "And then, you see, I could not live at home, in the provinces."

Little by little her story came out. Her mother was a widow, the principal of a primary school. Her elder sister was a real "intellectual" who had taken scholarly honors and taught in a girls' *lycée*. Marie was not the intellectual type, and her mother had expected to marry her off at seventeen to an adoring cousin. He was a good sort, her cousin Henry, rich enough, and—oh, well, very likely he had all the virtues. It was a tragic situation, because her mother had a disease of the heart, and might die of the least over-excitement.

"My presence excited her, this poor *maman*, when I refused to marry. So I just had to come away," she ended, as if it were the simplest thing in the world.

"Ah, Mademoiselle, I couldn't marry a man for whom I had only respect. I couldn't. *Il me faut une âme sœur!*" (I must have a twin soul), she added, very shyly, but with a sort of touching tenderness in her voice and eyes.

Remembering the Bazin novels, I reluctantly suggested that true affinities weren't too easy to find in real life.

"Ah, yes, Mademoiselle, I think—one finds them"—she hesitated, and then, taking a sudden resolution: "You won't laugh, like my Parisian comrades? Say what you will, romance is truth! Well, then, I *have* found one. He is an intellectual, too, just gradu-

"SHE CAME IN AND SAT DOWN IN A TIRED HEAP ON THE COUCH TO OPEN HER BAGS"

ated from the École Normale, and now he has his military service before he can get his professorship. So, though I am twenty-seven, I must live my little hard-working life for a long time yet."

"Twenty-seven? But you look nearer seventeen!" I exclaimed.

"Mademoiselle flatters me," answered Marie, resuming her workaday formality again, as she began to gather up her sewing materials. "I look my full age; nobody knows it better than I. But, *mon Dieu*, one must have courage. See what a beautiful hat I've given you, Mademoiselle! You will have many compliments for it in America. Good-evening, Mademoiselle." She vanished through the door, and I was left to reconcile myself to an "unmodified" Gothic hat.

That was the only time she spoke directly of her love affair, and I felt, in her shy manner, with an increased confidence, an appeal to me not to reopen a sacred subject. She could not afford to stop to think of love, poor girl, as the season advanced and the search for ideas became more frenzied. All sorts of ideas were needed: those that should crown the heads of the newly rich automobile people—"'the New York type,' we call it," explained Marie; then there was the elusive, the delicately decorative, to be expressed for ladies who cared for details of elegance; and the stiff tailor-made type, and much besides.

One Sunday morning, just before I left Paris, she came to bring her bill. It was absurdly small. I could not persuade her to take one extra sou. She accepted eagerly, however, some tattered novels. The bundle was heavy, and, as I was driving in her direction, I induced her to break the conventions as she understood them and go with me in my cab to the *quais*. When we separated, I happened to say that I was lunching with the family of one of her beloved novelists—one of those who believed in "romance." Her quiver of excitement was instantly suppressed. She merely murmured, "*Merci*, Mademoiselle, thank you for everything!" and flitted silently away. But a few minutes later, from the *salon* window that opened to the river, I had a last glimpse of her. She was standing on the Pont-Neuf, staring at the house, and screened from

observation, as she supposed, by the moving stream of carriages and wayfarers that flowed past her over the bridge. But I could see how, from under her hat-brim, and weighed down with her humble bags and her novels, she was absorbing, drinking in, as it were, every detail of that old façade. "To think in straw in October" had its painful moments; still, "say what you would, romance was truth" for Marie Constance.

It was a very different sort of truth that the Bourse du Travail (labor exchange) insisted on; here misery was truth, low wages were truth, and the greatest truth of all was that nobody had the right to lead a life that left out of account the difficulties of his fellows. Marie's shrinking fastidiousness, which took offense when she met so much as a group of working-girls walking arm in arm through the streets in their blouses, would have shriveled up indeed in this hardy, grim atmosphere where pink posters announce the latest strike, and the echo of voices declaiming in the "Hall of the Strikes" resounds through the ugly passages. Any girl who goes to the Bourse du Travail—the headquarters furnished by the French Government to the labor unions, and fronting suggestively the Place de la République, that old battle-ground of the social revolution—must hold impersonal ideas higher than romance.

Mademoiselle Marcelle, whom one found on Monday evenings in the tiny headquarters of the women flower-makers' union, was no friend to the men. She refused to have anything to do with the *syndicat mixte* of her trade, on the ground that women were not yet sufficiently emancipated to hold their own in a mixed union. She was a plump little person, with a sleek round head and no angles—such a Frenchwoman as Degas liked to paint, in a tight-fitting black dress, looking out at the world with competence and self-satisfaction. You might have mistaken her for a home worker—one of those women whose years revolve within the narrow confines of one small household, one small, perfect bit of work, and who, if they seem to carry a miniature model of the philosopher's globe in their capacious black pockets, never survey it with any more positive emotion than an ironic resignation. Mademoiselle Marcelle, though she had not chosen to marry, had shown herself a mother at heart by adopting a child. She had extended her love of good work and good housekeeping to the dirty corners of her trade—one family, after all, when seen "in the large," as she said; and, though she obviously mistrusted almost every one but herself, she had a firm and matter-of-fact faith in the Socialist state.

She was suspicious, for example, of "the intellectuals"—the women of the thinking classes, who in France, as elsewhere, are beginning to be preoccupied with social problems. If she was gracious to me, it was, I believe, because I came from a land where the torch of liberty is supposed to be held aloft.

"Oh, yes," she assured me, "I know how they talk, these ladies. We have a comrade of the Typists' Union who is employed at the Ministère du Travail [Labor Office]. She gives us reports. They go in, these ladies, to the Director, and they say to him: '*Cher Monsieur le Directeur*'"—Mademoiselle Marcelle pinched her lips and spoke in a mincing voice—"'Dear Monsieur, help us to raise up this poor working-girl, who can never, without our help, lift herself above her troubles.'" Mademoiselle Marcelle's mouth tightened into a small, hard circle. "Ah, I tell you, I want no help except what the State owes me and what my comrades can give."

She would not accept help from "these ladies," for fear of patronage, even when the co-operative flower-making shop into which she had put her whole heart, and the savings of ten incredibly economical years, was in difficulties. It was to the dignified corridors and the high-ceiled rooms of the Labor Office, in its archbishop's palace on the Rue de Varenne, that she had gone, before launching her undertaking, to ask for a subsidy. That the subsidy was accorded did not surprise Mademoiselle Marcelle; it was a matter of course that the State should help the workers. And when her co-operative venture seemed on the point of failure, she wrote to a well-known Socialist editor and Deputy.

"Of course I got no answer from *him*," she said, "in spite of his promises in his newspaper, just because I'm not a voter. Perfectly natural! Why, even my *concierge*, a woman altogether limited, would be interested in social questions if she had a vote. 'The day I can vote, Mademoiselle,' she says to me, 'that day I will organize myself!'"

Because she herself believed so firmly in the ideals of Socialism and the power of women to stand on their own feet, the failure of the Co-operative Shop had been the bitter-

est experience of Mademoiselle Marcelle's thirty-eight years. The twenty years of her *fleuriste's* existence had been consecrated to this plan. She had worked in every sort of factory, in every grade of flowers, that she might learn all the details of her trade in their largest industrial bearing. The cult of her profession was strong in Mademoiselle Marcelle, too, and she raged against the increased use of machinery, and all the dismal results of commercialized standards. For years, after her working day, she had taught an evening class in order to train young girls in the traditional secrets of flower-making. The union had been another of her efforts, and at last to the "Co-operative" she had given her very life's blood. And, after all, because of jealousies, disagreements, impatiences on the part of the comrades, the experiment had flamed into ashes.

Mademoiselle Marcelle had then swallowed her disappointment and gone back to work in an *atelier* like anybody else. She was no dreamer, but one of those obstinately practical people whose courage is inexhaustible. When I went to see her in her own room, I realized that her propagandist spirit had now found a new center and dear hope; she was arming her little girl to do in the future the great deeds that she herself, in a blind age, had not been able to achieve. The child was an orphan whom nobody had wanted. Mademoiselle Marcelle had not hesitated to adopt her on an income of five francs a day—she earned a little less in the dull season, she said, a little more in the good season. Marie Constance thought it impossible for one person to exist alone on five francs in Paris. Mademoiselle Marcelle's stoic virtues and her economic genius were such that she and the child were able with this sum to live very pleasantly in a clean, airy room in the center of the wholesale district.

She sometimes worked at home there, for a while, so that little Juliette might see, very young, what beautiful flowers were like. Apprentices had not half a chance now in the *métier*, she said.

"If I can make this little girl, first of all, an excellent *fleuriste*, and then send her out to spread the propaganda among her comrades, I shall perhaps do as much for my kind and my trade as if my Co-operative had succeeded," she said, looking fondly at Juliette, who was at that moment eating a large bowl of strawberries. "Do not put your elbow on the table, my child," she interrupted. I had found them at lunch; and Juliette's piquant face, the face of a potential Mimi Pinson, had registered a vivid interest in our conversation.

"Listen, *Maman*," she now broke in, mischievously. "I need a new hair-ribbon for Sunday."

"Good heavens," whispered Mademoiselle Marcelle, as she followed me to the door, "suppose she should turn out a little coquette, like the others!"

"A coquette, like the rest of them"—how often I heard that phrase! The men at the Bourse were always telling one, with a grin, that the Paris working-girl cared more for her mirror than for progress. Justine said that she would have been "as light-headed as the rest" but for the Sillon. The Sillon was a Catholic organization, later condemned by the Pope for its preoccupation with social reform, and the atmosphere at the little Café behind St. Sulpice was quite unlike that of the Bourse. There the spirit of one class, asking for revenge on all the others, had seemed to dominate. The minute you went into this funny little place, where the napkins of the *habitués* were in numbered pigeonholes by the door, and the sanded floor was as clean as the bare tables, you felt, on the other hand, in the presence of the actual fact of fraternity. The men and women who haunted the Café de Sillon appeared to hold their ideals in common, though some of them worked with their hands and others with their heads.

It was an art critic who introduced me to Justine. Remembering how the joyous consecration of her bearing struck me that night when she pushed open the low door, at last, and crossed the room, smiling, to sit beside us, I realize that my first impression of her was the true one. Her eyes were very blue, and had the inspired, mystic look of those who, from some desert land, spy on a dim horizon a sail of blessed hope. Though the depths of human misery had been revealed to her, she seemed to have had, at the same time, a vision of redemption. She was extraordinarily pretty, and wore her old clothes and her rusty black taffeta hat with the same inborn ease that gave her manner its charm. She made one at home in the café very much as if she were a great lady doing the honors of her own table.

Justine was as deeply concerned as Mademoiselle Marcelle with the theory of Socialism, the pains of the toilers, and the

necessity of organization as a protective armor for women, but in a less practical, a more exalted way. She lived with girl students and read Marx far into the night. The Sillon had persuaded her that she was a creature with a mission, and she felt this all the more because of the discouragement that she met everywhere else. Her family told her that she was a fool for her pains; her comrades laughed, and, of course, employers were ill-disposed, if they heard of her propaganda.

"My good fortune," she explained, "is in looking pretty and vain like the others. And then I am as nice as can be to everybody; they all adore me!—the ladies of the firm, too. I help the girls with their little blouses while we wait for our work, and gradually I get my influence!"

Justine's talk of the *ateliers*—she, too, was a *fleuriste*—and the sense that she seemed to have of her own phenomenal courage brought out very strikingly the defenseless position of the girl who works in an *atelier* in Paris. Every one knows the assurance of the woman of the small tradesman class, who is not only her husband's partner at the café desk or behind the counter, but usually the better man of the two. The women who follow the rougher sorts of trades, the market gardeners, the street venders of vegetables, and the rest, certainly fear no human being, not even a police officer. The *ouvrières en chambre*, or home workers, for their part, though their obscurity makes them fair game for the exploiting contractor, are intrenched behind the respectable ramparts of their home. But girls like Justine, whose hours and working conditions are carefully protected by law, walk, nevertheless, in terror of their forewoman or their *patron*, and—is it because custom has decreed that the unmarried have no influence in France?—dare not lift their voices in protest. Very few of them are organized in labor unions.

"Think of it!" said Justine, leaning across the table; "two months ago I was working in a shop; the piece rates declined so that we did not make two francs a day. Fifteen of us left together, but I was the only one who had the courage to say, when the *patronne* asked why, 'Because I do not earn my living here, Madame.' I spoke very politely, you may be sure, but how furious she was!" Justine shivered. If she ever did succeed in persuading the girls to ask for better pay, she was always ill afterwards, from terror and excitement.

Mademoiselle Marcelle did not dream of concealing her trades union sympathies, and maintained that they had never injured her professionally. A good worker, she said, was always welcome. Justine was haunted by the fear that her strong-mindedness would lower her earning capacity. She was a first-rate *fleuriste*, but she had never been able to support herself entirely, without some assistance from her parents. She respected Mademoiselle Marcelle, though she disliked her violent feminism—men should be treated as friends, not as enemies—and shrank from the anti-Christian spirit that prevailed at the Bourse. For all that, one felt in her, as in the other working-girls, a distrust of all authority—a hatred, on principle, of the *patron*. The ideals of Socialism seem far enough away when a democracy brings out such violent class distinctions. Justine and her friend Henriette, the feather-worker, had never permitted themselves, I am sure, a sneaking liking for an employer. Theirs were the sentiments of the *papillons*, those small oblong stickers, with anything but a butterfly significance, that one finds on the backs of benches in the industrial parts of Paris. "The heart of a *patron* is a strong box," they read, and, "The thinner the workman, the fatter the employer." Justine even suspected the factory inspectress.

"I should like to get hold of that woman," said Henriette. Henriette's mother, who had been forewoman in a feather shop, was now dying of consumption, and she herself was evidently already under the influence of the disease. "I'd say some things to her. She comes in smiling, well dressed. She says: 'Good-morning, young ladies. Are the windows open here? *Au revoir, mesdemoiselles.*' Why doesn't she pitch into the *patron* in our presence if she really means business?"

Justine was willing to concede that before the abolition of night work—until recently it was permitted during the busy season in the *métiers de luxe*—the inspectress, who had to be on hand by night as well as by day, had to deal with a complex question. Women inspectors are in charge of women's work in France, except where there is power machinery; and since Paris has few great factories or mills—since it is a town of so-called "small commerce," of innumerable small handiwork industries—inspection becomes a delicate matter.

"One is born skeptical in Paris," pleaded Justine, when I taxed her with injustice.

Where the *patron* or some other authority

was not concerned she was, nevertheless, anything but skeptical. She would jump up from the most absorbing of her industrial discussions and run to speak a word of friendly gossip or sympathy with the people who went in and out of the café, and never forgot, I noticed, to bring a newspaper to the waitress. This hard-featured, middle-aged person, it seemed, lived for the continued novel at the bottom of the page, and in the intervals of passing dishes retired to a corner with the smudgy sheet glued to her near-sighted eyes.

"Well, Mademoiselle, what has happened to her now?" Justine would ask with an air of intense interest, when Louise set down her plate of *purée*.

"Ah, Mademoiselle, just fancy! she is beginning to doubt whether he really loves her!"

"Little fool!" Justine's happy laugh reminded one—even though she herself never read anything less serious than Marx—of that inevitable Mimi, in whose heart bloomed "the white rose of gayety."

I wish that those who believe only in the Mimis of the river boats might once look through the low door behind St. Sulpice, where Justine, with a consecrated hope shining in her blue eyes, leans across the table to expound the future to an adoring group of enthusiasts. I wish they might see Mademoiselle Marcelle, in her more matter-of-fact way, teaching her adopted Juliette to be a good *fleuriste* and stuffing her with strawberries and propaganda; I wish they knew Marie Constance, who thinks boldly in straw and timidly conceals romance under her hat-brim.

THE JUDGMENT OF MOTHERS

BY CLARA GRIFFITH GAZZAM

And God spake: "Now bring me the mothers,
The women whose travail has wrought
The strength and weakness of nations."
And straightway the mothers were brought.

First Mary—the mother of Jesus—
Drew near to the feet of her Son,
As into the Infinite Presence
The women were led, one by one.

They came from earth's outermost borders,
From palace and hovel they came;
And some bore the heart of a mother,
While some were but mothers in name.

Behold them! so strong in their weakness,
These mothers of men; at whose breast
The kings of the earth have been suckled
And beggars have laid them to rest.

The brawn and the sinew of nations
Was born of these women, whose blood
Ran warm in the veins of our heroes
And marked them "the chosen of God."

The mothers of kings, in whose bearing
The pride of their offspring is shown.
The mothers of serfs, who had suffered
And carried their children—alone.

The mothers of men who have conquered;
The mothers of men who have failed;
Each bearing a cross on her bosom—
For each to that cross has been nailed.

And lo! at the feet of the Master
One bends—with the cross on her breast,
Although she has carried no children—
(Her place is apart from the rest).

The mothers of kings and of beggars
Withdraw from the spot where she lies.
"What right has *this* woman among us?"
They question, in startled surprise.

But Mary—the mother of Jesus—
Looked down on the woman, and smiled;
"Her soul is the *soul* of a mother,
Although she has suckled no child."

And God spake: "Oh, ye who are mothers!
This woman has surely her part
Among you; for though she is childless,
She still is a mother—at heart."

BY THE WAY

Eight Russian survivors of the battle of Borodino recently celebrated the hundredth anniversary of that bloody conflict between the Russians and Napoleon's Grande Armée. This seems incredible, but the newspaper reports give the names and records of these hoary veterans. One of them, at the age of 122, has recently been granted a pension by the Russian Government. Another, Peter Laptieff, aged 118, actually met Napoleon face to face during the campaign and has a vivid recollection of the interview.

The steel exports of the United States, Mr. O. P. Austin, assistant chief of the Bureau of Foreign and Domestic Commerce, announces, now amount to the enormous total of a million dollars a day.

Home-brewed beer has of late years, says Harold Simpson in his recently published "Rambles in Norway," largely displaced spirits as the national drink of the Norwegians. It is so popular that it is used even at breakfast to wash down the stock dish—fried pork smothered in onions. The first sight of a Norwegian breakfast-table, adds the author, is apt to astound one. It is covered with small dishes, principally fish—fresh fish, smoked fish, fish in tins, fish in miniature barrels; there are also cold meats, and an endless variety of cheeses, of which the Norwegians are very fond.

Only about one per cent of the total wealth of the United States is invested in church property, but, according to Dr. Booker Washington, over eight per cent of the wealth of the Negroes of the country is invested in this way. They have 35,000 churches, with 3,700,000 members.

Peter Roberts, miner, pastor, and author, in his just-published book "The New Immigration," tells of his method of teaching English to foreigners. The miners would not fuss with alphabet and grammar, so he taught them by acting out and repeating over and over the words describing the daily experiences of an ordinary man. The method met with great success.

The largest amount ever collected from a single estate under the inheritance tax law of New York State was recently paid by the heirs of John Jacob Astor—$3,150,000. The total estate amounted to about $77,000,000, and of this the principal heir, Vincent Astor, receives $67,000,000.

Oddly enough, this sum, $67,000,000, is the exact amount of the next largest estate on which an inheritance tax has been paid, and this was accumulated by a Scotch lad who came to New York in 1856, and in a liftime acquired what it had taken the Astors generations to amass. This was John S. Kennedy, honorably known as a great distributer as well as accumulator of wealth.

Three accidents on one railway have within fifteen months cost the road $1,500,000, according to newspaper reports. That sum would have gone a long way toward providing every possible safety device. Railway men assert that these wrecks were the result of false economy.

Before joining a theatrical company, stage-struck girls might well stop to think—if their temperament ever allows them to think—about Miss Julia Marlowe's recent statement in announcing her prospective retirement from the stage: "The world owes a certain amount of home life to every human being." The famous actress is as eager to escape from the continuous round of dressing-room, stage, hotel, and railway train as the often misguided amateur is to experience it.

An improved gate for stopping runaways has saved over a hundred horses from serious injury since it has been installed on the Williamsburg Bridge in New York City. This gate, instead of being, like the old one, simply a barrier across the roadway, brings the runaway horse into a V-shaped chute, in which the vehicle that he draws becomes wedged. The animal is thus stopped before he can strike the apex of the gate, and so escapes injury.

Cities that are planning to erect library buildings may find a suggestion worth considering in Mr. Charles G. Soule's recently published book, "How to Plan a Library Building for Library Work:" "I not only believe, but know, that one per cent of the cost of building, put into employing a really competent expert librarian" to collaborate with the architect "will save from ten to forty per cent on the cost, in space, convenience, and material."

The Suez Canal, according to "Shipping Illustrated," is owned by a private company, the Cie. Universelle du Canal Maritime de Suez. Its president, secretary, manager, and a majority of its directors, are French. Great Britain, it is stated, has never interfered in the management of this company, nor has the French Government.

Professor Herschel C. Parker, on his third attempt to reach the summit of Mount McKinley, the highest mountain in North America, was obliged to turn back when within 300 feet of the summit. The party attained a height of over 20,000 feet, and gave up their attempt to gain the highest point only when proceeding farther, in the face of a mountain blizzard and intense cold, meant certain death.

One settlement worker in New York City has made a specialty of teaching boys how to make articles of furniture out of old packing-boxes. The boys are said to be enthusiastic over the products of their industry. They learn to make tables, chairs, cribs, washstands, and even hammocks out of these unpromising materials. The city has recently recognized the value of this work by placing a building at the disposal of its originator, Miss Louise Brigham.

Throw away the superfluous furnishings of your rooms, says a contributor to "Good Housekeeping," and thus lighten housekeeping burdens; let five minutes' work suffice to set a room in order. In this matter the Japanese have ideas; a room that has one handsome rug, one fine picture, one beautiful vase of flowers, they consider well furnished. Americans must to this add a chair or two, since we cannot, like the Japanese and our own children, sit comfortably on the floor, no matter how handsome the rug that covers it.

A Girton undergraduate, says an exchange, having inadvertently changed umbrellas with a fellow-student, evolved this note: "Miss —— presents her compliments to Miss ——, and begs to say that she has an umbrella which isn't mine. So, if you have one that isn't hers, no doubt they are the ones." The exchange neglects to say that this epistolary entanglement was probably a "grind" by a Girton senior on her junior friends.

The Outlook

NOVEMBER 2, 1912

LYMAN ABBOTT, Editor-in-Chief HAMILTON W. MABIE, Associate Editor
THEODORE ROOSEVELT
Contributing Editor

An Open Letter from Lyman Abbott to the Doubtful Voter

YOU have not yet decided how to vote on November 5.

You believe, heartily believe, that the popular discontent is not without some justification. You recognize the existence of serious social injustice, and you are as earnestly desirous as any of your neighbors to see that social injustice righted. You do not believe that little children should be robbed of their childhood, and taken from the school and the playground and put into the mine and the factory. You do not believe that mothers should be compelled to leave their children and their homes to eke out the insufficient wages of their husbands. You know that the Supreme Court of the United States has decided, conservative as it is, that the long hours of labor in store and factory, to which young girls have been called by labor conditions, have unfitted them for the high offices of wife and mother, and you believe in protecting them from those too onerous conditions. You are not satisfied to see the Nation grow rich while tens of thousands of its willing workers grow poorer. The mob violence at Lawrence, Massachusetts, has not blinded your eyes to the conditions which excited that mob. You may not have personally suffered any very serious inconvenience from the high prices of living, but you know that some of your fellow-men are less fortunate than yourself, and you would gladly join in any rational movement which promised them relief. You do not believe in monopoly, whether in oil, or coal, or transportation, or land, or anything else. You are alarmed at the growing concentration of power in a few hands, due to great aggregations of capital, even though you do not sympathize with the bitter denunciations which have been leveled against the men who possess that power. You have seen with increasing irritation the increasing power of the political bosses, and with increasing discouragement the mere transfer, by alternate elections, of political power from the bosses of one party to the bosses of another. You have perhaps tried to do something to right the social injustice, or at least to relieve its victims, by social settlement or other philanthropic work; and to rectify political abuses by sporadic political reforms, or by attending your party primaries, where you have generally found your single vote count for as little as it seems to you to count for in a general election.

But yet you are not quite prepared to join the Progressive party. It is new, inexperienced, untried. It was born only last August as a National party. To intrust it with the destinies of the Nation seems to you somehow extra-hazardous. Most of the men whose counsels you have been accustomed to follow are in one or the other of the old parties. The remedies of the new party seem new, and you are afraid to try so many experiments at once. You do not believe in the present high protective tariff; but a tariff commission is an experiment. You do not believe in social injustice; but labor laws limiting the hours of labor, limiting the liberty of contract, fixing a minimum wage, are an experiment. You do not believe in monopoly; but a Government commission to deprive the great corporations of the power which makes them a monopoly is an experiment. You do not believe in the old political machinery which has transferred political power from the people to the bosses; but direct primaries, refer-

endum, initiative, recall, are experiments. You might be willing to try any one of these experiments. But you hesitate to try them all at once. Had you not better give one or the other of the old parties one more trial, make one more attempt at reform within the party?

I think not. I believe that it is safer to trust the new party than either of the old parties, and here sum up briefly the reasons for this carefully considered judgment.

New problems require new solutions, and our National problems in their present form, if not in their essence, are new. They are four in number:

The Tariff.
Social Justice.
The Trusts.
The Rule of the Bosses.

The Tariff. Neither party professes itself satisfied with the present tariff. The Republican party admits that "some of the existing import duties are too high." The Democratic party proposes to abolish the protective duties altogether and throw the American market open to the world. The Progressive party proposes an immediate downward revision of the tariff based on the report of a non-partisan scientific tariff commission, and aimed to secure protection for the laborer and the consumer. Thus both the Democratic and the Progressive party propose an experiment.

Which of these experiments do you prefer? Whenever the free trade experiment has been tried in this country it has invariably been followed by commercial disaster. It has been tried in England; and the poverty in free-trade England is immeasurably more abject and the discontent more widespread than in this country. The commission experiment has never been tried in this country, but it has been tried in protected Germany, and protected Germany leads the world in industrial development. And the discontent in Germany is political, not industrial. The Progressive tariff proposal is therefore, after all, not an experiment.

Social Justice. The whole country recognizes the need of measures to protect the rights of the common people. This need is recognized in the platform of each of the three great political parties. Contrast their respective remedies. All three would limit the hours of labor for women and children. All three would provide a workman's compensation law. The Republican party adds protection to wage-earners engaged in dangerous occupations; the Democratic party adds freedom of laborers to form labor unions. The Progressive party approves of all these measures, but adds seven other specified remedial acts: (1) Protection against involuntary unemployment. (2) Minimum wage for workingwomen. (3) One day's rest in seven for all wage-workers. (4) Eight-hour day in all twenty-four-hour industries. (5) Abolition of convict contract system. (6) Social insurance for wage-earners. (7) Industrial education.

Are these experiments? If so, they are experiments which have been tried out in Germany and in Australia, and some of them in some States in the Union, with successful results. They are experiments recommended with substantial unanimity by all experienced workers for the social betterment of their fellow-creatures. The Democratic and the Progressive parties agree in approving and recommending voluntary labor organizations. They differ in this: The Democratic party leaves the workingmen to maintain their rights and interests by labor organizations, which are largely framed and officered for the purpose of giving the laborer a better chance in industrial war. This is the only remedy for the wrongs of wage-earning men which is suggested by the Democratic platform. The Progressive party calls on the Government to define and protect the rights and interests of workingmen, that labor wars may cease, and favors labor organizations to supplement, not to do, the work of government.

The Democratic party trusts to labor wars, the Progressive party trusts to labor laws, to secure social justice for the workingmen of America. Between these two methods which seems to you preferable?

The Trusts. To deal with monopoly the Democratic and Republican parties propose the same experiment—civil suits or criminal prosecutions to dissolve any combination which becomes strong enough to establish a monopoly. The Progressive party proposes to prevent any establishment of monopoly, and for this purpose to maintain "a strong National regulation of inter-State corporations" by "a strong Federal administrative commission of high standing." The Democratic party waits till a monopoly is established, and then fights it. The Progressive party prevents its formation. Both proposals are experiments; both experiments have been tried.

The first experiment has failed. Great combinations have been forbidden by law; they have grown up despite the law; they have been prosecuted; their dissolution has been ordered; they have complied with the order of the courts, and, as a result, the wealth and power of the combinations have become greater than they were before.

The second experiment has succeeded. The Inter-State Commerce Law has forbidden the railways from charging unreasonable prices, and the Inter-State Commerce Commission has prevented them from charging unreasonable prices. The Pure Food Law has forbidden corporations to sell adulterated foods and drugs, and a bureau of the Government has saved the dinner-tables and the sick-beds of the Nation from the robbers of the home. A Federal Eight-Hour Law and Safety Appliances Law has protected workingmen when under Federal jurisdiction from the cupidity of contractors and from the carelessness of employers. Monopoly consists in power to fix prices, deteriorate quality, determine labor conditions, destroy rivals. The Democratic-Republican attempt to abolish monopoly by destroying it after it has been formed has signally failed. The Progressive attempt to abolish monopoly by putting all corporations under such administrative control that they cannot fix prices, deteriorate quality, lower wages, or destroy rivals has succeeded whenever it has been tried.

It is between these two experiments that you have to choose in the present election. Which do you prefer?

The Rule of the Bosses. Concerning the rule of the bosses the Republican party is silent and it proposes no remedy. Concerning the rule of the bosses the Democratic party is silent, though it proposes a measure which may be regarded as a partial remedy. The Progressive party declares it to be the first task of the statesman of to-day to destroy the invisible government which sits enthroned behind the ostensible government, and to dissolve the unholy alliance between corrupt business and corrupt politics, and for this purpose proposes direct primaries, the short ballot, the initiative, the referendum, and the recall. These specific measures are not untried experiments. They have been tried in different forms in different States with varying degrees of success. Nevertheless you regard them as experiments. Suppose they are. Still:

The choice of the voter in this election is between a party which sees no objection to the invisible government which sits enthroned behind the ostensible government, owing no allegiance and acknowledging no responsibility to the people, and a party which challenges the right of that invisible government, and forms the stern resolve to destroy that invisible government and give back the power to the people.

New issues involve new duties. New problems require new solutions. We have not to choose between old paths and new paths. We have come, in our National journey, to a fork in the roads. Both paths are new. We have to choose whether we will have—

A retrial of free trade, or a trial of a scientific, non-partisan tariff.

The pacific protection of the rights and interests of our fellow-men by labor laws, or their self-protection through labor wars.

Lawsuits to dissolve the great combinations after they have become a monopoly, or a Government administrative regulation and control to prevent any monopoly from ever being formed.

The rule of the bosses, with nothing done to destroy it, or a united resolve and definite measures to transfer the power which they now possess to the people from whom they have taken it.

Perhaps you would not hesitate which of these alternatives to take. But you are a little afraid of Mr. Roosevelt. I wonder why. Certainly he is not an experiment. He has been active in American politics for more than a quarter of a century.

As a member of the Civil Service Commission he gave that needed reform new life. During the six years of his Commissionership more than twenty thousand positions for Government employees were taken out of the realm of merely political appointment and added to the classified service to be obtained and retained for merit only. As President of the Board of Police Commissioners of the City of New York, though working under great disadvantages, he introduced a new morale into the police service, and life and property have never been safer than under his administration. As Assistant Secretary of the Navy he did efficient service in preparing the navy for its brilliant record during the Spanish War. As Governor of the State of

New York he reformed the administration of the State canals, strengthened and extended the merit system, was instrumental in securing for New York City its ownership of the subway system, and against vigorous and influential opposition secured a law for the taxation of corporation franchises.

When he returned to America from his African trip in June, 1910, he was perhaps the most popular public man in the world. He had been received in Europe with almost equal enthusiasm in the royal Courts, in the universities, and by the common people, and alike in every country which he visited.

He had an every way creditable record as a soldier. He had won the Nobel Prize as a peacemaker. He had a recognized standing among scientists as a naturalist. He had an honored, if not an eminent, place as a historian.

Under his Administration the National and international difficulties in the way of an Isthmian canal had been overcome, and the Panama Canal was well on its way to completion. By the promptitude of his action he had saved the Nation from serious international complications in a threatened Central American war. He had initiated a policy for the development and conservation of natural resources, for the Government regulation of corporations, and, by the creation of a new Federal department, for the direction and promotion of commerce and labor. He had given the nations of the world a demonstration of our strength by sending our navy around the globe. While these new enterprises had been initiated, and some of them prosecuted to their consummation, none of the established interests of our Nation had suffered. It is true that he had been accused of disregarding the Constitution, but no specifications had been given. It is true that he had been accused of being reckless, but no interests of the Nation had been imperiled. And, despite some petty jealousies and some personal malignancies, he was given, upon landing upon these shores, a reception rarely if ever before accorded to any private American citizen.

What has he done since to justify doubt either of his honest patriotism or his political capacity?

Nothing but this. He has thrown down the gauntlet of defiance to the unholy alliance between corrupt business and corrupt politics. He has rallied to his standard men and women who believe with him that to dissolve this unholy alliance is the first task of the statesmanship of the day. The battle will be fought to a finish. What its ultimate result will be I cannot doubt. I am glad, looking back, to remember that I joined the Republican party in its birth and worked under its leaders for justice and the rights of the people even before I was old enough to cast a vote. And I believe that every man and woman, every voter and prospective voter, who takes part with the Progressive party in this battle now will in the future look back with pride upon the fact that he understood the signs of the times and had his share in initiating the campaign for social justice and popular government.

LYMAN ABBOTT.

THE WEEK

The Assault on Mr. Roosevelt and its Causes

The people of the country last week followed from day to day, with an anxiety and sympathy that cannot be overstated, the story of the journey of Mr. Roosevelt from Mercy Hospital at Chicago to his home in Oyster Bay. The reassuring reports of his continued improvement led to the hope, which by the end of the week seemed almost certainty, that Mr. Roosevelt would be able to take some part in the great Progressive campaign rally at Madison Square Garden, New York, the date of which had been changed, to meet the emergency, from October 26 to October 30. Meanwhile the country is thoroughly aroused to hatred and contempt of the vilification and false accusation which lie at the basis of the crime. No one believes that the man Schrank has a strong or intelligent mind, but it is precisely because such persons become inflamed by newspaper excesses in language that crimes of this nature are possible. That this was the case with Schrank is not a matter of inference but of testimony. We have before up as we write a sworn transcript of the stenographic notes made at Schrank's examination in Milwaukee. Here is one passage:

Q. What did you read in the paper that directed your mind to Mr. Roosevelt?

A. You read a lot of things in the papers and especially in the New York "World;" the New York "World" practically come out that the country is in danger if he has the Chair again.

Q. Did they say anything in particular that centered your attention on this act?

A. No, sir, not at all. Perhaps a million people read it and didn't think anything and I just happened to read the matter over, I was interested from there.

Q. Editorial page?

A. Editorial page.

Q. You remember any particular editorial?

A. No, sir, I do not remember, I could not repeat it.

Q. Well, did you read anything else in any other paper except the "World" that made any impression on you of Mr. Roosevelt?

A. Well, in fact I have been following up all papers of the political views and I have been taking out the "World" as the right thing, she is right the way she talks and one paper I read, the New York "Herald," and she never speaks about Theodore Roosevelt but the third termer and she don't mention his name, only the third termer.

This shows what kind of newspaper assault impels a man of weak intellect and a brutal temper to a physical assault. That more than one man has been so influenced is shown by the fact, vouched for to The Outlook by one who knows, that since the crime Schrank has received letters from different people who signed their names saying that they were glad of what Schrank had done. But it is not only yellow daily papers which use language provocative of passion. In proof we may quote from two weekly periodicals nominally respectable and supposedly reasonable. "Harper's Weekly" of June 1, last, said editorially: "Mark these words! Roosevelt's election to the Presidency would spell revolution within ten years. And by revolution we do not mean mere political overturning of a system of government. We mean actual warfare by force of arms upon the rule of a despot. We mean bloodshed and carnage." The correspondent who calls our attention to this quotation quotes also a newspaper heading used just after the assault, which shows precisely how just such an assertion as that above might act on such a mind as Schrank's:

ASSASSIN IN FEAR
OF A BLOODY WAR

Believed Roosevelt a Menace to Country and thought it his Duty to put Colonel out of the way.

The same outrageous assertion that Mr. Roosevelt might become a tyrant, urging his claims by bloody war, appears in an article in the New York "Independent" of October 17, written by an ex-Attorney-General of Massachusetts, Mr. Albert E. Pillsbury. In this article, after asserting that it would be difficult to believe anything else than that if Mr. Roosevelt should be defeated he would be crying aloud that he had been cheated of the election, the writer declares that "it needs the addition of but one element to set the stage and furnish all the paraphernalia of a revolution, and that element is supplied by the circumstance that Major-General Leonard Wood, the original creation and bosom companion of Theodore Roosevelt, a man of whose personal characteristics the public knows but little, is in command of the army."

What the Assault Teaches

We have nowhere seen the lessons of personal and newspaper vilification and their consequences so well expressed as in an address by ex-Attorney-General Bonaparte, made the night following the assault on Mr. Roosevelt. We think it eminently worth while to quote at some length from this address: "We all know the American people have been taught by repeated and painful experience that among us, as in all other countries of the civilized world today, there are men of perverted sentiments and feeble intellect ready to conceive a blind, murderous, senseless hatred towards public servants or popular leaders when they hear these charged with imaginary misdeeds or blamed for evils, real or fancied, which they have had no share in causing. The passions of Wilkes Booth, of Guiteau, of Czolgosz, had been inflamed by furious abuse of their several victims before the homicidal purpose developed in their distorted minds; but, so far as I know, there has never been in American history a public man so persistently and so systematically traduced and vilified, week in and week out, month in and month out, year in and year out, as Theodore Roosevelt. I do not refer only, or even mainly, to what has happened during the present campaign; nearly all those calumnies about him which some of the most widely read newspapers in the Union have been trying for weeks to bolster up through deceptive headlines, suppression of facts, and all the other time-worn devices of slanderers by trade, are as old as the hills. . . . For ten years at least it has been the deliberate, unbroken purpose of certain interests and of

certain newspapers controlled by these interests to undermine public confidence in Colonel Roosevelt and public respect for him by misquoting or garbling his words, misrepresenting his every act, and always attributing to him the least worthy motives and the most alarming intentions. So far as the general public is concerned, these attempts have been utterly futile; the American people cannot be hoodwinked, like those silly sheep in the fable, which were persuaded by the wolves to send away their watch-dogs; they love and believe in Theodore Roosevelt all the more because of the enemies he has made and of the ways in which these enemies seek to harm him. But it was only a question of time when all these unscrupulous falsehoods, all this virulent abuse, would arouse in some clouded mind, in some heart embittered by disappointment or misery, a purpose of lawless violence towards their object, and, at last, that time has come. Now that it has come, now that the men and the newspapers who have done all they could for years to expose this man to this danger, see him overtaken by it, and their teaching bear its proper fruit, it is not enough, nay, it is no merit at all, for them to join in a chorus of 'So sorry!' 'So shocked!' 'Such a dreadful thing!' 'So awful!' The people ought not to be satisfied, I feel sure the people will not be satisfied, with mere empty lamentations over a result which has been long foreseen, which has been again and again predicted as inevitable if the conditions which caused it should continue unchanged."

⚄

Campaign Contributions

Perhaps the most striking fact elicited by the so-called investigation of campaign contributions which has been conducted by a Senate Committee during the past few weeks is that while Mr. Parker, in 1904, was making his charges about the collection of contributions on behalf of Mr. Roosevelt's campaign, his own campaign received a contribution from Mr. Thomas F. Ryan of nearly half a million dollars. This fact was discovered through the testimony last week of Mr. Ryan himself. Inasmuch as Mr. Parker's charge was based on the assumption that great contributions put the party under obligations to special interests, this contribution of Mr. Ryan's takes on special significance. Mr. Ryan's connection with great special interests, such as the Tobacco Trust, is well known. The mere fact that he contributed $450,000 to Mr. Parker's campaign does not bring any reproach upon Mr. Parker personally; but it does show how irresponsible was the method of campaigning which was used in the attempt to defeat Mr. Roosevelt eight years ago. This lesson has application at this time.

⚄

The Popular Vote and the Electoral Vote

Four years ago the total popular vote of all candidates for the Presidency was nearly fifteen million votes. Of these, Taft, the Republican, had over 7,600,000; Bryan, the Democrat, over 6,400,000; Debs, the Socialist, over 400,000; Chafin, the Prohibitionist, over 200,000; Hisgen, the Independent, over 80,000; Watson, the Populist, nearly 30,000; and Gillhaus, the Socialist-Labor candidate, nearly 14,000. Thus Taft won over Bryan by over 1,200,000 votes, and over all candidates by nearly 470,000 votes. So much for the popular vote. The electoral vote is represented by the so-called Electoral College, in which there are as many votes as there are Senators and Representatives from the States. In 1908 there were but 483 votes in the Electoral College. Based upon last year's Reapportionment Act there are now 531 electoral votes: 266 are thus necessary to a choice. The following will be the electoral representation by States for 1912. The States in order are:

New York, with	45	votes
Pennsylvania, with	38	"
Illinois, with	29	"
Ohio, with	24	"
Texas, with	20	"
Massachusetts and Missouri, each with	18	"
Michigan and Indiana, each with	15	"
New Jersey and Georgia, each with	14	"
California, Iowa, Kentucky, and Wisconsin, each with	13	"
Alabama, Minnesota, North Carolina, Tennessee, and Virginia, each with	12	"
Kansas, Louisiana, Mississippi, and Oklahoma, each with	10	"
Arkansas and South Carolina, each with	9	"
Maryland, Nebraska, and West Virginia, each with	8	"
Connecticut and Washington, each with	7	"
Colorado, Florida, and Maine, each with	6	"
North Dakota, Oregon, Rhode Island, and South Dakota, each with	5	"
Idaho, Montana, New Hampshire, Utah, and Vermont, each with	4	"
Arizona, Delaware, Nevada, New Mexico, and Wyoming, each with	3	"

The Presidential Succession

The question has arisen in regard to the electoral vote as to what would take place in case no one of the Presidential candidates received a majority—266—in the Electoral College. The Twelfth Amendment to the Federal Constitution provides that the electors shall meet in their respective States and vote by ballot for President and Vice-President; that they shall transmit their votes to the President of the United States Senate, who, in the presence of the Senate and the House, shall open the certificates of votes, and the votes shall then be counted. But what if no candidate has a majority of votes?

> Then, from the persons having the highest numbers, not exceeding three, on the list of those voted for as President, the House of Representatives shall choose immediately, by ballot, the President. But in choosing the President the votes shall be by States, the representation from each State having one vote, . . . and a majority of all the States shall be necessary to a choice.
>
> And if the House of Representatives shall not choose a President . . . then the Vice-President shall act as President, . . . The person having the greatest number of votes as Vice-President shall be the Vice-President, if such number be a majority of the whole number of electors appointed; and if no person have a majority, then from the two highest numbers on the list the Senate shall choose the Vice-President, and a majority of the whole number shall be necessary to a choice.

But suppose neither the House elect a President, nor, this failing, the Senate a Vice-President to act as President. In the event of these failures, there would be no President after March 4. The Federal Constitution gives no authority for any Presidential succession in the event of a failure to elect a President. In 1792, however, Congress provided for the Presidential succession in the case of the death, resignation, removal, or disability of the President and the Vice-President. It passed a law providing that the President of the Senate should act as President, and, if he could not serve, the Speaker of the House of Representatives should act as President. In 1886 a new law took the place of this law and declared that, if the President and Vice-President could not serve, the succession was to fall upon the Cabinet officers in the order of their rank: first, the Secretary of State; second, the Secretary of the Treasury, etc. As Cabinet officers are not appointed for specific terms, and always hold over into a new Administration until their successors qualify, and if the purpose of the succession act should be applied to an exigency in which there is no President at all, it would seem to come reasonably within the province of the Secretary of State to issue a proclamation convening Congress for the purpose of ordering a new Presidential election.

Mr. Brandeis on Labor and the Trusts

The only speaker on the Democratic side who has been seriously discussing with any definiteness the issues of the campaign on a National scale is Mr. Louis E. Brandeis, of Boston. Mr. Wilson, the Democratic candidate, has been content to deal in very wide and indefinite generalizations. Mr. Brandeis, however, in his statement of the Democratic position on the trusts and on social justice, has been more specific than any other speaker who has had a wide hearing. In a series of addresses he has been speaking largely to those who are called "social workers." He has called this a "year of jubilee" because for the first time in a political campaign there has been a recognition of the "true humanities." He expresses his gratitude to the new party for bringing this discussion about. In spite of that fact, he advocates the election of Mr. Wilson. He agrees with the planks of the Progressive platform proposing the prohibition of such things as child labor, night work for women, and conditions of work destructive to health. All these things, however, he regards as negative. On the other hand, what the Progressive party proposes regarding the trusts he thinks will destroy "the possibility of self-help" on the part of working people. He believes that the hope of the working people lies in their labor organizations, and says that the plan of the Progressive party not to restrict the mere size of large business enterprises is dangerous to labor organizations. He holds that there ought to be a measure of equality between the labor organization and the capitalists' organization in their struggle the one with the other, and undertakes to show that the whole tendency of combination in business enterprises is to destroy the labor unions. He cites in particular the Steel Trust, and refers also to the Tobacco Trust, the Beef Trust, and the Smelter Trust. He says that the laws, on account of the interpretation of the courts, cannot adequately protect the

laborers. The laborers must therefore protect themselves. The conclusion he would reach is that the way to deal with business combinations is to keep them from getting large. On the stump he has repeated his statement, in spite of authoritative denials from Progressive leaders, that the Progressive party stands for the regulation of monopoly as distinct from the Democratic proposition of the regulation of competition. We are informed that even after his attention was called to these denials, in one case by means of an editorial statement in The Outlook, he has continued his characterization of the Progressive position. Mr. Wilson has also repeatedly said that the Progressive proposal is to regulate monopoly. The only charitable interpretation of these statements is that Mr. Brandeis and Mr. Wilson do not understand the plain and clear language of the Progressive platform. That platform specifically declares as insufferable in a free government the uncontrolled system by which there is placed in the hands of a few men enormous, secret, irresponsible power over the life of the daily citizen. The Progressive party does not propose to regulate or even tolerate monopoly. Mr. Brandeis's plan is to deal with corporations by prosecution in the courts. He refers specifically to the so-called Stanley Bills, which would declare any combination which controls more than thirty per cent of a product to be presumptively in restraint of trade and a monopoly, unless it can prove itself to be otherwise. Mr. Brandeis would depend for justice upon reducing the size of business organizations so that they will not be so strong in their struggle against labor organizations, and then would depend largely upon that struggle between business men and laboring men for securing a fair degree of justice. In other words, Mr. Brandeis seems to look upon industrial war among business competitors and between employers and employees as the normal way by which to secure good results.

The Weakness of the Democratic View

Nothing more definite than Mr. Brandeis's statement of the Democratic position on the trusts has been given unless it is the statement in the Democratic platform in regard to State's rights. Briefly, then, what the country would have a right to expect of the Democratic party if it came into power would be the reduction of the size of business, the regulation of big combinations by prosecuting them in suits-at-law under a more rigid anti-trust law, and the leaving of any other kind of regulation to the States. The Progressive leaders hold that these three methods would not only be ineffective, but that in so far as they would have any result the result would be hurtful. Attempts to keep business from growing large must necessarily be accompanied by serious business disturbance. Moreover, the proposal to limit the size of a combination to that which controls no more than thirty per cent of a product is at best impracticable. What does thirty per cent of the steel business mean? Does it include iron ore and other ore products, or only the finished products? Would a combination that controlled over thirty per cent of steel rails but less than thirty per cent of steel products be in restraint of trade? Would control of coal mines supplying fuel for steel manufacture be included in the total? Ought these questions to be answered by a court? How could all the possible questions like these be anticipated in a law? In the second place, regulation by suits-at-law has proved futile. The recent illustration in the cases of the Standard Oil Trust and the Tobacco Trust is sufficient to show that courts require evidence, and court methods involve technicalities that make the speedy and prompt control of great business corporations by their means out of the question. In the third place, the Democratic proposal of invoking the powers of the States to deal with great National enterprises seems scarcely credible in view of what the States have done to allow these great corporations uncontrolled power; the State of New Jersey, of which the present Democratic candidate is Governor, is the worst offender of all. If these three methods of reducing the size of combinations, of prosecution by suits-at-law, and of leaving other regulation generally to the States, do not constitute the Democratic proposal, the Democratic candidate and his supporters ought to have made it clear long ago just exactly what they do propose. The Progressive plan has been made perfectly clear. It is stated at length in its platform, and has been repeatedly set forth during the campaign.

The Progressive View

As stated specifically in the National platform, the Progressive party is in favor of labor organizations; but, unlike Mr. Brandeis, it does not believe that the question of justice between employer and employee should be left to be fought out by the labor organization on the one hand and the business corporation on the other. The Progressive party believes that the question of the control of business is a National question; that it cannot be left to the States any more than the question of slavery could have been left to the States. It does not believe that the trust question can be settled by attempts to keep business comparatively small. In its platform the party distinctly says that it has no fear of commercial power. This has been curiously interpreted as a declaration in favor of monopoly. It is no more a declaration in favor of monopoly than Mr. Wilson's statement, in which he says "power in the hands of great business men does not make me apprehensive, unless it springs out of advantages which they have not created for themselves." The Progressive party does not believe in trying to make big business little. It does believe in trying to make little business big, and in regulating all business that needs regulation. It does not believe in trying to control business through the slow, technical methods of the courts. It does believe in regulating business by the prompt and efficient methods which have been used in regulating the railways. There is no danger to labor organizations in the administrative control of industrial corporations; and this has been proved because the same kind of administrative regulation has been applied to railway companies, and the labor organizations on the railways are among the strongest and most useful labor organizations in existence. The Progressive party's plan is definite and specific. Its plank on the subject would occupy more than half a page of The Outlook. The party would establish the same kind of Federal Administrative Commission for the regulation of great industrial combinations that now controls the great railway systems. It would give that Commission the power to prevent unfair competition and unfair privileges and those practices which lead to monopoly. It would no more give to that Commission complete discretion in the exercise of its power than it gives such complete discretion to the Commission that controls the railways. It would supplement the Anti-Trust Law by provisions stating more specifically than is now stated what practices are unfair and monopolistic, and it would keep that law on the statute-books as a guide to that Commission. This view is practically opposed to that which Mr. Wilson has taken, for Mr. Wilson has in public speech expressed a contempt for the expert. One of his journalistic supporters has hinted that Mr. Wilson might favor such an Administrative Commission, but if he should do so it would be entirely inconsistent with the view that he has taken, and with his attacks upon the Progressive plan. Such an Administrative Commission as the Progressive party proposes has been tested in the control of railways, as we have said, and in the control of banks. In each of these two cases, when it was first proposed it met with the same kind of opposition that the Democrats now put forward; but now no public man of any standing would dream of proposing to abolish administrative control for banks or administrative control for railways. It is in general this same method that the Progressives would apply not merely to inter-State business but also to the tariff. By such an Administrative Commission it could be definitely determined whether the tariff schedules were used to swell unearned dividends and promote monopolies. With an Administrative Commission to make public the facts with regard to the effect of the tariff, and with an Administrative Commission to control the operations of great industrial concerns, there would be maintained the advantage of the protective principle and of business co-operation, and there would be eliminated the evils that have grown about a non-regulated competition in tariff favors and in industrial privilege.

A Blow at Police-Protected Crime

By the conviction on the charge of murder in the first degree of Charles Becker, formerly the police lieutenant in charge of the so-called "strong arm" division of the police, the District Attorney of New York City, Mr. Whitman, and his associate, Mr. Moss, have dealt a telling and effective blow against the organized criminal conspiracy which has long existed between New York criminals and the police force. If the murder of the gambler Rosenthal had merely been, as Becker's counsel maintained, the cold-blooded killing of one gambler by

others whose lawlessness he was on the point of exposing, its significance would have been comparatively small, although, even so, it was astounding enough that such a bold murder could be committed in the heart of the city and in a spot all but surrounded by policemen without the immediate arrest of the assassins. But the evidence adduced at Becker's trial, and its acceptance by the jury as truth, sustains the reluctant belief of those who have studied this case and have studied also the defects and dangerous weakness of the New York police system as to collusion between police and criminals. The difficulty of establishing the facts was enormous, because, in the nature of the charge against Becker, the chief evidence against him had to be gained from his accomplices. All the more, therefore, is the victory for justice a triumph, and one which may prove a point of departure in the overthrow of police corruption. In this atrocious crime, as Mr. Moss pointed out in his argument, there were three kinds of murderers involved in one general purpose—first, the "gun men" who actually committed the deed, mere hired assassins who had no personal hatred of Rosenthal; second, the wretched go-betweens who arranged the murder and who may be called the brains of the deed; and, finally, the man who ordered the assassination and who rightly may be called the will back of the deed. The trial incidentally brought out abundant direct evidence against the four men who took part in the killing of Rosenthal, and their trial will follow in due course. The go-betweens who borrowed from Zelig for this crime his "gun men," just as a corrupt nobleman of the Middle Ages might borrow or hire bravos to kill an enemy, have probably saved their skins by turning State's evidence. The heartless and cruel police official who ordered the murder because his former accomplice was about to expose his evil deeds now stands convicted of one of the deepest and foulest crimes defined by the law. The jurymen were evidently convinced that in the main the truth was told by the informer Rose, and that he was sufficiently corroborated by the other witnesses. Briefly, Rose was intimate with Becker, saw him constantly, breakfasted with him repeatedly at his home, and was the agent who collected hush money for Becker from the gamblers. Rose testified flatly that Becker repeatedly urged him to procure the killing of Rosenthal, who was on the point of giving evidence as to Becker's criminal acts before the Grand Jury. If the story told to the jury is true, Becker not only furnished money to pay for the crime, and repeatedly drove Rose and others forward in arranging the details, but after the crime went to see the body of his victim, and in that presence burst into a foul and profane tirade of abuse of the dead man and exulted in his death. Becker's conviction, whether or not it is sustained on appeal, will be of immense value in the campaign to make New York a clean city.

Mr. Norman Hapgood and "Collier's Weekly"

Mr. Norman Hapgood has resigned the position which he has held for nine years as editor of "Collier's Weekly." Mr. Hapgood has a deservedly high reputation as a journalist and a man of letters, and, in common with thousands of other appreciative readers of that excellent periodical, we regret that "Collier's Weekly" is no longer to have the benefit of his trenchant and fearless pen in its interpretation of public questions. But it is quite clear that Mr. Hapgood does not take all the trenchancy and fearlessness with him in leaving his editorial chair, as will be seen from the following editorial which we reprint in full from this week's issue of "Collier's Weekly:"

A MAN

Theodore Roosevelt is a fairly close presentment of what this Nation likes to call a *man*. Such faults as fault-finders like ourselves have been able to descry in him are faults of the highly tempered, hasty, and not always reasonable Nation which selected him to govern it. No man probably could have risen so high in American politics and emerged as stainless from his early struggles. No man could have used his power with a larger moral usefulness to his whole people. And we doubt whether any man in history has undertaken late in life as high an unselfish venture in the field of politics as the Bull Moose. It is fortunate that those who value lightly the important things of life—courage, personal honor, and the well-being of those about them, and who guard closely safety, comfort, and their pocketbook—are almost the only Americans cynical enough to disbelieve in the honesty of Theodore Roosevelt's words within five minutes of an attempt upon his life:

> Friends, I want to say this about myself: I have too many important things to think about to pay heed or to feel any concern over my own death.

"Collier's" is not so hypercritical that it cannot recognize a man.

Mr. Hapgood has said in newspaper interviews that he resigned from "Collier's

Weekly" at least partly because he feared that the recent appointment of Mr. Patterson, formerly advertising manager, to become general manager of the Collier Publishing House might make the editorial policy of the journal less independent of commercial influences than it has been in the past. But it is very clear from the correspondence which has been made public by Mr. Collier that the immediate cause of Mr. Hapgood's resignation was the publication of the foregoing editorial on Mr. Roosevelt. Indeed, in an interview in the New York "Times" Mr. Hapgood called the editorial, which was written by Mr. Collier himself, "hopelessly commonplace," and adds: "If the office boy had written the editorial I should have rejected it." We do not agree with Mr. Hapgood, and we do not wonder that Mr. Collier did not agree with him when he protested as editor against the publication of the editorial, for, in our judgment, it states in admirable English and with readable terseness plain and exact facts. It has long been known among newspaper men that in the present political campaign Mr. Hapgood's sympathies were with Governor Wilson, while Mr. Collier himself, and Mr. Mark Sullivan, the able associate editor of "Collier's," were strong supporters of the Progressive party under the leadership of Mr. Roosevelt. We think it will strengthen "Collier's Weekly" to have its editorial atmosphere cleared by this temporary electrical disturbance, and to have its political convictions thoroughly understood by its readers, as they have not been understood during the last two or three months.

The Balkan War

Why the Balkan War? Why have the Bulgarians captured the city of Kirk-Killiseh ("Forty Churches") and why are they closing in upon Adrianople? Because Turkey has been oppressing the Balkan States: Bulgaria, Servia, Montenegro, and Greece—the last named not really a Balkan State, but included in the number. Hundreds of thousands of Bulgarian, Serb, Montenegrin, and Greek Christians live in Turkey. They have always been oppressed, and lately several hundred of them have been massacred. But the resentment of the Balkan States is not alone against Turkey; it is also against a continuance of perfidious European diplomacy. In 1878, with a view to a settlement of the Balkan question, the European Powers signed the Treaty of Berlin. Article 23 of that treaty provided for the local government of Turkish provinces, with large autonomy. Despite her promises, Turkey has never put that article into force, and the Powers have practically acquiesced in Turkish oppression, fearing that interference might be interpreted as a first step toward the fulfillment of their selfish, and not their unselfish, ends. Turkey and the Powers have also counted, and not vainly, upon the animosities which have divided the Balkan people. Now, however, they cannot so count; because, for the first time since their liberation from Turkey by the Treaty of Berlin, the Balkan States have been able to sink those animosities, and to be moved by the one thought that their blood-brethren in Turkey are really bound by ties of race and religion, not to the Empire of which they are subjects, but to the several states across the Turkish frontier. This is the great human reason for the present war. And it is this which has made possible the victories already obtained by all four armies—by Bulgaria in her advance on Adrianople; by Servia in the Turkish district called "Old Servia;" by Montenegro in rescuing the Christian Albanians; and, finally, by Greece in bursting through the famous Stone Gates. We have heard much about two of the bonds—race and religion—which unite the Christian races in Turkey to the Balkan States. But we have not heard so much about a third—tradition. We are likely to hear more. The newspapers are now pointing out what an inspiration it must be to the Servian army to capture the country about the field of Kossovo, where in 1389 the Servian Empire perished when engaged in its death struggle with the Turks; it is recalled that throughout the Serb folk-songs a continual prophecy runs that after five centuries have elapsed the Serbs would again go to war and win back their land. Such a tradition also animates the Bulgars as they think of the old Bulgarian Empire of their Czar Simeon, extending beyond the mountain passes through which they are now struggling into the Turkish plains. If this is true of the nations to the north, how much more is it true of Greece, once more winning back, as she did last week, the island of Lemnos, with its memories of Menelaus and Agamemnon, and Mount Olympus itself! But all this is to receive a rude shock. The Turks have really not yet begun to fight, despite the severe losses already sustained. Everywhere pos-

sible the Turks have shown their policy of a masterly retreat in order to draw their enemies as far as possible from bases of supplies and to condense their strength in the open country where their tactics are superior to those of their opponents. This is wise military strategy. Unfortunately, it has been accompanied in some instances, notably on the Servian and Greek borders, by the very thing which led to the present war—massacre of the Christians. As the population of European Turkey is half Christian, and as several million Greeks are scattered throughout Turkey in Asia, a general massacre is feared by the timorous. This fear is, we hope, not justified, but, in any event, the Christian Powers have before them an insistent duty in acquainting the Turkish Government with their feeling in this matter.

The Militant Programme

The English Suffragettes must be distinguished from the English Suffragists, of whom there is a large and influential body, and who have conducted the movement for the extension of the suffrage for women in an orderly and constitutional way. England is not Russia. It is a self-governing country. Women can secure the suffrage whenever they can persuade the English people that they ought to have it. They have a perfectly free field. Miss Millicent Garrett Fawcett contributes a very interesting article to the current number of the "Century Magazine," in which she states very effectively that, while no great emancipating evolution for men has been accomplished without violence, "the women's movement toward freedom did progress, and progress marvelously, for the first half of the nineteenth century till about six years ago without the use of any kind of violence. We shot no one, we exploded no bombs, we destroyed nothing; but we have been building up and creating a new social order in which the women of to-day occupy a wholly different and better place from that occupied by the women of preceding ages." She calls attention to the fact that the universities have been opened; girls' schools made over; medical and legal professions opened; municipal and all other local franchises in Great Britain and her colonies have been won; women have been made eligible for election on local governing bodies; civil service has been opened; mediæval laws modified; all these victories have been won without violence. She concedes that credit must be given to the "militants" for making the claims of women more widely known, but when they departed from the attitude of suffering violence to using it, they put themselves in the wrong morally. If militancy is renewed, Miss Fawcett predicts the defeat of the suffrage amendment to the Government Reform Bill. She regards the militants as the most dangerous obstacle in the way of the immediate success of the cause of suffrage in England. Meanwhile, Mrs. Pankhurst, the leader of the militant suffragettes, has taken a still more radical position. If newspaper reports are to be trusted, at a suffragette demonstration recently held in London she said: "I incite this meeting to rebellion. Those of you who want to go to the House of Commons and refuse to be sent away, do so. Those who will face party mobs at Cabinet Ministers' meetings, do so. Those who can break windows, break them. Those of you who can still further attack the sacred idol of property so as to make the Government realize that property is as greatly endangered as it was in the days of the Chartists, do so. . . . Our militancy consists in defiance of legal enactments and in attacks upon property. The only limit set is that human life shall be respected." But it is apparently a matter of pure luck that that limit has not been passed. The flinging of a hatchet into the carriage which contained the Prime Minister in Dublin, and the attempt to set fire to the theater, were not attacks on property but on life. Meanwhile, Mr. and Mrs. Pethick-Lawrence have declared against the new militant campaign planned by Mrs. Pankhurst, and have left the organization. Beyond doubt the English Government will be compelled in the near future to face some very difficult and painful duties; but the time for treating women who, in a country under such a political system as the English, endeavor to secure political rights by the destruction of the property of innocent persons, with the consideration which has always been accorded to women, is past. Women who voluntarily become lawbreakers ought to be punished as lawbreakers.

President Meiklejohn's Induction

Amherst has a new President. It chose Alexander Meiklejohn, Dean of Brown University, and he has now been inducted into his new office. As was fitting,

the October day was serene and the Connecticut River country lay in a blaze of autumnal color. The representatives of more than a hundred universities walked in stately procession and witnessed the delivery of the college charter, seal, and key into the hands of the new President. The addresses on the occasion were notable. President Hyde, of Bowdoin, described "The College President's Job," and President Faunce, of Brown, whose subject was, naturally, "Academic Reciprocity," praised "the Amherst idea" as the broadest interpretation of the word "classical." President Garfield, of Williams, suggested that "educational programmes should be framed with reference to National tendencies," and spoke strongly in favor of a more serious upholding of scholarship. This was also touched upon by President Lowell, of Harvard, who declared that "flowery beds of ease" were out of place in a college. The word "vital" characterized the address of President Meiklejohn. Concerning "freedom of election by the student" in his studies, there are, asserted the new President, "vast ranges of knowledge which have virtually no significance for the purpose of a liberal education, while, on the other hand, there are certain elements so fundamental and vital that without any one of them a liberal education is impossible." As "the college is fundamentally a place of the mind," there must be the kindling of an intellectual enthusiasm for these things as vital and fundamental. Dr. Meiklejohn continued—and his words contain at once a warning and a suggestion to all educators :

> A little while ago I heard one of the most prominent citizens of this country speaking of his college days, and he said: "I remember so vividly those few occasions on which the professor would put aside the books and talk like a real man about real things." Oh, the bitterness of those words to the teacher! Our books are not dealing with real things and for the most part we are not real men either, but just old fogies and bookworms. And, to be perfectly frank about the whole matter, I believe that in a large measure our pupils are indifferent to their studies simply because they do not see that they are important. Now, if we really have a vital course of study to present, I believe that this difficulty can in large measure be overcome.

It might be said that in this speech there was added to the "Amherst idea" the Meiklejohn idea—namely, that a college ought to deal with life.

THE PEOPLE AND THE PRESIDENCY

The country has not taken seriously the outcry against the third term. Nor has any public man of National reputation taken it seriously—except Mr. Bryan.

The argument against a third term is a distrust of the people. It is that they are either not wise enough to know whether they are well served or not strong enough to reject one who does not serve them well.

The framers of the Constitution had more trust in the people than Mr. Bryan has. There were politicians in those days who did not believe that the people were wise or strong enough to choose their own President freely, and they proposed to make the President ineligible for re-election. The framers of the Constitution rejected this proposal, and their conclusion, as reported by Alexander Hamilton ("The Federalist," No. 69), is recorded as follows :

> "THAT MAGISTRATE IS TO BE ELECTED FOR FOUR YEARS; AND IS TO BE RE-ELIGIBLE AS OFTEN AS THE PEOPLE OF THE UNITED STATES THINK HIM WORTHY OF THEIR CONFIDENCE."

With this conclusion of the framers of the Constitution Alexander Hamilton himself agreed, as is made clear by his words ("The Federalist," No. 72) : "Nothing appears more plausible at first sight, nor more ill-founded upon close inspection, than a scheme . . . of continuing the Chief Magistrate in office for a certain time, and then excluding him from it either for a limited period or forever after."

The reasons which led the framers of the Constitution to their conclusion he states at length. The following sentence sums up the argument :

> "There is an excess of refinement in the idea of disabling the people to continue in office men who had entitled themselves, in their opinion, to approbation and confidence; the advantages of which are but speculative and equivocal, and are overbalanced by disadvantages far more certain and decisive."

Washington, in a letter to Lafayette written April 28, 1778, affirmed the same conclusion, based upon the same reason :

> "There are other points in which opinions would be more likely to vary. As, for instance, on the ineligibility of the same person for President after he should have served a certain course of years. Guarded so effectually as the proposed Constitution is in respect

ence in the choice of President, I confess I differ widely from Mr. Jefferson and you as to the necessity or expediency of rotation in that office. . . . I can see no propriety in precluding ourselves from the services of any man who on some great emergency shall be deemed universally most capable of serving the public."

Mr. Bryan, and other men less well known, who, in the name of democracy, wish to prevent the people from exercising their free choice, are less democratic than George Washington and the other framers of the Constitution. There is something amusing in this phenomenon: men who fear a broad construction of the Constitution, or an easy amending of the Constitution, in the interest of the people, would engraft upon it an alleged tradition which does not exist, and thus secure a practical amendment to limit the power of the people.

The answer of George Washington and his associates to these counselors of distrust is as complete as it is simple—the people should not disable themselves from continuing in any office, from that of roadmaster to that of President, any servant of theirs for as many terms as he has the people's approbation and confidence.

VOTES FOR WOMEN

The question of woman suffrage is to be submitted to the voters this fall in the following five States: Michigan, Wisconsin, Kansas, Oregon, Arizona. It ought to be submitted to the women, not to the men. Therefore we recommend the man to submit it to the woman. Ask her counsel and vote in her stead.

Are you married? Ask your wife if she would vote for suffrage. If she would, vote for it. If she would not, vote against it. If she is undecided, vote against it. The duty of voting ought not to be imposed on her unless and until she is ready to assume it.

Are you unmarried? Take counsel of some woman whose interests you are bound to serve—mother, sister, friend. Act as her proxy. Vote in her stead.

The chief opposition to woman suffrage does not come from the liquor interests. It does not come from the politicians. It does not come from men who hold to restricted ideas of woman's sphere. It comes from women who find themselves already bearing able to bear. The women ought to decide this question. Let some trusted woman decide for you how you shall vote on this subject. Vote as she would vote.

WHEATHEDGE PAPERS

THE ORPHAN

There has been for some time a gypsy encampment upon the stream which flows through the village of Wheathedge. The sanitary conditions of this encampment were very bad, and the doctors in the village thought it perilous to health, and traced some cases of serious disease to the pollution of the stream, produced by the gypsies. Ineffectual attempts were made from time to time to induce the gypsies to introduce some sanitary reforms, and occasional demands were made by individuals in the village for a campaign against the gypsies to drive them from their camping-place. At last it was reported about the village that the gypsies had in their camp a boy of ten or twelve years of age who did not belong to them. It was believed that he had been stolen, and it was currently reported that he was very badly abused. Some investigation was set on foot, with the result that both facts were established—that he was stolen and that he was badly abused. This the village would not endure. A raid was made on the camp; the boy was taken away from the gypsies; and the gypsies themselves were compelled to move away from the vicinity of Wheathedge.

Then the question arose, What should be done with the boy? He was an Italian and could not speak the English language. He had had no education and was unable either to read or write. He was a remarkably bright boy and had in him the making of a fine man, but he had had no training, either social or industrial, to fit him to take care of himself. But naturally he did not entertain this opinion, and objected to being brought under any more thorough and systematic discipline than that to which he had been accustomed in his roving life with the gypsies. The result of this incident has been to create three parties in Wheathedge.

One party urges the authorities to set the boy free immediately. They say that the village never ought to have interfered with the gypsy camp. The maltreatment of the boy by the gypsies was none of its business, and

the village makes itself his guardian, it will be at considerable expense and involve itself in no end of responsibility. And what can the village hope to get out of it? Even if he grows up to be a self-supporting citizen, his custom never will bring back to the village enough to pay for the cost of his education.

A second party says that this boy should be set free, not because it is not profitable to retain him, but because the village has no right to retain him. He must decide for himself whether he wishes to remain in the village and go to school or whether he desires to take to the road. Liberty is sacred; it is better that he should suffer some misfortunes and be free than that he should be guarded from misfortune and be kept in a state of dependence.

The third party insists that it was well to take this abused boy from the gypsies, who did not know how to take care of him and were maltreating him; that, having taken him from the gypsies, the village has become responsible for his welfare; that it has no right now to set him free and put upon him the responsibility of deciding for himself what he will do; that it is its duty to provide for him an industrial education that he may be able to earn his own living, and such moral and political education as is necessary to make him a self-supporting member of a self-governing community. It is also necessary to teach him the English language. When it has done these things, it should then leave him to decide for himself whether he will remain a citizen of Wheathedge or go elsewhere. The village authorities have no right to put the responsibility of that choice upon him now.

The right decision in this question is important because it affects the honor of Wheathedge; but there is some danger that in this fall election the people of the village will be so much interested in other questions that they will let this question have the go-by.

The Outlook believes that the American war with Spain was not only justified but was greatly to the credit of the American Nation; that we did well to rescue the Filipinos from the despotic government exercised over them by Spain; that, having rescued them from Spain, it is our duty to maintain our sovereignty over them until they have learned a common language, acquired industrial and political education, and so have become able they wish to maintain relations with the United States or to be wholly independent; and that the question of their relations to the United States should be left until this work of industrial and political education is completed.

MR. MABIE'S VISIT TO JAPAN

A most interesting and, we believe, valuable extension of the system of exchange in lectureships between different countries is that under which Mr. Hamilton Wright Mabie will during the coming winter deliver before the great universities of Japan a series of addresses which will aim to interpret "The American Spirit, Ideals, and Life." Last year Dr. Nitobé, of the Imperial University of Tokyo, was sent by Japan to this country, and his lectures here did much to give American students and thinkers a just conception of the Japanese people, their modes of thought and their aspirations. It is as a return for Dr. Nitobé's visit that the Carnegie Endowment for International Peace, in cooperation with the Japanese Government, has arranged that Mr. Mabie should deliver in Japan the proposed series of addresses on Western civilization and ideals.

At a farewell dinner given in honor of Mr. Mabie by the Japan Society in New York last week President Butler, of Columbia, who presided, summarized the purpose of this exchange of ideas by saying: "Dr. Mabie is to go out in the footsteps of other Americans, to live in intimate contact with the Japanese, to leave his personality impressed upon them, and to reveal by his acts, words, and attitude the kindness with which the people of the United States view the people of Japan." It is in a true sense, therefore, that Mr. Mabie was repeatedly referred to in the addresses of the speakers at this dinner as "an ambassador of peace." In his response Mr. Mabie laid stress on his feeling that there should be variety and not uniformity among the peoples of the world, that as between the East and the West what is to be hoped for is not identity but unity, and that we might well strive to get an understanding of that discipline which in Japan has been perfected by centuries, of the deep love of the beautiful in Japan, and of that subjection of the individual will to the welfare of the State which together have made Japan so great and so centralized as a nation. Among the speakers of the evening

Numano, the Japanese Consul-General; President Finley, of the College of the City of New York; Dr. Henry van Dyke; Dr. Talcott Williams, head of the Columbia School of Journalism, and Mr. Hamilton Holt, of the "Independent;" and it is noteworthy that all of the speakers in one way or another have had an active part in the exchange of lectures between America and other countries, or in establishing the friendly feeling between Japan and America.

As all our readers know, Mr. Mabie is now, and for many years has been, the Associate Editor of The Outlook, and on the eve of his departure for this important undertaking his associates (writing, it need not be said, without consulting him) desire most cordially to join in expressing their personal good wishes and affectionate friendship toward him, and to express also their belief that his receptive and friendly attitude of mind and his appreciation of what is best in American life and literature make him peculiarly suited for the task he has now undertaken.

PUTTING ON IMMORTALITY

It would be difficult to call a more convincing or eloquent witness to the mutability of life than the Apostle Paul, one of the heroes of the spiritual romance of the world. His life reads like a sublime fairy story, so great were its transitions of condition, so marvelous was its unfolding. Honored and obeyed as the representative of an elect class, and clothed with the authority of that class, he became an outcast from his own people. The persecutor of a new religion, he became its foremost interpreter and apostle; a teacher of recognized position and of high intellectual power, he spent many months in a dungeon. He was born in the purple, so to speak; he died as the thieves and murderers of his age died.

If experience of change qualifies men to know how mutable life may be and what revolutions it may work in character and career, Paul is certainly one of the foremost witnesses in history. But through all these changes and in the course of these manifold vicissitudes there was no man in the world whose life had greater stability, nor was there one in whom the spirit was more invincible. His feet walked in dark places; but the track of his spirit shines like the day. Living in a and spirit in radical ways, the soul of Paul defied change and for two thousand years has defined stability.

Many a man, facing the ceaseless changing of the external world and the persistence of the human spirit, has asked himself, "What does it mean?" Paul answered that question when he said, "This mortal must put on immortality." This was not only the declaration of faith in a life beyond life, but it was also a statement of what goes on in us and about us in this world. We are all putting off the mortal and putting on the immortal; that is the sublime process of life; the purpose for which the world stands. There is no longer any dead matter, as our fathers thought; the whole material world flows like a great Amazon of force through space. There is no present; while one speaks of it it is past. It is sometimes said that it is impossible to step twice into the same stream; it is not even possible to step once into the same stream. Before the foot which touches the surface has buried itself in the water it is another stream. We do not live two days in the same body. The man who rounds out his seventieth year has had seven or eight bodies; and yet, though living in the sweep of this uninterrupted motion, his personality not only survives, but becomes stronger. If he lives with righteousness of brain and hand and with love in his heart, his whole life is a putting off of mortality and a putting on of immortality.

It is in one sense a deeply mystical and elusive process, and in another sense it is the most obvious and the simplest thing in the world. Every man and woman who submits to the discipline of life, and out of temptation gathers strength, out of sorrow peace, and out of work vigor of purpose, and who submits to the discipline of experience, not to resist, but to co-operate and to grow, is always putting off this mortal and putting on immortality. We all see the external process; what we do not always understand is the internal change. But men are beginning to understand it and to recognize the putting off of the mortal and the putting on of the immortal. Until a few years ago, if France had been asked to name the greatest man in her history, she would have answered, "Napoleon;" but when she was asked that question not long ago, she answered, "Pasteur." She had changed her ideals. She chose a man who had rendered great external serv-

different from the spirit of Napoleon as the spirit of the teacher, the liberator, and the spiritual leader is different from the spirit of the conqueror. Napoleon worked with perishable things for mortal aims. Pasteur gave himself to the service of humanity. The one destroyed, the other preserved.

It makes very little difference how little capital a man has when he starts the business of life; it makes all the difference in the world how he uses that capital. There are men of enormous material wealth who have not begun to put on immortality. When Dr. Grenfell went to Labrador he had little money, no buildings, no co-operation. He carried with him only the passion of helpfulness, the desire to teach men how to live in the spirit of Christ. Now that little capital has become immense wealth; the country is full of his friends, everybody group of young men, he is like the Pied Piper: they are eager to follow him. All men are born to work; the idlers are never really born into life, they simply sit on the outside and look on. All men who live work in some fashion; all women work and suffer. No man or woman has yet escaped the discipline of work or the discipline of sorrow; and to those who do not see what Paul saw, and what Dr. Grenfell has illustrated in his life, this experience which we call life is a mere round of duties and of toil, a long and hopeless drudgery, or a putting of the cup of pleasure to the lips only to dash it to the ground. But to those who see what Christ came to reveal, and what all the saints and heroes have learned, life is neither hopeless drudgery nor idle pleasure, but a glorious adventure of the spirit; a putting off of mortality, a putting on of immortality.

FOLLOWING THE CAMPAIGN

A WEEKLY DIGEST OF POLITICAL OPINION AS EXPRESSED BY PEOPLE AND NEWSPAPERS

THREE ATTITUDES

THE "Saturday Evening Post" of Philadelphia, a well-known popular weekly, has just published three articles by the three principal Presidential candidates. The authors reveal their personal attitudes and they reveal the attitudes of their respective parties.

The question uppermost in the minds of all three writers seems to be: "What is the chief issue of the campaign?" As regards the Progressive party, Mr. Roosevelt says that its social betterment programme is the thing most worthy of attention. What particular things are included in "social betterment"? They are thus recounted in an editorial which we find in the Missoula, Montana, "Missoulian" (Prog.):

> In the development of the United States into a great industrial Nation terrible evils have shown themselves. Child labor, the employment of women at less than a living wage, industrial accidents, destitution resulting from these accidents and from preventable disease, involuntary idleness, and a mass of other unwholesome products of modern civilization have begun to menace the country. These fearful problems are recognized only in the Progressive platform.

We do not get this attitude of concern from the articles by President Taft and Governor Wilson. Of course neither of them are opposed to social betterment, but their articles do not reveal Mr. Roosevelt's intensity of feeling. In any event, they would differ from him as to the way in which social and industrial justice should be brought about. For instance, Mr. Taft, referring to the Roosevelt plan of securing social justice by the review of judicial decisions, writes thus:

> The recall of judges and judicial decisions is hostile to that form of government which has made the United States the greatest nation in the world, which has fostered liberty, promoted equality of opportunity, and achieved a prosperity beyond the most sanguine dreams of our forefathers. The recall as applied to judges and their decisions would undermine the independence of the judiciary, subject our judges to political influences, and render it futile for the poor and the weak to look to the courts for justice. It should be our constant aim to achieve as complete a separation of the judiciary and politics as we have of Church and State.

Governor Wilson's way would be "to cut privilege absolutely." But Mr. Roosevelt

now famous decision of the New York State Court of Appeals, that a law providing for a ten-hour working day for women was unconstitutional, Mr. Roosevelt says:

The Court of Appeals said that under their interpretation of the Constitution the small sweatshop keeper or the big factory owner may work haggard women twelve, fourteen, and sixteen hours a day if he chooses, and we cannot stop it. Personally I will not submit to any such interpretation of the Constitution, and our proposal is this: When a court decides that we have not the power to do such an act of social and industrial justice as described, then, in decent, law-abiding, orderly fashion, the people shall decide for themselves whether or not the Constitution is to be a defense of vested wrong or a means of permitting the people to work for righteousness. That's all.

Governor Wilson believes that one way to cut privilege would be to cut the tariff, and therefore presents it as the campaign's chief issue. Speaking of the attitude of the other two parties, he says:

They both admit that some of the tariff duties are too high, but they fail to see the principle upon which they must be lowered.

According to Governor Wilson, that principle is:

Every part of the tariff that has afforded a covert to those who have organized monopoly in this country, and have thereby created high prices, shall be cut out as quickly as it can be cut out without risk of business disaster.

But this does not mean a tariff for revenue solely, according to one of Governor Wilson's most eminent interpreters, the New York "Times" (Dem.), for it says:

No one is foolish enough to think that under the Democratic party these lines will be strictly followed. In planning a tariff for revenue, a large measure of protection will remain. Some will be proper and unavoidable, and some will be sneaked in, as it always is.

But the Democratic position is not progressive enough even from the "regular" Republican standpoint, according to Mr. Charles D. Hilles, Chairman of the Republican National Committee. Writing in the New York "American" (Dem.), Mr. Hilles points out the fact that Mr. Wilson says nothing about a Tariff Commission and is necessarily committed to dealing with the tariff in an unscientific and destructive fashion.

As to the strenuousness of the three candidates on the tariff question, the Sioux Falls "Press" (Prog.) sums up as follows:

The tariff must be reduced, of course, and all three candidates indicate that revision downward can be fairly judged by examining the platform declarations on the subject. The Roosevelt platform "demands" such revision. The Wilson platform "favors" it, and the Taft platform appears to think something "should be" done. And there you are.

In his "Harper's Weekly" interview President Taft declares that "the trust question and the tariff seem to be the two crucial questions during the present campaign."

In the minds of many the trusts form the campaign's chief issue. In his "Saturday Evening Post" article the President thus defines the Administration's position:

During the less than four years of this Administration twenty-two civil suits and forty-five criminal indictments have been brought under the Anti-Trust Law. It is not surprising that the powerful interests that hitherto have enjoyed immunity from prosecution should employ strenuous and devious methods to create the impression that these prosecutions are ineffective, on the one hand, and certain to destroy the prosperity of the Nation, on the other. The fact remains that the law is now respected and observed, and that whereas in the past the organization of trusts designed to acquire monopolies of the industries in which they were engaged was an almost daily occurrence, none has been organized during the last two years.

In Governor Wilson's recent article the attitude of the Republican and Progressive parties is criticised as an acceptance "of the evil developments" of the trusts on the assumption that it is impossible to prevent monopoly. On the other hand, Mr. Wilson would preserve competition, and, where he could not, would dissolve the trusts. He would proceed against them, under existing law, apparently just as Mr. Taft has done.

"Governor Wilson favors the dissolution of the trusts, he says, and his platform agrees"—to quote again from the Sioux Falls "Press"—"by means of the Sherman Anti-Trust Law with which President Taft has had so much harmless fun." The "Press" adds:

Standard Oil and American Tobacco, both New Jersey trusts, have already been "dissolved" by the Supreme Court of the United States, and both are getting higher prices than ever before in their history and paying greater dividends. These combines, first prosecuted by Roosevelt, later "dissolved" by Taft, have been certified to Governor Wilson as guilty of gross illegal practices, of flagrant violations of the law. . . .

We do not intend to draw the inference that Governor Wilson is a trust man. Rather would we conclude that he simply does not grasp the subject as a practical man. Mr. Wilson has

made many utterances that show him a theorist rather than a practical statesman.

We will, until we are shown to the contrary, assume that Mr. Wilson would be glad to curb the trusts in New Jersey but does not know how. Certain it is that he has at his command a statute providing for the suspension or repeal of the charter of any corporation, and also a statute defining the guilt of trust officers and directors who violate law, and has not employed it.

"Here are the facts," says the Philadelphia "Evening Times" (Prog.):

The Legislature stood: Senate, eleven Republicans, ten Democrats; friendly to Wilson upon all his measures. House, forty-two Democrats, eighteen Republicans; wholly at Wilson's command upon party measures.

He never asked either House or Senate to frame a bill or enact a law regulating the trusts of New Jersey, although some of them had been declared unlawful by the Federal courts.

A bill to regulate the trusts *was introduced* by Senator Colgate, a Republican, whose vote for it, together with the ten Democrats, would have passed it to the Democratic house.

That bill was referred to a committee. The committee strangled it. Governor Wilson's attention *was* called to it and *his assistance asked* in its behalf. He gave no heed.

Those are the facts.

Against them you have Candidate Wilson's excuse.

Would he do in the President's chair?

As Mr. Wilson's position seems thus revealed by his course during his Governorship, the Richmond "Virginian" (Dem.) rises to his defense:

Governor Wilson . . . cannot work miracles. He tried to secure a change in the incorporation laws of the State of New Jersey and failed. Why? Because the Legislature was controlled by friends of President William Howard Taft and ex-President Theodore Roosevelt. . . . In his inaugural address he promised to try to change these laws. On three other occasions he demanded of the Legislature that it enact such legislation.

"Governor Wilson's explanation . . . is one that does not explain," replies the Boston "Journal" (Prog.).

His excuse that this opposition was believed to exist does not explain his own inaction. He was able to force the Legislature, he declares, to secure reforms of election laws. He does not know what would have come of a real, vigorous demand for trust law amendment, for he did not make the test. He must stand or fall on his own action. And his record on trust regulation is a blank.

To sum up on the Trust issue, the New York "Press" (Prog.) speaks as follows:

The Republicans are without definite plan. They have tried "dissolution," and the trusts have laughed as they pocketed enormous gains. Wilson, for the Democrats, has proposed State regulation. But when he had the chance right at his hand in New Jersey he did not take a step to secure it. How can any one expect him to do more in Washington? In New Jersey he sought to blame the Republican legislators. In the White House he could argue that he considered it work for the States, not for the Federal Government.

Roosevelt's plan will block decisively unwarranted monopoly. Roosevelt would prevent commission of monopolistic abuses under cover and not reached by the present machinery.

To which the Sioux Falls "Press," above quoted, adds:

We already know what a great good the Inter-State Commerce Commission has done in preventing unlawful railroad combinations and adjusting rates fairly for both the public and the railroads. Within the past few months that body has brought express rates down and stopped the dishonesty of express companies. Roosevelt simply proposes to establish a similar commission to deal with trusts. His proposed industrial commission will see to it that the law is obeyed: that prices are fair; that industrial and commercial interests are brought to a recognition of the rights of the people as the railroads and express companies have been compelled to do.

To this should be added a statement which has appeared in the daily press from the Rev. Dr. Washington Gladden, of Columbus, Ohio:

Upon the trust question the policy of the Progressive party commends itself to me more strongly than that of the Democratic party. The Democratic party proposes to maintain and enforce competition by judicial process. The Progressive party proposes to supervise and control combinations of capital by an administrative commission. The one looks toward the dissolution of the trusts, the other toward their regulation by stringent laws enforced by an executive commission.

Clearly such a portentous monopoly as the Steel Trust or the Sugar Trust cannot be permitted to flourish unrestrained, and the formation of such trusts ought to be rigidly supervised by the Government. Equally certain is it that when they begin to assume the character of a monopoly they should pass immediately into the possession or under the control of the Government.

As a result of these three attitudes, the impression is conveyed that the Republicans would leave things as they are, that the Democrats would like to change some things but do not know how, and that the Progressives would like to change some things and do know how.

Through a regrettable inadvertence, a statement on page 300 of The Outlook for October 12 was wrongly attributed to the Milwaukee "Journal."

A WOMAN TO HER FELLOW-CITIZENS

BY MARY ANTIN

AUTHOR OF "THE PROMISED LAND"

Many of us who have been born in America realize less what America means than some of those who have arrived here from another shore and have become American citizens by choice. Mary Antin, who writes these words to her fellow-citizens, knows what is meant when it is said that America is the "golden hope" of the world. Her early home was in Polotzk, Russia. She has known what it is to fear torture. Perhaps such a fear was not a mere idle fancy of a little Jewish girl "within the pale." She has come to America and has written the story of what it means to come out of the Middle Ages into American liberty. She has written that experience in a book called "The Promised Land." That book has made a great impression. Louis D. Brandeis says of it that "it teaches anew the blessings of freedom, and will enkindle the latent patriotism in many a native American." Rabbi Stephen S. Wise calls it "a human document of deep impressiveness." Mary Antin knows, if any one does, what American freedom is, because she knows what it means to be without it. The article printed below is a plea for a great mass of working men and women, who cannot speak for themselves. In it the dumb speak. It is not a party plea, it is a human plea. Some may read it without conviction; few will be able to read it without awakened interest and broadened sympathies.—THE EDITORS.

WHEN I was a school-girl and read in the history books of the stirring times when the Republic was in the making, I envied the little girls who lived in those days, in the midst of heroes and battles and patriotic conspiracies. That I should ever happen on such valiant times I could not hope; for was not the tyrant repulsed, and liberty enthroned in his place? The Republic was finished, perfect from the hand of Washington. There was nothing left on which to exercise my patriotism.

To-day, when I am old enough to smile at my childish notions, I am amazed to find intelligent men and women among my neighbors who appear to entertain just such ideas as I have long outgrown. They talk as if American history ended with our last war, whereas the most superficial survey of the life of the Nation shows that the Republic is still in the making. At this very moment the country is gathering itself together for a leap forward that shall carry it as far again as it was carried by the Revolution, and later by the Civil War.

Because, happily, there is heard no boom of cannon, many of our citizens fail to realize that we are facing a crisis as grave as any we have dealt with in the past. The American people have been taking stock of their political resources, and they find that existing conditions do not tally with the promises of the Constitution. They find the springs of liberty polluted, the machinery of justice clogged. Moreover, they have become aware of the need of many things that the founders of the Republic did not provide for. And all the alarm and longing born of these discoveries became articulate the other day, when the new political party announced its programme.

The Progressive movement fits easily into a general outline of American history. The War of the Revolution was a fight for political standing-room; the Civil War was a fight for order within our domain; the Progressive movement is a fight for righteousness that shall hallow our heritage of independence and unity. Whoever fails to take sides in such a fight is unworthy of the title of citizen. Whoever is influenced in his choice of a side by selfishness or prejudice or fear ought to forfeit his rights. Whoever, knowing on which side justice is, allies himself with the other, ought to be branded as a traitor.

A great many people who ought to know better have allowed their choice to be confused by the notion that there are several parties to choose from. There are only two parties in this fight: the party that insists on human rights, and the party that is concerned with materialistic quibbles. The latter, to be sure, is split up into two camps, distinguished mainly by the difference between low tariff and high tariff; but, as they are equally bitter in opposing the undivided human-rights party, every loyal citizen who is homesick for the kingdom of God ought to turn his back on both of them.

Complex as are the issues of the present campaign, there has been no lack of authority for the stand taken by the Progressive party

on each and every question involved. An army of statesmen, economists, humanitarians, and men of affairs—each a specialist in his line—have come forward voluntarily to defend every plank of the Progressive platform. If the revered head of a great university expressed an unfavorable opinion of the Progressive leader, a champion was ready at his elbow, one of his own colleagues, to disprove the validity of his criticisms. All over the country men who had stood aloof in previous campaigns—scholars who had been preoccupied with their researches, and happy-go-lucky citizens who thought the country could take care of itself—have surprised their neighbors by taking an active part in the present campaign. A cry has gone out that the State is sick of neglect, and the people, stirred to their hearts, are flocking to her assistance.

Here is the difference between this and other campaigns: that the issues of to-day do not turn exclusively on political theories, with which the layman feels incompetent to deal. Plain questions have been put to the people this time, questions that the plain citizen is competent to answer just because he is a plain citizen. Are you content to be ruled by political bosses, or will you rule yourselves? they are asked. Shall we run this Government for the benefit of the few, or for the benefit of the many? Shall we live for to-day only, or shall we provide for to-morrow's happiness? Have we the courage to put upon our statute-books laws that shall protect all our natural resources, from the forest on the mountain-side to the child in the city street? Have we the sense to put into power men who will do our will in these matters? Democracy or oligarchy, homes or slums, schools or jails—which shall we have?

Any man who has wisdom enough to prefer universal justice to private comfort, and education enough to read and mark a ballot, is competent to answer these questions. The people are answering them by rallying around the Progressive standard. Seeing this impetuous movement, the cautious ones have tried to check it by intimidating questions: "Do you really understand how initiative and referendum will work out? Do you know just how the cost of living is affected by the tariff?" And if the rank and file of voters are unable to give an academic answer to these questions, the cautious citizen declares that they are not competent to vote on the issues of the campaign. He feels safer, does Mr. Dare-Nothing, to vote under the familiar emblem of one of the two parties that have been taking turns in ignoring the problems that have arisen since the primary questions of liberty and equality were thrashed out in this country. I want to ask my cautious neighbor if he believes that every farmer's son who shouldered a flint-lock in '76 was an expert in political philosophy. Perhaps Mr. Dare-Nothing's great-grandfather asked the farmer's boy, "How do you *know* that all men are born free and equal?" Perhaps he added, out of the fullness of his timidity, "How do you reckon your homestead's going to be safe without no king's soldiers patrolling the country?" And what did the farmer do in the face of such posers? He went and oiled his musket against the coming of the Redcoats.

No! let nobody dare to tell you, Mr. Voter, that you are not fitted to pass on the plain questions of the day because you do not hold a college diploma, or have not completed a course on Wall Street, or have no back-door intimacy with the political patron of your ward. If the common man of '76 was competent to decide the novel question whether the people should be their own rulers, the common man of 1912, who has had a hundred times as much schooling and training and political experience, is quite competent to decide whether the theory of democratic government shall be carried out in practice. Very properly you have listened to the discussions of the wise before making up your mind as to what the country needs and how it is to be obtained. The plain man of '76 did just so. You noticed that estimable authorities disagreed among themselves. You watched to see how they grouped themselves in opposing camps. You attached yourself to that party which attracted the largest number of great-hearted public men and women. These you easily recognized; they are the men and women who have served the people heroically and unselfishly on many occasions that you have in mind. In the camps of the opposition you noticed here and there a fine figure standing out—an honest gentleman, a known patriot, a leader of thought whose opinion you have been accustomed to respect. This puzzled you. "Can it be that the Hon. Mr. So-and-So, that Professor So-and-So, is on the right side, after all?" you asked, for you are a man of conscience, and you hold your vote sacred. And, having listened to all sides

and given heed to every worthy counselor, you threw in your lot with that party which lays more stress on justice than on prosperity, because you in your heart crave for justice.

"What!" cries the cautious one again; "are we to vote from instinct?" From instinct, Mr. Voter! By all means follow your instinct. Instinct is sublimated common sense. Every political speaker you have heard has appealed to your common sense. If you take him at his word, you will be following your instinct. Instinct is the verdict of your ancestors formed in cold blood and issuing through you in the heat of an emergency. If you come of an honest race, you need not be afraid to trust your instinct. After you have taken thought, if your heart inclines decidedly in a certain direction, follow your heart.

I tell my neighbors that I have taken thought on the questions of the day and that my heart inclines decidedly toward the Progressive platform. "Oh, of course!" they smile; "it was to be expected of you. You are a radical." A *radical!* One who goes to the root of every question to be solved! Yes, I am a radical. I want the bosses thrust out as a preliminary to setting up a clean government. I'd rather see the slums torn down than ever so intelligently tinkered. I'm in favor of healthy mothers in place of milk stations. I would eliminate costly consumptive homes by widening city streets and planting trees and insisting on air spaces. My ideal city would supply so many amusement halls and open-air playgrounds and free concerts and single-fare trolley rides that the judge of the children's court and the superintendent of the house of correction would be out of a job. To be sure I am a radical. There isn't a sin or error that I wouldn't pull up by the roots, if I knew how.

To which my cool neighbor replies: "Oh, of course, we all want reforms. If that's being a Progressive, I'm a Progressive too. But you can't improve the country by plunging it into anarchy." Or he may go so far as to say that he believes in the Progressive programme, but—

"Now, I don't want to hurt your feelings, Madame Enthusiast, still, I am obliged to say that I don't like your *leader.*"

My leader, thank God! does not depend on my feeble logic for defense. Not a single slur has been cast on him that some unprejudiced judge, equipped with unassailable proofs, has not shown to be unmerited. In the chorus of his defenders I can pick out the voices of the men and women whom I admire most among all my contemporaries. Nay, more; when I push away the newspaper, and shut myself into my study, where the discussions of the street corner cannot penetrate, there come to me the voices of the great dead, iterating that my leader and his cause are just.

> Self-trust is the essence of heroism. It is the state of the soul at war, and its ultimate objects are the last defiance of falsehood and wrong and the power to bear all that can be inflicted by evil agents. It speaks the truth and it is just scornful . . . of petty calculations and scornful of being scorned. It persists; it is of an undaunted boldness and of a fortitude not to be wearied out. . . . That false prudence which dotes on health and wealth is the butt and merriment of heroism.

Who but a man like the Progressive leader was in Emerson's mind when he wrote those words?

> That false prudence which dotes on health and wealth is the butt and merriment of heroism.

Now I know what it was that stirred the great heart of America when Theodore Roosevelt, with the assassin's bullet buried in his side, told the people in Milwaukee that he was "ahead of the game, anyhow." It was the essence of heroism in his conduct.

But I am almost sorry I referred to that incident. I don't ask anybody to vote for Roosevelt because he came near dying like Abraham Lincoln. The better reason for electing him is that he has labored for humanity like Lincoln.

There are men of generous nature who cannot withhold their admiration from Roosevelt the man, who yet mistrust Roosevelt the statesman. He disturbs them in their political inertia. They take it that the Constitution has provided everything we can ever need politically, and they will not hear of altering it to suit new conditions. Hear what Edward Everett Hale has to say to them:

> It is no fault of the makers of the Constitution that they did not state in advance all the details of duty which would demand our attention a century after their time.

If we are not going to take our great teachers and philosophers at their word, and apply their ideas to actual life, we might as well set fire immediately to all the libraries where their golden sayings are stored. The following words from Emerson's noble appeal to "The

Young American" seem to me to have a personal message to every voter who stands undecided in this the eleventh hour of the campaign:

> I call upon you, young men, to obey your heart and be the nobility of this land. In every age of the world there has been a leading nation, . . . whose eminent citizens were willing to stand for the interests of general justice and humanity, at the risk of being called, by the men of the moment, chimerical and fantastic. Which should be that nation but these States?

I am not a suffragist, but I wish I had a vote just this once. I am very jealous for the reputation of these States. I want America to be the leading nation of this age in respect to justice and humanity. All I have of reason and instinct tells me that the first step towards putting this country in advance of other nations is to send a Progressive President to the White House. That is why I wish I had a vote. I'd like to put my mark under the Bull Moose emblem.

Enthusiasm is not argument, I know; but the measures that argument decides on enthusiasm has to carry out. The Progressive party is strong in both.

Reduced to the simplest terms, the Progressive movement is an attempt to record in our state papers the progress of humanity since the founding of the American Republic. Now the greatest achievements of this interval have been in the accumulation of scientific knowledge. But all this knowledge is useless until it is applied to daily life, both public and private. It is the intention of the Progressive party that our legislators shall be the clerks of the wise men of our time. If the scientists find that heredity and environment are equal factors in shaping a man, then the legislatures shall pass such laws as will insure to every future American the best possible birth and the finest possible nurture. If it is the opinion of experts that deforestation destroys the soil, and so impoverishes the Nation, then not a stick of timber shall be cut without State supervision. The inspiration of the legislatures shall be the laboratory, and not the counting-room. The man of wisdom shall not be elbowed out of the law courts by the man of means. The law of the land, in every instance, shall be the law of nature, in so far as we have ascertained it.

This is the Progressive programme in part. Is there any one who objects to utilizing the brains of the Nation for the happiness of all the people?

The Republican and Democratic leaders also talk of reforms, but what half-hearted measures they propose! They are not radicals, no; they don't dare to go to the root of the evils to be treated. And what reason have we to hope that even the little they promise will be carried out by either of them if put in office? Governor Wilson is undoubtedly as true a patriot as the present generation can boast, but what can he do against the Democratic machine? He has been accurately described as "a kid glove on Tammany's paw." And Mr. Taft, to refrain from coining a new epigram, is the mate of that glove on the paw of the Republican mascot.

For my faith in Roosevelt I have cited enough authority, I hope. Or, if the testimony of Emerson and Dr. Hale, our predecessors, and Jacob Riis and Oscar Straus and Heber Newton, our contemporaries, is not sufficient to identify Theodore Roosevelt as the leader of leaders, there is still one more sponsor to be called. There is Jane Addams, of Hull House. If Jane Addams says that Roosevelt stands for righteousness, I know that he stands for righteousness. The woman who has succeeded in injecting a little righteousness into the municipal veins of Chicago ought to know a righteous man on sight. The woman who has stood like a rock in opposition to determined politicians, who has fought prejudice and treachery and organized enmity, ought to know how to take the moral measure of a man.

Turn to the other candidates, and we see Wilson supported by Charles Murphy, and Taft supported by William Barnes. Now it may be that Mr. Murphy is a better authority than Jane Addams on such a matter as the tariff—he surely appreciates a wide-open town; and Mr. Barnes may be more familiar than Miss Addams with questions of currency—he has handled more than his share of it in his time; but there is considerable evidence that, of the three, Jane Addams has been most intimate with the Ten Commandments. For this reason, if for no other, I would beg every voter who is still in doubt to let Jane Addams's candidate have the benefit of the doubt.

Turning once more from the personnel of the Progressive party to its platform, one is struck by the definiteness with which it treats every subject touched upon. I note, for example, that there is definite provision for

dealing with the problem of immigration. Recently my fellow-citizens all over the country have paid me the compliment of listening to what I had to say concerning America as I found it, when I came here an alien, eighteen years ago. If in these exciting days they can recall what my story was about, they will admit that I am not unqualified to form an opinion on the immigrant problem. I am very sure that it is a bigger problem than most people think, that it affects not only the seaport towns, but every part of the country. Even if the restrictionists should have their way, there will still be thousands upon thousands of aliens pouring in from Europe every year. What effect they will have upon the country will depend largely on the attitude of the Government towards them. If they have hitherto herded in the slums, it is because the Government has allowed them to do so. The immigrant stops in New York because he has not been directed to go anywhere else. That he responds to direction has been recently demonstrated by private philanthropic agencies which have taken the matter in hand. But the United States Government ought not to leave to chance charities a matter of such importance. It is possible to send the immigrant where additional population would be welcome. It is possible to spare him some of the sufferings of transition that undermine his mental and moral strength, and so lessen his value as a citizen. It is possible to hasten his assimilation, for his own and for the country's good. The restrictionists could afford to hold their peace while the Government tries out a logical method of dealing with the immigrant. It is hardly fair to call immigration a burden before a consistent National effort has been made to turn it into a resource. I call the attention of all naturalized citizens to the fact that the Progressive party is the only one that has any idea of what is due to the immigrant.

My closing word is to the pessimists, the grumblers, of whatever political persuasion. They are fond of dwelling on the mistakes we have made in our political and social life. They do not realize that most of the mistakes are experiments that have failed, and that need not be repeated again. What nation in the world's history has ever tried so many and such vast experiments in so short a time as America? Self-government, separation of Church and State, transcontinental jurisdiction, universal education, amalgamation of races—these are a few of our experiments. Does not the world owe us something for daring so much? And our principal experiment, at least, has not failed. We have realized the dream of the rule of the people. We have proved that for every tyrant democracy has a sword.

Here we are in the year 1912, the 123d year of the Republic, beset with sins that we abhor, grafted on the body politic by the selfishness of a handful of unscrupulous citizens. Are we, then, discouraged? Not in the least. We know that the machinery for National right-doing exists; we have only to set it in motion. We recognized the first whir of the mighty wheels when Jane Addams rose to second the nomination of Theodore Roosevelt at Chicago.

YOUTH IN AMERICA

BY TERTIUS VAN DYKE

I ask no easy living,
With tithe of love and gold.
This brave world owes me nothing,
Nor shall when life grows cold.

Let some adventure take me
In this forward-looking land,
For my heart is fain of the battle strain,
And the sword leaps in my hand.

THE SCHOOL-HOUSE OR THE SALOON

BY EDWARD J. WARD

IF you go to what was Schlitz Beer Garden on Vliet Street in Milwaukee and enter the old beer hall, go up to the bar, and ask for something, you will get a book from the branch public library.

Schlitz Beer Garden is not the only one which has been transformed into a leisure place where entertainment may be had without payment of a wet tax.

What is the explanation? It is not that Milwaukee has *gone* Prohibition; it is simply that music—good music—began to be provided in the public parks. Mr. Schwartz and his family used to go of a summer evening to the beer garden because they wanted to hear the music and they wanted to sit about where they could visit with their neighbors. They wanted the music and the social opportunity so much that they were willing to pay thirty, fifty, eighty cents a family in the purchase of beer to get the music and the sociability.

When the opportunity was established to have the music and the neighborhood gatherings without the necessary expenditure of the thirty, fifty, eighty cents, the Schlitz Beer Garden property became unprofitable and for sale cheap.

To say that the saloon problem can be as easily and speedily solved by the equipment and opening of the public school-house in each district, and its use as a common center of neighborhood gathering for free discussion, for wholesome recreation, for music and entertainment in the evening, is true, provided there can be secured in the service of each community a man who will create in the school-house the same atmosphere of comradely and, for the weaker ones of the community, fatherly welcome which is the secret of the successful saloon's success.

When Colonel Roosevelt, at the Progressive Party National Convention, was interrupted by a voice from the gallery asking, "How do you stand on the liquor question?" his answer was, "My friend, you should go to school." Whether Colonel Roosevelt intended merely to shut off an interruption or not, the fact is that in these words (taking the term *school* constructively, as including the possible wider uses of the building) was suggested the solution of the liquor problem in this country.

One evening, in the city of Rochester, at a meeting of the Neighborhood Civic Club—*i. e.*, the deliberative organization of the voters of the district—at the West High School Social Center, William Schalber, the Chairman of the Prohibition County Committee, introduced a resolution that the body invite Clinton Howard, a prominent prohibition advocate, who happened to be in the city, to speak on "The Evils of the Saloon" at its next meeting. An amendment was offered that Mr. Joseph Reuter, the President of the Rochester Turnverein, be invited to appear on the same evening to defend the saloon from the attack of Mr. Howard. The motion, as amended, carried. The two men were invited, and both accepted the invitation.

The large audience at the meeting the following week was made up of a small group of ardent Prohibitionists, a small group of equally ardent saloon advocates, and a large majority of citizens who had not taken sides on the question, but came with minds unbiased.

Mr. Howard opened with a bitter attack and catalogue of evils, political, moral, physical, which he attributed to the presence of the saloon in American life. Mr. Reuter followed with an address in which he admitted many of the abuses which Mr. Howard had mentioned, but in which he pointed out in a manner convincing in its sincerity that the saloon now stands as the one institution in which the man of small means may find the indispensable comradeship which the wealthy man finds in his club; and he said that, while society can ill afford the losses which come through drunkenness, society cannot at all afford to get along without the social opportunities to the coming man which the saloon now alone supplies.

In the discussion which followed these two addresses a tendency thrust itself forward which may be expected always to be shown by such neighborhood gatherings of citizens, since they include a minority of people whose minds are already made up and a majority who are without prejudice either way. This was the constructive, what-are-we-going-to-do-about-it attitude; and upon the demonstration with which these men were familiar of the possible attractiveness of the School-House Social Center was based the conclusion of this

discussion, *in which both Mr. Howard and Mr. Reuter agreed*, that the practical answer lay in making of the convenient common school-house a place in which men might find the freedom, the *bon camaraderie*, the democracy, of the saloon.

Finley Peter Dunne makes his typically human saloon-keeper, Martin Dooley, say of the project to make the school-house the social center wherein " us proletaries " gather and form " nuclei :" " It's goin' to be bad f'r me bizness, . . . but I'm willin' to make a sacrifice. I'll go mesilf."

This attitude is being shown by more than one big-souled Mr. Dooley in real life.

In one of the cities of Minnesota a public school principal was working to secure for the school-house a motion-picture machine as a part of its equipment for use as a social center. One day he met on the street the keeper of a neighboring saloon, who stopped him with the question, " What are you trying to do ?"

" I'm trying to get the people in this neighborhood to spend their evenings in the school-house," answered the principal.

" Do you know what that will do to my business ?" asked the saloon-keeper.

The principal was a Yankee, and he answered with the question, " What are *you* going to do about it ?"

The saloon-keeper put his hand into his pocket, drew out a five-dollar note, and, handing it to the school principal, said : " That's all I can do about it now, but if you do not get enough to buy the machine, let me know. I'm against the prohibition idea and always will be, but I'm for the thing that will make a good place for fellows, especially young fellows, to be evenings, even if it puts me out of business."

The fact is that one of the big supporters of the Social Center Association of America, whose aim is the promotion of the larger uses of the public school-houses as a common center of democracy and wholesome recreation, is a man whose income was derived from the manufacture of whisky. He opposes the negative, he welcomes the constructive, solution of this problem.

My own way to the Social Center idea was by the acquaintance of a workingman who, when I asked him to help in the effort to close the saloons in the town in one of whose churches I was serving, gave back the challenge: " Provide a place where the fellows will be just as free as they are in the saloons, without the headache, and I'm with you. I don't like the booze, but take away the sociability, the man-to-man frankness, the practice of the brotherhood that the church is talking about, which the saloon supplies, leave nothing in its place, and the town will quit being human."

The old name of the saloon was the " public house." The saloon as it is to-day is not a public house ; it is a private house, run for private profit with a financial premium upon its intemperate use. The opening of the public school-house, first as a civic headquarters, a common place where the citizens of the district gather, not only to vote upon public questions but to discuss them, the establishment upon this democratic foundation of a neighborhood club with such recreational and loafing equipment as the citizens themselves may desire, with a community-hired man of catholic interest and from-behind leadership on the job—all this will give each district a real public house. And with the opening of this center of more real democracy and truer freedom than a private place can ever offer, indoor saloon properties will be on the market " for sale cheap," as were the outdoor saloon properties (the beer gardens) in Milwaukee.

Moreover, if some of us patronize the saloon, not primarily to find fellowship, but to dull the hurts and relieve the fatigues of bad economic conditions, the use of the school house as " the Senate Chamber of the people " provides ready means by which in working out the economic problem we may use our heads instead of " lose " our heads.

THY BLOW

BY MYRTA LOCKETT AVARY

Thou smotest a weak thing and laid it low ;
It could not rise and smite thee back. And so,
Thou thinkest thou shalt go unsmitten ? Know,
The Force Invincible received thy blow !

DOES IT PAY?

ONE WOMAN'S HOME-MAKING EXPERIENCE

AS a rule, the home-making woman does not wish work or care. Her whole attitude toward life is different from her husband's. He looks on work and difficulties as *his* opportunity to show what is in him, while his wife looks on work and troubles as so many stumbling-blocks in her career of personal freedom and socia activities.

A man loses his trusted bookkeeper or finds some of the office machinery not running smoothly, and at once he is on his mettle to meet the trouble. A woman loses her nurse or cook, and she is immediately bewailing the servant problem. Yet managing the home is woman's business, as bread winning is the man's.

One of the greatest fallacies of the present day is the slogan of the suffragist, "Woman's work has been taken out of the home; it doesn't pay to do things at home."

When I look back over my housekeeping books of the past twelve years, I am appalled at the increased cost of living, and it is largely on the labor side.

IN 1900 I WAS PAYING

Cook, per month	$20.00
Waitress, per month	18.00
Laundress, per day	1.25
Seamstress, per day	1.25
Outside laundry, per dozen	.75
Shirt-waists, each	.15–.20
Children's dresses, each	.25–.50

IN 1912 I AM PAYING

Cook, per month	$30.00
Waitress, per month	25.00
Laundress, per day	1.50
Seamstress, per day	$1.50–2.00
Outside laundry, per dozen	1.00
Shirt-waists, each	.25–.35
Children's dresses, from	.50 up

In 1900 two maids did all the work of a fair-sized house. Laundry work was all done by the two maids, except a few starched pieces averaging five dollars per month. The extra work caused by company was well and cheerfully done. We gave small lunches and dinners, with everything cooked and served by our two maids. In the spring and autumn the house-cleaning was done by them, with the help of a man for heavy work.

In 1912 we are living in an apartment with one less in family. In addition to the increased wages of $17 per month (which twelve years ago would have paid an extra maid) we sent out $10 worth of laundry each month. This was an increase of $22 per month in our labor or service department.

When we give a lunch or dinner now, some part of it must usually be bought—either ice-cream or cake, or whatever happens to be cook's weak point. An extra maid, at $2 per lunch or $3 per dinner, must come in to assist the waitress. With the semi-annual cleaning, besides the man for heavy work, we must also engage a woman to come in for those things which the maids declare to be "not their work."

Now this is an average two-maid household. Some women get more work out of maids, others less, but I think all housekeepers will agree that this is a fair statement. The same proportion of *increased* wages—with *less* work—applies equally to the one, four, or eight maid ménage.

Then, too, the complications of modern life and the "doesn't pay" attitude have led us to stop doing many things which a few years ago saved us money.

Ten to twenty years ago each household had its tool-chest and glue-pot. Some one in the family liked tools, and many a broken piece was mended or upholstered seat recovered, while now madam goes to the telephone and calls in carpenter or upholsterer, and another bill is added to the monthly pile. A housekeeper can have the painter mix her a bottle of equal parts of raw linseed oil and turpentine. She can hire a handy man at thirty-five cents an hour and, personally directing his work but without soiling her fair hands, in a few hours will have her furniture shining like new. For this work a professional polisher charges $5 a day and loiters over his job. A friend of mine last fall paid $40 to have her mahogany polished. And still you women say it "doesn't pay."

In the good old times many a bit of fine laundering was done by madam's own hands. To wash fine lace or a dainty embroidered bit was a fine art, and one not despised. Now, even where a laundress is kept, how many things must go to the cleaner's! Cur-

tains? Oh, no; Hilda "never does curtains." And those fine centerpieces and lace frills? Oh, no; she is "not a French cleaner." As madam and her daughters could not even launder a pocket-handkerchief, they cannot, of course, be expected to lend a hand, and so the monthly bill at the cleaner's adds many more dollars to the rapidly growing pile.

Then the preserving. In small quantities it is undoubtedly as cheap to buy. But if one uses much of this class of food and deducts the first year's cost of glasses and jars, she will find, on calculating cost of materials, that doing it at home does pay.

On soups, bread, cake, and desserts I have also made careful calculations, and find that they are better and more cheaply made at home. For instance, for a household of six we average a barrel of flour in three months. This covers all our bread, muffins, and biscuits. A barrel of flour costs $7.50, or $2.50 per month; add to this a little extra for yeast and baking-powder, and we find an average cost of $3.25 per month. In buying bread from the bakery we use at least one ten-cent loaf per day, or $3 per month, and extra rolls and muffins double this expense, making $6 per month, and sometimes more.

Cake I find much more expensive to buy, and soups also. Ice-cream which we pay 75 cents per quart for I find costs me between 40 and 50 cents to make. Yet women keep on telling us it "doesn't pay." One cook tells me, "My last lady bought all her cake at the Exchange; she said it didn't *pay* to make it," or, "My last lady said it didn't *pay* to bother with freezing ice-cream, it *only* costs seventy-five cents to buy."

And yet the 25 cents on each quart of ice-cream, the doubled bakery bill, the filling out our menu with canned soups, bought preserves, and Exchange cake is what makes the cost of living go higher. To say nothing of the carpenter sauntering (I use the word advisedly) in to do some odd job which takes him one hour of actual time—but, when the bill comes in, they have counted the time he ran in to see what was to be done and the time consumed in his leisurely walk back to the shop for his tools, and we are charged for half a day, four hours at 65 cents an hour, or $2.60 for our "small job."

Oh, you young housekeepers and you young men about to marry, beware of the leakages! It is the countless *small* items which make housekeeping expensive.

And now I want to speak of this "doesn't pay" attitude in regard to sewing. I know I shall not be popular with many of my sex. If a woman can afford to spend a fair amount on clothes, I most certainly do not advise her to have home-made dresses. Personally I prefer, and think it actual economy, to get a few well-made clothes at a good dressmaker's than to have many home-made ones. It is more of the mending, repairing, and fine sewing of which I wish to speak.

A few years ago a gentlewoman preferred to wear fine, well-mended lace, linen, and stockings rather than cheap things. But now one hears well-reared young girls say, "Oh! I buy cheap stockings and throw them away when the holes come; it doesn't *pay* to mend nowadays," or, "Make shirt-waists at home? No, it doesn't *pay*. I can buy a pretty lace-trimmed waist for three dollars. Now you know I could not make it at home for that." No; it could not be made at home for that price; it would cost:

Seamstress, 1 day	$2.00
2 yards Persian lawn	.70
Lace, 6 yards at 20 cents	1.20
Making a total of	$3.90

But it would last twice as long as the bought waist.

A crepon waist, however, which costs $10 to buy I have reproduced at home for $7:

Seamstress, 1½ days	$3.00
2 yards Japanese crepon	2.00
Irish lace	2.00
Total	$7.00

In this case the waist was not only better made, but actually cheaper.

One of the most pathetic things to me in a working-girl's budget published last year was the item of twelve waists at a total cost of twenty-four dollars for one year—probably all tawdry, and all worn out at the end of the year. Allowing that she had no time for making, but understood the care and mending of a good waist, would not six tailor waists at $3.50 each, or a total of $21 for the year, have been a better investment? Nowhere is this false idea of its not paying to sew or mend doing more harm than among our working-girls. Who buys the $1.98 shirt-waist, all lace and embroidery, which tears out in a few washings? Why, the salesgirl, factory girl, and household maid. The very ones who should get the best value for their money are the ones who are caught the

hardest by the cheap, ready-to-wear articles.

The same comparison of figures holds good in underwear as in shirt-waists. The plain lingerie can be reproduced at home for the same price as, or a trifle more than, is charged in the shops, but with finer material and better made. The fancy lingerie can be made much more cheaply at home, as here the hand-work is what costs. In all these items I have counted a seamstress's time; but if a woman can do all, or part, of the sewing herself, she actually saves so much money in labor.

To show how the fine art of darning is neglected, I bought at a sale a fine lace-trimmed child's frock. It had a small ragged tear, and the salesgirl said they would either mend it for the original price, $25, or let me have it for $20 if I could get it mended. Ye gods! $5 for a darn! I carried it home, took out my spool of two hundred cotton, and in half an hour my darn was complete, and $5 saved.

I am not trying to insist that women shall spend all their time in sewing or household drudgery. But when I see the strained, anxious faces haunting the bargain-counters, I cannot help wondering whether the same amount of time and thought quietly spent in the sewing-room at home would not show better results.

I also feel that we are going around in a circle in regard to the industrial question. We are told that it "doesn't pay" to do things at home—this creates a demand for factory-made goods—and then we are asked to inspect factories, laundries, and bakeries, and told that we would be horrified if we knew the terrible conditions under which our food and clothing are produced.

If we women can keep homes sweet and attractive for husbands and children, have their food cooked in clean kitchens, their laundry done in light and air, and guarantee that their clothing is not made in sweatshops, does not this pay?

If by our good management we plan our homes so that our husbands do not dread the monthly bills, and so train our daughters that the young men shall not be afraid to marry, will not this pay? H. P. T.

OUR FRIEND THE "EX"

BY JAMES FORBES

DIRECTOR NATIONAL ASSOCIATION FOR THE PREVENTION OF MENDICANCY

A SOFT-SPOKEN and well-mannered young man, whose card bore a well-known Hungarian name prefixed by the title Baron, came into my office the other day in response to an invitation. He had written me, a total stranger, begging me to do something for him in the way of employment. The young man pleased the eyes, and, what was more, seemed capable of many good things. His references showed that, notwithstanding the physical handicap of a slight limp and the disadvantage of noble birth, he had held some important executive positions in New York. Yet he was at the end of his resources, moral and physical, and was willing to offer his services for the barest wage necessary to sustain life. He had lost an estimable and beautiful young woman of his own race to whom he had been engaged, and who, he passionately declared, united in herself all the attributes necessary to a perfect romance. And why? Because, fifteen years before, a boy in a strange land, speaking the language imperfectly, unfamiliar with the customs, high-spirited, generous, and trusting to the point of credulity, he had made a terrible mistake. In a city not far from New York, where he had found humble employment, an evil chance threw in his way a wallet containing some three hundred dollars which a careless and suspicious man had left in the dining-room of the boarding-house at which both lived. He admitted that he was tempted in his poverty by the comparative wealth it contained. While he still counted the bills the suspicious man burst into the room, accompanied by a detective whom he had chanced to meet and in whose company he had discovered his loss. The detective, one of the old, unmoral school, eager to get a case for himself, arrested the boy and by insidious advice restrained him from telling the Court the true circumstances. The unhappy lad was sentenced to two years

in State's prison. Finally released, he did not sink into the mire, but, by the force of energy and courage, won first a private secretaryship, and later one executive position after another, each more valuable than the last.

He became a man of some note in the community, and presently his engagement was announced to a well-born and wealthy girl of his own race. The newspapers eagerly printed portraits of the pair, giving the biography of the baron, so far as they knew, and a sketch of his family history.

That publication was the means of striking the death-blow at the man's hopes for happiness and success. An anonymous miscreant identified the title and portrait as belonging to the boy victim of fifteen years before, eagerly imparted the story to that particular newspaper, and soon the jackals of its editorial department were scurrying about to "connect up" the links for a full-page story that would be a real sensation. They succeeded in securing from the prison keepers identification of the photograph and the name, printing all, and by this devilish act crushing the man at a blow.

As I write, the young man is in the position I have already outlined. There is but one thing in his favor: he still has great courage, faith in the efforts of his friends who can at the best secure for him a humble position, and a determination to "win out."

It is not the purpose of this article to dwell upon the cases of men who have been ruined by prison life, but to tell of the men who have refused to be ruined by it, and of some who have actually been regenerated by the discipline of penal life.

There was a foreign-born youth who was habituated from childhood to labor on the farm. His name was Ludwig. He was clownish, inarticulate, but with strong muscles and great physical endurance. On the very day that Ludwig landed in America he stood gaping wonderingly at the entrance of the ferry-house. He had been directed to go to an employment agency on the other side of the river for a job. While he stood there, a man approached leading a horse, and, putting a piece of silver into the young immigrant's hand, directed him in his own language how to lead the horse on to the ferry-boat and take him ashore on the other side and wait until he should meet him. But just as Ludwig got ashore with his charge he was arrested for horse-stealing, and was railroaded to State's prison for ten years. In prison the lonely, despairing boy found solace in the visits of a good woman who represented a militant religious organization. Presently he expressed himself converted, and, the true facts being made known, through the efforts of his friends a free pardon was issued after the boy had served some five years of his sentence.

The prison had wrought a marvelous change in Ludwig—or possibly it was the religious influence of the woman. In any event, the youth who had entered the dark walls a clown, apparently foreordained to be a hewer of wood and drawer of water only, left that house of suffering a most accomplished carver in wood and ivory. By reason of the underlying stolid endurance of his character he had been able to concentrate upon this developing work, and in the long, silent hours when men of more nervous temperament had gone mad he had put to advantage every minute of spare time, and emerged a master in this particular craft.

The labor union in this special field was found responsive to the human appeal, and Ludwig was admitted to membership and was soon earning a comfortable living as a layer of parquet floors.

Ludwig never lost his grip from the day he left the prison. During the first few years of probationary effort he remained in close touch with those who had been the means of his salvation. In time he married a young woman attached to this same organization, and, after thriftily accumulating a sufficient sum, left the city behind him and is now a prosperous truck farmer with a growing family about him. Owing to the comfortable obscurity of his life, it is not at all likely that his past will ever be raked up.

Ludwig is typical of many upon whom the prison and the world of crime make no real impression.

In Pittsburgh, three years ago, the writer saw a familiar face in the person of a fireman in full uniform who was sitting at the door of a hook and ladder company. The recognition was mutual, though marked by a slight embarrassment on the fireman's part. But comradeship was soon established, and soon Tom Sinclair was telling how he had "squared it," got a job, married, and settled down. Less than three years before, the writer had seen Sinclair in the workshop of a big State penitentiary, where he was about completing a long term for grand larceny.

He had the reputation of being one of the best "dips" and "rock getters" in the country. He was a slave to the "hop," and, like many of his kind, suffered untold miseries when for any reason a "right" guard was unavailable or the girl on the outside failed to make good. One could hardly expect a city fireman to make good in such a trying life unless he were rid of so debasing a habit. But Sinclair stoutly claimed that by will power and prayer he had conquered his attachment for the drug. His appearance bore him out, and I mentally added to the agencies he had mentioned the fact that he was out of the criminal world and no longer consorted with men and women who habitually keyed themselves up by stimulants like opium.

Now it may shock the kid-gloved reformer, but we have to assure him that it was a political boss of the unregenerate type who had given Tom Sinclair his "chance." The boss had been a schoolfellow of the fireman, and, unhampered by civil service regulations, he took it upon himself to put the young fellow who had been "away West" the sort of job that any active, intelligent, and ambitious young man might well covet. Sinclair's fight was the fight against the allurements of "easy living" which men of the pickpocket type so love. It was the fight against the drug habit so common in the Great White Way sphere of life.

Terence McQuaid was the son of an ambitious carpenter who had become an influential police captain. The father's ambition left but little room for personal attention to the boy. But the mother made up for the neglect the boy suffered at the hands of his father. They were now domiciled in a brownstone house with servants and money galore. Unrestrained, the boy drifted from bad to worse in the matter of associates, until the day arrived when all his father's "pull" had to be exerted to save him from State's prison for grand larceny. But long before this the father had driven his "wayward son," as he called him, from the house. But the mother surreptitiously harbored the boy and supplied him with pocket money. Unfortunately for all concerned, the newspapers chronicled the incident of the crime and hinted at the influence of the captain that was used to save him from his deserts. The father, ambitious for preferment in the service, was furious at the implied stain upon his honor, coming at such a time, and harshly destroyed all opportunity for the mother to help her son as in the past. The inevitable happened. The son was arrested again, this time for a ferocious assault upon a man who taunted him with his former crime and his father's "pull." He found himself deserted, and was sent to a reformatory.

This was the best thing, apparently, that had happened to him in his twenty-four years of life. Bright, capable, and likable, he responded cheerfully to the semi-military discipline of the establishment, became a leader in the band, and soon an expert worker at a new industry, instruction in which had been added in the reformatory workshop by a progressive superintendent.

The day Terence left the reformatory he went to a Western city, entered the employ of a great automobile-making concern, and, owing to the skill acquired in prison, soon became one of its most responsible employees. Before leaving he advised his mother that his salvation lay in keeping away from Broadway and its associations, and that she must not expect to see him for five years. Last Christmas he paid a visit to his mother. He is a strong, wholesome, thoroughly regenerated man. When it was suggested to him in a jocular way that he'd better look out for the dangers of Broadway, he replied quietly that the allurements of the Great White Way had passed as entirely from his consciousness as if they had never been there.

Ernst Schultz was the son of a Prussian financier. Every whim of his youth was indulged. The most conspicuous achievement of his early manhood was to steal from a Russian diplomat his mistress, Alma Nordlingden, one of the most beautiful women in Berlin. The dissipations into which Ernst plunged put too severe a strain upon the purse-strings even of a great Prussian banker. Presently we find him and Alma in London, hiding from the Scotland Yard people and holding on to several satchels crammed with bank notes—nearly two million marks—the plunder of the elder Schultz's banking house.

In less than five years—years of wandering upon the face of the earth—the money was dissipated, squandered in a thousand extravagances, and the couple are located in a squalid furnished-room house in the poorest quarter of the city of New York.

Chance friends interested wealthy relatives in Schultz, who gave him another opportunity. A little later he organized a corporation and styled himself "banker." A measure of

material prosperity followed, but reactions came, and once again Ernst was a fugitive from justice—this time an unsuccessful one. He was captured and sent to State's prison in the Southern State where he had located. Many pitiful letters were sent out from the prison walls, but relatives turned a deaf ear. Stay he must. Here again a prison industry was the making of a man who at forty years of age still prided himself on having never done a stroke of manual labor in his life. In a mechanical department of the prison Schultz was put to work. Here he found opportunity for the development of a certain aptitude which he had never known he possessed. He was very clever at mechanics, and soon acquired great skill. Further than this, he took a deep, almost affectionate interest in his work. By it he seemed to be revolutionized morally and mentally.

Once more a free man, he succeeded, after many and disheartening obstacles surmounted, in establishing himself in connection with a machine industry. In such good measure has he "made good" as a high-class mechanician—now running a shop of his own and employing a considerable number of persons—that he is in comparatively easy circumstances. Those who knew Schultz as a young man would find it impossible to recognize in the man of dignified bearing the dashing blade of Berlin's night life. Those who knew him in his former American days when, under the influence of absinthe, he used to grow inspired with mad financial schemes—all completely unmoral—would never recognize in the respectable middle-aged business man the wildcat and dishonest banker.

Among the most difficult of these human problems is the rather finely bred, feminist type of young man who steals to supply himself with good clothing, good eating, and good surroundings. These youths are only too common in our prison population to-day, which means that a very much larger percentage exists outside, since it is the exceptionally unfortunate man who goes to prison. This fellow is largely the victim to the get-rich-quick charged air which is so vicious. The infection seizes him and he succumbs. He is especially pat to fall where he has inherited over-refined and delicate susceptibilities, which render contact with the rougher sides of life something to be avoided at any cost.

But this man is not intrinsically vicious. He requires to be "kicked" into hard work and kept there until his muscles harden and he gets the cigarette poison out of his blood. His regeneration is worth while, although at times more from an economic than from a spiritual standpoint. Here is a case in point.

A young man graduated from a pretentious college, through which he had worked his way. Securing a position in which he was brought into contact with the wealthy, he had little difficulty in applying the secret methods of stealing which his intelligence showed him were easy for one employed in a confidential capacity. His salary was small, his tastes expensive. In fact, his tailor bills alone accounted for all that he earned. By stealings through forgery and the abstraction of cash donations to the educational institution which employed him, he paid his other expenses. He was detected at last, and tearfully pleaded for another chance. This was afforded him, but it proved to be only another chance for him to pit his predatory genius against the good-natured and tolerant board of directors. At last the crash came again, and this young man declared himself deserving of punishment, and suggested that he be put in a correctional institution, as such a course might help him to gain moral strength to fight the impulses which he claimed he had yielded to ever since childhood. "I never entered any employ or established relations with any individual or institution but that I immediately and instinctively gauged the opportunities for secret thieving," were his exact words.

The accommodating board of directors got for him a brief term in the penitentiary. Here he was coddled because of the influences behind him, and he was given a post as warden's secretary. He was visited from time to time by well-meaning sons of wealthy directors, and came to regard himself as a person of considerable consequence. "A very complex case," he used to say. His ego suffered no diminution by this so-called punishment, but it did effectually break the obsession to steal which had held him. And to-day, thanks to the helping hand of wealthy friends, he is earning an honest living as a traveling salesman, though psychologically one feels that his regeneration is more material than spiritual.

The case of a clever young American youth whom I know is typical of the betrayals that ex-prisoners have to contend with—the tendency in debased human nature to drag down to the level of the "gang" any individual who tries to get away from old asso-

ciations. This youth was an expert bookkeeper and cashier for a large commission house in New York. He was married, had two children, and got along very comfortably on the moderate salary he drew. But, being a likable young fellow, he was patronized by buyers, salesmen, and others of expensive and dubious tastes. In time the attraction of a misnamed sporting life got hold of him. He became known in the high-priced restaurants and in the night life along Broadway. To be brief, he wound up by stealing many thousands of dollars from his firm in the three or four years which elapsed before detection. He was sent to prison, whereas in this enlightened age he should have been paroled and compelled to support his family. However, he came out resolved to redeem himself.

He accepted humble employment, and, thanks to the loyalty of his wife, succeeded in re-establishing his home in a modest way. Step by step he won his way back in six years to an important commercial position. But, by an evil chance, a fellow-prisoner with himself learned of his success and began to blackmail him. When, in desperation, the poor fellow refused to be bled further, the blackmailer wrote letters to his employer, who dismissed him. Fortunately for our Nation's conscience, employers of this sort are growing fewer daily.

But for this unfortunate man the whole desperate struggle had to be begun over again. And, while he did not lack courage, it drove him almost to madness to witness the deprivations forced upon his wife and children. It is needless to give the details of his sufferings and struggles here. It is enough to add that courage, loyalty, and perseverance have again triumphed, and, though it took seven years for the second climb, he is to-day holding an important position with a large corporation, and in all human probability his lapse is buried for all time.

The burden of the ex-prisoner is heavy enough, yet the outlook for him grows more hopeful day by day. Awakened social conscience is fast leavening our whole course of criminal procedure. A few enlightened judges, prison directors, police chiefs, and district attorneys have set the pace. More and more the ex-prisoner finds men "on the outside" willing to give him a square deal. He who knows may find friends in most of our large cities to-day. Astonishing instances multiply of the redeeming of men by their own steadfast fortitude and perseverance, and the co-operation of individuals and employers. In banks, railway and steamship offices the ex-prisoner is to be found. Many good people believe, or pretend to believe, that the wicked labor unions are eager to impose upon the released prisoner the intolerable torment of idleness. Nothing could be further from the truth. In machine shop, foundry, and factory generally he is employed in positions of all grades. The attitude of all men of affairs towards the ex-prisoner is changing. Many institutions make a specialty of helping him. But, as a matter of fact, most ex-prisoners who get on to their feet do so by their own efforts, shunning the various prisoners' associations and prisoners' aid societies as resolutely as the self-respecting poor shun the big charitable agencies. There is, however, a large field of effort open in behalf of the exceptional man who, because of some inherent defect, cannot get back into the normal relation to things through his own efforts, yet earnestly desires to abandon crime.

Such a man is handled about as follows: John Doe, released from Auburn, Concord, Rahway, or any other penitentiary, has heard among his fellow-prisoners or from some well-disposed warden or guard that our Association wants to help him. He shambles into our office and makes a shambling request for work. I say shambling, because John Doe feels thoroughly ashamed of the ill-fitting prison suit which he wears. Such a suit always has a certain sinister individuality which simply "screams" of the prison, as though it were a sentient thing, eager to betray the wearer to his downfall. Usually it is a product of corrupt alliance between rascally contractor and thieving politician, and has cost the State the equal of the best broadcloth. The color of this suit is the worst thing about it—a peculiar shade of black with a hideous suggestion of dull green, and it has a woolly sort of finish. I never saw anybody else wearing anything else like it. John Doe knows, too, that the pallor of his face shows recent intimacy with the prison. In spite of himself, he betrays timidity, nervousness, the natural results of the unnatural repression to which he has been subjected. But he wants work. That is the encouraging feature.

The first thing usually is to get rid of the prison suit, not alone because of the intrinsic horror of that article, but because of its

depressing psychological influence on the man. The mere offer of other clothing will often win his confidence. It makes him feel that he has a friend who understands. This must be followed by immediately providing in a decent measure for his necessities. For there is no man in the world so poor as the ex-prisoner. While the canvass of the group of business men—at the best a small one—which will employ such men is going on, John Doe must be taken care of. He must not be turned out upon the street with only a meal ticket and the guarantee of a few nights' lodgings. He must have money in his pocket—not enough to lead him into temptation, but enough to help him get over the terrible feeling of being "different" from other men. Having been provided for in one of the Mills Hotels or in a decent boarding-house, he must, in addition, have money enough for car-fares, laundry, shaving, shine, newspapers, and the little incidentals which crop up and the dealing with which makes him feel like a normal human being. This is especially true of men who have suffered long imprisonment. Throughout the whole preliminary period the feeling of personal interest in and sympathy for Doe must be carefully cultivated. It is not advisable to go deeply into his past. It often happens, however, that, the terrible repression of the prison being removed, such men seek the opportunity to talk freely to those whom they can trust. Often a considerable time passes before employment can be found for John Doe, and there is no getting away from the fact that he must be maintained in spirit as well as in purse during that period.

Eventually we succeed in placing all such men as stick by us in some position, assisted as we are by the merchants, even though such places be humble ones. They prove to be stepping-stones by which Doe definitely establishes a barrier between himself and the prison. With such a position as a reference, the ex-prisoner steps forward into more lucrative and agreeable employment.

The positions secured for prisoners are to a degree a matter of capacity and previous experience. They usually go back to their own calling; even bank clerks who have violated their trust return to the field of finance. In our work we are careful to remove any suggestion of prison flavor. For example, in our reports we do not say that we have placed so many ex-convicts, but that we have placed so many bookkeepers, clerks, salesmen, mechanics, porters, etc. Where it has been necessary for the men to carry union cards, we have found that the union is brotherly and sympathetic—in some cases the officials of the union making themselves personally responsible for the good behavior of the new member. This means a good spirit and sacrifice on behalf of the unions and their members, for always there is a long waiting list of men in good standing and a perfectly understandable prejudice against an increase of membership while such conditions exist. Occasionally our men have been placed in positions in which it would be necessary to provide bonds because of their handling money—not because they are ex-prisoners, but because such positions are bonded in any event. It is creditable to human nature that men and women able to shoulder the financial burdens involved through giving such bonds have not hesitated to do so in these particular cases, and have had no cause to regret their act.

Some of our men drop out from time to time before they are placed. But we try to keep in touch with them, and it usually develops that they have found employment through their own efforts or the efforts of friends or relatives. Sometimes it happens that the impulse to resume criminal activities is too strong to be successfully fought. But the percentage of relapsed men is small.

In order to strengthen the work further by enlarging its social side and appealing still more to the individual man, our Association has opened a branch called "Stepping-Stone House," which in some sides of its work will be zealously devoted to the helping of ex-prisoners. However, it will not be a work for ex-prisoners solely, but will be designed to avoid the taint which fastens, in the prisoner's mind, to all social efforts of the mission, home, shelter, rescue order of things.

Many of our applicants are not men just out of prison, but the "old-timers" getting on in years and unable to keep up the criminal life, even if desirous of doing so. To help such men permanently is a very difficult proposition. Their immediate wants may be supplied, and temporary employment found for them. But, in the end, the truest charity seems to be to get them admission to some home for the aged, where their past is obliterated among the many poor folk there awaiting the end. Quite a number of the more promising men, however, are those who come direct from the prison gates, sometimes with written introductions from wardens who

believe in practical work for prisoners and who are many of them men of good instincts, earnestly desirous of bettering their charges.

On the whole, it is the system more than the men that is at fault in the administration of American prisons. It has been a scandal for years that the low wages paid prison guards and keepers are such that periodically reformers or charlatans, as the case may be, are enabled to make capital out of the illicit trading in supplies from outside the walls by guards among the prisoners. Slowly the trend of things is for the better. In many States the barbaric hair-cropping is now a thing of the past, and the hideous lock-step is fast sharing a similar fate. This fact leaves the prisoner in a much better condition of manhood and reliance with which to face the world when he gets out.

We handle about twenty a week, old-timers and all, and, as I have said, it is encouraging that the younger men eventually can be placed.

Unfortunately, there is no law providing for the helping of ex-prisoners, even when proved innocent and wrongfully punished. One of the most conspicuous and deplorable cases that would be avoided under such a beneficent law, or to a degree atoned for at least, was that of Andrew Roth. Roth was a Slavic workman. He was charged with murder, convicted, and sent up for life. When he had been in prison twenty years, another man confessed the crime and Roth was liberated and cast out upon an apparently unfeeling world. The Legislature of Pennsylvania would have passed an act indemnifying the man, but it was found that such a proceeding would be unconstitutional. Then it was reported that Mr. Carnegie had pensioned Roth. Later it was reported that this was not the case. The unfortunate man, broken by the long prison life, found it impossible to secure employment, and actually went back to the prison office and tearfully implored the warden to receive him again into a servitude which at least guaranteed shelter and food of a kind.

THE ABBÉ'S ROSES

TRANSLATED BY ALLIS JACKSON AND H. TWITCHELL
FROM THE FRENCH OF GUY CHANTEPLEURE

AS the sun was sinking in the west, depicting the glory of God in long lines of gold on meadow and hill, Abbé Cyrille peacefully sprinkled the roses in the garden of the presbytery.

He was a frail, gentle little man, so frail that the outlines of his figure were quite lost in the folds of his cassock, so full of loving kindness that in Fontanettes, his parish, he was venerated as a saint, and one look from him calmed anger and assuaged sorrow.

He loved his humble peasants of Fontanettes; he loved his house and its blooming garden; he loved the church with its delicate tracery—in fact, in his adoration of God he attached himself to the multitude of God's creatures.

On this June evening the fragrance of the flowers, the magnificence of the rays flaming in the west, so filled his soul with exultation and gratitude that, as he drenched the plants with showers of fresh water, he began reverently to murmur, in homage to the Eternal Giver of so many blessings, the beautiful canticle of St. Francis of Assisi:

"Praise the Lord for all things, especially for our brother the Sun, who gives us the light of day. Praise the Lord for our mother the Earth, who sustains and nourishes us, who gives us fruits of many kinds and the many-hued plants and flowers."

At a time long past, when he had no thought of becoming a priest, Jean-Cyrille Morel had passed through a terrible ordeal. Thus it was that, far in advance of winter, the snow had fallen upon his locks. Often he saw himself as he was in the days of his youth, full of hope and confidence. It was then that he went to Paris to seek employment suited to his modest tastes. He had presented himself at the office of the commercial house to which he had been given a letter of recommendation. While waiting alone in the room into which he had been ushered, a young man, presumably an employee, had entered, a pen behind his ear, a bundle of papers in his hand. He had not

noticed the humble solicitor who sat back in the shadows. Ah! when the Curé of Fontanettes thought of this trivial incident he trembled to the very marrow, and a distinct recollection of every phase of the drama that followed surged through his brain.

Then he would quickly thrust away the hideous nightmare. Ought he not to bless the cruel experience as a divine purpose? Had it not led him to the Healer of all wounds, to the one Comforter of earthly sorrows? Unjustly accused, despised of men, he had remembered the first aspirations of an orphan boy reared by priests, and, profoundly attracted towards the joys of the holy priesthood, he had consecrated himself to God.

Now all the revolt that had once filled his heart had forever disappeared. He excepted no man in the prayers he offered up to God, not even that unknown, whose name had remained a mystery to him, that unpunished wrong-doer who had not hesitated to doom him to dishonor. He was happy, asking nothing beyond the gentle pleasures of his calling except a bit of land to till and some roses to cultivate.

The garden gate opened, giving entrance to a miserably clad peasant, who stopped, his eyes full of entreaty, a few feet away. Immediately the Abbé set down his sprinkling-pot.

"Ah, it is you, my poor Charbonneau," he said, kindly. "Yes, Pauline has told me everything. I went to the château this morning, my friend, but Monsieur Minoussier was not at home. I shall go again."

A silence followed. Charbonneau fumbled his hat with his calloused hand, scuffing the gravel underfoot. The Abbé continued, with extreme kindliness:

"But why will you poach on the property of Monsieur Minoussier? It's a bad business, the seriousness of which you don't seem to understand. It's only one way of stealing."

Charbonneau's head dropped still lower as he tried to explain:

"I don't intend to steal, Monsieur Curé. I wouldn't go after the Mayor's game if I only had a little more money or a little work."

Then, changing his mood, he shook his fist towards heaven.

"Curses on the luck!" he exclaimed, defiantly. "Why did Pauline sew my name in my cap? That's what told on me. I have good legs; no one could have laid hands on me. But just as I was getting away a branch caught my cap, and that gave them the best of proofs against me. That stupid Pauline!"

"She thought she was doing the right thing, my friend," replied Abbé Cyrille in a paternal tone, "and she is an excellent wife; you know that very well."

Charbonneau's manner softened. "Yes, she's a good wife, and takes good care of her children. And it's all wrong, I know; but, you see, if I didn't love them all so much I wouldn't be drawn into trouble so easily. I tried to say as much to the Mayor, but he has no ears for poor people."

"Did you show him a real repentance and promise that you would not do it again?"

"Bah! promises don't count with such as he is. I said to him, 'Monsieur Mayor, I am a good man at heart, and, if you will let me off, I will never again poach on your property.' Then he began to laugh with that silent, sneering laugh of his that gives you gooseflesh. He said: 'Père Charbonneau, you are wasting your breath; I detest whining. I have no grudge against you for poaching in my woods; you take your property where you can find it. As for me, I defend mine, and, as I have caught you this time, I intend to profit by it. You may or may not be a good man; I won't dispute that. Success doesn't come necessarily to the good, who are often stupid, but to the clever, who are often rogues. If I were your friend and were giving you good advice, I shouldn't say, "Don't poach any more, it's wrong," but rather, "Don't lose your cap, it's careless." And with that, let's have done!'"

Instinctively the good priest had clasped his hands as he listened to Charbonneau's story without interrupting.

"Then, Monsieur Curé, I saw there was nothing more for me to do, and I thought, if there is any one who can do anything with this tiger—not on my account; no, indeed, but because of the good wife and the little ones—it is Monsieur Curé. Beast that he is towards the poor, he esteems you, and it's well for him that he does. It's just this respect that lets us still think that he might have a soul, like the rest of us."

A smile flitted over the lips of the listener. He had had only business relations with the Mayor of Fontanettes; but it had been impossible for him not to be struck by the deference always shown him by that functionary, who frankly detested priests.

Indeed, on one occasion, on taking leave

of him, the Mayor had extended his hand and had said in a brusque yet cordial tone:

"Monsieur, I know very well that saints do not exist; but every one tells me you are as good as a saint, and I believe you to be quite capable of inventing them. And, as I am quite sure that you take an interest in my affairs up above, permit me to take an interest in yours here below to the extent of granting any favor you may ask of me."

Touched by the remark, the Abbé had replied: "I thank you for your consideration, Monsieur Mayor. You are right about my taking an interest in the affairs of your soul. I pray for you every morning and night."

The memory of this little incident came to the Abbé's mind now. Amicably patting the peasant on the shoulder, he said:

"Certainly, my boy, the Mayor has a soul, just as you and I have. Rest assured that God does not forget it, any more than he authorizes us to forget it. And who can know his designs upon this soul whose existence you are so willing to deny? St. Paul was only a Pharisee at first. In the meantime, my good fellow, I am going to use, for the first time and to the best of my ability, the influence that you fancy I possess with Monsieur Minoussier. Sleep soundly, and don't scold Pauline. Ask her, on the contrary, to sew your name in your new cap. That will teach you to lose it where it might be found without any harm. Somewhere I have read a saying like this: 'If you don't want any one to know it, don't do it.' How true that is! Even though men do not see us, my son, God sees us—and that is much more serious."

Charbonneau now took his leave, and as his footsteps died away on the highway Abbé Cyrille again took up his sprinkling-can; but it was decreed that the roses of the parsonage were not to be permitted to drink in peace this beautiful evening. A dull rumbling was heard, and soon a carriage drew up before the little gate. It was the victoria of M. Leon Minoussier, Mayor of Fontanettes. A man already gray, but still robust, tall, proud, correct, even elegant, alighted and respectfully bared his head on entering the garden.

"Good-evening, Monsieur Curé," he said, extending his hand with a smile. "They told me you climbed up to the château this morning, and, as your visit permits me to hope that I may be able to render you a service, I have hastened down to save you the fatigue of a second trip."

Quite overjoyed on Charbonneau's account at this good humor and friendliness, the Curé led the way into his study. This was a small room, scantily furnished. A large ivory crucifix on the wall seemed to protect the narrow cot, and here and there flowers bloomed in earthen jars, giving quite a festive air to the dark, wainscoted walls.

When the Mayor was comfortably settled in the only armchair, the Abbé hastened bravely to the attack.

"Monsieur, I am the more grateful for your kindness in that I have a great favor to ask of you. I have just seen Charbonneau, who has deeply offended you, and who—"

In a flash the Mayor's face clouded. With a brusque gesture he cut short the phrase just begun.

"Do not finish, I beg of you," he exclaimed. "I came here with the sincere desire to please you, Monsieur Curé. But even if that man up there himself," pointing irreverently to the crucifix in the alcove, "were to come to life and make the request that is in your mind, my answer would not vary by a single word. Charbonneau has been robbing me long enough. I have repeatedly warned him to look out for himself. Now I have caught him in the very act; so much the worse for him!"

Disconcerted and wounded to the depths of his being by the scornful term applied to his beloved Saviour, Abbé Cyrille nevertheless restrained himself, and replied, very gently:

"I know quite as well as you, Monsieur Mayor, that Charbonneau is guilty. I have rebuked him for his deeds, and he has promised me that he will respect your property in the future. And then, consider that he is poor, more tempted perhaps than another, and that he has a wife and two children—"

At these words the Mayor laughed with that silent mirth that had so repelled Charbonneau.

"Come, Monsieur Curé," he said, "that song doesn't sound well in your mouth. How well I know it! 'The wife and children!' Unless it's a blind mother, a feeble father, and all the rest of it! No. I am too old a rabbit; I can't be caught that way."

As the Curé, completely discomfited this time, remained silent, Minoussier settled himself still more comfortably, and continued, with a courtesy wherein was perceptible a touch of chill irony:

"Disinterested as you are in worldly matters, Monsieur, you cannot have failed to

hear of a man named Charles Darwin, and of a book entitled 'The Origin of Species.' I do not flatter myself on being a scholar, still less a philosopher, and I will confess that of all the balderdash of the English physiologist I have retained but one formula; but that one, applied to the needs of practical life, is worth a fortune. It is, 'Kill me or I will exterminate you,' or words to that effect. That is my motto. Teach it to Charbonneau, who will perhaps profit by it. As for me, you see that, so far at least, no one has killed me."

This cynicism caused the poor Curé not only deep pain, but also a sort of embarrassment, and, as a little while before at the words of Charbonneau, his thin white hands clasped in silent prayer.

"Ah, Monsieur Mayor," he cried, "do not pride yourself on accepting a principle so cruel, so utterly inhuman! I could wager that you are better than you yourself believe —and—"

"You would be wrong," replied the Mayor with the same calm politeness and veiled sarcasm. "For, if in this matter of Charbonneau I am acting only within my province, it might be possible that I would apply my Darwinian theory to more debatable cases. Now," he continued, drawing his chair still closer to the table upon which Abbé Cyrille was leaning, "do not ask me why, but you have always inspired me with the greatest confidence—a confidence so great that if you were to say to me, an unbeliever, as you know, 'I give you my word that God exists,' I should almost be tempted to believe you. But we will leave that. What I want to say is that I desire to give you a proof of my respect by making to you, not a confession, for that would imply the idea of a repentance which I do not feel, but a confidence which will enlighten you as to my position."

The Curé shook his head with an air of dissent.

"Really, Monsieur," he replied, with lack of interest, "all this talk seems idle, and I do not see—"

"I shall be brief," interrupted the Mayor in his peremptory tone. Then, drawing his chair still farther forward, he began his story.

"When I was a very young man, I worked for a small salary in a commission house. I was so poor that when I decided to try my luck in Paris I was obliged to leave my wife and two children with my mother-in-law at her home in the country until better times should permit me to take them with me. Work had no terrors for me. I felt myself quite capable of making a fortune. It would be only a matter of time.

"One day—it would take too long to explain the circumstances—I found myself in a position where I simply had to have a small sum of money at any price. I was desperate, and fate came to tempt me. On entering an office where my business seldom called me I found myself alone presumably, and in an open drawer lay the exact sum I needed. Without hesitating a moment, I took the money."

Here the Mayor paused, almost suffocated, in spite of himself, at the memory of his theft. He did not notice that the Curé had grown very pale and was staring at him searchingly.

"I said that I believed myself to be alone," he resumed, collecting himself. "That was not quite true. "Hidden in the shadow of a curtain—it was late in the afternoon—there was a person, a solicitor doubtless, who was awaiting my employer, and he must have seen me. He did not make his presence known, however, so apparently no one had seen me enter or leave the place.

"At the close of the day's business they searched in vain for the missing money. I was not suspected for a moment. The unknown person, whose pallor and agitation had been noticed by the director, was held responsible for the theft. He had no proof of his innocence, but I think he must have defended himself very clumsily. At any rate, if the director had not been a man who dreaded any scandal that might work injury to his business, the poor fellow would have had to go to prison. As it was, he was made to feel all the contempt his act inspired, and was warned to leave Paris. I was saved.

"Twenty-five years have passed since then, and I give you my word that in all that time I have never committed an act for which I could blush. I am now rich, and long ago I returned to the bank anonymously the amount I took. I am universally respected, if not beloved. I am Mayor, and I hope to be chosen Deputy at the next election. Where would I be to-day if the man who was accused in my stead, and whom I refrained from justifying, had had the slightest advantage over me? Fate did not give him the chance to ruin me, and I ruined him. I never knew what became of the poor unfortunate," concluded the Mayor.

As he talked he had not noticed the varied expressions that flitted over the face of his

listener. Looking closely now, he was struck by the look of majesty and peace on the priest's countenance. For a moment he felt a sort of remorse for having soiled the whiteness of a pure soul by his personal souvenirs. Mingled with this was a touch of malice at arousing horror in an inexperienced man who had voluntarily fled from the sins and struggles of a worldly life.

The Abbé sat for a time with his eyes fixed on the floor, across which streamed the rays of the late afternoon sun. Suddenly he threw up his head and, in a voice full of suppressed emotion, he said:

"Monsieur, the duties of a priest bring him into close contact with many people and an intimate knowledge of many things. It happens that I am acquainted with the unfortunate man whose fate has remained unknown to you, and his story coincides with yours in almost every respect. One detail, however, you have omitted to relate. When, in your frightened haste, you took out your pocketbook to thrust the bills into them, a paper fell to the floor without your notice. It was a half-sheet, the end of a letter.

"When he was left alone, the man who had been the mute witness of your—weakness—picked up the paper and had the indiscretion to read it. It was from your wife. The document was placed in my hands, and, since the occasion now presents itself, I will return it to you."

Slowly, painfully, as if the years had suddenly become heavy to bear, the Abbé rose, went to his desk, opened a drawer, and took from it a paper upon which could still be deciphered a faded feminine scrawl. He handed this to the Mayor.

"Good-by, my dear husband," it ran, "or rather *au revoir*. Ah, how I long for your embrace! You see, dear, I am so afraid of that great Paris, of all that I know about it and all that I do not know. I hope you will make some friend, some one who will protect and comfort you. Every night the children kneel beside me and we pray God to watch over you and bring us all together before many days. We all love you dearly.

"Your wife,
"GABRIELLE."

The Mayor's hands trembled so violently that the paper fell to the floor, while his eyes, full of bewilderment, questioned the priest.

Leaning heavily on the table, his face as white as his locks, his frail form appearing almost transparent, the Abbé looked squarely into the face of his visitor. Then, averting his gaze, he said:

"Monsieur, the poor solicitor who was condemned in your place had never read 'The Origin of Species,' and was quite ignorant of the teachings of Darwin. But he had read the holy Gospel, and he knew that a certain Jesus of Nazareth had said, 'Thou shalt love thy neighbor as thyself.' Moreover, this person was very young and doubtless very stupid, for, instead of ridiculing this wife's letter breathing her great love for her husband and children, he was moved almost to tears at it. He said to himself, 'Who knows? Perhaps this man is not so bad as one might think. Circumstances might have tempted him too strongly. Certain it is, his wife is good and pious; his children are small, and they all pray for the absent father. With this letter, which establishes the identity of the guilty party, it would be easy for me to free myself from all false charges; but then I should send this husband and father to prison, and the wife and babies would weep and mourn.' The poor foolish boy thought all these things, and so he refrained from showing the letter. Thus, without your knowledge, you found the friend your wife had prayed for to protect you. You were saved by a prayer—you who deny God. The simpleton was accused and treated with great indignity. He insisted upon his innocence, but there could be drawn from him no word of defense, no sign that would indicate the guilty party. He remembered that his Christ had died in ignominy and shame, bearing the sins of all humanity, and he thought that a son of Adam might well find the strength to bear the offense of only one of his brothers and live. He suffered much, but God comforted him and sent him peace. He afterwards became a priest."

As he listened the Mayor's head drooped, and gradually his whole body followed, until he seemed bent almost double in his supreme humility.

"Forgive me," he murmured in choking tones. Seizing the priest's thin hand, he stammered:

"I am not worthy of your forgiveness. I must earn it by the good I shall henceforth do, by charity—"

He paused, and his robust chest heaved with sobs.

"I am not a believer," he said, as soon as he had mastered his emotion; "but I venerate a faith that has made you what you are. Monsieur, will you pray for me?"

"Blessings upon you, my brother, for that

request," replied the Abbé, gently. "If I have recalled the past, it is to bring you closer to our heavenly Father. May he send you light, and forgive you as I forgave you long ago!"

Then he knelt down, and in tender, pleading accents he prayed to God, the friend of sinners, who had comforted the dying thief and absolved the woman of sin.

The sun had disappeared behind the hill and the first stars twinkled in the dark-blue sky before the Abbé could resume his task. He was very pale and he trembled with emotion, but he was happy. Noticing a rose of marvelous whiteness that had bloomed that very afternoon on a sickly bush, he reflected that certain souls, like certain flowers, burst into bloom at the moment when one least expects it.

In his gratitude the good priest bent over to breathe the odor of the new rose, and two great tears dropped on its petals.

I fancy that in days of old the whole bush would have suddenly become a mass of blossoms under those tears of love and pity.

THE SPECTATOR

THE Pilgrims came to Plymouth in the Mayflower, as every one knows. The Spectator is glad that he did not have to come that way. As a descendant of nine of the Mayflower band, he attended the latest triennial Council of the descendants, held in the old First Church, and he found modern voyaging in a touring car along the winding, elm-shaded roads in the golden autumn air far pleasanter than the historic and original voyage must have been. The Pilgrims were a progressive set; they would have been as quick as Kansas farmers to use automobiles, the Spectator is sure, and their descendants showed the same up-and-coming spirit.

Nobody knows how many Mayflower descendants there really are in America. John Alden, the Spectator has heard, has five thousand and more, and Governor Bradford's descendants are said to reach almost ten thousand. Be that as it may, there is no doubt that the lines of Mayflower descent spread over America like a cobweb. The official societies gather in their thousands—the Alden Kindred, the Howland Descendants, the Pilgrim Society, the Mayflower Descendants, and so on—and yet a greater multitude stretches outside of all these again, covering the whole continent until, as Daniel Webster said at Plymouth in 1820, "it loses itself in the murmur of Pacific seas."

The triennial Council was a pleasant and friendly affair, as became a family gathering. The church in which it met is midway between Burial Hill and Plymouth Rock, and is full of reminders of the Pilgrims. From the pew in which the Spectator sat he faced the triple window, with the figure of John Robinson in his preacher's gown on the one side, Myles Standish clad in armor on the other, and between the two the signing of the Compact in the cabin of the Mayflower, where not only the Pilgrim fathers but the Pilgrim mothers are given a place, as befits the historic value of the latter in the little colony. Close beside the Spectator on one side sat a descendant of Mary Chilton, the first woman to step ashore on Plymouth Rock. In the pew behind was Myles Standish, of the ninth or tenth generation in lineal descent. The pulpit was draped in the American flag, and on the arched doorway to one side was the classic saying of Robinson: "The Lord hath more truth and light yet to break forth out of his holy Word."

The roll, called by States, showed Massachusetts ahead, with 733 members; New York, with 693, next; and at the end, Washington, just starting with twenty. The names of the officers had an old-time turn—Captain-General (Myles Standish's own title), Elder-General, Governor-General, Deputy-General, and so on. To the student of old times, however, those old times continually repeat themselves in the new, and in one of the speeches following the roll call it was shown how, in "the first state paper of America," the Compact, signed by every man of the forty-one, the Pilgrims put themselves on record for the square deal, by resolving "to enact such just and equal law" as should be the foundation of the colony. Among all political documents on record, this one stands out as beginning "In the name of God" and binding each and all in equal authority by the word "together."

Not long before the triennial Council, on the other side of the Atlantic, England had celebrated the setting sail of the Mayflower from Southampton on August 15, 1620, by laying the corner-stone of a memorial to the Pilgrims close

by the spot where they embarked, and a graphic account of this was given by one descendant who had been there and taken part in the ceremonies. Some of the ancient walls, with their battlements, still remain as on the day the brave little band left Southampton, and the old West Gate under which they passed to their ships is exactly as it stood when that "right hopeful young man, John Alden," threw down his cooper's hammer and doffed his apron to join the daring voyagers for the New World. Here at Southampton, too, the departing Pilgrims received that farewell letter from John Robinson which contained in its counsels the essence of the future Compact signed in the cabin in Provincetown harbor three months later.

The tercentenary of the Plymouth landing, in 1920, is looming ahead, and by one consent the subject of commemoration was taken up. The usual trouble with such a wide-spreading historical celebration is that all sorts of memorials are left scattered by its receding flood to disfigure the vicinity. In this case the one thing needed is a large and simple one. Plymouth Rock is at present a truly saddening sight. On either side of it are coal wharfs and excursion piers, moldering and dingy. Above and behind it, on the slope of Cole's Hill, are excursion hotels and restaurants. It has a canopy over it like an ancient soda-water fountain. The gates in the iron railing that is supposed to protect it are open, so that trippers can have their photographs taken in the act of standing on the Rock, and couples are occasionally married on its summit. One eloquent New Yorker has urged lately that it should be removed from "the trespass, the neglect, the profanation, which has been its share during long years," and transported bodily to Riverside Drive, "where twentieth-century patriotism perpetuates that of the seventeenth and eighteenth." One wonders whether the Pilgrims would really feel akin to Tammany or would prefer the coal-sheds!

They will not be left, however, to this dilemma, for 1920 is to show a restored Pilgrim landing-place. The Pilgrim Society and the Colonial Dames both had representatives at the Council in the interest of this restoration. It is proposed to buy and tear down the disfiguring sheds, remove the unsightly wharfs, and allow the tide to ebb and flow upon an open shore, lapping almost to the Rock, though by the changes of the centuries it is now lifted above high-water mark. Cole's Hill is likewise to be cleared, and on its top the order of Red Men have volunteered to place a fine statue of Massasoit, the historic chieftain, looking down upon the sands as he did when he first greeted the adventurous voyagers. The Spectator, strolling down to the Rock to see its present indignities and its future possibilities, was struck by both. A graceful portico or peristyle is proposed over the historic pebble, but the whole effect will be simplicity itself—and, like all exquisite simplicity, will probably be extremely expensive. Still, if the coal-sheds soar too high, is there not a law of eminent domain—and can any domain be more eminent than that held in the American mind by the first settlers of New England?

From the Rock the Spectator's steps wandered to the Howland house, built by Jabez Howland, the son of John, and described as "the last house left standing to-day in Plymouth where the feet of the Mayflower pilgrims have trod." It is frankly tumbledown, and is elbowed off its own lot, so to speak, by a rickety livery stable. The Howland descendants are trying to buy and restore it, and it is to be hoped they will, not because it is beautiful, but because of its very bareness and sturdy plainness. The Mayflower band were simple folk, no matter how aristocratic their posterity may feel at times, and it is a good thing to see just how primitive their dwellings and their lives were. The broad planks of the floors in Jabez Howland's house were hewn by hand, and the iron latches were hand-wrought, too. There was no cellar—only foundation stones at the corners to raise the timbers from the ground. The ceilings were low, the rooms cramped; but what mighty men and women came forth from these plain houses of Plymouth to rear the fabric of a new nation!

"Why not run down and see the Cape Cod Canal while we're here?" suggested another delegate to the Council to the Spectator after luncheon; and, basely deserting the afternoon session, which was wrestling with new and amended National by-laws, the two set out in the touring car, swinging along the innumerable wood-road curves, mile after mile, down to Sandwich. Purple asters fringed the roadsides and the spicy scent of the pines breathed in the sunny air. A wide new boulevard was in process of building, and every now and then the road came in sight of it and then curved away again into thicket and glade. The land must have been fine hunting-ground indeed when Massasoit and his allies roamed here. Wild turkeys, deer, quail, wild pigeon—the Pilgrims had their compensations, though how they ever bagged anything with a matchlock the Spectator cannot see. The Indian arrows must have whistled merrily through the greenwood in comparison.

Sandwich clusters peacefully along one side of the half-finished canal. Two years has the big ditch been advancing across the seven miles

of land that used to join the Cape at this point to the rest of Massachusetts. Now only four miles remain, and the worst of the work is over. In another year the canal will be completed, and Sandwich will be a metropolitan Corinth—at least so the present inhabitants are peacefully sure. "Stands to reason, Sandwich hez to be a big place," said one white-haired citizen, leaning reposefully on the bridge rail. "No more wrecks round the Cape; everythin' movin' through here safe's a church, 'nd all stoppin' at Sandwich." Tragedy retiring—prosperity advancing, wreathed in smiles and dividends; no wonder the inhabitants congregate around the bridge and contemplate the canal workers with sustained satisfaction! By this quiet flank movement Cape Cod is forever conquered, and its storms can no longer take toll of human lives. No stern and rock-bound coast has any chance against man in the end. The Pilgrims threw down their gauntlet to the wilderness, and look at it now!

THE NEW BOOKS

Homer Martin, Poet in Landscape. By Frank Jewett Mather, Jr. Privately Printed, Frederick Fairchild Sherman, New York. $12.50.

"It is said that he coined the phrase 'the Hudson River School.' If so, it would have been only half in jest, for he was introspective enough to realize that he himself was the last and the greatest expression of that discredited movement." So writes the art critic Mr. Frank Jewett Mather, Jr., of the late Homer Martin. The volume before us has a double merit. It is a story of real life. The descriptions of Martin's friends of his early years—that period which opened in frank emulation of Kensett and ended under the leading of Corot—is graphically done, especially so the account of the struggle with constant poverty. But the interest in the book as a biography yields to that in it as a criticism. We are particularly interested in reading that what Martin "drew from Corot was chiefly an increased sense for elegance and clarity," that Martin usually brought to the observation and interpretation of nature a "definite and poetical mood full of that noble and measured melancholy which in poetry we call elegiac, . . . the mood proper to a lover of Keats and Beethoven," and that what Martin sought in nature was "solace, suspension of the will, expansion of the contemplative self: the mood I have in passing called Virgilian." Mr. Mather says that his grudge against those who decry Homer Martin is that they do not discuss his sentiment, but assert some weakness in his diction. The critic adds:

> He splits his pictorial infinitives or ends his phrases feebly with a preposition, or otherwise breaks the rules. Whose rules? I admire those who know so exactly how a vision they themselves have never entertained, save through what they call a defective form of expression, should be conveyed. Yet there is a professional realm in which these technical matters are subject of legitimate interest. Only we should keep in mind that such considerations are subæsthetic and quite secondary. Taking the work of Homer Martin on this lower plane, it is obvious that he is not, strictly speaking, a great painter. The zest, variety, swiftness, and deftness of the consummate practitioner he has fitfully, and on the whole rarely. An impeccable sense of mass and close-knit atmospheric balance was not his. Tryon, who in some respects may be regarded as his closest living affinity, is more skillful and curious in these matters. . . . Yet it is precisely the twilight, and occasionally unsure, vision of Homer Martin that we value. And the unsureness in no wise affects what he has to say to us. Beautiful pattern, vibrating color, distinguished mood—all these things are precisely and fully conveyed. What matters it, while the "Harp of the Winds" balances rhythmically in pellucid air and shimmering water, that perhaps you couldn't walk on the nearer strand? The fact that you conceive the feat shows that you have missed the picture entirely.

To Mr. Mather, Homer Martin was an appealing type of the minor artist, "the kind one loves better than those of accredited greatness." For variety, copiousness, and vitality, Inness, Winslow Homer, and perhaps Wyant are his superiors, this critic admits; "any of these comes nearer to meeting the usual notion of the great painter, and yet I would sacrifice all their work if I might keep the 'Manor House' or 'Adirondack Scenery.' Not because I underrate these large and genial personalities just mentioned, but because I believe that the future is more likely to duplicate approximately their type of vision and degree of skill."

Poetical Works of William Henry Drummond. G. P. Putnam's Sons, New York. $2.50.

It will surprise many readers to find so small a volume large enough to contain all of Dr. Drummond's poetry; and the book is to be commended because of its moderation of size and its general modesty of demeanor. The writer, who more than any one else has caught the spirit and interpreted the experience of the Canadian habitat, did not begin writing until comparatively late in his life; and his audience is probably limited to those who are willing to face what may be called the intellectual inconvenience of a dialect. But it happens to be a very taking dialect, and one that is easily surmounted, and it is well worth surmounting because Dr. Drummond has enriched it with very genuine and often moving poetry. His little book is an original contribution to literature. It has the vital quality which belongs to the poetry which deals with the real feelings of real people; and no one can read it without a deep sense of the loss which poetry on this side of

the ocean sustained by the early death of this warm-hearted and greatly loved man. The volume contains an introduction in French, an appreciation of Dr. Drummond by Mr. Munro, and an appreciation in verse by Dr. Mitchell.

The United States Catalogue. Books in Print January 1, 1912. Edited by Marion E. Potter. The H. W. Wilson Company, Minneapolis. $36.

Indispensable for librarian, publisher, and book reviewer is this mammoth volume, while its usefulness in other directions is manifold. Its appearance has long been impatiently waited by those who have occasion to search for titles, authors, publishers' names, or prices of books, or who desire to see the grouping of book titles under one subject. To do any of these things it has been necessary to consult two large but already semi-antiquated volumes, one dated 1902, the other covering the years 1902 to 1905 inclusive, and then follow out the search through six single volumes for the years 1906 to 1911. Now, although the book is necessarily ponderous, we have the whole subject-matter before us under one alphabet. The work involved must have been tremendous; 150,000 American books in print January 1, 1912, and all American books published since January 1, 1905, whether in print or not, are here described through 450,000 entries under one alphabet, with ample cross-references; scientific classification, full division by subjects, excellent bibliographies under such titles as, for instance, Children's Literature (in itself a most valuable and, we believe, novel feature), all in 2,837 three-column quarto pages. This is now the only cumulated record of American books, and it will be kept up to date by new and supplementary cumulative lists from month to month and year to year. We congratulate editor and publishers on the conclusion of their gigantic task, the admirable physical appearance of the work, and the scientific way in which the needs of those who use it have been met.

Left in Charge. By Victor L. Whitechurch. Doubleday, Page & Co., New York. $1.20.

Mr. Whitechurch's "Canon in Residence" made his reputation. It was a pleasant tale of English village and clerical life, and it also had invention and incidents of a surprising as well as humorous turn. This description is exactly true also of the present story. It tells what took place when the worthy but conservative vicar of a sleepy little Devonshire village was obliged to leave his parishioners in charge of an athletic and unconventional curate from Australia, who, moreover, had a singular past personal history. A delightful poacher is one of several well-drawn minor characters.

Lost World (The). By Sir Arthur Conan Doyle. Hodder & Stoughton, New York. $1.25.

The author of "Sherlock Holmes," and of what some of the readers of pre-Sherlockian days liked even better, "Micah Clarke" and "The White Company," here tries his hand at creating a bit of South American country cut off by nature from the rest of the physical world, where the animal life of the Jurassic period still survives, and the reader may revel in their gigantesque and horrifying forms and their jaw-breaking names. Into this lair of the prehistoric breaks a quartet of queerly assorted Englishmen—two scientists, an explorer, and a reporter. Their adventures are calculated to make the hair of the timid stand on end. The book has a good deal of fun, incidentally, and it has also animation and dash.

Miss Philura's Wedding Gown. By Florence Morse Kingsley. Dodd, Mead & Co., New York. $1.

How Miss Philura, whose earlier experiences have entertained and instructed many thousands of readers, married at last, and more especially how she reached out by faith into the Encircling Good for her white wedding gown, and how, moreover, she helped make two younger lovers happy—all this is told with cheerfulness and good will in this pretty little volume, suited for a holiday gift to just the right person.

Lifted Masks. By Susan Glaspell. The F. A. Stokes Company, New York. $1.

Capital short stories, some with a serious suggestion toward good citizenship and square dealing, almost all with a quiet but effective humor, and a few (such as that of the elevator boy who thwarted the lobbyist) heartily funny.

Marshal (The). By Mary R. S. Andrews. The Bobbs-Merrill Company, Indianapolis. $1.35.

A tale of France and of a peasant boy who was made a *chevalier*, when a little child, by the great Napoleon, half as a jest, and with the hope expressed that the boy might sometime do a great thing for his country and even become, perhaps, a Marshal of France. How the boy's life upheld this prediction makes a romance of real charm and with plenty of incident. Young readers especially will enjoy the tale.

Pan's Garden. By Algernon Blackwood. The Macmillan Company, New York. $1.25.

The reader who should notice the sub-title of this book, "A Volume of Nature Stories," would be likely to find that his conception of the word "nature" needed expansion. In these tales, as elsewhere, Mr. Blackwood delights to cross and recross the line that separates the natural from the supernatural. "The Man Whom the Trees Loved," for instance, is an exquisitely wrought and truly imaginative conception. One reads it as if it were a poem by Keats rather than a "nature story." So with most of the others; the author plunges with boldness, yet with consistent invention, into the realm of the fantastic, and the pictures thence evoked may well long haunt his reader's memory.

Romance of Billy-Goat Hill (A). By Alice Hegan Rice. The Century Company, New York. $1.25.

Mrs. Wiggs's philosophy, if not her hopeful spirit, reappears in Myrtella, the faithful, sharp-

tongued serving-woman in Mrs. Rice's latest story. The romance is of the pure, old-fashioned sort, and, although tragedy enters in, it is relieved by much nobility and sweetness. The many humorous scenes and bright sayings keep the book upon a high level of interest. The pretty, humorous tale will find a warm welcome among those who like everything to end happily.

Out of the Wreck I Rise. By Beatrice Harraden. The Frederick A. Stokes Company, New York. $1.35.

A unique character in fiction is that of Tamar Scott, the Jewess, who dealt in curios and faked antique jewelry "for the Americans" in London. She and Nell Silberthwaite, the founder of the Society for the Abolition of Sweated Labor, are the two women to whom Adrian Steele turned when he found himself facing the humiliation of discovery as an embezzler. He was a fanciful man of small stature and of temperament, who, as Tamar said (though she loved him), "never could run straight." This situation Beatrice Harraden handles with all her accustomed skill, yet she only succeeds in making us wonder why she did it. These three character studies and the other one, apart, yet influencing them, young Richard Forest, the mystical English rector of a desolate parish, are most cleverly done. But if Robert Browning, in the motto chosen for the book,

> "Out of the Wreck I Rise—past
> Zeus, to the Potency o'er him,"

meant, as we are asked to suppose, that, pursued by "temperament" (a comfortable word), one might escape by death, chosen deliberately, from the consequences of dishonorable dealing with friends, and be justified, then our understanding of Browning is wrong.

Jingo (The). By George R. Chester. The Bobbs-Merrill Company, Indianapolis. $1.35

The fun of this lively tale is like that of Mark Twain's "A Yankee at King Arthur's Court." A clever, resourceful, capable American is shipwrecked in Isola, a kingdom cut off from the rest of the world, civilized in its own way, but centuries behind as regards invention and finance. Jimmy Smith, aided by a pocket handbook, teaches the people how to make telephones, mirrors, gunpowder, face-powder, how to use the latest American slang, how to manipulate stocks, and how to play baseball. To all this they eagerly incline, and Isola ends up by becoming an American dependency after Jimmy has married the King's sister. How did he communicate with America? Why, by air-ship, of course; Jimmy could make *anything* in three weeks. The story is jolly and amusing.

Olympian (The). By James Oppenheim. Harper & Brothers, New York. $1.35.

Kirby Trask, in the words of the author, emerged out of the millions and finally dominated. His was the power of brain and money. First drudgery, then a precarious kind of business success, and in time the adventurer became an Olympian. The story is well told in colloquial, every-day talk, with some underlying apprehension of the spiritual significance of life. This, however, comes within Kirby's horizon very occasionally, and only through the inevitable facts of birth and death. The various scenes in the tale which represent the drudgery of ordinary men and the empty days of ordinary women are marvelously graphic.

Voice (The). By Margaret Deland. Harper & Brothers, New York. $1.

There cannot be too many Old Chester tales; and this one of Dr. Lavendar, the wise old minister, and of a younger minister who was unwise because he knew too much, and of a charming, simple girl and of her father who was an Irvingite and ever listened for the Voices—this story, we say, with its tragic-comic catastrophe and love disclosure, is one of the very best of all Old Chester tales.

Concerning Sally. By William John Hopkins. Houghton Mifflin Company, Boston. $1.35.

At first it seems a pity to waste such rare and elusive powers as are possessed by the delineator of Sally upon such a theme. "The Clammer" never could have met Sally's horrible father, the gambling professor. Yet the further we read the more attracted we are, and, in spite of uneasy suspicions of De Morgan's influence, we accept Sally and acknowledge her potency. If only she did not chuckle continually—really, that is too bad. Her admirable management of everybody within her reach is truly De Morganesque, as are also the witty reflections and affectations of ignorance and detachment cultivated by the author.

Woman of It (The). By Mark Lee Luther. Harper & Brothers, New York. $1.50.

Realistic pictures of Washington officialdom as seen by the representatives of our Government and their families, transplanted from provincial surroundings, serve as a background for the extremely human people in this story. The common sense of Olive Braisted, originator and beneficiary of her husband's well-known "Relish," did not prevent her family from follies and pretense, but, in the end, triumphed over a snobbish son and daughter and a vain, misguided man.

Son of Columbus (The). By Molly Elliot Seawell. Harper & Brothers, New York. $1.25.

An especially interesting book for American boys is the story of Diego, the son of Columbus, during the anxious months when the fate of the bold scheme presented to the Spanish sovereigns hung in the balance, and the discovery of America might not have been in 1492. The faith of Diego and his companion, Don Felipe, never wavered, and when the noble

Admiral returned in triumph they welcomed him with true boyish enthusiasm.

Dickens's Children: Ten Drawings by Jessie Willcox Smith. Charles Scribner's Sons, New York. $1.

It may be said with certainty that of all the many attempts to present the children of Dickens's imagination to the eye, none have been more successful than these ten drawings. The types indicated by the early illustrators of Dickens have been so far followed that there is no feeling of strangeness in seeing these new pictures. Yet each child is individualized and its character comes out strikingly and sometimes beautifully. The picture of Jenny Wren and that of Little Em'ly, for instance, are charming in the fullest sense.

New China (The). By Henri Borel. Translated from the Dutch by C. Thieme. Dodd, Mead & Co., New York. $3.50.

Most books on China have to do with figures and statistics, with linguistic lore and political economy. As Dr. Borel says, the Chinese have always been abused as inferior—as dirty, cowardly, cruel, and particularly as materialistic and egotistical. Not only merchants and diplomats, but missionaries and educators alike have often mistaken the external for the internal; they have described the Chinese as a nation of heathen, too much debased to feel any devotion to higher ideals. The author endeavors to show that the Chinese represent something else, and that there is in China itself a beauty—æsthetic and spiritual—of which we little dream. Instead of describing the upper reaches of the Yangtse River or the broad expanses of the Grand Canal, he takes what is to many the ugliest spot in all China, namely, Peking, the imperial capital itself. He finds beauty there, and he finds in the people men who are thinking not so much about crops and concessions, loans and exploitations, as about a more spiritual side of life. The idea at the heart of the movement in the Far East towards higher things is, says the author, essentially spiritual and even mystical, and the reason that China in particular, with her four hundred millions of people, is moving upwards in the world's course is because in the future she is to work mightily towards the intellectual and spiritual progress of all humanity.

Grant White Shakespeare (The). 12 volumes. Pocket Edition. Little, Brown & Co., Boston. $18 per set. $1.25 per volume.

The reprint, in twelve volumes, of the plays of Shakespeare edited many years ago by Richard Grant White is eminently serviceable. Mr. White was a thoroughly equipped Shakespearean scholar. He was, moreover, a man of general learning, of an acute and penetrating critical instinct, and he had the gift of humor. Forty-five years have passed since this edition was published, and although in that period much has come to light which is of value to the Shakespearean scholar and reader, the critical acumen and sound judgment of Mr. White have kept this edition among the standards. The text needed revision at some minor points, and the editors tell us that some changes in matters of more importance have been made. But the text remains substantially intact. The edition has gained more, perhaps, by elimination than by addition; and the editors have come to the aid of readers by an enlargement of the glossary. The revision has been made under the direction of Dr. William P. Trent, of Columbia University, an accurate and thorough scholar; of Benjamin Wells, Ph.D., with whose work in other fields thoughtful readers are familiar; and of Professor John B. Hanneman, of the University of the South, who recently died. A short sketch of Mr. White prefaces the first volume.

Crime of 1812 and its Retribution (The). By Eugène Labaume. Translated by T. Dundas Pillans. McBride, Nast & Co., New York. $2.75.

A translation of Eugène Labaume's "The Crime of 1812 and its Retribution" is, of course, interesting historically. But it is especially and pathetically interesting because of an introduction by the late William T. Stead—perhaps the last thing he wrote. The introduction bears all the marks of Mr. Stead's vivacious and vigorous campaign in the interests of peace, and the reason why he wrote the preface is perfectly patent—to show the horrors of war. As Mr. Stead says:

> The most striking chapters in the book are those which describe the ghastly catastrophe of the headlong rush of the wreck of the Grand Army across the territory which Napoleon had desolated. Like a wounded mastodon, crippled and bleeding at every pore, the once invincible army staggers blindly, madly, through the snow, intent only on escape, until at last, a mere shadow of its former self, starving, frost-bitten, despairing, it reaches safety in Prussia.

Fourteen Years of Diplomatic Life in Japan. By Baroness Albert d'Anethan. McBride, Nast & Co., New York. $1.25.

The late Baron d'Anethan was for over sixteen years Belgian Minister to Japan. In the present volume his wife, an English lady by birth, chronicles much of interest in the diplomatic life at Tokyo during those years. Her story also reveals a sympathetic and broad-minded woman.

Joseph Pennell's Pictures of the Panama Canal. J. B. Lippincott Company, Philadelphia. $1.25.

"I did not go to Panama to study engineering—which I know nothing about," says Mr. Pennell; "or social problems—which I had no time to master; or Central Amercan politics—which we are in for; but to draw the Canal as it is." And excellent they are, these lithographs, drawn when the Canal was at just the right stage for picturesque art purposes. Excellent also for picturesqueness and sharply drawn personal impressions is Mr. Pennell's account of his visit and work. Together text and pictures make a permanently valuable as well as beautiful book.

BY THE WAY

"Vaudeville," says Mr. E. A. Woolf in the "Dramatic Mirror," "now demands that the material in a playlet must be weighted with an idea; it must be free from horseplay; it must be developed in consistent character-drawing; it must be along new lines; and, above all, it must be clean." Mr. Woolf writes thus encouragingly with the authority of one whose name last season "appeared upon more theatrical programmes than that of any other author in the United States," according to the editor of the "Mirror."

A happy idea in house construction, says "Country Life in America," is the new plan of combining conservatory and living-room. The idea has possibilities both for the elaborate mansion and the modest cottage. Ferns, flowers, easy chairs, and abundant sunlight make the conservatory living-room an apartment that radiates beauty, cheerfulness, and comfort.

Automobiles for children are the latest French novelty. These are not the toys with which the American public is familiar, but real motor vehicles with a three-quarter horse-power engine. They are so designed that they cannot exceed four miles an hour in speed, even on a down grade.

The assembling of the great fleet of war-vessels in New York Harbor recently was followed by a rush of applicants for enlistment in the navy. One day brought the largest number of such applications that has been received in a single day at any recruiting office since war time.

The steady advance of surgery in the treatment of wounds received in warfare is shown in the statistics of three wars. In the American Civil War the mortality of the wounded was 13.2 per cent; in the Franco-Prussian War, 11 per cent; in the Russo-Japanese War, 5 per cent.

Dr. Albert Weidemann, one of the German delegates to the International Congress of Chambers of Commerce, found one of the most agreeable features of American towns to be "the universal garden about the American dwelling and the absence of fences or hedges." The effect, he says, is very attractive; "most of the smaller towns are made to resemble parks." This praise should hearten village improvement associations everywhere to new efforts.

Gas mantles that have become black may be cleaned, a "Scientific American" note states, by sprinkling salt upon them while burning. Caution, of course, must be used in this experiment, or the experimenter will lose both salt and mantle, for the latter is a most fragile article.

Cheesecloth coverings for plants, a farmer tells us in an agricultural paper, are superior to glass, for they let the moisture through. The white shelter has a forcing effect, and also keeps out insects. Cucumbers from vines thus sheltered were gathered two weeks earlier than usual this season, and the enthusiastic experimenter is planning for large results next year through the use of these cheesecloth protectors.

The Bantu tribe in South Africa, an English writer affirms, were formerly much healthier than now. One of the reasons given for the change is a curious one. In the old times the Bantu smeared his body liberally with grease, and wore almost no clothing. The rain made no impression on his oil-protected skin. Now the native wears cheap European clothing, and when this gets wet the wearer is soaked through, catches cold, and is liable to contract pulmonary disease.

A new American submarine boat, the F-I, has made a world's record for depth of submersion—283 feet. The vessel maintained this depth for ten minutes while traveling at a speed of six miles an hour.

A laborer in a Connecticut town recently dug up an iron pot full of "pieces of eight," or Spanish dollars of the eighteenth century. Doubtless there are many treasure-troves like this in various parts of the country, for in troubled times our ancestors liked to put their dollars in Mother Earth's safe-keeping. Now here is a chance for the psychometrists, spiritualistic fortune-tellers, etc., to show their powers; let them tell where to dig for some more of those iron pots with silver linings! It should be easy for them to get the information from the original owners of the treasure.

New York City has 750 hotels—not counting the so-called Raines Law hotels—and they are said to be able to accommodate 350,000 persons. An exchange, in recording this fact, remarks that these hotels could quarter the entire standing army of Great Britain. The illustration, while no doubt hospitable in intention, is not entirely happy. New York City lodged a British army once, and we are sure that it would much prefer to entertain our English friends as civilians.

The flea, according to a Public Health report on "Flea Destruction," resists many insecticides—formalin, phenol, mercuric chloride, sulphur; he succumbs readily, however, to a mixture of soap and water! Simple cleanliness, then, is the most potent foe of one of the most annoying disturbers of human peace.

A curious bid to bargain-hunters is found in an advertisement of one of the great department stores of New York City: "It is often possible to give better values in Kurdistans than in any other rug," says the announcement, after speaking of the Kurds as a "robber tribe," "inasmuch as the Kurds steal from the semi-wild herds of sheep a large proportion of the wool that goes to these rugs." How about the ethics of the appeal?

"Would you save the picture or the baby?" is a question that has been discussed at English dinner tables recently and even in the London "Times." The question refers to Raphael's Dresden Madonna and to the ordinary, garden variety of baby: which would you try to save in a fire? One distinguished gentleman asserts that he would save the picture, for "there is only one Dresden Madonna," while "one can get another baby any day, by adoption if not by grace." To offset this, a well-known novelist says he would save even a live kitten rather than a dead picture.

The baby would undoubtedly stand a better chance of being saved in Australia than in England, where babies are so plentiful. In Australia, where they are scarce, the Government has just voted to grant a bonus of $25 for each child born in that empire of vast area and meager population.

The Outlook

NOVEMBER 9, 1912

LYMAN ABBOTT, Editor-in-Chief HAMILTON W. MABIE, Associate Editor
THEODORE ROOSEVELT
Contributing Editor

The exigencies of mechanical production are such that it is necessary to go to press with each issue of The Outlook nearly a week before the date of that issue, in order to secure its timely distribution in all parts of the country. The present issue went to press before Election Day, and therefore contains no comment upon the outcome of the election, which will be known to our readers before this issue reaches them. The election results will be reported and their significance analyzed in The Outlook for next week.

Vice-President Sherman

One of the most dramatic incidents of the very dramatic Presidential campaign just closed was the fact that while an ex-President of the United States, not yet recovered from a bullet wound, was speaking in Madison Square Garden in New York City, the Vice-President of the United States was dying in his home in Utica, New York. He was the seventh Vice-President who has died in office; the first was George Clinton, a distinguished citizen of New York, who died in 1812. We forget that the Vice-President is the second most important officer of the Government until we are reminded of it by death. Mr. Sherman's illness began four years ago; and although he made a brave fight under the most expert medical advice, he succumbed in the end to a complication of serious diseases. He came of a thrifty Central New York family. His grandfather was captain of the steamboat Burlington, of which Dickens wrote in his "American Notes;" and those who remember how carefully dressed the Vice-President always was will not be surprised to know that his grandfather left, besides a considerable estate, no less than forty-six fancy waistcoats. Mr. Sherman's father was a journalist in Rochester and Utica, and for many years a Federal officer in Washington. The Vice-President began life on a farm, working in the summer and attending the district school in winter. He prepared for college in an old-fashioned academy and was graduated from Hamilton in 1878, and at once began to read law in an office in Utica. Although he practiced law for a time, Mr. Sherman was essentially a business man, and a small interest which he secured at an early stage of his career in a factory prospered greatly. For many years he was a man of means, and at his death was president of an important trust company. For at least a score of years he was prominent in Congress, where his executive ability and skill in despatching business made him an important member of various committees. He was a conservative Republican of an aggressive type. He was also an astute parliamentarian. He was in no sense a statesman; he was a business man in politics, and belonged to the type of men, now rapidly passing off the stage, who felt that the interests of business and the interests of the country were at all times identical. Mr. Sherman's record in Congress was a record of active fostering of business interests. On the organization side of the Government he rendered valuable service, and as presiding officer in the Senate he was courteous, ready, and fair. On one occasion, when he was presiding, Mr. Bailey, of Texas, moved to lay a pending motion on the table. Mr. Sherman ruled the motion out of order as dilatory, and, when Mr. Bailey protested, said: "If the gentleman from Texas makes his motion in good faith and will assure the Chair that it is not a dilatory motion, the Chair will put it through." Mr. Bailey did not renew his motion, and said subsequently to the presiding officer, "Well, Jim, you had me that time!" Mr. Sherman's manner in the chair was always dignified and quiet. He was a man of many personal friends and of considerable practical ability. He was in no sense a man of vision, and he represented

the type of public men who conserve the material interests rather than advance the spiritual development of the Nation. If the country voted directly for President and Vice-President, the death of a nominee on the eve of election would introduce an element of confusion; but as the ballots in a Presidential election are cast for a group of electors, there has been no need for a change in the ballots.

⊠

Mr. Roosevelt in Madison Square Garden

Spontaneous, heartfelt, personally affectionate, an indorsement of both man and cause—these are accurate and moderate terms in which to describe Mr. Roosevelt's reception at Madison Square Garden in New York City on Wednesday night last week by an audience of men and women variously estimated at from fourteen to twenty thousand, while outside many thousands waited to give him greeting. The meeting was not only the culminating event of the Progressive campaign, with the Progressive candidates for President, Vice-President, and Governor of New York as the speakers; it was a tremendous outgiving of admiration and belief, a public avowal of faith in the purpose and sincerity of a leader of men now first seen since he was stricken down in the fight. Even journals which have been both skeptical and hostile so interpreted the meaning of the enthusiasm; an illustration of this is seen in the comment of the New York "Evening Post;" after referring to the mechanism common to all political demonstrations, bands, banners, and lights, it says: "There was a thrust behind the demonstration that scorned this, as it either scorned or swept with it the cynicism of those who had come only out of curiosity. It had all loyalty to a cause and devotion to an individual rolled into one and offered to the man whom they regarded as the personification of that cause." How exactly this is true cannot be gained from description; it does not matter whether the cheering when Mr. Roosevelt appeared lasted forty-one or forty-five minutes, or whether Mr. Bryan years before or Mr. Wilson the night after heard a tumult which, timed by the watch, was a few minutes longer; the feeling of the people was in their faces, in their manner, in their talk to one another, in their combined heartiness, and it was felt in the stillness with which they listened as well as in the noise of their greeting. Nowhere more strongly was this last fact apparent than when Mr. Roosevelt quoted from his own words in the opening days of the campaign: "The leader for the time being, whoever he may be, is but an instrument, to be used until broken and then to be cast aside; and if he is worth his salt he will care no more when he is broken than a soldier cares when he is sent where his life is forfeit in order that the victory may be won. In the long fight for righteousness the watchword for all of us is spend and be spent. It is of little matter whether any one man fails or succeeds; but the cause shall not fail, for it is the cause of mankind. We, here in America, hold in our hands the hope of the world, the fate of the coming years; and shame and disgrace will be ours if in our eyes the light of high resolve is dimmed, if we trail in the dust the golden hopes of men." And there was a grave, thoughtful moment of silence which preceded a last tumult of approval when he reaffirmed this in his final sentence: "Friends, what I said then I say now. Surely there never was a greater opportunity than ours. Surely there never was a fight better worth making than this. I believe we shall win, but, win or lose, I am glad beyond measure that I am one of the many who in this fight have stood ready to spend and be spent, pledged to fight, while life lasts, the great fight for righteousness and for brotherhood and for the welfare of mankind." Throughout the speech was noteworthy for its calmness, its poise, and its penetrating note of conviction and of duty; to quote the hostile "Evening Post" once more, the speech "was in good taste, grave yet with a moving quality, and breathed aspirations for the betterment of the world to which every humane person must say amen." It was practical also in its references to the constructive programme of the Progressive platform—or, better, its Contract with the People to make specific changes.

⊠

Campaign Contributions

One of the distinctive features of the Presidential campaign which is now closed was the use of the machinery of the Senate to create political capital. The Committee on Campaign Contributions which held its sessions during the campaign was a sub-committee of one of the standing committees of the Senate. It exhibited on a National scale what has often been shown within the limits of State politics, namely, the bi-partisan character of the opposition to the Progressive movement. Immediately upon the adjournment

of Congress that Committee heard charges against Mr. Roosevelt made by Senator Penrose, of Pennsylvania, and Mr. Archbold, of the Standard Oil Company. The members of the Committee immediately scattered, allowing no opportunity for the prompt answer that Mr. Roosevelt offered. Although the answer was given in the form of a letter to the Chairman, it was not officially received or given the weight of sworn testimony until more than a month later. From that time on until a few days before the campaign closed the Committee held daily sessions. Some of the more important statements made before that Committee have already been reported in The Outlook. A great deal of the so-called testimony consisted of hearsay evidence that was practically worthless. Some of the facts elicited were given a significance which they did not possess. For example, every large contribution established by the evidence has been supposed in some quarters to be a sign of corruption, or at least of political demoralization. This is pure assumption. There is no reason why a man of wealth should not give of his money to a political cause in which he believes, so long as there is no agreement expressed or implied that he is to get special favors in return. One reader of The Outlook, who is evidently not a Progressive, thinks that it was unfair of The Outlook not to state that Mr. Dan R. Hanna, of Ohio, had contributed one hundred and twenty-seven thousand dollars to the Progressive cause. This reader evidently thinks that that is damaging. But that is no more damaging either to Mr. Hanna or to the Progressive cause than it is damaging to Mr. Charles P. Taft or the Republican cause that Mr. Taft contributed very many thousands of dollars on behalf of his brother's candidacy. It seems to us that both of these contributions are entirely creditable.

A Wrong Impression

One witness before this Committee, whose testimony we referred to, has objected to The Outlook's report of it. We used the following words:

> Indefinite statements with regard to the expenditure of these funds seemed common in the testimony before the Committee. Thus Mr. Ogden Mills, the New York County Republican treasurer, could only estimate what was spent in the primary campaign in the county.

Mr. Mills writes us as follows:

> This is grossly inaccurate in every particular. I submitted to the Senate Committee an itemized statement of money received and expended by me in my capacity as treasurer of the Republican County Committee, showing from whom the money was received and for what purpose each specific sum was expended.
>
> I also submitted the full amount raised by me in my individual capacity and turned over to Mr. McKinley's agent, giving at the same time the name of each contributor, together with the amount contributed by him.
>
> In answer to a question of the Committee as to how much was expended by Mr. McKinley's local agent, I stated that I was unable to give the figures from my own knowledge, but it was my belief that such a sum did not exceed $24,000.
>
> It was perfectly clear from my testimony that every cent handled by me, either individually or in my capacity as treasurer of the Republican County Committee, was accounted for, not in round figures or from memory, but that in each case the exact amount was given and copies of my books submitted.

The statement which we made is not incompatible with Mr. Mills's statement, but it evidently has given to Mr. Mills, and therefore probably has given to other readers, an impression which The Outlook did not intend to convey. We had not thought of implying that Mr. Mills did not give an accounting of the money for which he was responsible. Mr. Mills's own statement, however, shows that there was money raised in New York County for that primary campaign of which he had no exact account, and concerning which he can offer only an estimate. The statement made by The Outlook is in substance that which was made by newspapers friendly to the party, and to the candidate of the party, to which Mr. Mills belongs. For example, concerning Mr. Mills's testimony the Boston "Evening Transcript" reports: "Mr. Mills raised seven thousand and twenty-five dollars for that organization. He said he had no information as to the amount of money raised in New York for the general use of the Taft National campaign." The New York "Tribune" uses the same words. The "Sun," another supporter of Mr. Taft, says that Mr. Mills "estimated" the sum expended by the Taft managers in New York County in the primary campaign. There is nothing at all derogatory to Mr. Mills in this statement. But it does afford an illustration of the indefiniteness of the statements made before the Committee concerning the expenditure of campaign funds. We take this first opportunity we have for putting Mr. Mills's side before our readers. Our original statement, it seems to us, correctly states the facts. The Outlook has

reported the contribution of Mr. Cyrus H. McCormick, of the International Harvester Company, to Mr. Wilson's pre-Convention campaign. It has now been announced that upon hearing of this contribution Mr. Wilson requested a few days ago that that contribution be returned. We see no reason why it should be returned any more than any other contribution. Certainly the return of the contribution does not affect the result which that contribution helped to secure—Mr. Wilson's nomination—and, moreover, it singles out Mr. McCormick's contribution as if there was something wrong about it. We believe that this is entirely unjust to Mr. McCormick. It is possible that some of the facts secured by means of these hearings may help the framing of laws concerning the financing of campaigns. It is, however, equally likely that a good deal of this so-called testimony may help to darken counsel on the subject. We trust that when the heat of the campaign has subsided Senators and Representatives will approach this subject with more common sense than has been shown during the hearings themselves.

⚄

The Balkan War: Land Warfare

Last week the most important battle so far in the Balkan war was fought. It occurred at Lule-Burgas, a town on the line of the railway running northwest from Constantinople. It resulted in the rout of about two hundred thousand Turks under the command of Nazim Pasha, Minister of War and Commander-in-Chief. This defeat exposes the capital itself to attack. The main Turkish army has now fallen back to the forts of Tchataldja, only twenty-five miles from Constantinople. As the more timorous fear for the safety of foreigners in Turkish towns, the European Powers have sent their war-ships to various Turkish ports for the protection of foreign life and property. The Balkan war has now been three weeks in progress. It has been a wonderful three weeks. The first week the war was between Turkey and Montenegro only; the Montenegrins had an uninterrupted success. The second week the Bulgarians, Servians, and Greeks joined the Montenegrins. The Bulgarians advanced from their frontier to Adrianople, which they have now "bottled up;" the second week brings them to within fifty miles of Constantinople. The first week saw the Servian occupancy of Novibazar; the second week finds the Servians in possession of the city of Uskub to the south, in their former territory, now known as Old Servia. The first week of the larger war saw the Montenegrins in possession of all the fortresses between their southern border and Scutari, the most important town in northern Albania; they have now entirely surrounded the city and lake of Scutari; the Montenegrin operations to the east now include the captures of the cities of Prizrend and Ipek—in the Middle Ages Ipek was the capital of the Servian patriarchs. The first week of the war saw Greece advance through the Stone Gates into her ancient province of Epirus and capture the towns about Mount Olympus; the second week finds the Greek army within fifty miles of Salonika. In accordance with the understanding among the allies before the war began, every captured town is being fortified as quickly and as strongly as possible, cannon taken from the Turks being mounted and made ready for use. Why all these successes on the part of the allies, and why the corresponding failure in Turkish resistance? The Turks have disputed the way, it is true, and there have been fierce and long-contested battles. But it is also true that the Turkish army has fallen back, not only in the endeavor to draw the allies further from their bases of supplies, but also for the more mortifying reason that the Turks have made a sorry spectacle in the fighting so far. There may be three reasons for this. The first, of course, is that the allies struck a swifter blow than was expected, and at a time when the Turkish army had not had time to meet the blow. The second is that the recent Young Turk Cabinet had recalled many of the older and more experienced officers of the army, replacing them by Young Turk officers. The third is that, in its desire to Ottomanize the Empire, the Young Turk Cabinet had compelled non-Mohammedans to fight in the army, not realizing that these, if opportunity presented itself, would prove deserters.

⚄

The Balkan War: Sea Warfare

Alone among the allies, Greece has a navy as well as an army, and the work of that navy has been interesting. The first week of the war the Greek navy captured the important island of Lemnos, off the coast of Asia Minor, and last week captured the islands of Samothrace, to the north, and Thasos, off the south coast of Turkey-in-

Europe. As the population of all these islands is mainly Greek, the captors were received with enthusiasm. As to the islands further south, Turkey has the advantage of continued control. It was feared that Italy would not conclude peace without insisting that Rhodes and the other eleven islands captured by her should become either Italian or, as their population is mainly Greek, pass to Greek control. At this point, however, Italy collided with the other European Powers. For the vital point to them was not the cession of Tripoli, but the occupation of the islands. Germany and Austria, acting together, wish to control the country between the present Austrian border and the Ægean Sea. For Austria there would be enough local advantages to make up for any effort in thus rounding out her empire. For Germany, her ally, there would be the advantage of having a friendly country between the Fatherland and Asia Minor, which may become Germany's greatest colony. But Russia also wants to move southward. Italy, in possession of the islands, might have threatened both Austrian ships and Russian ships. It is now Greece's turn. The gallant little Greek navy may now upset the plans of the Powers—indeed, the British naval adviser appointed last year may have been doing double duty. Another deed of the Greek navy last week was the sinking of the Turkish battle-ship Feth-i-Bulend by a Greek torpedo-boat in the Gulf of Salonika, the enterprise being carried out apparently unobserved within range of the guns from the Turkish forts. The battle-ship's crew numbered over two hundred men.

The Balkan War and the United States

The Balkan war is of special interest to the United States because of the large numbers of Greeks, Bulgars, and Serbs in this country. There are more Greeks here than any other of the above peoples. By the new army law in Greece, all reservists are called back from foreign countries to service in the army. It is said that ten thousand Greeks have already left this country, and that twenty thousand more will go. Should the war continue, other thousands will probably go; and, with this prospect, those industries in which Greeks are employed will probably suffer. In the cities the Greeks are most prominent in hotels and restaurants —indeed, some restaurants employ Greek waiters, dishwashers, and helpers exclusively. Throughout the country, however, Greeks are employed in large numbers in other callings—especially in those so curiously contrasted as the manufacture of tobacco and confectionery, and iron, coal, lead, and zinc mining. The Utah coal mines and the lead and zinc mines of Illinois employ many thousand Greeks—indeed, a dozen of the Illinois mines have had to close because of the exodus of Greeks and other foreigners. All the returning Greeks are enthusiastic over the prospect of war success, especially as they read the accounts of the victories already achieved. They fully expect that these successes will finally assure to them what they were fighting for in 1897 with Turkey—the definite possession of the island of Crete—as well as the possession of the islands once theirs and captured during the past fortnight. Enthusiasm also marks the other returning peoples. Like the Greeks, the Bulgarians and the Serbs look forward to a recovery of lost territory—the Bulgars to getting again the Bulgarian Empire, such as existed under their Czar Simeon centuries ago; and the Serbs to getting back Old Servia, to which they have an even greater ethnic and historic claim. Several thousand Servians are waiting in New York to be sent back, but as there is no Servian port they must perforce go by way of Greece or Montenegro. As to the Montenegrins in America, although the smallest in proportion, as would be expected from a nation of only a quarter of a million inhabitants, their patriotism is in disproportion to their numbers, as will be noted from the remark of one of the Minnesota miners: "There will not be an able-bodied Montenegrin left on the iron range if the war continues."

"Recognition" in International Law

The seizure of the port of Vera Cruz in Mexico by insurgents under the leadership of Felix Diaz, a nephew of the deposed President of that name, brought into discussion recently the question as to whether it might not become desirable for the United States to recognize the new insurgent movement so far as to concede to the insurgents the rights of belligerents. The sudden collapse of the Diaz movement and the capture of its leader have made the immediate importance of the question slight, but the general condition of affairs in Mexico, and, still more so, the relations of this country to the new Republic of China, which are dis-

cussed below, make it worth while to consider what a neutral country may do in this matter of recognizing belligerents or in recognizing a new government. A confusion of ideas seems to exist on this subject. There seems to be a prevalent belief that the recognition of a state of belligerency is equivalent to an indorsement of the justice of a cause. Nothing is further from the fact, nor does such recognition in any degree imply an acknowledgment of the independence of a dependency in which a revolution may be going on. Generally speaking, recognition of belligerency means that the forces so recognized are not merely rioters, brigands, or lawless mobs, but that their armed acts are in the nature of a war. Recognition of belligerency as to insurgents is merely, in the words of one authority on international law, "the granting to the revolutionary party in a foreign state the rights of war which it would have if it were in the position of an independent belligerent." This is simply admitting that the conflict is not local or trivial, but one which may affect the interests of other countries. The most notable illustration is that of Great Britain's recognition as belligerents of the Southern Confederacy in 1861, which was quickly followed by the same action on the part of other foreign Powers. This was beyond doubt entirely justifiable, but the proposed recognition of the Confederacy's independence by France was, says, in effect, Woolsey's "International Law," at no time justifiable, because at no time was the success of the South more than a possibility. In short, recognition either of belligerency or of independence, to be in accordance with international law, must be based on actually existing conditions. The reason why it seemed probable that the occupation the other day of Vera Cruz might call for action on the part of the United States was that for the first time the Mexican insurgents had possession of a seaport, and that questions of blockade and of neutral commerce would be likely to arise. In several cases the United States has done precisely the thing proposed as regards the Mexican insurgents with relation to revolutionary movements in other countries, and without in any sense making itself an ally of or committing itself either to one side or the other. Recognition of belligerency is made by proclamation. On the other hand, the recognition of a new government as being a government *de facto* is almost always informal, and really consists only of acts by which a working relation is maintained between the two governments in the usual transactions between two countries carrying on commerce and other amicable relations one with the other. So, too, when a government *de facto* is so well established that it is entitled to be considered a government *de jure;* a friendly foreign nation does not necessarily issue a proclamation of recognition, but shows its stand by such formal acts as the crediting of an ambassador to the new government and by the taking up of really important diplomatic questions with it. Let us now apply this definition of the various processes of recognition to the interesting state of affairs which exists between the United States and China.

The Recognition of the Chinese Republic

While our Government is in practical and every-day working relations with the new Chinese Government, there has been as yet no formal recognition. This has occasioned protests, and during the past month two important public protests have appeared. The first comes from the Chinese-American League of Justice. It declares that "all actual revolutionary conflict has terminated in China, and the disturbances reported in the daily press are not of a revolutionary character, but are only semi-political." Hence the new Chinese Government, it concludes, should be formally recognized by ours. The protest fitly includes these words: "The Republic of China cost its people much suffering, much bitter sacrifice, and much bloodshed. It is built on the same sacred principles that form the foundation of American freedom, liberty, and equality." The second protest is an open letter to the President by Major Louis Livingston Seaman, the eminent surgeon and authority on the Far East. Dr. Seaman is also President of the China Society of America. He says that our delay "not only prevents the prosperity and development of the country [China], but menaces its very life by threatening the maintenance of the integrity of its territory." No specific instances, however, are mentioned. Dr. Seaman adds: "The opportunity of cementing the friendship of a third of the human race should not be lightly neglected." Certainly not. Our general feeling towards China was shown last spring by the unanimous passage through Congress of a resolu-

tion recommending the immediate recognition of the Republic. Why, then, do we not formally recognize it? A first reason, we may assume from the protest, is that our Government has been somewhat "held up" by the other Governments—the English, French, German, Russian, and Japanese—with which it has been connected in the friendly proposal to loan enough money to the Chinese Republic to start it adequately in the business of government. Dr. Seaman refers to a "feeling" that the Powers expected to use this loan "for their own purposes and not for the best interest of the new Republic." That may be true of a few bankers, and possibly of Russia and Japan among the Powers. But most of the bankers, and at least four of the Governments, there is reason to assume, honestly believe that the conditions of the loan are in China's real interest. Of course no banker expects to engage in any loan without proper recompense and guarantee. Yet, with one exception, the conditions of the loan do not indicate a lack of appreciation of China's "best interest." The one exception is the provision for foreign supervision of the salt tax—the security for the loan. Any proud and self-respecting nation, we agree, would hardly submit to such a provision, even though it had for many years submitted, as China has done, to a foreign supervision of the collection of maritime taxes. But as those are collected at the ports, they do not touch the country as a whole as would the collection of the salt tax. The provision should be removed, and doubtless will be.

The Reason for Delay

The real reason for the delay in recognition is revealed in the State Department's reply to the China Society: "It is the disposition of the Executive to accord recognition at the earliest opportunity afforded under the established usages of international law." So far as we understand it, our Government's policy in the recognition of new governments has been to apply the *de facto* test; that is to say, when we are satisfied that a new authority in power exists, with the acquiescence of the governed, and is able to discharge all international obligations, our policy has been, pending final organization, to enter into practical relations with the temporary Government of such a state. But were "the established usages of international law" followed in our recognition of the Republics of Brazil and Portugal? asks Dr. Seaman. As to Brazil, immediately upon the Emperor's dethronement, in 1889, our Government instructed the American Minister at Rio de Janeiro, first, to obtain diplomatic relations with the Provisional Government, and, second, as soon as a majority of Brazilians should assent to the establishment of the Republic to give to it on behalf of the United States formal and cordial recognition. When it was ascertained that the Brazilian Government had popular approval and support, our Government recognized it as a Republic *in fact*. In the case of Portugal, our Government entered into practical relations with the proclaimed Provisional Government formed in 1910 under Senhor Braga's Presidency. When that Government summoned a Constitutional Assembly, and that Assembly proclaimed a Republic, our Government instantly recognized the Assembly's action. The Portuguese precedent will, of course, be followed in the case of the new Chinese Government, with which we are already in cordial working relations. But we wait on China's necessary action as a precedent to formal recognition. Last February the Chinese Foreign Office notified our Legation at Peking that China had entered upon a formative period of new government, and that the "Provisional United Government" had decided to continue the Chinese Minister accredited to the United States, and to designate him, temporarily, "Provisional Diplomatic Agent." The following day that Minister officially informed our Government that the Emperor, in abdicating, had invested Yuan Shi-kai with power to establish a republican form of government, and that, pending such establishment, the diplomatic and consular officers of China abroad would continue in the discharge of their functions. Hence, agreeably with our established policy, our Government admitted the Chinese Minister to full relation with the State Department, and ordered our Minister at Peking to continue in the exercise of his office. Thus, during the earliest period of the new Chinese Government—which announces itself to exist provisionally in virtue of an Imperial decree, and to be formative only—the two countries have been practically in full relations. When the existing Provisional Government is changed into a permanent constitutional Government, with the assent of the governed, it will, of course, be promptly recognized.

When will that be? Presumably as soon as the Chinese hold their elections and the parliament convenes and takes action. The delegates to the present Assembly at Peking were not elected by the people at large. Elections for a permanent Parliament were to take place not later than six months from last April, when Sun Yat-sen, the Provisional President chosen at Nanking, resigned in favor of Yuan Shi-kai, chosen at Peking. Thus the elections should occur about this time. As Article 53 of the Provisional Constitution declares that the Provisional President shall convene Parliament within ten months of the promulgation of the provisional Constitution, we may expect the first meeting of Parliament to take place in February, at which time we hope and expect the formal recognition of the Chinese Republic by ours, and not only by ours, but by the other Powers, among whom we are regarded as a leader in all that concerns China. That recognition will, we are convinced, swiftly follow the convening of a duly authorized national Parliament, and its declaration in favor of a Republic, together with its election of a permanent President.

The Woman Suffrage Movement in China

The impression has gone forth that women in China have already been granted equal suffrage with men. The rumor obtained because, when the provisional Assembly was in session at Nanking, the ancient Chinese capital, a number of native suffragettes marched into the Assembly and petitioned that the suffrage be immediately granted to women. This being refused, the ladies acted exactly as their British sisters have done—they shouted and shrieked and smashed windows. They petitioned the Assembly again and again. Finally, in order to free itself from further friction, that body passed a resolution expressing an opinion in favor of equal suffrage. Now the Assembly was only a provisional body, and hence could not make any final decision on this question for the nation; but it did recommend favorable action to the National Assembly, then being organized to represent the country after the definitive union of the north and the south, a body soon to be superseded by a regularly elected Parliament. But the suffragettes took a different view. They acted as if the suffrage had already been granted to them. When the National Assembly opened its sessions, last June, at Peking, the capital, a petition was presented reminding that body of the provisional Assembly's promise. But the petition was in vain, if we may judge from the Suffrage Act passed in July, which will soon be tested by an actual popular election to a permanent Parliament. The Act made no provision for women's votes. Even the vote to male citizens was granted only under strict limitations. Any male citizen of the Chinese Republic over twenty-one years old may vote if he has resided two years in his election district and has paid a direct tax exceeding two silver dollars, or owns real estate valued at more than five hundred silver dollars, or is the graduate of a primary school. But no citizen may vote if the Government had suspended his citizenship, or if he is an illiterate, a bankrupt, an insane person, or—last but not least—an opium-smoker.

American Missions Imperiled in Korea

An important conference was held recently in New York City to consider a somewhat serious crisis that has arisen in Korea, one which seriously affects Christian missionary work in that country and conceivably may grow into such proportions as to affect indirectly the relations between Japan and the United States. It is an old proverb that a little matter may kindle a great fire, and it is a subject of congratulation that wise men have taken this matter up in time to prevent what might otherwise grow into serious contention. Christian missions have had a great success in Korea. There are said to be 300,000 members of Christian churches in that country, including catechumens—that is, those who have definitely become Christians, but have not yet been received into full membership pending further instruction and observation. Japan grants, both in her own country and in her provinces, full religious liberty, and the Christian Church has the same standing before the law in Japan as the Buddhist Temple. But the Koreans are uneasy and discontented under the Japanese occupation of their country. It is certain that under that occupation order, peace, and civilization have been promoted. It is also certain that conditions are far more favorable for the Christian Church under Japanese occupation than they would have been under Russian occupation; and such was the course of events in the East that, if Japan had

not occupied Korea, Russia would have occupied it. But Christianity is the only social religion in that country. The Buddhist worships in his temple in solitude. The Christians gather in assemblies of considerable size, and their worship is accompanied with singing and with public addresses. In many villages the Christian church is the only assembly-room, and the Korean Christians gathering in these assembly-rooms become an object of suspicion to the military authorities. In some cases this suspicion is intensified by wholly innocent incidents, such as the singing of "Onward, Christian Soldiers," or a sermon on David and Goliath. In other cases it may conceivably, though not at all probably, be justified by incidents that are not wholly innocent. The American missionaries have apparently taken very great pains to keep the Christian churches from any appearances of revolutionary or even political tendencies; but some of the native Christians have been accused of not being equally careful. Some of them have been arrested and tried for stirring up insurrection. These trials have been conducted according to the Japanese criminal law, which is largely borrowed from the Code Napoléon and in its methods is unlike the Anglo-Saxon law, and seems to the Anglo-Saxon lacking in necessary protection for the accused. It is even affirmed that in some instances these Christians have been subjected to torture and that confessions have been thus extorted from them. This is denied by the Government officials, and the American must bear in mind that what is euphemistically called the "third degree" is not uncommon in police examinations in some of our own States. One hundred and six of these Christian Koreans have been condemned. An appeal has been taken, and their case is now to go to the higher courts. The conference to which we have referred was called by certain of the missionary boards working in Korea for the purpose of getting the counsel of disinterested Americans upon the situation as presented.

Pacific Counsels

Among those who took part in this conference were Dr. Eliot, President Emeritus of Harvard; Dr. Hadley, President of Yale; Dr. Seth Low, former President of Columbia; Professor Jenks, now of New York University; the Hon. John W. Foster, ex-Secretary of State; the Hon. James Brown Scott, formerly solicitor for the Department of State. The importance of the conference is indicated by the fact that, although the notice was very short, all those who were invited attended, except two or three unavoidably detained by previous engagements. The judgment of the conference was unanimous that the Mission Boards were right in believing that the United States Government could not, directly or indirectly, interfere. If American citizens had been arrested, the Government might possibly interest itself in the matter, but it would be an international impertinence for the American Government to interfere in the trial of Japanese subjects by Japanese courts, as it would be an international impertinence for the Japanese Government to interfere with the trial of Filipinos by American courts. There was, however, a general agreement that, informally and unofficially, representatives of the American interests in Korea, especially representatives of the American churches, might bring the matter again, as heretofore, to the attention of the Imperial Government in Japan, and might with entire propriety raise the funds necessary to secure eminent Japanese lawyers to present the case of the Korean ministers before the Japanese courts. There appear to us to be two perils involved in this situation: one, the peril to individual Christian ministers who may be unjustly condemned because of natural, though perhaps groundless, suspicions; the other, the peril to the amicable relations between Japan and the United States, which might easily be aggravated if unscrupulous journals were to lay hold on the facts which we have here stated, and, by misrepresentation or partial and imperfect representation, take the occasion to inflame American prejudice against Japan. So far as we can judge from such examination of the facts as we have been able to give, the American leaders of the Christian churches in Korea are taking the utmost pains to avoid every occasion of offense. If the actual facts can be brought in a conciliatory manner to the attention of the Japanese Imperial authorities, there is no reason why the not unnatural suspicions of local officials should grow into a national suspicion, and we trust that the conference may result in both providing a fair trial for the accused Korean Christians and preventing any inflaming of race and religious prejudice between the Japanese and the Americans.

Safeguards for the "Movies"

Three hundred thousand people in New York City alone throng the seven hundred motion-picture shows every day. Yet for this vast public there is no law fully protecting health and safety. This result is partly due to the fact that the Building Code exempts those places under a 300 seating capacity from its elaborate and costly provisions, yet provides no special rules for those below 300. Hence the vast majority of moving-picture shows are of the typical "store-front" kind, which seat not a soul over 300. For these places there remain only old, hopelessly insufficient laws, the duty of enforcing which is scattered among seven city departments, with numerous twilight zones of authority. Much confusion and neglect result. The public is served by hundreds of cramped, ill-ventilated houses, poorly lighted, sometimes overcrowded, sometimes dangerous. Many of these houses defy the State law by admitting children under sixteen without parent or guardian. The entertainment is lowered in many cases by vaudeville of necessarily the cheapest kind. To remedy all this and to bring healthful, safe, clean conditions into the theater, and to give a better show, there is proposed a "Folk Ordinance," framed after searching investigation here and in Europe, and indorsed by the People's Institute and recreation societies. This safeguards the public and gives the showman fair measure. It recognizes that the latter cannot pay for the imperative improvements without a larger income; so it raises the seating capacity of strictly motion-picture houses from 300 to 600, while still freeing them from the excessive cost of coming under the Building Code. The improvements required are excellent, and for the most part the ordinance is retroactive on all existing moving-picture theaters. Every such building, for instance, must be lighted during the entire performance so well that one may be able to read ordinary print. As an aid in fire and to prevent panic, the public is to be further protected by many minutely specified improvements, such as adequate exits, fire-escapes, outside doors opening out, fireproof stairs, metal-covered floors and ceilings, seats fastened to the floor, ample aisles, the prohibition of "standees," and by a safer operating booth, with flues reaching the outside air. To safeguard health reasonable appliances are required, not only to insure a specific amount of cubic air space, but for the introduction without direct draughts of copious fresh air, to be kept in motion by electric fans; when the temperature is below 60° outside, it must be between 62° and 70° within.

Other Improvements Would Follow

Vaudeville, stage, and scenery would be abolished, by the passage of the Folk Ordinance, in these small motion-picture theaters, though song, recitation, music, and lectures could be given. Two things would be accomplished by thus abolishing vaudeville: the fire risk would be much less, since everything inflammable—scenery, costumes, etc.—would be gone from the front of the hall; and the entertainment itself would be more dignified, since in the small houses the vaudeville is almost impossible to regulate. All these improvements could be installed without raising the present price of admission, because more tickets would be sold. Authority would be given to inspectors from the License Bureau to issue licenses only after all improvements have been installed, and to investigate shows and report violations of decency to the Mayor, who can revoke the license. With the vaudeville eliminated and the films judged, as now, by the National Board of Censorship of Motion Pictures before "release," there should be a minimum of objections to the entertainments. It is believed that much of the Folk Ordinance could be adopted in many other cities which desire to improve the conditions surrounding the moving-picture performances. Though the Folk Ordinance makes provision for educational and religious moving-picture entertainments in schools and churches, this vast possible development in New York State must wait for a proposed amendment to an antiquated State law. This law provides that the operating booth shall be of such size and of such heavy materials that a practically permanent structure weighing about two thousand pounds is required—out of the question to build into most churches and schools. The amendment permits a much lighter but just as safe portable booth, and also provides for the use under proper restrictions of the "home" miniature moving-picture machines, which have almost endless possibilities for school, charitable society, and scientific institution. The Folk Ordinance will doubtless meet with opposition from rivals and commercial interests concerned, and to some extent from persons whose

motives are conscientious but whose knowledge of the subject is incomplete.

Offensive Advertising: England and France

The crusade against offensive advertising has been vigorously started in this country, chiefly by the American Civic Association, and is having more or less success. Our crusaders should take heart from the example of England and France. In 1893 the Scapa Society of England began its work of calling public attention to inartistic advertising; and finally, in 1907, Parliament adopted the principle advocated by the Society by passing an Advertisements Regulation Act. This act empowered local authorities to frame by-laws "for regulating, restricting, or preventing the exhibition of advertisements in such manner or by such means as to affect injuriously the amenities of a public park or pleasure promenade or to disfigure the natural beauty of a landscape." It is only now, however, so we learn from the London "Spectator," that local authorities show a general disposition to avail themselves of the provisions of this law. The Home Office was to carry out those provisions. Its method was to schedule defined areas. But this did not work. So the Home Secretary ordered that no advertisement should be exhibited on any stand or other erection visible from any highway and so placed as to disfigure the natural beauty of the landscape. The "Spectator" instances such a pleasure resort as Scarborough and such a historic city as Exeter as among those places where the success of the crusade against offensive advertising has been specially evident. Turning to France, we find that in 1906 the French Parliament passed a law providing for the protection of sites and natural "monuments" of artistic character. Under this act commissions were constituted for each of the eighty-six departments into which France is divided. The commissions consisted of the prefect of the department, its chief engineer, the heads of the forest and water bureaus, two members of the council, and five persons of distinction in art and literature. The commissions were to frame a list of lands whose preservation would have general interest because of the picturesque character of the views involved. The owners of these lands were then to be asked not to destroy or alter the aspect of the lands in the list without the departmental commission's permission. If the owner refused, the prefect was empowered to expropriate any such property. The next step was to obtain legal powers to prevent defacement. In 1910 the Legislature granted these; indeed, it empowered the prohibition of any advertising at all within a zone to be defined by a prefectoral order. The legislation just passed goes still further. Its aim is to tax the *affiches*, or large signs, out of existence. Advertisers will have to pay fifty francs (ten dollars) a square yard, and a proportionate rate for larger areas of advertising space. But, in the view of the new law, the persons putting up the *affiches* are not alone responsible. The owner of the sites is also responsible, and is liable to a special duty on his gains from this source. When we record the fact that the Chamber of Deputies and the Senate passed this law unanimously and without discussion, the impressive character of the event is sufficiently indicated.

A School Gymnasium

The development of secondary boarding-schools for boys in this country during the past few years has been notable. Old foundations, like the Phillips Academy at Andover and the Philips Academy at Exeter, have gained in material and educational resources. Schools founded within the present generation, like St. Paul's, Groton, Hotchkiss, Lawrenceville, and The Hill School, have established themselves on permanent foundations. This result has sometimes been accomplished by devoted and clear-headed masters dealing with large bodies of alumni, and sometimes by men like Dr. John Meigs, who have the genius not only for teaching but for school-building. The Mercersburg Academy, in the beautiful Cumberland Valley in Pennsylvania, has grown in like manner and for the same reason, Dr. and Mrs. Irvine bringing to a great opportunity the spirit of leadership, unselfish devotion, and tireless industry. The equipment of this school, which now numbers more than four hundred boys, has been materially enlarged by the building of an impressive and well-appointed gymnasium in memory of a Mercersburg boy, Carl Lewis Nolde by name. In his address of dedication Dr. Irvine spoke of him as a boy of "clean, pure character, energetic, self-controlled, and faithful," who died very near the day of his graduation, and of whom the head master said, "Like a lighthouse, he simply kept shining." A Mercersburg boy

was one of the conspicuous winners in the Olympian games at Stockholm last summer. And the head master finely interpreted the spirit of the Academy when he declared of the new gymnasium that it was "to tell the story of divinity in the human body." The Rev. Dr. N. M. Waters, of Brooklyn, who also spoke, said that a man who develops his brain only is one-third of a man; the man who develops his soul only is one-third of a man; but the man who develops his brain, his soul, and his body is a complete man; and he gave a vivid interpretation of the picture of the Mercersburg athlete which Mr. Blashfield is to paint on the walls of the trophy room in the gymnasium.

Safe Travel, the Saloon, and Railway Employees' Clubs

Nearly twoscore lives were lost within the year through collisions on railway lines protected by automatic block signals. Though the mechanism did its duty, the human factor failed. Signals were either not seen or disobeyed. These disasters emphasized the fact that safe travel depends as much upon the clear eyes and brain, upon the effective coordination of the railway man's mind and senses, as upon automatic safety appliances. Further emphasis was given this fact by a recent bulletin of the Inter-State Commerce Commission analyzing the accident records of the country's railways. This bulletin reported that the Southern Pacific system had carried 150,000,000 persons in the four years ending June 30, 1912, without killing a single passenger through collision or derailment. In connection with this report it is significant that the Southern Pacific and the allied lines of the Harriman group have for six years carried on a systematic, startlingly effective war against the saloon—the railroader's worst foe. The lines supplemented the strict enforcement of Rule G, prohibiting the use of intoxicants on or off duty, by erecting sixteen club-houses for the employees at operating centers. Neat rooms, well-cooked, wholesome food of the best quality, non-intoxicating drinks, cigars, candy, and tobacco were provided for the men in these club-houses. Billiard and pool tables, bowling alleys, libraries, shower-baths, lounging-places, halls for dances and meetings, were placed at their disposal. Almost from the beginning these club-houses became extremely popular, and proved to be powerful factors in enforcing Rule G, effective competitors of the saloon. In one small railway town of three thousand souls twenty-nine saloons flourished when the club-house was opened. Six months later half a dozen drinking-places closed their doors. The others showed fight. Club-house employees were bribed to give poor service, cooks were induced to poison the men's food; as a last resort, the entire club-house crew was bought to go on strike. But the saloons lost. Two years after the opening of the club only seven of the original twenty-nine bars were left. Twenty two closed their bars for lack of patronage. At Tucson the floor of the club-house had to be relaid four times in six years. At Green River, a Wyoming division point so desolate and dreary that few workers remained after the first pay-day, the club-house lengthened the average term of service from less than thirty to more than ninety days. Everywhere the division superintendents reported greater efficiency, sobriety, and self-respect among club-house patrons. Undoubtedly the clubs' influence upon the human factor assisted materially in bringing about the record of four years' safe travel. The victories won in the fight against the saloon by the institution have been permanent and progressive, thanks to the novel principles upon which the management of the club-houses is based. F. G. Athearn, the social engineer who founded the clubs, realized that institutions similar to the Young Men's Christian Associations would not reach the class of men he dealt with. Departing from the accepted standards of social welfare work, Mr. Athearn studied the methods of the enemy, the saloon, and adapted them to the railway's purposes. The saloon requires neither dues nor membership cards from its patrons. Neither do the railway clubs. They are open day and night to every employee who wishes to make use of their facilities. As in the saloon, all club patrons stand upon a plane of social equality—the same courtesy that greets the aristocratic engineer or conductor is extended to the humble section worker. Like the home and the saloon, the walls of the club-houses are innocent of signs prohibiting swearing, smoking, expectorating. There are no rules of conduct. The men's freedom of movement and action is as unrestricted as it is in the saloon. But the subtle influence of wholesome, neat environment has in no instance failed to prevent abuses. The men are expected to behave as gentlemen—and they do. They pay their way just as they

do in the saloon, though no profit is derived from the operation of the club-houses except the indirect benefit resulting from cleaner, stronger, healthier manhood. Social welfare workers will find food for reflection in the remarkable success of this enterprise, which vigorously suppressed every tinge of paternalism and patronage in order to lay hands upon that most elusive, unwilling individual, the adult, independent, self-respecting worker, and keep him out of the danger zone of the saloon.

Is Art Decadent?

Mr. George Moore is a well-known English art critic. But he is a pessimist, and the habit of being a pessimist seems to have grown upon him. He recently issued a statement to the effect that art had now reached its climax, and that henceforth we must expect to go down hill. Mr. Moore's position seems to be that ours is emphatically an industrial and commercial age; hence the expression of that age is seen in various mercantile enterprises and works of engineering rather than in art production. The rejoinders of American art critics have not been wanting, and among them that of Mr. William M. R. French (as published in the New York "Times"), Director of the Art Institute of Chicago, deserves quotation. "My own prosaic idea," he says, "is that it is a matter of supply and demand." He explains this thus:

> In Athens the State furnished a demand for art. In the Renaissance the Church furnished the same demand. . . . With us the same thing is happening through the extension of mural painting and the freer use of sculpture in connection with architecture. On a lower plane modern illustration has made the practice of art into a profession equal in its rewards to other professions, so that an enterprising young man need not fear to follow it. With the opportunity will come the men.

As to art in general, Mr. French denies that it is at a low ebb. It is true, says he, that Greek sculpture stands confessedly unequaled, and yet "within fifty years we have had sculptors equal to any except the Greek, unless it be one or two men of the Renaissance." As to painting, we have of course the inevitable reference to Whistler. His production in painting looks limited, Mr. French admits, when compared with that of the great masters. But that is no reason for asserting that there are no longer any national schools of painting. "I believe it is true," declares Mr. French, "that a practiced critic can pick out the American paintings in the Paris Salon by sight as soon as his eyes rest upon them. No doubt the same is true of the English and Spanish, for example." Mr. French's position is justified by the facts, and we are therefore glad to add further publicity to his statement.

Forestry in New York State

During the past summer the New York State College of Forestry at Syracuse University acquired over eighteen hundred acres of cut-over land in the Adirondacks for educational and experimental work. The land was given to the University by the Rich Lumber Company. In its operations this Company has endeavored not to denude the immediate shores of Cranberry Lake, along which it has been operating for a number of years; consequently the lands contain more green timber than is usually found. It is also significant that a lumber company which has long operated according to older methods of logging should wish to help in educational work by placing so large a tract of land in the hands of an educational institution. While lumbermen have been taking an active interest in forestry education, few of them have done more in adopting improved methods of management than to carry on utilization a little more fully and to pay more attention to the protection of their timber. This latest gift of forest land, though relatively a small tract, should, of course, be so effectively reforested and managed as to become an object-lesson for the entire State. A particular and gratifying immediate result to be noted is the establishment of a State Ranger School. There has long been need to train a class of young men to fill the gap between the average woodman and the trained forester; indeed, in this country it seems difficult to train a man for any intermediate position when so much opportunity for advancement exists, fortunately, about us. Some attempts have been made to establish regular courses in the Western States, and one or two colleges there are now giving regular range work. The New York College of Forestry's Ranger School will offer a one-year and a two-year course of training. Both courses will lead to such positions as guards, rangers, forest estate managers, tree-planting experts, and nursery foremen.

Billy Rugh, Hero

The rôle of heroes is a long one, and is always receiving additions; for this age, which is so often described as unheroic, lives from hour to hour by the heroism of an army of men and women. The latest name to be added to the shining list of those who face death for some principle or cause, or who make some great sacrifice for an unselfish end, is that of Billy Rugh, of Gary, Indiana, who sold newspapers. A young woman, severely burned as the result of a motor cycle accident, was in danger of death because skin could not be procured for the grafting operation. Rugh, who had been a cripple from childhood and whose left leg was practically useless, heard of the case, went to the hospital, and offered his leg to the surgeons for use in the emergency. He was warned that amputation would be necessary, and very dangerous. His answer was, "If it will save the girl, take it off;" and he added, with the quick humor characteristic of his class, "I'll save money—you know I'll have to buy only one shoe." The leg was amputated and the grafting operation successfully performed; but Billy Rugh paid the extreme penalty of his heroism, saying quietly, as he went out of the world, "Yes, I'm going; but I was some good to the world, after all." Such a modern instance of the old virtue of the men about whom Plutarch wrote is only one of the countless refutations of the slander that heroism has died out of the modern world. On the contrary, it has become so much a part of modern life that it is taken for granted. But Billy Rugh ought to be remembered. His was the quiet courage which faces death without the support of the bugle-note or the encouragement of a multitude of onlookers.

⚄

A Bird Haven

Mrs. Russell Sage has added another item to the list of her public-spirited benefactions. Her latest good deed is the purchase of Marsh Island, in the Gulf of Mexico on the Louisiana coast, as a bird haven. This island, it is asserted, is one of the best which could be chosen for refuge purposes. In their spring and autumn migrations it is the stopping-place for many varieties of birds, and in the winter it is frequented by great numbers of wild fowl. It is a natural refuge and building-place, especially for egrets (which have been almost exterminated, owing to the demand for their snowy plumes), and also for herons, bittern, and loons, while in the winter there are many species of shore birds. Of course the island has attracted the pot-hunter and has furnished its quota to the four million game birds killed in a single season in Louisiana alone. The birds will now be protected. And not only will they be able to feed and nest, no longer molested by poachers and plume-gatherers; their sanctuary will be a reminder to certain Southern States that they have not, as yet, afforded the most elementary protection to the migrating birds.

⚄

The Beecher Memorial

A full description of the memorial at Brooklyn, New York, about to be erected to Henry Ward Beecher and dedicated next year, the centenary of his birth, has recently appeared in the Brooklyn "Eagle," with plans of its component parts. These show the space westward of Plymouth Church cleared of dwellings to the corner of Hicks Street, on which, fronting the church, stands the memorial edifice, a three-story building, connected by an arcade with the church. It is to be the church's working plant for the benefit of a multitude of young men and women rooming in the numerous boarding-houses on and near Brooklyn Heights. There they will have their club-rooms, assembly-room, library and reading-room, with gymnasium, swimming-pool, and lockers for use on alternate days, besides class-rooms for evening instruction in vocational and other lines. In the reception-room this inscription will be placed:

PRESENTED
TO PLYMOUTH CHURCH
AND
THE PEOPLE OF BROOKLYN
IN RECOGNITION OF
HENRY WARD BEECHER
AND WHAT HE DID TO
SAVE THE UNION

The arcade is to bear bas-reliefs measuring about five by eight feet, commemorating leaders of the anti-slavery struggle—orators, preachers, poets, statesmen. On the little park in front of it will stand a bronze statue of Mr. Beecher. It represents him making his successful appeal, in 1848, at a mass-meeting in Plymouth Church, for the ransom from a fate worse than slavery of two sisters of remarkable beauty who had been shipped from Washington to the slave-market in New Orleans. At the base of the marble pedestal of the statue these sisters, whose tragic lot

had aroused deep sympathy, appear in the attitude of supplication. The artist, Mr. Gutzon Borglum, specimens of whose bronze work are in the Metropolitan Museum of Art in this city, is now engaged on the heroic model of this statue. At the eastern side of the church, on ground cleared for the purpose, a memorial gateway is to be erected, the wall on either side of it bearing large bronze tablets. The memorial edifice was devised by the late John Arbuckle, the widely known Brooklyn manufacturer and merchant, for many years warmly attached to Mr. Beecher and his church. Desirous of testifying his affection, in a form that would be permanently beautiful, to the young men and women of the neighborhood, he and his architect made progress with the plan. Since his death this has been revived and matured by his nephews and successors in business, Messrs. William and Charles Jamieson, and its realization is secured by the gift of about one hundred thousand dollars by his sisters, Mrs. Jamieson and Miss Christine Arbuckle. The dedicatory service is announced for Sunday, June 1, 1913, at the end of the centenary commemoration week beginning on the Sunday preceding.

⚄

The Farm Treatment for Insanity

The city of Philadelphia is making an interesting experiment. Since Mayor Blankenburg's advent a number of municipal improvements have taken place, but among them none seems more notable than the change in the treatment of the city's insane patients. Hitherto these patients have been herded together, and their malady has only been made worse by the conditions of crowding to which they have been forced. Fortunately for them, a large farm—known as the Byberry tract—of nearly nine hundred acres, near Philadelphia, was available for colony treatment, the only rational kind of treatment for the insane, the feeble-minded, or defective and delinquent cases. On the tract were several old and dilapidated farm-houses. These were reconstructed. Each became the home of some twenty-five men suffering from a mild form of mania, and harmless, but willing to make themselves useful. Each colony has been supervised by a man and his wife, the latter acting as matron. Each colony is separate and distinct in every particular, having its own farming implements, horses, cows, pigs, etc. A total of three hundred mild insane men have now been transferred from the main institution in West Philadelphia. Although the insane take kindly to farming work, Dr. Neff, Director of the Philadelphia Department of Public Health, informs us that they seem best adapted to the care of animals. He adds: "There seems to be some communion between them that is more marked than in those of sound minds." Another interesting fact noted by Dr. Neff is that concerning Sunday, on which day "there is a distinct restlessness not observed on other days." This is doubtless due to the fact that when working the insane are more quiet and sleep better. In general, however, the feeling of dependence and the chafing at the lack of liberty—the inevitable accompaniment of inmates of an institution—have given way to an atmosphere of greater self-respect. The patients have become not only contented with new surroundings, but have gradually learned to forget old grievances.

⚄

Henry Martyn

Seldom, if ever, have six years of a life ending at the age of thirty-one left an impression resulting in the commemoration in many lands of the centenary of its closing day. Next after Raymond Lull in the fourteenth century stands Henry Martyn as a pioneer of Christian missions in Moslem lands. The day of his death, October 16, 1812, was widely observed as a day of united prayer for the evangelization of the Moslem world. The son of a man who had risen from the lowly lot of a British miner, Martyn at the age of nineteen won the first place in the list of honors at St. John's College in Cambridge University, and the next year was chosen fellow of his college. In the same year he resolved to become a missionary. His reading of the memoir and diary of David Brainerd, who died in 1747 at the age of twenty-nine, after three years of missionary labors among American Indians, is believed to have partly influenced his decision. After serving two years as curate under Charles Simeon, the leader of the evangelical or Low Church movement in the Church of England, he reached India in 1806. Here his evangelical spirit soon drew him into intimacy with the Baptist missionary Carey, who wrote of him, "We take sweet counsel together, and go to the house of God as friends." His rare linguistic genius so quickly mastered the vernacular that he soon became a fluent and attractive preacher to large audiences. In

1808 he had translated the New Testament and part of the Book of Common Prayer, but failing health induced him to remove to Persia. Here he began work at Shiraz among Moslems, winning respect both by his learning and his character. His grave in the American cemetery at Tokat is often visited to-day. A century has passed. The ice-barrier piled by thirteen hundred years of racial and political enmity between the Crescent and the Cross, though shaken by modern education, seems as solid as ever. Veteran missionaries look for its melting, but only in the moral temperature to be created by Christian lives of the blended strength and self-devoting sweetness that were exemplified in Henry Martyn. In this hope, and in view of signs of promise amid the general unrest throughout the Moslem world, the World's Evangelical Alliance and several other associations joined in a call to prayer on the 16th day of October for the work bequeathed that day by Henry Martyn a century ago.

THE BALKAN WAR

The Balkan war may be long or short. It may drive the Turk from Europe. It may add territory to the Balkan States. But whether these things take place or not, those States are already enjoying their greatest gain—the sense of federation.

Never before have they acted together. Their mutual animosities and conflicting claims have prevented. Indeed, on several recent occasions they have led perilously near to war. On one occasion they did lead to war. That was in 1885, when the conflict was between Bulgaria and Servia.

Keenly aware of all this, the Sultan of Turkey, Abdul Hamid, now deposed, always fomented quarrels among the Balkan nations. But now that a less crafty monarch has been on the throne, the traditional quarrels and animosities have largely died out, and the four States have become proportionately animated by a sense of unity. The most notable evidence of this was on the occasion of the Bulgarian Crown Prince's coming of age at Sofia, when, as reported, the Crown Princes of Greece, Montenegro, Servia, and Bulgaria agreed to sink their differences in the face of a crisis common to all. Whatever ambitions for wider territorial boundaries may have moved them, their immediate aim was to get a proper government for the Christian Bulgars, Serbs, Montenegrins, and Greeks still living in Turkey. Such a government had already been promised both by Turkey and by the Powers.

The promise came about in this way. In 1878 Russia and Turkey were at war. Turkey was defeated. Peace was concluded almost at the very gates of Constantinople, namely, at the little town of San Stefano, on the Sea of Marmora, a few miles from the Golden Horn. By this treaty much of the province of Macedonia was to have been joined to Bulgaria, now an independent principality. But England, France, Germany, Austria, and Italy saw a bigger Russia behind that bigger Bulgaria. They finally forced Russia—of course Turkey was glad to be thus "forced"—to supplant the Treaty of San Stefano by the Treaty of Berlin. In that treaty occurs the famous paragraph 23:

> The Sublime Porte [the Turkish Government] engages itself to apply scrupulously in the island of Crete the organic regulation [autonomy] of 1886. . . . Analogous regulations adapted to local conditions . . . will be introduced as well into other parts of Turkey in Europe. . . . The Sublime Porte will charge special commissions—in which the native element shall be largely represented—to elaborate the details of these new regulations in each province. The projects of organization resulting from these labors shall be submitted to the examination of the Sublime Porte, which, before promulgating the acts destined to put them into effect, shall follow the counsel of the European Commission.

This article has for thirty-four years remained practically a dead letter. Now and then the Powers have stirred themselves a little to see if something could not be done. But the condition of the Christians in Macedonia and Albania still remains much as it was before 1878. From neither Turkey nor the Powers was there much to expect. If reforms could be instituted, there was apparently only one language which Turkey or the Powers could understand—force.

Who could apply it? The Balkan States. Two conditions were essential: First, they must sink their differences in the face of the common oppressor. Second, their united strength ought to equal the Turk's. Little by little that sense of union has come, and little by little their armed forces have grown equal at least to attempt the task.

But it is not alone against Turkey that resentment is felt. It is not surprising that the allied States felt moved to this irony in their "Identic Note" of last month to Turkey:

> Notwithstanding the promise of the great Powers to take in hand the realization of re-

forms in European Turkey, the Governments of the allied States feel bound to address themselves directly to the Sublime Porte, and declare that only radical reforms, sincerely and integrally applied, can improve the miserable condition of the Christian population of European Turkey, guarantee order and tranquillity in that country, and assure durable peace between Turkey and the Balkan States.

The reforms are defined as follows:

> The . . . States . . . invited Turkey to apply the reforms indicated in Article 23 of the Berlin Treaty on the basis of the principle of nationalities with administrative autonomy of the provinces, Belgian or Swiss Governors, elective assemblies, their own gendarmerie and militia, and free education; the reforms to be applied by a council composed of an equal number of Christians and Moslems, under the superintendence of the ambassadors of the Powers and of the Ministers of the four States (Bulgaria, Servia, Montenegro, Greece) in Constantinople.

Turkey declined to accede to these demands, on the ground that they constituted an interference with her internal affairs. Hence the war.

It has begun well for the allies. In fighting practically side by side they now feel a sense of federation such as they never felt before. But the most inspiring news that comes is not that the Bulgarians are closing in upon Adrianople and the Montenegrins on Scutari, that the Servians have taken Uskub and the Greeks Verria; it is that the Balkan States have entered into a formal written alliance, defining the zones of the respective countries as they may be enlarged, and, what is more important, providing for a common tariff and a postal union.

Thus the Balkan federation has already gone beyond the stage of a mere military combination. It seems like a permanent, if as yet loose, federation, for it is intended not only to exclude external authority but to provide also for a common internal government.

Even on that thorniest question, religion, there is a proposal to end the age-long rivalry by uniting the Orthodox churches of Greece, Bulgaria, Servia, and Montenegro, as in ancient times, under the Patriarch of Constantinople; the national churches, however, to retain their national rituals and languages.

It is rumored that the King of Greece, on nomination of the King of Montenegro, may become head of the Balkan alliance. This would seem to be a not unfitting choice, especially in view of the alarm in Europe at the sudden development of the purely Slav element as represented by Bulgaria, Servia, and Montenegro.

Be this as it may, the object of the alliance is certainly "the Balkan States for the Balkan peoples." Hence, whether those States enlarge their boundaries or not, we must believe that, under any circumstances, the boundaries of freedom and good government are now about to be enlarged.

NEITHER PARTISAN NOR NEUTRAL

The campaign which has just closed has been characterized in a marked degree by strong convictions regarding the political issues presented to the voters. It is not surprising that in the heat of such a campaign strong convictions should be mistaken for partisanship, nor are we surprised that The Outlook should be sincerely regarded as a partisan journal by some of those old friends who do not agree with its views. That the members of our increasing Outlook family may know the varying opinions of other members of their circle, we print on another page extracts from some of the letters recently received, both of protest and of indorsement. We are sorry to have any of our old readers leave us; we are still more sorry to have them leave us under a misapprehension of our purposes and spirit; but the facts seem to warrant our conviction that the number of our readers who think that the course of The Outlook during the campaign just ended has been partisan is but a small proportion of the whole number of our readers.

There are three kinds of journals: the partisan, the neutral, the independent. Each serves a useful purpose. Neither can serve the purpose of the other. All that readers have a right to expect of the journal which they read is that it shall be what it purports to be. The Outlook does not purport to be a partisan journal; it does not purport to be a neutral journal; it does purport to be an independent journal.

A partisan journal belongs to a party. It is the organ of that party, the means which that party possesses of communicating its convictions and its purposes to the public. The relation of such a journal to the party which it represents is analogous to the relation of a lawyer to his client. It is morally bound to tell the truth. It has no right to mislead its readers by a misreport of facts, or to misrepresent opponents by putting into their mouths words they never uttered, or imputing

to them opinions which they would repudiate. But it is under no obligation to tell the *whole* truth. It is under no obligation to report facts if the report will be injurious to the party whose organ it is, or to publish opinions if those opinions are adverse to its party. It is an advantage to the community to have some party organs: a Presbyterian organ from which we can learn authoritatively what Presbyterianism is, and a Roman Catholic organ from which we can learn authoritatively what Roman Catholicism is; it is similarly an advantage to have Republican organs and Democratic organs and Socialistic organs, from which we can learn with authority what the Republican, the Democratic, and the Socialist parties respectively stand for.

The neutral journal is simply a reporter of current events and current opinions. It is a talking-machine: all sorts of people talk into it, and what they have said it reports to others. The "Nineteenth Century and After" in England is such a neutral publication. One could never guess from reading it what opinions its editor entertains on any subject. The "Literary Digest" is such a neutral publication in America. It has no opinions; it gives free circulation to all. The convictions of the editor of a neutral periodical can no more be surmised from its pages than the convictions of the maker of a talking-machine can be surmised from the speeches which it gives out to the public.

The Outlook is not, and never has been, a partisan paper. It is the organ of no party, either in Church or State. But neither is it a neutral paper. It is not a mere reporter of other people's opinions. It is an independent paper. It has strong convictions on every moral problem which arises, whether that problem be social, political, or individual. If it has not such a conviction when the problem arises, it proceeds to study the problem that it may form a conviction. Such convictions it expresses with all the vigor it can command, and it will always continue to do so. It was not founded, and it has not been carried on, "as a news organ chiefly, with editorial comments;" it was founded, and it has been carried on, to inculcate certain fundamental principles of character and conduct, individual and social, and to inspire in its readers a spirit of open-mindedness to receive the truth and a spirit of courage to follow whithersoever the truth leads. It has not been a mere reporter of either news or opinions; it has been an interpreter of both, measuring them, not by their relation to any party or any Church, but by their relation to human welfare and social progress. We can best illustrate our conception of an independent journal by some pages taken from the past history of The Outlook.

It has not been a Protestant organ. It has spared neither effort nor expense to secure accurate and trustworthy reports of Roman Catholic opinions, and has heartily commended the service rendered to the community by the Roman Catholic Church, and has brought upon itself vehement censure from polemically inclined Protestants for so doing. But it believes profoundly in the right of private judgment, in the ultimate authority of conscience, and in the direct and immediate communion between the individual soul and God, and it has tested all claims of all churches, Catholic and Protestant, orthodox and liberal, by that religious faith.

It has not been a Christian organ. It has criticised the faults in organized Christianity and commended the virtues and excellencies in pagan forms of faith and life. But it believes profoundly in Jesus Christ as Master and Leader, accepts his teachings and his spirit as containing the solvent of all spiritual and ethical problems, and it has been as ready to commend and to co-operate with Jew or agnostic as with orthodox Christians, when Jew and agnostic were carrying on the work of Jesus of Nazareth in the spirit of Jesus of Nazareth. When, on the other hand, orthodox Christians have insisted that it is an essential tenet of Christian faith that the mercy of God is limited to this life, The Outlook has resisted that claim as inconsistent with the spirit and teachings both of the Old Testament and of the New Testament. It has refused to defend orthodoxy merely because it is orthodox.

The Outlook has carried the same spirit of independent, but not neutral, journalism into the political field. It is there more difficult to maintain, because political partisanship is more common in our time than ecclesiastical partisanship. It is our sincere belief that the men who have found The Outlook partisan in politics have found it so chiefly, if not solely, because they were partisan themselves.

When in 1896 Mr. Bryan committed the Democratic party to free silver, we urged our readers to vote for Mr. McKinley, because we believed that free silver would bring

upon the country a great disaster in which the poor would be the chief sufferers. But we never joined in the assaults on Mr. Bryan's motives; and we counted ourselves fortunate in having on our staff at that time an expert on economic questions who was an admirer of Mr. Bryan and an enthusiastic believer in free silver, on whom we could depend to give sympathetic summaries of Mr. Bryan's speeches and sympathetic interpretations of Mr. Bryan's principles. Before the war against Spain was declared we both anticipated and recommended it; and when it was ended we urged the doctrine, which the Anti-Imperialists condemned, that the Nation could own territory which was not a part of the United States and could govern dependent people who were not citizens of the United States. For maintaining this doctrine we were violently attacked as partisan at the time; but this doctrine has since been affirmed as Constitutional by the Supreme Court of the United States and is now acquiesced in by practically all the people of the United States.

When the Progressive party was born last August, The Outlook could not do otherwise than give to it a cordial support, for the new party advocated principles which The Outlook had advocated for years. Long before the Progressive platform was framed The Outlook had demanded a tariff arranged, not for revenue only nor for capitalists chiefly, but for the workingman and the consumer. Long before that platform was framed The Outlook had urged that lawsuits were no remedy for monopoly; that the only remedy was such regulation of great combinations as would make it impossible for them to acquire a monopoly. Long before that platform was framed The Outlook had urged the duty of securing by labor laws such justice for the workingman as would make labor wars impossible. Long before that platform was framed The Outlook had urged that "the remedy for the evils of democracy is more democracy;" that the only way to destroy the power of the bosses is to transfer that power to the people. It would have been a curious way of demonstrating our independence had we abandoned our principles because a party had been created to take them up and incorporate them by Federal and State legislation in the life of the Nation.

There is no one on the editorial staff of The Outlook who does not heartily believe in the four fundamental principles of the Progressive party: a protective tariff framed for the benefit of the wage-earner and the consumer; a governmental regulation, State and National, of all great corporations, in order to prevent the creation of monopoly; labor laws in place of labor wars; and the substitution of popular rule for boss rule. But The Outlook has not been, and will not be, an organ of the Progressive party. It has opposed woman suffrage and indiscriminate pensions, both of which the Progressive party advocates; and it has advocated that measure establishing Canadian reciprocity which the Progressive party condemns. It has reported, in interviews with them, the political opinions of Mr. Taft, Mr. Champ Clark, Governor Harmon, and Governor Wilson. It has presented, in a series of articles by business men of different parts of the country and different party affiliations, their answers to the question, "What's the matter with business?" It has presented by the very vigorous pen of Mr. Gladney the views of those who hold that big business is, by mere reason of its bigness, dangerous to the country and that it should be broken up and that those who have organized it should be treated as criminals and sent to jail—a doctrine which The Outlook disbelieves as untrue and condemns as unjust. Though opposed to woman's suffrage, it has secured the ablest advocate it could secure to represent the cause of woman's suffrage in its columns. Opposed to State-wide prohibition, it has invited Prohibitionists to present the grounds of their faith to its readers. When the charges of fraud against the Republican National Convention were made—charges which we believed, and still believe, were well founded—we gave to our readers the accusations in the words of the accusers, the official defense in the words of the authorized defender, and our judgment on the issues thus formed. In short, while other weekly journals in America have given more space to political questions than The Outlook has given, we do not believe that any other weekly journal has taken more pains to give to its readers a fair and able presentation of both sides of every question under public discussion.

This history of The Outlook in the past is our pledge to our readers for the future. The Outlook will continue to be a non-partisan but also a non-neutral journal. It will spare neither pains nor expense to give its readers accurate and trustworthy accounts of disputed events, as it did in the case of the Lawrence tragedy.

It will not only open its columns to conflicting opinions, but it will seek the ablest expression and interpretation of opinions the reverse of its own. But it will not merely report events; it will interpret them. It will not merely report the opinions of others; it will urge its own convictions upon its readers. For it is founded and carried on to be not merely a reporter of news, but an interpreter of life and a guide and inspiration to life. And its steadily increasing subscription list justifies it in the belief that there is an increasing number of Americans who wish in their homes a journal that is neither partisan nor neutral, but is independent.

MARK TWAIN'S PORTRAIT

Benjamin Franklin stands for the practical genius of the American; Emerson, for his power of vision; Lincoln, for the romance of the man of slight opportunity; and "Mark Twain," for humor. All these men represented other qualities; but when one thinks of American sagacity, spirituality, opportunity, or humor, this group inevitably come before the imagination. They were all men of the soil; they could not have been produced in any other country. There have been many distinguished Americans who might have grown up in other surroundings and conditions; but not one of this group could have been what he was on any other soil or under any other sky. Mark Twain was all his life an exponent of the pioneer qualities of the Mississippi Valley; the large, free, unconventional, humorous point of view of the men who crossed the Alleghanies, built up the Central West and Southwest, and created in the thirties and forties of the last century a world of their own. They were hardy spirits, divorced from European association, with small access to libraries, with great native energy and power of imagination. They were thoroughgoing Americans in their love of their Government and their pride in it; but they lived their lives with very little governmental interference, and they would have resented any curtailment of what they regarded as their individual rights. In the amplitude of the great valley through which the Mississippi passes there was a sense of opportunity which was so accessible and led so far that it took on the more romantic aspects of adventure. The Mississippi was then, as it has since been, a river of careless habits. It had small respect for private property; and when the floods came, it changed its course without consulting the real estate records. The same spirit of freedom animated those who lived upon it; and Mark Twain appeared on the scene at the moment when to be a pilot on a Mississippi boat was the highest ambition of the boys who lived along the river. It presented a rare combination of exalted position, large responsibilities, and personal independence. It was a thoroughly masculine life. It had much more to do, even among its sober practitioners, with the bar than with the drawing-room. It was lawless so far as conventions were concerned, and it was not specially deferential to statutes; but it had its own standards, and woe to the man who did not meet them.

In that free and easy life men formed the habit of looking at things in the large, of minimizing discomforts, and of regarding a man's dependence on external conditions as a subject for humor. In fact, all life was looked at with a large and careless eye, and men were judged by the possession of primitive qualities rather than by conformity to accepted standards. Everything rested on elementary bases; the upper ranges of social life were yet to be climbed. But there was the stuff of which heroes are made in the men of the Mississippi Valley. Their courage, buoyancy, and sense of fun set them in striking contrast with the people who live on the Volga as they have been described by Gorky. Good-fellowship, readiness to help, indifference to the opinion of the world but great deference to local opinion, quickness to turn a hand to any occupation, and general resourcefulness were the characteristics of the men with whom Mark Twain had to do in the early days.

He never was in any sense a literary man. It was probably to his advantage that in that early period he read few books, but dealt with life at short range, and used the vocabulary of his contemporaries. It was a very fresh, pictorial, and unconventional vocabulary. A good deal of it would have sounded profane in the ears of any other section. As a matter of fact, it was profane, but it was picturesque, hyperbolical, and, in a rough sense, poetic swearing. It was an age without reverence, but not without respect for the fundamental verities of life. When Mark Twain, commenting on his inability to remember names, said, "I'll forget the Lord's mid-

dle name sometime, right in the midst of a storm, when I need all the help I can get," he was not conscious of any irreverence; he was using the most vivid form of words in which he could put a defect which annoyed him.

Mark Twain never had any sense of reverence, any more than he had the sense of reticence or the sense of privacy. The free and easy habits of his early life, the ease with which he took the fundamental attitude towards his fellows without reference to the conventional attitude, remained with him to the end; and he was quite as much at home talking with royalty at a garden party at Windsor Castle as he was talking with his old friends in the pilot-house of a Mississippi steamboat. The whole valley was a big neighborhood. Everybody was more or less interested in everybody else. There was no formality, and any stiffness of social intercourse would have been regarded with as much opprobrium as a dress coat. It was a fresh and, in a sense, an original development of humanity; and Mark Twain arrived on the scene just in time to know it at first hand and to report it in his own speech. For this reason his descriptions of life on the river, his "Tom Sawyer" and "Huckleberry Finn," will probably form the basis on which his future reputation will rest.

A man with such original force and such indifference to conventions needs an open-minded biographer; and Mark Twain was fortunate in finding such a reporter in Mr. Albert Bigelow Paine, who has drawn a full-length portrait of his subject on a very large canvas. This biography (Harpers) fills three large volumes. It is much too long; but it presents the apology of being interesting from cover to cover; and Mr. Paine is entirely within the truth when he says, commenting on the death of Mark Twain, "Nations have often mourned a hero—and races—but perhaps never before had the entire world really united in tender sorrow for the death of any man." Mark Twain was undoubtedly more widely known than any other American whose reputation rests on what he has written; and if the interest in his work sometimes rested on its contrast with European opinion and standards rather than on its intrinsic vitality and veracity, it remains true that the world had a great respect for the author of "Innocents Abroad." It did not always approve of him; but it was immensely entertained by him, and it discerned the tenderness of the man's heart and the resolute integrity of his nature. For Mark Twain was also a representative American in his love of his home and his devotion to his wife and children. No man could have been more fortunate than was he in the intimate relationships of his life; and no romance was ever more tender or beautiful than his adoration of his wife, herself a woman of exquisite nature, not unaware of her husband's limitations and defects of taste, but splendidly loyal to the pure gold mingled with the alloy, and year by year, with intense patience and devotion, helping him in his career. And all the world knows how his innate integrity came out when financial misfortune overtook him, and how, on the edge of old age, he set forth on an adventure which might have taxed the energies of a young man, and returned with his debts behind him.

Humor was the very atmosphere of his mind. When he began to observe or to speak, it was inevitable that he took the humorous point of view. Like all other humorists, he was profoundly serious at heart; but when he looked at the world it was bathed in the great liberating atmosphere of a quality which is as much an element of genius as imagination. Sometimes this humor was pictorial, sometimes fantastic; for a time after the death of Mrs. Clemens it was corrosive and destructive. It was often homely. When he returned from his wedding trip and found a house ready for him, completely furnished, the gift of his father-in-law, he promptly invited that gentleman, whenever he was in town, to send his bag there and spend a night or even two nights, remarking that it would not cost him a cent. That was the easy, familiar speech of the old frontier. It was the equivalent of the most elaborate expression of gratitude, and had the great advantage of being both fresh and entertaining.

Mr. Paine's biography will always be a mine for students of the American life and literature of our time. Although it is too long, the material which should have been omitted will be of great service for other uses than that of immediate biography; for it gives at full length the portrait of the most original American representative of a section and a time, the exponent of certain qualities which are not original on this continent but which have here taken on original forms. Read in connection with such a tender tribute as Mr. Howells's "My Mark Twain," this biography recalls one of the most fascinating personalities of the age.

WHAT EUROPE THINKS OF THE BALKAN WAR

A POLL OF THE EUROPEAN PRESS

"THE Christian populations in Turkey-in-Europe have been systematically despoiled," affirms the "Journal de Genève," the well-known Swiss paper.

How can this be stopped? The paper answers:

Only by the effective and permanent control of all the Powers would there be a guarantee for the little Christian States [the Balkans] whose aim is to better the condition of their racial brothers who are Turkish subjects.

The position of these Turkish subjects, says the London "Times," might have been made tolerable if Turkey had tried to win their allegiance by humane government; and it adds:

For a brief moment after the overthrow of Abdul Hamid in 1908 it looked as if the Young Turks had set some such goal before themselves. But if they ever intended to pursue this policy they speedily abandoned it. Many things doubtless were better under the Young Turks, but among them was scarcely the lot of the Christians of Macedonia. Bulgars, Serbs, and Greeks continued to suffer from an oppression which had become only more unendurable . . . by being directed toward their forcible Ottomanization. Little or nothing was done to give them that security for life and honor and property which it is the first duty of a government to give.

The London "Daily Chronicle" declares that the Balkan States "have vindicated their claims to be treated as something more than pawns." A writer in the London "Daily Mail" calls attention to the fact that in Turkey the last three years have been spent in "internal dissension." This has given a chance to Turkey's enemies. The writer rather cynically comments thus:

The Balkan States have strengthened their armies, increased their equipment, speeded up their mobilization, and at the same time have been careful, by their bomb outrages and by the activities of their bands, to maintain that misery and unrest in Macedonia which should serve them as a pretext for war when the moment was ripe. Aggravated by the recent Kochana massacres and fired by the Salonika and Kuprili bomb reprisals, the Macedonian Bulgar now calls upon the Bulgarian Government to make war and obtain autonomy for Macedonia.

A prominent protestant against the war is Baron d'Estournelles de Constant, the well-known French Senator, member of the Hague Court, and formerly secretary of the international commission for the delimitation of the Montenegrin frontier. He writes to the King of Montenegro, in part, as follows:

You are again threatening to put the world on fire just so that you can cook an egg. You have no contradictors under your régime in depopulated Montenegro. That is a pity, for it is through them that you would receive without delay the chastisement that you deserve and that the civilized world's judgment reserves for you.

The Liberal Turkish attitude is thus defined by the editor of the Constantinople "Tanzimat" to the Paris "Temps's" correspondent:

Unfortunately there is between us Turks and Europe a reciprocal distrust. I recognize the fact that we have, to a certain extent, justified it. But Europe ought to recognize that while the Unionist party wanted absolute supremacy of the Turks over the other races, ours, much more liberal, wishes to establish complete equality among all the citizens of the Empire. . . .

Most of the Bulgarian demands have been already inscribed on our programme; for example, the proportional representation of nationalities and the recognition of the equality of the Christian schools.

The general Turkish attitude, however, says the "Temps's" correspondent, is reflected in these words: "Rather war with all its catastrophes than the shame of these reforms compelled by the menace of our former subjects."

Turkish opinion concerning military success in the war is doubtless revealed by a cartoon in the current London "Punch," displaying a powerful-looking armed Turk glancing towards a lowering cloud on which one reads the legend, "Balkan Crisis." Remembering his Tripoli experience, the Turk remarks, "Well, this time, at any rate, I should be able to get at 'em!"

Turkish interpretation of what is assumed in Constantinople to be the real significance of the war was reflected with epigrammatic cynicism by Kiamil Pasha himself, Turkey's Grand Vizier and the head of the Cabinet, in an interview with the London "Daily Mail's" correspondent:

This war against the little Balkan States is really a combat which we are waging for Austria and Russia. If Turkey wins, Austria wins; if Turkey loses, Russia wins.

The Sultan's proclamation to his troops reads in part as follows:

In centuries no movement so important has come to our country. Our neighbors, with whom

we wish to live in peace, . . . have—not heeding the counsels of Europe—provoked us, rendering of no avail the efforts which we were using to maintain peace.

You must . . . defend the honor and the rights of the Government and prove to the world that the virtues of our Ottoman ancestors remain intact.

Now follows a most astonishing and gratifying passage ; it is in dreadful disaccord with the report, quoted later, from the Leipsic " Neueste Nachrichten :"

It is not necessary to shed blood unreasonably and cruelly. It is necessary to treat well the aged, the women, and the innocent children, to save the lives and property of unarmed peoples. . . . You must, in short, prove before the civilized world, which little knows you, that the Ottomans are among the most civilized peoples.

Contrast this with the Leipsic " Neueste Nachrichten's " account of the battle of Kirk-Kilisseh :

All the Balkans wounded on the firing line were massacred by Kurds and bashibazuks. When the ambulance corps men came up, they found in all directions dead and dying. Those whom bullets had not killed outright were in the last agonies, having eyes gouged out, noses and ears cut off, and bodies ripped with knives by the Turkish irregulars. The Turks defended every inch with the utmost stubbornness. Axes, scimitars, knives, rifle butts, and even bare knuckles and teeth were their weapons. The ambulance corps found more than one Balkan with his neck bitten through by some mad tribesman.

What will be the final outcome? The writer of the article in the London " Daily Mail " sees no solution unless " Austria, as well as England and France, and probably Russia," interpose. " It is evident," he adds, " that the Balkan States need some absolute overlord." The most obvious overlord would be Austria, he thinks. But would the other Powers stand her interposition? At all events, Austria's attitude is the governing factor. We read :

It is difficult to believe that Austria would be willing to see Bulgaria and Servia, or Bulgaria alone, consolidated as a powerful Slav state, lying across the road to Salonika. A successful Bulgaria would bar the eastern sea road to Austria for all time. It is no less difficult to believe that Austria would calmly view the gathering power and progress of a completely independent Albania, or welcome the effect which the examples of Slav independence and power would have upon the minds of Montenegro, Croatia, Bosnia, and Herzegovina.

The Vienna " Fremdenblatt," thought to be used occasionally as the mouthpiece of the Austrian Foreign Office, defines Austria's present general policy as one which does not aim at preventing any territorial changes or preserving Turkey, but merely at maintaining the interests of the great Powers and of Rumania in the Balkans. Commenting on this, the London " Daily News's " correspondent at Vienna declares that it is " a great step taken toward the maintenance of European peace."

Now as to Russia. Writing in " La Revue Hebdomadaire," M. Gabriel Hanotaux, the former French Cabinet Minister, declares that in the present crisis the European nations divide easily into two groups, following the rivalries of Austria and Russia. For instance, Germany is certain to support Austria. On the other hand, the sympathies of France are naturally with Russia, not only because France is Russia's ally, but because under any circumstances France would continue to sympathize, as she has ever done, with the struggles of new nations for liberty.

Russia, as always, stands behind the Slav states in the Balkans. Hence some Paris papers are clamoring to know whether the Franco-Russian alliance binds France, in terms, to support Russia in a Balkan war. Other papers reply that their country must follow Russia unless France wishes to end the alliance and revert to the old days of isolation. In general, the Paris press is pessimistic.

Let us turn to the Russian press. A well-known newspaper in Russia is the " Novoye Vremya." It is especially interesting reading just now, for it is attacking Russian allies in the " Triple Entente," England and France, and declares that " Russia is disposed to support the demands of the Balkan States."

The " Dien," a new democratic paper, thinks that Russia is not outspoken enough. It says :

At the moment when Russia should show the greatest decision . . . in supporting the legitimate demands of the Balkan States she finds herself obliged by her interior decadence to continue a foreign policy double and contradictory. . . . That interior decadence has brought us to a complete paralysis with regard to all international questions.

An important statement concerning the war has been that of M. Raymond Poincaré, the French Prime Minister, who outlined the way, prepared on the initiative of France, for mediation by the great Powers, but, if war must come, for localizing it.

The " Kölnische Zeitung " is the semi-official mouthpiece and the " Norddeutsche

Allgemeine Zeitung" is the official mouthpiece of the German Foreign Office. It may be significant of more harmonious relations between Germany and France to find in these papers homage paid to the French Premier's endeavor. The "Kölnische" says:

Other peoples may take part in the war. The only barrier, however, is an assurance that the conflagration will not spread to the great Powers, and the merit of all this is M. Poincaré's.

The "Norddeutsche" says:

In face of the peril of war, the great Powers have a unanimous attitude. It is no longer possible to hope that we can prevent the Balkan war. . . . But it is worth while to say that, since the beginning, M. Poincaré's proposition and the following diplomatic action comprehended the possibility of war. In consequence, the Powers, in advance, did not limit themselves to the endeavor merely to prevent the conflict. Their principal object was to take measures to prevent the great Powers from being drawn into the conflict.

The London "Times" adds:

The concert of Europe may not have averted a local war, but it has been successful in its endeavors to preserve the larger peace of the Continent.

Mediation generally precedes war, and it was so proposed by M. Poincaré. But in this case, says the London "Daily Express:"

After another decisive battle and more bloodletting, the task of the peacemaker may not be impossible.

To this the London "Standard" adds:

Berlin argues that the Powers can only act in the interests of peace when one or the other of the belligerents scores a decisive victory. We are inclined to lay more stress, however, on the French Minister's belief that the day is near when intervention will be possible.

The "Frankfurter Zeitung's" Vienna correspondent thus advises:

The time for intervention by the Powers is near, whether requested or not. . . . Blood enough has been spilled, and peace can be offered to both sides.

For the present, however, many will agree with the London "Times" in this conclusion:

There is something intensely dramatic in the spectacle presented by the Balkan States just now, a phase of modern warfare for which more populous countries have shown no complete parallel. . . . By the wholesale summons to arms we get the measure of the intensity of the conflict. . . . This is to be no war in pursuit of a limited object. . . . The day is at hand when the fighting qualities of both sides will be put to the severest tests. The issue will probably depend less upon strategy than upon staying power.

PARTISAN OR INDEPENDENT?

THE VIEWS OF SOME OF OUR READERS

(See editorial comment elsewhere in this issue)

The Outlook has ceased to be of service to me. For years it has been my political guide, as it was an independent, unprejudiced paper, but obviously it is that no longer. I do not care for it now.

Malden, Massachusetts,
October 26, 1912.

Kindly stop sending me The Outlook. I have read it for years as a paper in which I could find a fair presentation of both sides of public questions, but at present it has become so hopelessly partisan that it presents only one side in many cases. Why keep up the pretense when every one except a partisan on your own side treats the situation as a joke? Your paper would gain by frankly announcing its real character. In fact, I should be inclined to take it on that basis, for my policy is to read partisan papers on all sides of current questions.

Middlebury, Vermont,
October 25, 1912.

I would not insult the intelligence of my friends by asking them to subscribe for or read as untruthful and partisan a paper as The Outlook. I have read it for many years, but now I swear every time I look it over. It is not alone the political partiality, but the gross untruthfulness about the Lawrence strike and the courts of Essex County.

Salem, Massachusetts,
October 26, 1912.

I am writing to ask you to discontinue The Outlook for the rest of the year. We have taken it for more than twenty years and have thought it the best periodical published. Since it has become such a decidedly partisan periodical, and devotes so much space to Mr. Roosevelt and his ideas, it has become very disagreeable to our whole family. I feel as if "the mighty" had indeed fallen in regard to The Outlook, and it is with regret that I am sending this word.

Concord, New Hampshire,
October 26, 1912.

Since The Outlook has become the personal organ of Theodore Roosevelt I no longer approve of it. In fact, I so thoroughly disapprove of it that I do not care to promote its circulation anywhere. . . . When the sweetness and light which used to characterize and

pervade The Outlook, and the sanity and sense of its former course, shall again prevail, I shall feel differently.

Kansas City, Missouri,
October 26, 1912.

The Outlook has degenerated so much since it espoused the cause of Mr. Roosevelt that I cannot recommend it to my friends.

Rosemont, Pennsylvania.

I have been a subscriber for thirteen years, and prized the magazine highly so long as it was independent. Now that it is no longer independent its chief value to me has ceased. In closing, I wish to say that I shall especially miss the good Spectator, who still seems to retain his non-partisan attitude toward men and manners.

Hingham, Massachusetts,
October 29, 1912.

For twenty-three years, nearly, I have been a subscriber to The Outlook. I have enjoyed its coming from week to week, and the paper now seems like an old friend. In spite of my high regard for The Outlook of the past, I cannot longer remain a subscriber, and ask you to discontinue the paper on November 1. There is too much Roosevelt in the paper for me. Besides, I do not care to read a personal campaign organ.

Springfield, Vermont,
October 25, 1912.

I have been a reader of The Outlook for many years. It has always seemed to me to be a magazine of broad vision. In it I was sure to find a sane, unbiased view of both sides of all important questions, and the judgments pronounced in its pages I most generally accepted. No other magazine has filled quite such a field of usefulness or has had the opportunity of educating the general public to such an extent. But The Outlook is no longer worthy of its former prestige. It has become a party organ. As such it is no longer of any use to us.

Orange, Connecticut,
October 25, 1912.

I have always welcomed in any magazine editorial discussions and occasional articles bearing upon the political controversies of the day. But I resent as highly improper the course of any journal, of whatever political faith, whose character has been fixed through years of publication, in converting itself into a political organ of any candidate, having accepted subscriptions on the assumption that it would continue as a news organ chiefly, with editorial comments designed to illuminate rather than to promote party aspirations.

San Francisco, California,
October 22, 1912.

Unless the policy and character of The Outlook should greatly change, I shall want it until I cease to have an interest in the world and its inhabitants.

Placentia, California,
September 5, 1912.

Permit me to say that The Outlook has front rank upon my library table, and is valued, not alone for its fair comment upon public matters, but also for the many lucid articles upon subjects religious. With the conclusions reached I, of course, do not always agree, but those from the editorial pen are always luminous and fair.

Butler, Missouri,
September 6, 1912.

I wish all the papers in the land would copy The Outlook's methods in time of political campaigns. It is refreshing to turn from the average daily, with its columns of personal abuse, ridicule, and misrepresentation, to The Outlook, with its clear presentation of the issues involved, the entire absence of personal invective, and the evident spirit of "malice toward none and charity for all."

Hackettstown, New Jersey,
August 15, 1912.

I believe you are taking the right stand in politics. There are many, many men whose views are clarified by your able articles. We are in this movement for better government to stay, no matter who may be the leader.

Montclair, New Jersey,
September 25, 1912.

I want the magazine again, and I wish to commend the editors for the stand they are taking in the present political affairs.

Galesville, Wisconsin,
September 12, 1912.

The Outlook has the rare power to see the right on every subject and fearlessly and forcefully, though without passion, proclaim it.

Sandeval, Illinois,
August 25, 1912.

I wish to send your most excellent magazine to my grandson, who with his family has gone to England to live. His place of business is in London, but he lives in Harrow. He says the papers there have little or no news from the States, and, as he is anxious to keep in touch with affairs at home, it occurred to me that The Outlook would be the very best and most reliable news I could send him, it is so impartial and gives all sides of the different questions that come up, besides a large amount of other good reading.

Ann Arbor, Michigan,
September 25, 1912.

We could not get along without the weekly Outlook. Could much better do without a daily paper.

165 West 80th St., New York,
October 30, 1912.

Years ago I thought ——— to be the best weekly. Later ——— was the favorite, but now The Outlook seems to be the one that has the best matter and the best manner of presentation. I give a course on contemporary American society that keeps me on the alert for the best discussions of current questions.

Lawrence, Kansas,
October 12, 1912.

I want to express my increasing sense of obligation to The Outlook for its missionary service in bringing me and, I am sure, many another into the political light.

Boston, Massachusetts,
October 11, 1912.

THE SPIRIT OF THE BALKANS

BY EDWARD A. STEINER

"GOOD-BY, Europe," said Carl Emil François when he left Vienna on the Northern Railway; "I am going to Halfasia." He was leaving behind him order and cleanliness, the intelligent obedience to authority, the careful attention to detail, the feeling that the word spoken was the word meant. Although more than half of the continent of Europe was still to be traversed, he already felt the atmosphere of Asia when he left the domain of Germanic civilization, with his face turned toward the "Slavic World."

The explanation for this strange phenomenon is not to be sought in the racial psychology of the Slav, but rather in the impress left by Mongol, Tartar, and Turk, who, like Attila, the chief of their first invading host, "left no grass growing underneath the ruthless trampling of his horse's feet."

European civilization still has a struggle for existence eastward from the walls of Vienna, from which the Turks were driven more than three hundred years ago by Sobieski and his heroic Polish soldiers. This in spite of the fact that Germans and Latins have settled in Transylvania and that Magyar and Slav have left but scant standing room for the Turk upon the continent of Europe. The spirit of the Balkans differs in many respects from that of the rest of the vast territory upon which Asia has left her indelible imprint, and this difference is not all created by climate, food, soil, and other geographic factors. It is true that the Balkans are largely mountainous and that freedom thrives on mountain-tops. But in the Carpathians the Slav is subdued, his spirit broken, and he is all but assimilated by the semi-Asiatic Hungarian. There he cringes before his master, and the Tatra peaks do not stir his imagination nor keep alive in him the lust of battle. In the Balkans another spirit broods, and one feels it as soon as one leaves Trieste facing the hot Shirokho or the cold Bora which blows across the Adriatic. Like other Slavic territory, it is ancient battleground. Illyricum, Istria, Dalmatia, recall Roman legions. Zara, Spalato, and the ruins of Salona are witnesses still of this vital period. Sebenico and Ragusa tell of Venetian fleets of pillaging Crusaders, and all these barren shores were denuded of their verdure that the city of the Doges might rest upon mighty oaks driven into the sands of her lagoons.

Age-long poverty, French invasion, Austrian regiments and fortresses, have failed to break the spirit of this Slav, who but waits the day when he can shake from his shoulders the galling yoke of the alien invader.

Strong as this spirit is on the shores of the Adriatic among the disarmed and conquered and reconquered Dalmatians, it is stronger still in the "hinterland," Bosnia and Herzegovina. Held by Austria since the Berlin Treaty, and recently incorporated into her territory without the formality of asking the consent of the signatory Powers, its spirit is neither conquered nor incorporated. Austria has held Bosnia and Herzegovina as a foster child and treated it most benevolently, in strange contrast to Turkish misrule, but the child is not weaned from its Servian mother. Everything a shrewd diplomacy could invent has been done to accomplish this end. The Roman Catholic Church has been favored where it was wise to do so, checked again in other places and the Greek Orthodox Church made dominant. Moslems were treated with such consideration that the soldiers of that faith served in special regiments and a *mollah* was assigned to watch over their spiritual welfare. Neither Austria's autocratic and unjust rule in Dalmatia nor her benevolent government of Bosnia has broken the spirit of the Balkans.

It is a temptation not easy to be resisted to pause in this analytical study and to let one's eyes wander again from the heights of the Lovchin over the bay of Cattaro down to the Lake Scutari, over the ragged ranges of the Albanian Mountains, and to joy in the mere pleasure of the scene, not easily rivaled in beauty and variety. But here is the unhewn altar, the unenshrined holy of holies, of the Balkans. Here the Slavs

> "Rose to where
> Their sovran eagle sails—
> They kept their faith, their freedom on the height,
> Chaste, frugal, savage, armed by day and night
> Against the Turk, whose inroad nowhere scales
> Their headlong passes, but his footstep fails,
> And red with blood the Crescent reels from fight

Before their dauntless hundreds, in prone flight
By thousands down the crags and thro' the vales.
O smallest among peoples! rough rock throne
Of freedom! warriors beating back the swarm
Of Turkish Islam for five hundred years.
Great Tsernagora! never since thine own
Black ridges drew the cloud and brake the storm
Has breathed a race of mightier mountaineers."

Thus Tennyson sings of the people on this, the only uninvaded, unconquered spot on the Balkan Peninsula; and in the Montenegrin's dreams he has heard Czar Duchan call to arms in these last decades of inglorious peace.

To these bleak mountains came Servian peasants and nobles three hundred years ago, and neither an inhospitable climate nor scant food nor years of famine have broken the spirit of those who preferred to starve, if need be, upon these mountains rather than live on the fat of the land under Turkish rule. If spirit is ever tangible, it is here; and one learns to value a historic inheritance which survives three hundred years of isolation, of almost continuous conflict, not only with the Turk, but with poverty, hunger, and cold.

Twenty years ago the writer followed the mule-path which leads from Austria to Montenegro, then the only approach to this mountain fastness, since that time often over a military road built by Austria—not yet by automobile, which now carries one in two hours from Cattaro to Cettinje. Each time this spirit seemed real, virile, almost tangible.

In the wretched village of Nyegus, in front of low stone huts, stood these Montenegrin peasants armed for the conflict. They were soldiers born, not made. The children greet the stranger with the military salute, and the woman lifts her fingers to her heart—for she too shares in the warrior dream of her mate. They all walk with head erect, the neck unbowed, fearless, dauntless, and unsubdued.

The writer had the unique privilege of being the guest of the Prince of Montenegro when the rulers of the Balkans came to Cettinje, ostensibly upon a friendly visit, but in reality to reach some agreement in regard to their relation one to another and to their common foes. While of course nothing which happened at their conference was revealed, both Turkey and Austria felt apprehensive. The little village capital of Cettinje grew into a metropolis overnight; from all the mountain ranges came the heads of the Bratstvos and the gun-bearing members of the tribe.

Albanians came from across the border—fierce, savage, undisciplined. The Prince of Bulgaria and his retinue, the Servian Minister of War, and the representative of the King of Greece, Dalmatians, Bosnians, and Herzogovinians came, in spite of the fact that Austria forbade their coming, and that they were not recognized officially.

The Montenegrin army was reviewed, and on an open, rock-circled field mass was said, and in the evening, by the camp-fire, the tribesmen danced the national *kolo*, while bards played the *gussla* and sang of the Balkan heroes.

Beneath all the ceremonies and civilities exchanged, the one sentence which in a way brooded over all was, "The Balkans for the Balkan people."

Prince Peter, the younger son of the Montenegrin ruler, an eaglet, a graceful and worthy youth, said to the writer then, "It may be ten years, but it will not be longer, before we march on to Scutari." During a three days' journey in company with Prince Peter, which the author shared then with the readers of The Outlook, the conversation rarely turned upon any other subject than "a war with Turkey."

Riding down to Lake Scutari, to the very border of his father's domain, the youth then dreamed of leading his Tsernogorczy against the Turk; and his dream has at last been realized. One can easily imagine the joy of the people when the cry went from village to village, across the crags and mountain barriers, that the war was really on against the Turk, and thirty years of weary waiting had an end.

They leaped to their guns and rushed "down the hills and headlong passes," and if the Turks had been less demoralized than they were they must have yielded to this human avalanche.

While the Albanian is not a Slav, and his grievance against the Turk is all his own, he shares this Balkan spirit, but it expresses itself in a somewhat different way. His tribal consciousness is not unified. Gheg and Tosk, the two main divisions, have running through them smaller lines of cleavage, creating inner hostilities, intensified by religious differences.

For the Albanian owes religious allegiance to Pope, Patriarch, and Sultan, and prayers are rarely said by any of them without a watchful eye upon their brothers of another tribe or faith, and across the bended knee lies always the ready gun.

The one thing which unites them is their hatred of their master, the Turk, to whom they have given their best soldiers and statesmen, and for which, in return, he has made the burden heavier in taxes and thraldom.

These centuries of Turkish misrule have told heavily upon the Albanian national character, and the best in it is nearly crushed. The Albanian is nevertheless a vital factor in the make-up of the Balkan spirit, and a firm, stable, enlightened government would give back to the world, and that in a short time, a brave and useful people.

Bulgaria owes much of the dominance of its spirit in Balkan affairs to the fact that its people are of mixed origin, an illustration of a rare phenomenon, where the conqueror took on the speech and nationality of the conquered. Industrious and capable of continued effort, growing in intelligence and in national wealth, the Bulgarians have thrown off more readily than the other Balkan peoples the evil effects of Ottoman rule. It is good strategy that the Bulgarian army should meet the main body of Turkish soldiers, for it is the army best equipped for the Turk, and here the Balkan spirit is most disciplined and at its best.

The people of the Balkans have but little faith in Czar Ferdinand, the ruler of Bulgaria; and his own people are not over-loyal to him. He has shown himself not incapable of treachery; for the death of Stambuloff they hold him responsible.

Servia, the weakened mother country from which the Slavs on the Balkan sprang, more nearly approximates in its spirit the more docile northern Slavs. Though a rich and fertile country, it gives the impression of poverty, and the ruins wrought by the Turkish oppressor are still unrepaired. The Servian people are still undisciplined; their government has been unfortunate and tragic, and bloodguiltiness seems to hang like a pall over the country.

In spite of the fact that Greece is Greece, it not only shares in all the unfortunate phases growing out of Turkish rule, but in its inner spirit has suffered more than the Slavs. That it has seized its opportunity with decision, that it has faced without fear the enemy, are auguries of a recovery of the ancient Greek spirit. Nowhere has this been more clearly illustrated than in the United States, where her immigrants who followed petty trades or wielded pickax and shovel not only gave in large sums of their savings, but joyfully left their work in large numbers to return and join their brothers in this fight.

The people of the United States have seen thousands of immigrants come to their country because of war; rarely, if ever, have they seen tens of thousands of them return for the same cause.

The revival of the Balkan spirit, its cleansing from the effects of centuries of Turkish rule and ruin, is due to many causes: the awakening of the national spirit among the people of the Balkans, the desire to claim their historic heritage and perpetuate it, the world-wide sweep of the spirit of resistance to special privilege.

The growth of the spirit of democracy comes from many sources—from France, England, and the United States, embodied for the last in Robert College, Constantinople, and the many kindred schools established by Christian missionaries, and from the returning emigrant, who brings with him a clarified vision and new social desires.

The Balkan spirit as it manifests itself in the different national groups is primarily an unbroken spirit. Hemmed in on all sides by the great Powers, struggling in poverty and ignorance for centuries, it has never ceased to live, and has waited for an opportunity to manifest itself.

It is a religious spirit bearing the imprint of a great mission. To have been a wall against the battering-rams of the Moslem, to have borne the brunt of the first onslaught, to have felt the last assaults of his retreating armies, has been a sacrificial and a vicarious task.

While in the north of Europe our forefathers built schools and followed the arts and commerce, the people of the Balkans held watch upon their mountains, followed the plow sword in hand, that we in peace might prepare ourselves for the great tasks of Christian culture and civilization.

Crude, cruel, often undisciplined, the spirit of the Balkans is—for it is still the spirit of the soldier—a warrior spirit. One who knows the people of the Balkans, and loves them for what they have done and for what they are, cannot help but wish that this spirit shall have the opportunity to develop itself normally, without the constant fear of invasion, rapine, and plunder; and for this reason he hopes and prays that the Balkan peoples may be victorious in this the last of the age-long struggles against the Turk.

TRAINING CITY BOYS FOR COUNTRY LIFE

THE FIRST OF TWO ARTICLES

BY LYMAN BEECHER STOWE

THE wear and tear of modern city life bears hardest, physically and physiologically speaking, upon the two extremes of society; that is, upon the very poor and the very rich. That explains why philanthropists working in the interests of dependent children are tending more and more to fit them for earning a livelihood on the land, and also why rich men are more and more buying country estates and inducing their children to take up country life. A prominent New York physician whose specialty—if a generality may be so called—is the general health in distinction from any given malady recently gave this advice to one of his patients. The patient was an immensely successful and prosperous scion of an old family, who was suffering from nervous exhaustion. Worried as he was about his own health, he was even more distressed about his two boys—pale, nervous, overwrought, and anæmic youngsters of twelve and fourteen. The doctor finally said to him: "You want your family to be perpetuated, you want it to continue to be prominent and successful, do you not?"

He naturally assented.

"Well, then," continued the physician, "there is only one way out. Buy a farm, put your boys on it and keep them there, have them trained as farmers, and, if possible, extract a pledge from them that they will always live in the country. If this is done, and if they marry with any reasonable regard for physiological consequences, there is a fair chance that their children may be strong enough to return, if they choose, to the strain of city life."

While a great deal of nonsense is talked about the "back to the land" movement, is there not nevertheless a real movement countryward, which, like all real movements, has come in response to a real demand?

Between the years 1893 and 1896 the bottom fell out of the prices of farm products in this country, profits vanished, and a great country-to-city migration began. In spite of the fact that the prices of farm products and farm wages are now higher than ever before, this stream is still swollen beyond its normal and healthful proportions. To stop it would be as impossible as undesirable. To restrict it is certainly desirable, and would seem to be possible. There always has been, there always will be, and there always should be a country-to-city migration. Likewise there always has been, there always will be, and there always should be a city-to-country migration. Neither movement could we stop if we would, nor should we stop if we could. The migration cityward does, and long into the future probably will and should, largely exceed the reverse movement, but it should not so greatly exceed it as it has since the early nineties. Good farm prices, good farm wages, and improved facilities for agricultural training, as well as many minor causes, are now constantly increasing the city-to-country movement, but it has not yet reached the stable equilibrium of normal give and take between city and country. It should be stimulated in every legitimate way.

While untrained city-bred adults have in large numbers proved their ability to succeed on the land, they must, in all reason, be held the exceptions rather than the rule. Perhaps a majority of the native-born adults who go on to farms have been failures, or, at any rate, not successes, as town workers. Most of these merely exchange known and tested evils for those they know not. Starting as city failures, they end as country failures. Just as most people think themselves possessed of executive ability, so most people think they could run a farm successfully. Little do they realize that successful farming requires a wider range of knowledge and experience, more wisdom, skill, persistence, and resourcefulness, than almost any other calling. The spirit in which many city people enter this intricate and difficult occupation is well suggested by the following ingenuous letter recently addressed to the Secretary of the New York State College of Agriculture. It reads:

Mr. Secretary:

Dear Sir—I would like to know if you have on hand illustrated pamphlets on farming. Having lived in New York City, my parents are going to buy a farm up New York State; but, knowing nothing about farming, I was advised to write to you for a few pointers on stock-

raising and the taking care of the different fruit-bearing trees, etc.

Hoping you will oblige, and to hear from you soon,

Yours respectfully,

—— ——.

These people had probably read some *illustrated* articles on the joys of farm life. The Secretary replied in part:

Your letter leads me to doubt the wisdom of your anticipated change. You ask for "a few pointers on stock-raising and the taking care of the different fruit-bearing trees, etc.," as though it were possible in a letter to make a farmer out of a city man. For your own good I wish to say that many years of experience on a farm are required before a person gathers the "few pointers" necessary for success. We have a college course extending over four years covering the elements for success. The popular discussion of the opportunities in farming as presented in some of the current magazine articles is very misleading. There are big opportunities in farming for persons who are properly prepared for the work. There is practically no opportunity for the man who is not adapted to farm work. A great many persons are being caught in the present back-to-the-land movement who are making a serious mistake.

The city-bred youth with an agricultural training must be the really hopeful emigrant to the farm. He must form the sound and vital nucleus of this economically necessary city-to-country migration.

If the present city-to-country movement is real, it must be in response to real needs and demands. Are there such needs and demands, and, if so, what are they? Interesting light is thrown upon this question by Professor Liberty Bailey in his book "The Training of Farmers." In this book Professor Bailey gives the answers to a questionnaire which he addressed not long ago to the city-bred students in the State College of Agriculture at Cornell University. He asked these students why they were studying agriculture and why they intended to follow farming as their business. Professor Bailey divides the reasons given under two heads: first, "the personal or subjective desires;" second, "what farming provides." Under the first head, "desire to be out of doors and love of nature" appears most frequently; "love of farm life" comes next; and "natural bent for farming" third. Under the second head, or "what farming provides," "farming is an independent occupation" is the most frequent answer; "farming provides healthful life" comes second; and "there is money in farming" next.

The following are some of the more significant letters in which these reasons appear: A city-bred boy from the South, intending to take up "general farming," writes: "I have always had a natural desire to work among economic plants and animals and make my soils and barns the laboratories for such economic work. It is a supreme pleasure to see and to help accomplish fulfillment of certain laws of the fundamental sciences to as high a degree as possible under the conditions put in force, and get a result, in course of time, that brings much money and happiness. A farmer of this sort becomes an independent man in every sense of the term, and should prove a valuable citizen in his home community. His increasing love for and study of nature also become valuable assets."

Another city youth desires to follow farming "because it is the most independent life and the most healthful one; also, a man is free to do as he pleases, for he has not a boss standing over him all the time. The things around him grow up with him, and each has its own particular place in his life." Another says: "I like farming because it is independent, healthful, noble, useful, and wide enough to utilize all of one's faculties."

A boy from a city of one hundred thousand inhabitants gives as his main reasons for desiring "to get a position on some large, well-run farm:"

"(*a*) I much prefer the country to the city;

"(*b*) I think there is a good opportunity to make a success as a scientific, business-like farmer on a large farm;

"(*c*) The living expenses are less on a farm, and for me the pleasures are more numerous."

And, finally, here is what might be called a human nature reason: "Perhaps the farm is attractive to me for much the same reason that the city attracts country-bred lads—a desire for change. One thing is certain, I do not want to be cooped up in a factory or office all my life. I have seen all I want of factories. A farmer works hard; but he is never out of a job, never on a strike, and never subservient to a labor union. Lack of experience, lack of physical power to endure heavy labor, and the necessity for a reasonable income in the near future, will force me to take a town position; but sooner or later I hope to be a farmer, keeping a salaried position until the farm assures me a good living and is entirely paid for."

Professor Bailey points out as a particularly

significant feature of these replies "the prominence given to ideals" and "the subordination of mere personal emolument and desire for money." Very few mentioned "the expectation of earning money as the leading motive." "Nearly every one of them gives higher ideals of living as the propelling motive, and these ideals crystallize about two points—the love of nature and the desire of a free, independent life." To me the constantly recurring desire for an independent life is particularly striking. The desire for independence is mentioned in every letter, either as a dominant or subordinate motive. This protest against the highly organized, corporation-dominated, specialized, and autocratic structure of industrial life in the great centers is never entirely absent.

Twenty years ago a city-bred student in an agricultural college would have been regarded as a curiosity. To-day there are so many that in many instances the methods of instruction have had to be changed to meet their particular needs. In the New York State College of Agriculture at Cornell University during the decade ending in 1907 about twenty per cent of the students came from cities of upwards of one hundred thousand inhabitants, about forty per cent from large towns and small cities, and of the remainder probably not more than thirty per cent came from actual farms. Of the graduates of this college about fifty per cent are now on the land either as farmers, farm managers, farm employees, landscape architects, nurserymen, or gardeners. Last year half of the entering class at the Iowa Agricultural College were from the cities, at the Ohio State College between thirty-five and forty per cent, and at the Michigan College seventy per cent. During the past ten years very nearly half of the students at the Massachusetts Agricultural College came from cities of twenty thousand inhabitants or over. Of the classes entering this college during the last three years less than twenty-two per cent have come from homes where the father's occupation is agriculture or horticulture. In these colleges it has become necessary to segregate the city and country students, so different are their needs and aptitudes. Within the last ten years, and more particularly within the last five years, there have been opened secondary schools in agriculture in connection with the agricultural colleges of the following twenty-five States: Alabama, California, Colorado, Florida, Idaho, Illinois, Louisiana, Maine, Maryland, Minnesota, Montana, Nebraska, Nevada, New Hampshire, New Mexico, North Dakota, Oklahoma, Oregon, South Dakota, Tennessee, Texas, Vermont, Washington, West Virginia, and Wisconsin. While there are no definite figures to be had, most of the agricultural experts with whom I have talked believe that the proportion of city and town bred students in these State institutions is not only large, but constantly increasing—increasing faster, probably, than the relative increase of urban over rural population.

Besides these Government schools, private, quasi-public, and philanthropic agricultural schools have during the past dozen or fifteen years been springing up all over the country. Notable among these are the National Farm School, near Philadelphia, which is successfully performing the modern miracle of turning young city Hebrews into adequate farmers; the Baron De Hirsch Agricultural School, at Woodbine, New Jersey, which is doing the same work; the Lincoln Agricultural School, at Lincolndale, New York, which is turning in the same direction a great majority of the outcast Irish Roman Catholic street boys who are sent there from the New York Catholic Protectory; the New York State Industrial and Agricultural School of Industry, near Rochester, New York, where lawbreaking city boys of all kinds are being given country tastes and training to such an extent that in large part they never again permanently seek the dangerous allurements of the city streets; the Billings Polytechnic Institute, at Billings, Montana, which is fitting town boys of the new Northwest to meet the new conditions brought about by the transformation of the surrounding country from grazing to agriculture. By way of experiment the superintendent of this institute persuaded a judge in Butte to parole in his custody a young tough who was about to be sent to prison for his latest act of vandalism. The superintendent told the boy about the school and what it stood for. The boy became interested at once. His father, who had given him up as hopeless, was persuaded to pay his board. At last accounts, which was six months after the boy reached the school, he was one of the best workers on the farm and had given no trouble. He had become interested in his work, and too busy for escapades even had he had the inclination. If this boy is permanently successful, the superintendent plans to give the same oppor-

tunity to other boys of the same kind. This the boy knows, and it gives him an added sense of the importance of his own reformation. At the Interlaken School of La Porte, Indiana, the students, of whom a majority are the sons of rich or well-to-do city parents, are conducting intensive farming on a square mile of land under the supervision of agricultural experts. Then there are the various George Junior Republics, which are all located on farms run by the boy citizens, almost all of whom are from the cities, under the supervision of practical farmers who are in some cases graduates of agricultural colleges, and hence able to supplement practical information with theory. At the Good Will Farm in Maine, which is run for the purpose of converting dependent boys into independent men, they have gone further in this direction than have the George Junior Republics, and have established a systematic course in agriculture so that they may in the future turn out prospective farmers in distinction from mere farm hands. There are a number of other good agricultural schools, of which space does not permit even a passing mention.

There have during the last decade sprung up various agencies other than formal schools of agriculture which are imparting to city boys the tastes and aptitudes for country living. Of great importance among such agencies is the demonstration work for boys of the United States Department of Agriculture and the work of the Young Men's Christian Associations in connection with their back-to-the-land educational campaign. Up to the present the Government's work has been largely confined to the Southern States. Of the 75,000 boys enrolled last year approximately 25,000 were city or town bred. Some of those from the larger cities did the work during their summer vacations in the country, and many of those in small cities or towns lived in the suburbs where they could secure near their homes the necessary acre of ground. The boys of each locality are organized into cotton or corn clubs, as the case may be, and each boy cultivates an acre of cotton or corn under the supervision of an agent of the Department. At the close of the season the crops are graded and marked and prizes given to the most successful growers. In a list of 100 boys who raised from 133 to over 200 bushels of corn to the acre during 1910 several are from cities and a large number from considerable towns. The members of these clubs wear buttons upon which are designed four-leaf clovers with an H on each leaf. The H's stand for equal development of head, heart, hands, and health. These clubs were specially designed for farm boys. The city and town boys were neither urged nor asked to join.

There is, however, a branch of the work especially designed for city and town children which has thus far found its chief development in Memphis, Tennessee, and Greenville, North Carolina. Practically all of the mill operatives of Greenville now have back-yard vegetable gardens run by the children under the instruction of the Department's agent. One of these boys, with a garden 165 by 175 feet, cleared $150 in a year from the sale of his vegetables to the local grocers. In most of the more progressive cities nature study has been introduced into the regular curricula of the public schools. In many cities theory is supplemented by practice by school gardens. Each child has a small plot for which he or she is solely and proudly responsible. In a certain school district in Baltimore where these gardens are prevalent I found that about one-third of the children had started back-yard gardens at home. While, of course, this home gardening was encouraged by the teachers, they naturally had no authority to enforce it. Although nature study and children's gardening is a far cry from practical farming, it is nevertheless significant. Its value lies not so much in the knowledge imparted as in the tastes and desires implanted. By these means are tastes and aptitudes for country life being developed in thousands of city children.

The Government's work is ably seconded by the Young Men's Christian Associations. Last year over one thousand boys in various cities had gardens of their own which they cultivated under the supervision of agricultural experts whose lectures they were attending. A few Associations have given special attention to poultry-raising, and have started what are popularly known as "Chicken Schools." The members of these schools actually raise and care for chickens, reporting progress every week to the teacher and the class. The National or State Agricultural officers often co-operate in the leadership of this work. There is such a school, with one hundred members, in Portland, Oregon. The Chamber of Commerce of Portland has reported that this one school during its three years of existence has been worth

over half a million dollars to the Pacific Northwest. Besides this more practical work the various Young Men's Christian Associations are giving each year hundreds of lectures connected with the back-to-the-land movement, which are attended by thousands of city boys.

By these means and for these reasons an ever-increasing army of city boys is each year leaving behind the nerve-wearing stir and confusion of the city streets for the invigorating quiet of the open country. How they measure up in aptitude and training with their country-bred fellow-craftsmen, and what success they are meeting, I shall describe in a second article.

GLORY

BY JAMES BARNES

CAPTAIN PHILIP SYDNEY GLYNN-EYRE stood outside the post-office tent, pitched on the veldt back of the remount station. The sunlight was blinding, and the Captain's deep-set eyes, that were never very wide open, were narrowed to little slits as he glanced at the envelopes he was shuffling in his hand. It was two months since he had read a line of writing addressed to him, except the terse notes of his colonel, the very unintelligible information supplied by the brigade intelligence officer, the reports from his lieutenant, young Ramsay, or McLeod, his first sergeant.

These letters he was holding were from "home;" some postmarked at the little town in Gloucestershire, some from Scotland, and some from London. The very latest was a month old, and one had been chasing him through the ramifications of the army postal service for at least ten weeks. Letters from home! As a rule, men did not delay long in opening them, but Captain Glynn-Eyre, after he had shuffled them sufficiently to get them in order of their dates, put them all in the breast-pocket of his tunic and buttoned the flap.

Six months' active service—days spent in the saddle under a grilling sun, nights on the dew-soaked ground—mark a man's general exterior, but in Captain Glynn-Eyre's case it showed only in his brick-red complexion; he was as neat as if he had just been turned out of a Jermyn Street outfitter's. His boots and leggings were polished, and his khaki uniform no one would ever have thought had been worn for more than a week. His straw-colored mustache was waxed at the ends to neat stubby points, and his handsome chin still showed traces of the powder he had used after the morning's shave. Not only did the Captain's neatness attract the attention, but his high-pitched, cultured voice did also. It had the unconscious affectations of generations of slow, musically drawling ancestors—the inherited accent of caste.

"I say there, Rawlins," he called abruptly, turning in the direction of a group of men who sat opening letters and packets of newspapers that had come in by the last convoy, "saddle up the dun mare, and look alive."

"Yessir." A bright, curly-headed lad in a gray shirt and broad canvas belt jumped to his feet, saluting as he answered.

Captain Glynn-Eyre stood watching the saddling up with a keen, observant eye. He noticed the saddle galls on the dun mare's back. "Still a bit tender, eh, Rawlins?"

"Yessir, but fit for ridin', sir." The rising inflection proclaimed the soldier's birthplace. He stood aside and saluted again as the officer slung his long legs over the mare's back and slipped his toes into the stirrups.

"Good news from home, Rawlins, I hope?" He noticed the letters stuck into the canvas belt.

"Yessir, thank you, sir. Hope the same with you, sir."

The Captain smiled and nodded and rode away—still good to look at, apparently at peace with the world; and yet at that very moment he was more afraid than he had ever been at any time in his whole life. And afraid of what? Nothing tangible that any one could see, or that he himself had yet seen. He was afraid of the letters that a moment before he had buttoned into the breast pocket of his tunic! It was the most miserable and abject coward that ever wore

a uniform who sat so gracefully on the lithe dun mare as she walked down the hoof-worn path toward the river-bed. Every now and then soldiers with towels slung over their shoulders, fresh from the swimming-pool, saluted him. Across on the opposite bank a bathing party of Highlanders, looking like so many mediæval blacksmiths in their khaki aprons, were being coaxed along by a perspiring and persistent piper.

Captain Glynn-Eyre, urging the mare to an ambling fox trot, followed the edge of the stream, and came at last to a group of mimosa trees. It was shady here, and at last he was alone. He threw the reins over the thorny branch of a wait-a-bit bush, and, seating himself on the ground, drew forth the unopened letters. Slowly he read each one, and when he had finished the lot he took out his silver match-safe, and, striking one of the precious Vestas, made a little bonfire and scattered the ashes with his foot. No one else would ever read those words—no one would see the names mentioned therein, or the signatures attached.

"Leaves me about two weeks," he remarked to himself, quite casually. "It's all up! What a rotten blighter—what a God-forsaken waster!"

No more bitter arraignment could have been framed by the use of any words known to the Captain's vocabulary. There was no loophole of escape—not the least possible chance for him. There was no reprieve—no question of any pardon forthcoming. He was condemned just as surely as that Roi-Kaffir boy whom he had sentenced to be shot, offhand, for tearing the earrings out of that Boer woman's ears the other day. No one had interceded for the poor savage black. No one would, or could, intercede for him. He sat there with his head in his hands thinking. A proud name the Glynn-Eyres had borne for years—soldiers since the old red-coated days, the elbow to elbow and hollow squares, and long before that. From Flodden Field to Culloden, from the Plains of Abraham to Quatre-Bras, from Lucknow to Khartum, and thence to now. The uniform worn by a Glynn-Eyre had never been disgraced. Yet in two weeks how would it be? He could hear that honored name as people would speak it—an undischarged bankrupt was bad enough, but *forger, thief!* Awful, unspeakable; and nothing—nothing he could do to stave off the inevitable!

One sentence in the old lawyer's heavy hand had fairly shouted in its insistence, like words heard in delirium: "To return here before the warrant reaches South Africa is the only way to escape arrest. Sir Charles is inexorable. It is but a question of time when the whole matter will become public property. It is deplorable, but cannot be avoided."

"Cannot be avoided!" The Captain laughed bitterly to himself as he repeated the phrase. It went humming itself to all sorts of tunes through his mind as he rode back to camp. Oh, thank God that his father and mother were dead! That was one comfort. But his brothers and sisters? They must know by this time. They must be doing their best to keep it quiet. That one unmarried sister who had always loved him, who had ever helped him—what would she say? Why had he never thought of any one but himself before? "*It could not be avoided!*" What a ruin, what a hell, he had made of his own existence! Come to think of it, he had never had any pleasures. He had had excitements, passing interests—once or twice he had thought he cared, but he hadn't. Love? He didn't even know what it was. Happiness? Foolish word—there never was any such thing. Contentment? Yes, some men might be contented—so might an ox. Oh, the whole thing had been a sham, a farce, a lie, and a mistake! In his writhing soul he saw his life, as if in review, swing past him in the hell of his own creation. No conscience-stricken sufferer, no demon-tortured spirit condemned to flame, but he, neatly dressed, upright of shoulder, calm of voice and proud of eye, stalking alone, clean and well groomed, and—rotten to the core!

It was only within the past six months that Sydney Glynn-Eyre had found himself—at last found what he was good for. With this discovery had come at times a certain forgetfulness, a certain relaxation; and more than once there had risen, with the bitter feelings of remorse, chaotic, half-formed resolutions. Oh, if he could only wipe out the fearful, hateful score! The actual experience of actual things had opened his eyes to comparative values. Repentance, he had known that—the unconfessing repentance of the self-abandoned. Under the gleaming South African moon at night he had thought of how he could make restitution—how he could atone. He had smiled through bitter, scalding, unshed tears at his hopelessness—laughed in his loneliness at his own sheer despair!

Something had been regained—he had restored himself as a soldier; but what was the use of it now? His fellow-officers of the line regiment from which he had resigned four years ago, under the shadow of the on-coming cloud, had met him with the outstretched hand, but he had sought no friendships. He was a promoted volunteer. From an enlisted man in Laurent's Horse he had been appointed to a troop, and then, as the fever and the bullets created vacancies in the regular forces, he had been picked out and placed in command of a company of the mounted infantry. He had come to his own again. His men trusted him; yes, by all the tokens that such men give, they loved him!

But what was the use of anything? "*It could not be avoided!*" When he had signed his cousin's name back there in London, he had to have the money, and he was going to pay it back before it should be discovered; but now—"Oh, what a blighter, what a God-forsaken waster!"

The dun mare, unguided, was struggling up the steep, hoof-worn path. Captain Glynn-Eyre raised his head.

Just at the top of the bank were a few hummocks of brown, sun-baked earth and a number of wooden crosses. He remembered the scene and the words that had been spoken when they had placed the blanket-swathed objects in the unwelcoming ground, and he envied them. He did that, as sure as he drew breath!

When he reached his tent, Captain Glynn-Eyre fished a bottle out of the head of his sleeping-roll, but before he had time to draw the cork a headquarters orderly appeared at the entrance and saluted.

It was quite characteristic of the Captain that he did not start or attempt to hide the bottle, and it was quite characteristic of him also that, having received the orderly's message, he did not take a drink. Boer dop-brandy has a strange way of permeating one's breath, and permeated breaths were not good things to bring into the presence of a teetotaling general. . . . There had been some movement in the wind for a long time. It was expected that the mounted infantry would be going out sometime during the day, and the orders had come. He knew the country to the eastward well; the general wished to ask some questions, that was all. But not only the mounted infantry were expected to take part—the whole of the Twelfth Division would be on the move by one o'clock. It was now after ten. That meant some work. Captain Glynn-Eyre was glad. Work is a great thing for distraught minds.

In the heat of the midday he was leading B Company over the dusty, blackened, fire-swept veldt, a battery of the Royal Horse Artillery clucking and rumbling behind them. On ahead were varied commands of the Sons of the Empire; a detachment of New Zealanders and Australians on tough Waler horses led, then came a fresh batch of volunteers from Ceylon—indigo planters mostly—on well-intentioned little ponies, and far out on the flanks Canadian mounted men in their stiff-brimmed sombreros. A mile behind the mounted infantry and the guns, trudging through the film of filtered dust, came the plodding hawk-eyed men on foot, laden like beasts of burden; then the ambulances and the transport and the rear-guard. It was more than a reconnaissance in force—there was something big intended. By evening they had covered at an easy marching pace some fourteen miles and camped, the stragglers and transport coming in till all hours of the night.

The next morning early, while the dew still glistened in the spiders' webs that gleamed everywhere in the grass like hoar frost—for they had left the fire-swept zone—the mounted force were on the move. To the eastward rose a broken country, marked here and there by the truncated cones of tall black kopjes. Suddenly from the left flank there broke a sputter of distant rifle fire—the familiar double report of the Mauser. The slanting sun was directly in the faces of the khaki men, and they halted for the belated batteries to come up.

Captain Glynn-Eyre wore a strange smile on his face as he looked out and saw the mounted scouts come trotting back—a riderless horse here and there among them. As the sun rose higher and the glare was less disturbing, he took out his field-glasses and swept the crest of the black hills.

Somewhere in there it was going to happen! He looked round at his men. It was an old story to them by this time—all in a day's work. Some were chatting, others silently smoking. One young fellow, standing beside his horse, was reading a ragged copy of a London paper, spread out over his saddle. He hardly looked up as the guns came lumbering by, crashing through the small ant-hills, the tired, tucked-in horses stirred from their listlessness by the flogging, short-handled

whips. A quarter of a mile ahead they wheeled into position. Soon the shells were hissing out toward the ridges, and the little white puff-balls bloomed and faded along the tops and hollows. No reply.

Perhaps it was only a commando of the guerrilla Celliers's force that had been harassing the flank the day before. No one could tell; there was but one way to find out.

The mounted men swung themselves into saddle and in rough alignment passed the guns and led the van again. Half a mile or more they progressed in silence, and then the sputtering began in front. Soon the air was filled with the crazy little musical notes, whimpering and snapping overhead or flicking along the ground. Men eyed their officers restlessly, and eyed each other with quick turnings of the head. Some rode with lips compressed, others with foolish smiles. The guns had opened once more, and the shells went snarling above them. They were quite close to the hills now; directly in front the steep sides pitched down into a kloof, or valley, guarded at the entrance like a gateway with two pylon towers. In the center rose a slight elevation of massive black rocks, with stunted bushes growing in the crevices.

"Forward! Trot!"

Captain Glynn-Eyre half turned as he gave the command. Two hundred yards of this, and he looked back again. To his surprise, he saw the main force behind him sweep off to the northward. Ramsay, his lieutenant, a promoted volunteer officer like himself, glanced at him anxiously, but said nothing. As to the men who followed, there was not even a question in their minds. It was not their place to think—they had no responsibility in the matter. If they were killed, it wasn't their fault. Blunders and mistakes were never laid at their door or on their graves.

"Fours left! Gallop!" The Captain's hand went up over his head as if with the sweep of a blade instead of the light rattan that descended on the dun mare's sweating flanks. She wheeled sharp to the right and was off. He twitched at her head viciously, as if trying to hold her in or turn her, but his eyes were straight ahead.

To his men his action had spoken louder than the words that they had failed to catch, and so they followed. Whip and spur, loosened reins and digging heels, for five hundred yards; the jangle of accouterments as a saddle emptied, or a smothered cry and a jumble of dust as a rider and horse went down. Twenty—thirty—lengths in front, the distance widening constantly, rode the leader of the mad onsweep, on the little dun mare. "Pow-pow! pow-pow!" the Mausers coughed and sputtered from the kopje's sides.

Oh, how could they *miss* him! His stirrup-iron rang, and something tore at his boot heel. The strap of his field-glasses gave a sudden quick tug at his neck, and the ruined case swung round behind his back. How clear the big shoulders of the hills were! For the first time since giving his last command he turned.

They were coming on! Wide spaces in the narrow line, wounded steeds tottering behind, staggering figures lurching here and there, dust spots where dying horses lay kicking and struggling, and silent bundles of things that had been men. Oh, why had they followed? Why had they not obeyed?

But what was this? The rifle fire had ceased. Except for the sound of the oncoming hoofs, all was silent. The two pylon-like towers rose on either hand, jutting slightly forward, hiding the ridges that stretched back and away from them, north and south. Quick—what would he say to the men who had never questioned? Would they question now?

He swung himself from the saddle, lifting his hand, palm outward, in the gesture of the command to halt. They swept in, surrounding him—breathless, excited, their mounts heaving of flank and quivering of knee.

"Dismount!" His voice rang clear, his manner was cool and collected. "Well done! well done! Fourth men, take the horses! Here you, the rest, scatter up among those rocks—take cover! Up with you! Rawlins, take my horse; she ran away. Come on!"

Once more they followed him—unslinging their rifles, filling their magazines. Spurs clattered and scraped the smooth black rocks. Panting, drawing labored breaths, they pressed on, hauling themselves up in places by aid of the strong-limbed bushes. Sergeant McLeod forged to the front—he had been a gillie on the steep highland moors—he outdistanced all the others. As he reached the crest they saw his right elbow lift, and, as his cheek found the butt, his rifle blazed. He called back over his shoulder as he crouched: "Coom on—hurra-oop, laads, hurra-oop!" One after another they reached the top and flung themselves prone among the black

boulders. The narrow valley echoed with the thrubbing of the Lee-Metfords.

Captain Glynn-Eyre was stumbling after them. His left foot was bleeding; he could scarcely put his weight on it. The lieutenant greeted him excitedly as he gained the crest at last.

"By gad, sir, just in time—we've got 'em!"

And then he saw it all! The kloof beyond the little ridge swept smoothly upwards, bare as a boulevard between the steep walls on either side. Through the middle ran a well-defined trail that, turning to the right, led down among the big boulders and out into the veldt. In the very center was a crowd of huddling mounted men in full retreat, riding at top speed back into the farther hills.

"Cease firing! Save your ammunition, men."

Captain Glynn-Eyre's voice was as calm as if at an Aldershot review. His mind was cleared of the tempting thoughts of death.

He began to drink deep draughts of the joy of living; a mad rejoicing filled him. He felt no pain from the torn and mangled foot. The born soldier in him had risen to the sense of his responsibility; but above all insisted a sudden, strange, new thought, "There is a God!" To his lips came a swift, unspoken prayer.

The spiteful Mausers began to sputter again. A few of the enemy had found places of concealment along the steep enfilading sides, but no force would dare advance on those seventy rifles that barred the gateway. They held the key. Unknown to themselves, they had stopped the second great raid into the colony!

The men were laughing garrulously, like school-boys at a game, taking out their cartridges and spreading them in easy reach. Nothing but artillery or an overwhelming charge could dislodge them now!

Distant firing sounded from the north—volleys and the reports of twelve-pounders firing short-time fuses. The division must have found lodgment on the hills. The enemy's flank was turned; nevertheless a few stubborn marksmen held ground in front of B Company on the kloof and quite close up. From the black rocks the bullets glanced and hit, leaving blotches of lead and twisted nickel cases.

Captain Glynn-Eyre crawled to the side of Sergeant McLeod. The latter saluted from his recumbent position with a grin of joy.

"We headed 'em, sir. Have a care, sir! O God! guid God!"

Whether by chance or as the result of some keen eye watching the little space between the rocks, it made no matter—*it had come!*

Captain Philip Sydney Glenn-Eyre never groaned nor moved.

The despatches that flashed to London referred to "the saving of the day." The cairn of black stone at the foot of a tall black kopje tells nothing.

Only another of the "Fighting Glynn-Eyres" had died the glorious death.

AN AMERICAN WOMAN'S FRIENDSHIPS

BY ELIZABETH WALLACE

THERE was a merry girl, often called a "tomboy" in the unathletic days of our grandmothers, who grew up under the wise care of her doctor-father, and won a name for herself as Harriet Hosmer, the sculptress—the feminine term favored at that time. She was born in Massachusetts and trained in the exceptional atmosphere of Mrs. Sedgwick's school at Lenox. There she began a lifelong friendship with Fanny Kemble, who was a frequent visitor at the school, as were also Hawthorne, Emerson, Fredrika Bremer, Mrs. Child, and others of like distinction. Harriet was the life of the house, and never hesitated to help make a cheerful evening, unawed by the presence of a famous actress. This charming lack of self-consciousness and abounding optimism were prominent characteristics throughout her long life, and, combined with undoubted talent, brought her into close relations with the eminent people who seem vividly present in her letters to friends both in England and America.

One is beset by the temptation to quote freely from the letters and memoirs of Har-

riet Hosmer, wisely and adequately edited by her chosen classmate and lifelong correspondent, Mrs. Carr (Moffat, Yard & Co.).

Boldly venturing upon untrodden paths, Harriet, with a view to her chosen art, went to St. Louis and took a course in anatomy in the Medical Department of the Missouri State University. Before returning to her home in the East, the venturesome girl, still in her teens, voyaged down the Mississippi to New Orleans, passing undismayed several boats aground in the treacherous waters. Delighted with the old French city, she determined to explore the upper Mississippi, and went as far as was possible in the year 1851. One of the high bluffs which she scaled now bears her name, and the tradition of her courage is still held there. Reaching home, she worked hard at modeling, and her first work was a medallion bust of her revered professor in anatomy, Dr. McDowell She copied Canova's bust of Napoleon, and cut it in marble, unaided, presenting it to her father. In 1852 her father took her to Rome, and her ambition was satisfied when she was received into the studio of John Gibson, at that time England's foremost sculptor. He never took pupils, but something in the young girl impressed him, and for several years he taught and encouraged her, giving her a small room to work in which had formerly been occupied by Canova. It is not necessary to enter into the details of her artistic life; her personality is too vivid to be obscured by her achievements. She worked voraciously, copying the masterpieces of ancient art. Later her original work showed strongly the influence of this practice and the impress of her master.

It is of her friendships that I wish to speak especially. That a young, inexperienced woman could live in Rome for years, protected, unconsciously, by what she called her "Godlike faith in human nature," and her supposition that others were as busy as she was, is a high tribute to American womanhood. A friend wrote: "She has surmounted all the difficulties of her position as woman and artist nobly by the simple earnestness of her nature and life." Mrs. Kemble wrote to Mr. Wayman Crow, Harriet's generous patron and beloved "Pater," that "she has energy, perseverance, and industry," adding that her peculiarities might interfere with her success in society, but sensibly reflecting that it is unreasonable to expect a person who is singular in gifts not to be equally unlike people in other matters. She was in a beatific state of mind, often quite oblivious of conventions. For some years she shared an apartment with Charlotte Cushman, to whom she was devotedly attached. Later she established herself in her own beautiful house, where she entertained freely.

She soon became a valued member of a group which included Mr. and Mrs. Browning, Mrs. Sartoris and her sister Mrs. Kemble, and, as she wrote, "these, with two young artists and your humble servant, met every Sunday and Wednesday evening at Mrs. Sartoris'." The Thackerays came too. One of the young artists was Frederick Leighton, of whom Harriet Hosmer saw much. She wrote, after his death, a lovely tribute to his character. He was known as "Fay" in the Sartoris circle, and confided to Harriet his dream of building a house to his mind as soon as he could "earn the money to pay for it." The realization of this dream may be seen in London to-day. Of Leighton his friend Watts said, "He was the most perfect character I have ever known." The wicked query of Whistler, more the artist than the friend, was, "Leighton? President of the Royal Academy? I believe he also paints?"

A letter from Browning to Miss Hosmer gives a detailed criticism of one of Leighton's paintings, "the whole one consistent anachronism," the modern violin no more a surprise than the modern faces and figures; yet, as Browning said, Leighton drew deliciously.

Miss Hosmer met and loved the Brownings in her second winter in Rome, when they were living a life of seclusion, unappreciated, unobserved. More than once she was asked by English people about "your countrymen the Brownings." When she wondered at their ignorance, the reply would be, "Oh, yes, yes, Mr. Browning *is* English, but Mrs. Browning is American?" In those old Roman days the halo had not dawned. Mr. Browning wrote charmingly to "Dearest Hatty," and left blank corners for "Ba," Mrs. Browning, to fill. One letter from Paris says that "Ba" has worked like a spirit at her poem, "Aurora Leigh," since they had moved into comfortable rooms. "I have read the first six books, all transcribed and corrected in two months. Lord! I don't dare say in cold words what I cannot help thinking of them; while warm words are not proper, you know." The apartment they had left was one "with

no bottom (for carriages were under it), no top (for the roof tiles were over it), no back (for there was an end to the house with the end of our room), and a front facing the due east." Of Mrs. Browning Miss Hosmer writes: "I can never fancy her in a bustle or in a busy crowd, any more than I could fancy the night-blooming cereus to blossom in the Piazza Navona." Miss Hosmer remembered that "one day at dinner Mrs. Browning said, in half soliloquy, 'I wonder which is the best name, Laura Leigh or Aurora Leigh?' and asked both of us our opinion. Browning gave his vote for Aurora, and I, not knowing at all to what she referred, and thinking merely of the sound, said, 'Oh, Aurora; Laura Leigh lacks backbone.' When the book was published, Mrs. Browning, remembering this casual remark, sent me a copy with the message that she 'hoped it contained backbone.'"

It was during this winter that Miss Hosmer conceived the idea of modeling the clasped hands of Mr. and Mrs. Browning. She made the casting herself, as Mrs. Browning shrank from sitting for the *formatore*. Hawthorne alludes to this work in "The Marble Faun."

Browning and Miss Hosmer were companions in a most amusing escapade, accomplished in a donkey cart borrowed from a Florentine vegetable vender. The reproduction of the adventure was elaborately managed by Browning for Mrs. Browning's benefit later in the library. Miss Hosmer described it in a paper published some years ago, and the fun of it is irresistible. "'Nothing does Ba so much good as a good laugh,' said Mr. Browning, gazing with satisfaction at her helpless condition and at her face glistening with tears, and I will set this down as the laugh of her life." Neither Mr. Browning nor Miss Hosmer avoided puns, though they estimated them at their proper value. An amusing bit of nonsense was a Round Robin, which she calls Browning's last unpublished poem, sent to her from Lady Ashburton's place in Scotland, and signed by Browning and his sister (Sarianna), Lady Marian Alford, and Sir Roderick Murchison. She promptly replied, in merry doggerel, declining the invitation to be of their party.

Many of the letters are addressed to Mr. Crow, and reflect the busy, happy life led in Italy, with occasional English holidays. In 1870 she wrote at length of the triumph of Victor Emmanuel's troops, and announced that "Rome belongs no more to the dear old gentleman in the Tiara!!" She knew the Empress of Austria well, and was devoted to the lovely Queen of Naples, "my violet-eyed heroine of Gaeta," whose modesty was as great as her beauty. It is of some interest to know that Miss Hosmer did not take the book called "The Martyrdom of an Empress" seriously, regarding it as a romance containing some well-known facts and the rest fiction. Among her dearly loved English friends was Louisa, Lady Ashburton, the friend of Carlyle, Browning, Landseer, and all the interesting men of her day. From 1867 until 1903 this friendship lasted "with no shadow of change."

That the pleasure was not all on Harriet Hosmer's side in these companionships is amply proved from the letters written to her. She was one of the happiest and merriest of beings. One of her Scotch friends said, when she was indulging in some nonsense, "Oh, Hattie, I wish you would be buried here; it would be jolly only to look at your grave." "Thank you," she replied; "I would rather live though I had to be wise." Her later years were passed in America full of honors. One day, walking with a friend in Cambridge, Massachusetts, they met two ladies who inquired their way to Longfellow's house. Miss Hosmer was somewhat in advance, and her friend, thinking to give pleasure to the tourists, told her companion that *that* was Harriet Hosmer. With perfect gravity, Miss Hosmer, who had overheard the remark, as the group parted said: "Perhaps you don't know that *this* lady is Mrs. Somerville." To her speechless friend she explained later that she was tempted to introduce her as Jane Austen or Mrs. Browning, but she was afraid her dates would be questioned.

She took pleasure in sharing her stores of artistic knowledge with others, and at times lectured with excellent effect, often dwelling upon the value of persistent work. In 1894 she went to California to be present at the unveiling of her statue of Queen Isabella. She criticised unreservedly such statues as were set up in our parks. After praising French's monument to Milmore, one of the most beautiful works in the Columbian Exposition, she describes the opposite, so often seen in portrait statuary, as "betrousered obituaries"—a phrase so acute and true that it should be taken to heart, never to be forgotten.

Her life was one of happiness in work,

and she was more fortunate than many others in gaining recognition during her working period. She established in Rome a hunt, importing horses and hounds from England. She knew how to play as thoroughly as she toiled, and that perhaps was the secret of her long and balanced life. She lived from 1830 until 1903, and with her there was apparently missed no joy of living, either within her own nature or in her relation to others.

THE SPECTATOR

THE Spectator indulged in the novelty of spending the summer in the South. The dog days of our lower latitudes held no terrors for him. At first he even thought of going to the tropics. There were very pleasant reports extant as to the climate. Was there not a man visiting New York once who used ostentatiously to long for the cool breezes of Tegucigalpa, or Chiquimula, or whatever place it was he called home? And was there not that other reassuring anecdote about the man who, after living a long and healthy life at Havana, visited the metropolis and died of sunstroke? And then think of the novelty! How piquant to date one's letters Havana—or Chiquimula—August first, when other, every-day people were writing from Bar Harbor or Saranac!

On sober reflection, however, the tropics seemed unnecessarily far away. Even Florida was a bit remote, though Palm Beach or St. Augustine in summer must be spiritually refreshing. But the vicinity of Hatteras and Pamlico—there was the chosen land, truly Southern with its palmettoes and Spanish moss and oleanders and fig trees, and yet not too far away. Pamlico, then, it was; or rather a small town on the shores of the sound. Only, the Spectator always prefers to spell it Small-town, analogous to Professor Matthews's Short-story and other such compounds.

With the Small-town itself the Spectator was enraptured the moment he alighted from the train. Not only was it warmly, glowingly Southern, but it was even better. It was Colonial, essentially eighteenth century. The Spectator took a "transfer"—a shabby one-horse carriage with a black driver, "fare ten cents, suh"—and proceeded uptown.

The admiration of the Colonial grace received a rude shock when the Spectator wheeled around a corner and was confronted by an ugly and wholly superfluous sky-scraper of five stories. But then all Small-towns make mistakes sometimes. Farther down the street were several brass banks—at least they had a quantity of polished brass in front—with mysterious, secretive-looking men passing in and out, engaged here, as elsewhere, in the strange rites of their golden goddess. Farther along was a crystal dry-goods emporium, which probably absorbed the money the mysterious men got from the banks, it being got out of them by even more mysterious wives. In the door stood the incredibly fat shopkeeper, extending a jovial hand to every comer, and passing pleasantly the time of day with those who did not stop.

The Spectator alighted at a brass bank for the transaction of some unavoidable business, and was introduced by the functionary of that institution to the fat gentleman of the dry-goods persuasion, who, having quantities of unexpended time and endless stores of good nature, introduced him to everybody else—that is, everybody else "wuth knowin', suh." Finally the Spectator escaped. There is no disrespect in the word. Just the same, he escaped. Like a street urchin suddenly released from his elders who have caught him and tried in vain to make him respectable, he—not exactly ran away, but hastened down the street as rapidly as was consistent with dignity; and, with the true instinct of his vagabond counterpart, who would have run up an alley, he turned up a side street.

The maneuver was designed for escape, but surely a better angel than the angel of flight guided the Spectator's steps. For nowhere else in the South perhaps is there so delectable and altogether entrancing a little street as that into which terror of the dry-goods gentleman and his friends had impelled the Spectator's flying feet. On either side of the glowing, sunlit roadway were dark, low-browed houses that would cause any lover of the beautiful to sing for very joy at the sight. How did these people contrive to build houses that seemed so natural, so inevitable, so much at home with nature, as though they had just sprung out of the soil and had never even heard of an architect's catalogue? A day or two later there appeared for a moment the elusive shadow of a clue to this problem. In one of the oldest of these very houses the Spectator mashed his finger in manipulating a window without cords, and incontinently said things that he did not really mean about the style of architecture. "But," said the hostess, gently, "the windows

have been that way for over a hundred years." The Spectator forgot his pain in the wave of rejoicing that swept over him. But the clouds followed the burst of light. After all, the remark was only a clue, and an elusive clue at that. It was not a solution of the mystery.

Perhaps the trees had something to do with the matter. Trees help greatly in determining the character of a town, as do the elms of the North or the palmettoes and live-oaks of Louisiana. The characteristic tree of this community seemed to the Spectator to be the crape-myrtle tree; not the bush which grows farther north, but the crape-myrtle tree, with strange barkless bole, like the trees of Doré's "Inferno," incongruously crowned above with glorious green and with soft, crinkly, tissue-paper masses of pink. Other trees there were equally striking, but in less profusion: fig trees, rough and shapeless; magnolias here and there, but not much in favor because of their somber shadows and the heavy scent of their too-tropical blossoms; oleander bushes or treelets, awkward in growth but splendid in blossom. There was even one tall palmetto, grave and stately, as always, though a little lonesome so far north. The Spanish moss the Spectator did not admire. In spite of its dismal beauty, it is a pariah among plants, the gray, ragged, and dismal beggar of the vegetable world, barred from most respectable gardens, though occasionally cherished by persons with a taste for the bizarre.

Farther along, where the little street merged once more in a larger thoroughfare, was the City Hall, an imposing and as yet unimproved structure of brick and stucco, flush with the sidewalk, with walls two feet thick and built to last forever. Upstairs sat the chief of police, palm-leaf fan in hand, smoking and talking politics, as chiefs of police sometimes do. Below were the quarters of the volunteer fire department, with the fire-engine horses fiercely looking out of their stalls upon a world that might any day burn up, and ready at a moment's notice to dash furiously down the street, as they actually did next day, followed by the force in various stages of dressing and a crowd of small boys and dogs.

Across the street was the water-front, and there—oh, blissful sight to the true antiquarian!—was an open-deck, side-wheel steamer just departing, wheels threshing the water into boiling rage, bells excitedly clanging, and the captain shouting, while the passengers sat on deck and already began to unpack sandwiches and hard-boiled eggs.

The captain saw the Spectator approaching, and called to him: "Want to get on board, suh? Fare to Turkey Quarter only three bits."

The Spectator would have liked to go to Turkey Quarter to see the turkeys, or whatever else might inhabit such a seaport; but he had no baggage along, and explained the matter to the captain.

"I'll wait for you, suh," replied that official. "It won't take mor'n an hour to get your trunks, will it?"

But the Spectator, seeing the passengers on deck eying him with no friendly glances, forebore to detain them.

At the next dock lay a schooner, just in from Philadelphia, with a mixed cargo for delivery to the various retail stores. The railway here seemed to be a luxury, but real commerce, whether breakfast foods and lamp-shades coming in or turpentine and lumber going out, took to the water. So with the passengers. Rich people used the railways to go to Asheville in the summer or to Norfolk in the season to see something of the world. But poor country folk went by boat.

Time, in this blissful community, somehow did not seem to move so rapidly or so inexorably as in the cities. When city folk discussed the remote past of ten years ago, the Pamlicese, as the Spectator used fondly to call them, discussed the real past, dating back to the early days of the Republic.

"And did such and such an event"—preserved in story—"happen before the Civil War?" the Spectator would ask.

"Oh, dear, yes! It was in the time of my great-grandmother, when the British passed this way."

Listening to these tales, the Spectator felt himself almost unconsciously receding into a more and more remote past. At times the very existence of the Nation would seem to fade out, and he would walk once more in a Colonial town among the liege subjects of King George. Was there not the very church the British soldiers beheld, were there not the very graves of the citizens who lived under the flag of Britain, even the very houses that sheltered them in that remote time? It was almost with a shock that the Spectator came to himself when he turned another corner and saw a gang of men laying rails for a street railway. In his heart he cursed them. But, after all, it must be uncomfortable to live always in the eighteenth century; and the Spectator is little by little becoming reconciled to the idea that this adorable little town, like all others, must change, must have sky-scrapers and brass banks and street car lines. And he went back to those things, resolved not to fly from the laws of nature. Yea, he even conversed with the dry-goods gentleman and every single one of his friends, and found all of them, like the true creations of Providence everywhere, good.

THE NEW BOOKS

Romances of Théophile Gautier (The). 10 vols. $15. **Travels of Théophile Gautier (The).** 7 vols. $10.50. Little, Brown & Co., Boston.

It is now about forty years since Gautier died, and the mere fact that it has seemed worth while to put forth at this date seventeen volumes of his romances and sketches of travel indicates pretty positively that there was something enduring in his art. More than most writers Gautier suffers by translation (although Professor Sumichrast's rendering of his manner is capitally done), and it is also true that much of his non-fictional writing has lost interest because of the changes in the scenes and conditions described, yet there is very good literary browsing in these volumes, and the reader who knows of Gautier only as the author of "Mademoiselle de Maupin" and "Le Capitaine Fracasse" will be surprised at the grace and finish even of much that might be supposed to have been ephemeral in its nature.

Lady and Sada San (The). By Frances Little. The Century Company, New York. $1.

Of course the Lady of the title is the Lady of the Decoration. A sequel to a successful book is not always equally a success, but this little volume certainly carries on the original method of the author's first book with equal shrewdness and sharpness of observation, although, one suspects, with sometimes a little too sweeping criticism. This time the Lady goes to Japan to be near her husband, who is chasing microbes in China, and the Sada San of the tale is a girl, half Japanese and half American, who must be rescued from her cunning and heartless uncle, who would have her marry a Japanese gentleman with a wife and family of his own. Like its predecessor, the book arouses attention and affords interest and amusement in a novel way.

White Shield (The). Stories by Myrtle Reed. G. P. Putnam's Sons, New York. $1.50.

Twenty short stories by the late Myrtle Reed have been collected and published in one volume, bound and decorated in similar style to her preceding books. They are occupied with the youthful phases of love, and are brimfull of such exclamations as "Only one little hour to last us for all eternity!" "The Book of Clever Beasts" still stands first among the works of this author, in our opinion, and there have been ten since, and seven before that appeared.

How Phoebe Found Herself. By Helen Dawes Brown. Houghton Mifflin Company, Boston. $1.15.

Why is it so much easier to write good story books for boys than for girls? The former are legion, the latter can be counted on the fingers, with thumbs to spare. A measurable success is attained in this chronicle of the good works done and the sunshine shed by Phœbe, returned from college. It may be that her example will have a wholesome effect upon dissatisfied college girls who desire to be something besides daughters, but the veil drawn by the author over Phœbe's sweet superiority is rather too diaphanous for sharp young eyes.

Inner Flame (The). By Clara Louise Root Burnham. Houghton Mifflin Company, Boston. $1.25.

Mrs. Burnham has added another to the long list of bright, pleasant stories she has written. The young people in this particular tale are all possessed of unusual artistic ability, and in different ways are allowed to develop their gifts of painting, singing, dancing, and writing—a remarkable quartet. There are bits of humorous talk and clever reflections of modern life in city and country, while underneath all works the "philosophy" disseminated through "a little black book" modestly described as a commentary on the Bible.

New Trails in Mexico. By Carl Lumholtz. Charles Scribner's Sons, New York. $5.

Any new volume of description and travel written by the author of "Unknown Mexico" and "Among Cannibals" is sure to receive attention, for Mr. Lumholtz is a cheerful and graphic narrator as well as an intrepid explorer. The "new trails" here described are along the upper part of the Gulf of California and east of the Colorado River, and the journeys recorded were made in 1909 and 1910. There is much told about regards Indian life, ancient customs and superstitions, and the like that is little known, and Mr. Lumholtz makes it all, together with his personal adventures, decidedly entertaining as well as informative. The book is beautifully printed and illustrated.

Flower of Gloster (The). By E. Temple Thurston. Dodd, Mead & Co., New York. $2.50.

A pleasing and delightfully illustrated account of a leisurely, irresponsible journey made by barge through English canals. The author's reports of his talks with the people he ran across make good story-sketches, as might be expected from so good a novelist as Mr. Thurston.

Around the Clock in Europe. By Charles F. Howell. Houghton Mifflin Company, Boston. $3.

The author in this "travel-sequence" works on a novel, odd, and picturesque plan. We have here a dozen papers of description and impressions of famous places, large and small, each scene at a particular hour of the day. Thus we are at Edinburgh from one to two in the afternoon, at Antwerp from two to three, and so "around the clock" until midnight comes at Venice and one o'clock strikes at Paris. Apart from the charm of impressionism which attaches to this scheme it must be added that the author has caught admirably the atmosphere and tone of the places described, and this is

even more noticeable with the small places, such as Prague and Scheveningen, than in the great cities like London and Rome. The book is printed with true taste, and the publishers have had the good judgment to make the illustrations for each of the twelve articles few and fit.

Omens and Superstitions of Southern India. By Edgar Thurston, C.I.E. McBride, Nast & Co., New York. $3.50.

Those who are interested in the evil eye, in snake worship, in votive offerings, in charms and divinations, will find much to their taste in Mr. Thurston's volume.

Pilgrim Life in the Middle Ages. By Sidney Heath. Houghton Mifflin Company, Boston. $3.

Mr. Heath's volume is one to be enjoyed by every lover of the romantic and religious in history. Pilgrim life was a very real life in the Middle Ages, and, fortunately, it has left certain memorials, as any one knows who has followed the famous road still remaining in its entirety running along the English Downs from Winchester to Canterbury. The present volume has to do with England only.

Gates of the Dolomites (The). By L. Marion Davidson. The John Lane Company, New York. $1.50.

A welcome addition to the growing literature of the Dolomite country. Neither the map nor, for the most part, the photographs, are what one might wish, but the author's accounts of his journeys (and especially those made on foot to the less accessible parts of the region) are readable and full of suggestions to others who may be wise enough to want to get off the ordinary tourist's route, beautiful as that is in itself.

Camera Crusade Through the Holy Land (A). By Dwight L. Elmendorf. Charles Scribner's Sons, New York.

The author is widely known through his illustrated lectures. Here are a hundred large and fine photographs accompanied by a graphically written account of the "crusade" in which they were taken. The pictures do bring out vividly (as was the author's purpose) the meaning of the passages from Scripture attached to them.

John M. Synge and the Irish Dramatic Movement. By Francis Bickley. Houghton Mifflin Company, Boston. 75c.

This small but comprehensive and interesting book gives a résumé of the rise and development of the Irish Theater, of the little group of Irish playwrights and Irish poets, and an analysis of Synge's plays, with a few biographical details. The book is compactly written; the criticism is pointed and judicious. Without over-laudation, it emphasizes the strong points, the salient characteristics, of Synge's very striking work. He was far and away the most original writer whom Ireland has produced for many decades, though not all the Irish in this country were open-minded enough to recognize this, lacking either the imagination or the knowledge which would have made his work intelligible to them.

Personal Traits of Abraham Lincoln. By Helen Nicolay. The Century Company, New York. $1.80.

An interesting and well-written personal sketch, based on material left to the author by her father, the private secretary and official biographer of the great President. It is a valuable addition to our personal knowledge of the lovable man.

Retrospection, Political and Personal. By Hubert Howe Bancroft. The Bancroft Company, New York. $2.

Advertised as an "analytical review of the century," this is something more than a history of the course of American life during the past hundred years. It is rather a critical exposition, with the emphasis on the critical; its distinguished author, so favorably known for his monumental history of the Western States, voices his sentiments freely with regard to those phases of the National evolution which seem to him to call for condemnation. Not so many years ago much that he says would be bitterly resented—and undoubtedly he is at times unduly severe—but we of to-day realize the force of his charges, and are even now in the midst of a reformatory movement which is bound to have far-reaching effects for good. It is a book vigorous, vivid, forceful, lacking perhaps in orderly arrangement, but exhibiting so clearly the causes of the present political unrest and upheaval that it ought to be widely read.

Causes and Effects in American History. By Edwin W. Morse. Charles Scribner's Sons, New York. $1.25.

This compact volume, which tells the story of the origin and development of the Nation, is so obviously useful that one wonders why it has not been written before. It is only superficially a political history; for the most part it ignores details; but it presents clearly those causes which have operated to create a nation on this continent—causes which are religious, ethical, economical, and political, and which have not only directed the growth of the Nation, but have entered into and largely shaped the character of the Americans. Mr. Morse has written an informal history of the soul of America as revealed in the larger and more significant events in its history. It is a colossal fairy tale, and every man, woman, and child in the country ought to know it. It is not too much to say that Mr. Morse's book ought to find a place in all schools and public libraries, and in every home where the endeavor is made to make children intelligent American citizens.

Billy Fortune. By W. R. Lighton. D. Appleton & Co., New York. $1.25.

An amusing story of the "cow country" of Wyoming, in which various things happen to Billy through his admiration for various young ladies who always seem to belong to some one else.

LETTERS TO THE OUTLOOK

THE GEORGE JUNIOR REPUBLIC

I should like to explain to the Outlook readers who may have gathered a different impression that the temporary resignation of Mr. Thomas Mott Osborne, the President of the Board of Trustees of the George Junior Republic Association of New York, had absolutely no bearing upon Mr. George's decision to remove his home from the Freeville Republic. That decision was arrived at quite independently, and for the following reasons: First and foremost, he found that while he still resided at the Freeville Republic, although having no official connection with the work, it was affirmed that it was dependent for its success upon his personality. He wishes to demonstrate beyond the possibility of contradiction that a Junior Republic is founded upon principles of immutable right, the successful working out of which is dependent neither upon himself nor any other individual. Secondly, so long as he was on the grounds it was inevitable that helpers and citizens should constantly turn to him for advice and counsel, which naturally he could not well withhold. This, however, placed him at times in the embarrassing position of appearing to thwart by indirection the plans of those locally in authority. Finally, as Mr. George's duties as National Director of the eight Junior Republics now in existence, as well as his plans for the founding of new Republics throughout the Union, become more and more engrossing, it becomes increasingly important that his time should not be encroached upon by petty matters of purely local concern.

LYMAN BEECHER STOWE, Secretary.

THE PANAMA TOLL QUESTION

I agree very thoroughly with the views you express in your issue of October 5 on the question of the Panama Canal tolls. The administering of the Canal is one thing, the regulation of our coastwise trade is another. We cannot discriminate between any two nations, ourselves being one of them, in the question of tolls or in the price we charge for coal or oil. But our coastwise trade is something with which "other nations" have nothing to do and in which they have no interest. The meaning of the term had already been extended to cover a voyage from New York to San Francisco via Cape Horn. No nation can say that it did not understand that a voyage between ports of the United States on opposite sides of the continent would fall under the definition of coastwise trade, from which they were entirely excluded. We should have no right to complain if any foreign nation paid their merchant ships the sums paid us in tolls. Subsidies, or extravagant payments for carrying the mails, are matters of domestic economy with which outsiders have nothing to do.

It might be added that we have received no valuable consideration from England for the burden of building the Canal. It would have been out of the question for her to have undertaken the work; it was a great risk for us to assume. We received something from France and from Panama, and paid them liberally. Why should England complain if all foreign commerce is put on the same footing and our coastwise trade, in which she does not and cannot compete, is franked? It gives no "other nation" an advantage over her.

A complication might possibly arise if products of the Pacific coast were brought to an Atlantic port and afterwards reshipped to Europe. Suppose Oregon and Washington lumber is brought to a convenient port, say Mobile, on the Gulf, and mixed with Southern pine and shipped to Europe. It might be that the dollar a ton saved at Panama would more than cover the expense of unloading and reloading. This might give us an advantage over other nations, but a law could be passed forbidding such a practice, and doubtless would be on the representation of foreign nations. At best the contingency is remote.

The position of England and Germany is an attempt to interfere with the regulation of our internal commerce. This is something entirely outside of the domain of international law. No nation would tolerate for a moment an attempt to interfere on the part of an outsider with its control of freight rates in its territory, or of rebates. It is a matter of domestic economy in which we may make mistakes, but cannot infringe on the rights of others, because they have no rights.

CHARLES F. JOHNSON.

Hartford, Connecticut.

VICTOR HUGO ON IMMORTALITY

The Outlook's editorial upon "The Habit of Immortality" some time ago was exceedingly interesting and helpful to me. In reading the article by Mr. Bacon, "The Argument for Immortality," I was reminded of the remarkably beautiful and impressive essay on "Life and Death" in Victor Hugo's "Intellectual Autobiography." I shall not undertake to trace the argument, but wish to quote a striking passage toward the conclusion which is to me very suggestive, to say the least. He says:

"An idea has crossed my mind. Can it be a glimmer of light?

"Two men are talking of the future life. One affirms it, the other denies it. One says: 'There is no death; my *I* will persist; I feel in me immortality; I call myself soul.' The other says: 'There is nothing after death; my *I* will be eaten by worms; I shall die completely; I feel that there is no to-morrow for me; I name myself dust.'

"By what authority do these two men speak? By the authority of intimate conviction. The affirmative of one and the negative of the other have no other source than intuition. Intimate feeling, intimacy itself, the great and holy voice that whispers mysteriously to each soul. In the present case this voice contradicts itself; to the ear of one it says, '*Immortality*;' to the ear of the other it says, '*Nothingness*.' . . . Can it be possible that both these men speak the truth?

"Dante has just written two verses. While he leans on his elbow, meditating, the first verse says to the second: 'Do you know what, brother? We are immortal! I feel in myself life everlasting; we are born for glory; I have the conviction that I shall live through the ages.' The second replies: 'What a dream! I feel that I shall not live a day; I have death in me; I am not.'

"At that moment Dante came out of his reverie, took up his pen, re-read the two verses, and erased the second.

"Both were right.

"Are there sketches of souls which feel themselves but sketches, embryo individualities destined for recasting, beings who are mere essays, who shall disappear in nothingness, and who have the consciousness of it?

"Are there men whom God blots out?"

T. W. Rainey, Dean.

Oswego College, Oswego, Kansas.

MORE MORGUE MEN

The interesting and informing article of Mr. Lewis E. Theiss, in your issue of September 14, describing the biographical department of the modern metropolitan daily, appeals to the writer as one of the best arguments for and expositions of the practical value of specialized libraries that he has read.

Just as the newspaper's "morgue" furnishes information and facts about people, just so does the special library furnish facts about things and events. Anything that appeals to the newspaper man as a money or time saver certainly should appeal to the professional or business man as well. The special library idea has been admirably worked out in many kinds of business to the advantage of all concerned.

Public libraries are developing, for example, special technological libraries for the benefit of the expert and the artisan; special libraries on the problems of municipal government for the benefit of municipal officers; also business men's branches in which the statistics of commerce, trades, and manufactures may be had without delay. State libraries are furnishing the accurate data of political science, economics, and sociology to busy legislators that they may legislate in accordance with modern conditions. The practical man of affairs is coming to realize the advantage to his employees, and through them to himself, of having in his business or manufacturing establishment a select reference library of the literature pertaining to his work. Public service corporations, banking houses, insurance associations, State tax commissions, automobile manufacturers, and many others are among those who have already turned such libraries into money-making institutions.

Special libraries need specially trained library workers to run them. Where is the information? is the important question, not, What is it? And it takes a person thoroughly familiar with filing systems, classification, indexing, cataloguing, and cross-referencing, as well as acquainted with the subject-matter, to produce with the least possible delay the bit of information that a high-salaried expert absolutely needs, but should not be compelled to hunt out himself.

Call it a "morgue" or a cemetery, or—what it really is—an enterprising information bureau, the special library idea has a practical investment value not generally realized.

Urbana, Illinois. John Boynton Kaiser.

AN EXAMPLE TO FOLLOW

Your recent remarks on "Medical Education" were of especial interest to me for the reason that we have been "doing things" in our town. Through the kindness of the physicians, we have introduced a system of medical inspection in our public schools that has created a great awakening in things medical. We try to prevent disease, and in that effort we have the co-operation of all the pupils in the schools, and through the pupils we have the help of the parents. Every child is examined thoroughly by the physicians and the dentists without a cent's cost to the taxpayer, and, in addition to this, our teachers teach practical hygiene in every grade; and as a result we have almost stamped out preventable diseases. Every one is enlisted in making the town sanitary. We rarely have a case of contagious disease, and we have decreased the death rate in pneumonia and tuberculosis by having taught the people that fresh air is their friend even when asleep. A diplomatic school man may enlist the support of physicians in every town to give free medical inspection. They are anxious to co-operate, because they realize that it places their profession upon a higher plane and gives them an opportunity to practice preventive medicine.

Theodore B. Shank, A.M.

Jeannette, Pennsylvania.

WHAT A REACTIONARY IS

A correspondent sends us, clipped from some unknown newspaper, this definition: "A reactionary is defined by a Chicago lawyer as one who thinks more of his church than he thinks of his religion, who thinks more of his college than he thinks of his education, who thinks more of his party than he thinks of his country."

BY THE WAY

At a sale of first editions in London recently the works of the inexhaustible G. P. R. James, 139 volumes, brought $127—almost precisely the sum realized by the sale of a first edition of the one volume that made Lewis Carroll famous—"Alice in Wonderland."

The huge paintings required as scenes for theaters are now, according to an article in the "Scientific American," painted with the canvas lying flat on the floor, instead of, as formerly, in an upright position. In this way the work can be done much more rapidly. The colors used are in powdered form, a barrel to each color.

Any one who has an unused thirteen-cent United States postage stamp printed on blue paper would do well to hold on to it rather than to use it on a letter or package. A stamp dealer who has heretofore sold these stamps to collectors for $62.50 each announces that after November 1 the price will be $75. Four thousand of these stamps were originally printed, but less than a hundred are known to exist at present.

An American woman who has visited both the Froebel kindergartens and the schools in which the Montessori methods have been adopted in Rome says that the children in the latter schools are far beyond those of their own age in the other schools in their studies and in general mental development.

Such has been the popularity of moving-picture shows, according to an article in "McClure's," that one of the promoters of these enterprises not long ago proposed to lease the Metropolitan Opera-House in New York City for their production, and offered a rental of $150,000 a year; this being refused, he is now building a moving-picture theater in Harlem which will seat even more people than the Opera-House.

The dairy cow owes a salute to the "Country Gentleman" for the fine compliment paid her by that journal in saying that "civilization and the dairy cow are closely associated." As a food producer, says the "Country Gentleman," the cow returns eighteen pounds for every hundred pounds of feed given her, while her nearest competitor, the hog, returns only fifteen pounds, and the hen, with all her cackling, gives her owner but a scant ten pounds of food in return for his investment of a hundred.

A witty headline in a daily paper precedes an inquiry as to the grammar of two lines in Trowbridge's poem "The Vagabonds," one of which ends with "Roger and I" and the other with "Roger and me." Both are pronounced correct, the simple explanation being given in the heading, "Circumstances Alter Cases."

A pigeon recently flew from Niagara Falls to New York City in 6 hours and 33 minutes, or at the rate of nearly seventy miles an hour. While the aeroplane can beat this rate, it will probably be some time before an aviator equals this record for a flight between the two places.

Carl Schurz, according to an article in the current "Century Magazine," never succeeded in really becoming an American. "If I should live a thousand years," he once said, "they would still call me a Dutchman." And yet the article declares that "no man of his time spoke so well or wrote to better purpose."

In spite of the complaints of hard times for the railways because of increasing Government oversight and control, recently published statistics show that they have made a relative gain in the last decade. In 1900 the percentage of net return to the railways on their capital was only one-quarter as great as that on manufactures. In 1910 the percentage had increased to nearly one-half. Manufactures in 1900 returned 17.119 per cent profit, railways 4.650; in 1910 the figures were 12.041 per cent for manufactures and 5.729 for railways.

"Not many years ago," says a writer in "Office Appliances," "American business propositions in the West Indies were considered more as objects of distrust and ridicule than as means of commercial success. To-day one can go throughout the British West Indies and find American business methods and American office appliances displacing the long-established European systems of doing business."

The Hamburg-American Line is to institute a fortnightly service from Boston to Hamburg, beginning next May. But New York City is to keep the big vessels which the line is now building, through the extension of the piers to accommodate 1,000-foot steamships.

Good manners on the part of employees toward customers are a recognized business asset; good manners on the part of employees toward each other ought also to be required in a well-conducted commercial establishment. A visitor to a department store in New York City was recently disenchanted as to the pleasant conditions in which its employees were supposed to work by a loud-voiced, imperious command, "Miss Blank, come here!" Obedience to authority does not require harshness of language in issuing orders.

A hint for the man who likes to work about the house: To avoid splitting a board when driving a nail, says a mechanical magazine, cut off the point of the nail with pliers; such a nail will punch rather than wedge its way through, and may be driven almost on the edge of the board without splitting it.

Parachutes for saving the lives of aviators who meet with accident in mid-air are being adopted in Europe, the Russian Government having, it is reported, ordered two hundred of them for its army aeroplanes. The parachute is strapped to the aviator's shoulders and unfolds automatically in case of accident.

Few book collectors ever have the luck which befell the Vicomte d'Ollone in a little transaction described in his recently published work entitled "In Forbidden China." A very rare manuscript was offered to him in a Chinese city by an agent who asked the large sum of $200 for it. The Vicomte became suspicious as to the real ownership of the document, and on questioning the seller the Chinaman suddenly decamped, leaving the manuscript in the hands of the Vicomte. Being unable to find the real owner, Vicomte d'Ollone thus came into possession of one of the chief treasures of his collection.

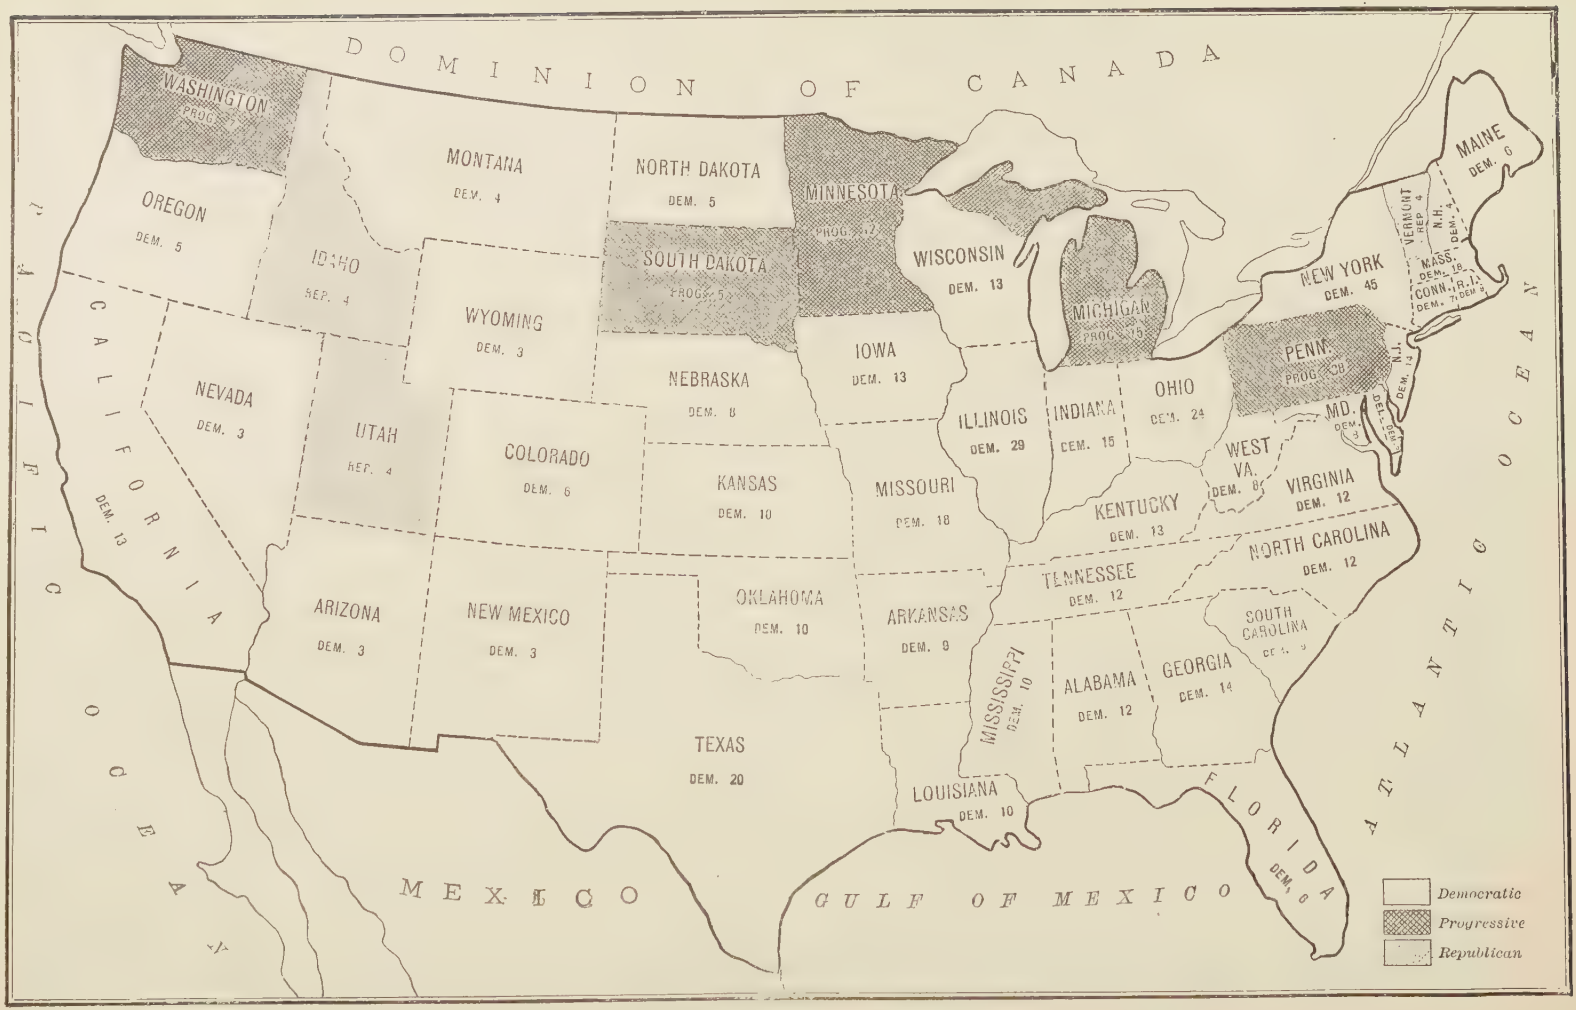
Contributing Editor

The Election: The Presidential Vote

Since the Civil War the Democratic party has not been in control of all three branches of the Government except during the latter part of President Cleveland's second Administration. From March 4 next the new Democratic President will have the support of a majority both in the Senate (although there is a possibility of this failing) and in the lower house, and his party will, when united, have full power and full responsibility. The exact total number of votes to be cast for the Presidential candidates in the Electoral College was in doubt even as late as four days after the election because of the delay in securing full returns from remote districts in two or three doubtful States. On the following page will be found a map indicating graphically the number of the electoral votes in each State and the way in which they will be cast. If California's thirteen votes and Illinois's twenty-nine votes go to Wilson, the total Wilson vote in the Electoral College will be 442, or 176 more than the 266 necessary to a choice. Mr. Roosevelt carried Michigan, Pennsylvania, South Dakota, Minnesota, and Washington, with a total of seventy-seven electoral votes; Mr. Taft, Idaho, Utah, and Vermont, with a total of twelve electoral votes. Reports as to the popular vote the country over are still incomplete, but it is not far from 15,000,000 (divided approximately into three and a half millions for Mr. Taft, four millions for Mr. Roosevelt, over six millions for Mr. Wilson, and the rest for the Socialists and minor parties), while the total popular vote in 1908 was 14,887,133, divided as follows, so far as the three largest parties were concerned: Republicans, 7,679,006; Democrats, 6,409,106; Socialists (including the Socialist Labor party, about 14,000), 434,645. Governor Wilson, with all his large majority in the Electoral College, did not receive a majority of the popular vote. If the estimate given above is correct, the growth in the total popular vote in the last four years has been astonishingly small, and it is at least possible that completed figures will increase the total above estimated. The Socialists claim in the neighborhood of a million votes, and it seems unquestioned that, even if their 1908 vote has not been doubled as they hope, it has been substantially increased. It is not correct, as some commentators have done, to add together the Taft and Roosevelt votes and judge from the total how a straight-out contest between Republicans and Democrats would have resulted, because, on the one hand, many non-Progressive Republicans voted for Wilson, and, on the other, many Democrats voted outside of their party lines in both directions. The total Democratic vote as estimated is about 300,000 less than in 1908. That is, Mr. Wilson, who is elected, received a smaller vote than Mr. Bryan, who was defeated. The deductions to be drawn at large from the results of the Presidential election are discussed on another page. In Governor Wilson's statement made the day after election he said:

> The result fills me with the hope that the thoughtful progressive forces of the Nation may now at last unite to give the country freedom of enterprise and a government released from all selfish and private influences and devoted to justice and progress. There is absolutely nothing for the honest and enlightened business men of the country to fear.
>
> No man whose business is conducted without violation of the rights of free competition and without such private understandings and secret alliances as violate the principle of our law and the policy of all wholesome commerce and enterprise need fear either interference or embarrassment from the Administration.
>
> Our hope and purpose is now to bring all the free forces of the Nation into active and intelligent co-operation and to give to our prosperity a freshness and spirit and a confidence such as it has not had in our time.



THE VOTE BY STATES

Summary of Electoral Votes: Wilson, 442; Roosevelt, 77; Taft, 12. This is on the suppositions that California's votes are given to Wilson and Idaho's votes to Taft, both of which were in question when this map was drawn

The Election: Congress

The apparent result of the election has been to make Congress Democratic in both branches. Thus the balloting gives the Democrats full control at Washington for the first time since 1892. So far as the House of Representatives is concerned, the outgoing Congress—the Sixty-second—was already Democratic. It now becomes doubly so in majority; indeed, it is anticipated that the majority may considerably exceed a hundred and fifty over the combined Republican and Progressive strength. The Progressive strength will exceed sixteen, so it is said. The Senate is more evenly divided, the effect of more complete returns from the doubtful States being to cut down the estimated Democratic majority. The present returns, however, leave little doubt that President-elect Wilson will have the support of half the membership of the Senate, which—with Governor Marshall, of Indiana, in the chair as Vice-President with the casting vote—would mean the control of the upper house. A full Senate consists of ninety-six members. The terms of one-third of the Senators expire on March 3, 1913. Because of the deaths of Senators Hughes, of Colorado, and Heyburn, of Montana, and of the ousting of Senator Lorimer, of Illinois, there is a total of thirty-five seats to fill. Several Senators have already been elected by the State Legislatures: for instance, Senator Bankhead, of Alabama, has already been chosen to succeed himself; Representative James, of Kentucky, has been elected to succeed Senator Paynter, and Representative Ransdell, of Louisiana, to succeed Senator Foster. Senators Martin, of Virginia, and Fall, of New Mexico, have already been chosen to succeed themselves, and Senator Vardaman, of Mississippi, has been named to succeed Senator Percy. Of the Republican Senators holding over and likely to be elected, at least ten have called themselves Progressives, though not as many have supported the Progressive party. As to the appearance of the new Congress, its most striking feature at first will probably be not so much the presence of new members as the absence of old. In the House a large number of picturesque and interesting men have failed of re-election, among them ex-Speaker Cannon and Representative McKinley, of Illinois; Representative Crumpacker, of Indiana; Representatives Currier and Sulloway, of New Hampshire; and Representative Hill, of Connecticut. In the Senate Mr. Crane, of Massachusetts, and Mr. Bailey, of Texas, retired voluntarily; Mr. Dixon, of Montana, and Mr. Bourne, of Oregon, failed of re-election. A defeated candidate at the primaries was Senator Curtis, of Kansas; he was worsted by Governor Stubbs; Mr. Stubbs, however, is now himself defeated by his Democratic opponent, Mr. Thompson. Another defeated candidate at the primaries was Senator Cullom, of Illinois; he has served longer in the Senate than any other living Senator, and his political activity dates back to the days of Lincoln.

The Elections in the States

Naturally, the same public sentiment that resulted in the election of Mr. Wilson showed itself in the State elections by the success of many Democratic State tickets. About two-thirds of the States elected Governors, and a large majority of these are Democratic. In these State elections the Republican party did not suffer as severely as it did in the Presidential election. In several instances it happened that the Republican candidate for Governor was either elected or nearly elected, while the Republican electoral ticket of the State stood third. In Minnesota, for example, in which Roosevelt stood first, Wilson second, and Taft a poor third, the Republican nominee for the Governorship was chosen. The local organization is always chiefly interested in the local ticket, and withstands most vigorously any attempt to dislodge it from control over local offices. This partly explains the way in which a number of Republican State tickets survived the shock of battle which routed the National Republican organization. In some cases, moreover, the Republican ticket successfully appealed to a large number of Progressive voters. Among the State tickets chosen that of New York easily stands out as most conspicuous. This is due to the fact that the Progressive nominee, Mr. Oscar S. Straus, is a man not only of National but of international reputation. His vote was surpassed by that of each of his two chief opponents. The successful candidate, Mr. Sulzer, has for years been a member of the Tammany organization. He is the first member of Tammany to sit in the Governor's chair since the days of Tweed. His election is a proof of the political astuteness of the Tammany leader. By means of this election Mr. Murphy becomes the Democratic leader of the largest and richest State

in the Union. The National Democratic victory has also carried into power the other two members of the so-called Murphy-Taggart-Sullivan triumvirate. In Indiana the Taggart Democratic machine, with Mr. Ralston as its candidate, triumphed over the Progressives headed by Senator Beveridge; and in Illinois the Sullivan Democratic machine, with Mr. Dunne as its candidate, triumphed over the Republicans, who were second, as well as over the Progressives headed by Mr. Funk. In Ohio the Progressive State ticket was third in the race, which was won by the Democrats, who made Congressman James M. Cox successor to Governor Harmon. Winston Churchill, who was early the leader of the Progressive movement in New Hampshire, and was the Progressive nominee to succeed his Progressive associate, Governor Bass, was defeated. In Massachusetts Governor Foss was re-elected as a consequence of the general Democratic landslide, but the Legislature remains Republican. In Connecticut Governor Baldwin was not only re-elected over his opponents, Judge Studley, Republican, and Mr. Herbert Knox Smith, Progressive, but was given a Democratic Legislature. Among the Republican candidates for Governor several were in sympathy with the Progressive movement and had the support of Progressives. Among these perhaps the most conspicuous is Governor McGovern, of Wisconsin. By virtue of the Progressive support he has been elected, though his State voted for the Democratic Presidential ticket. One interesting feature of the State elections is supplied by Kansas. In that State certain voters are allowed to cast their vote by mail, but their votes are not counted until three days after those which have been cast at the polls. There were about three thousand of these votes by mail. So close was the contest between the Democratic nominee, Mr. Hodges, and the candidate of the Progressives, who controlled the Republican machinery, Arthur Capper, editor of the Topeka "Capital," that the result was not known before the mail vote was counted. Woman's suffrage gained a great victory. Of the five States in which the question was voted upon—Oregon, Kansas, Arizona, Wisconsin, and Michigan—Wisconsin was the only one which rejected it. Michigan now supplants California as the most populous State of those having woman suffrage. West Virginia adopted at this election State prohibition.

The Balkan War: The Bulgarian Advance

Following the Battle of Lule-Burgas, described on another page, last week's most striking events in the Balkan war were the Bulgarian attack upon Tchataldja and the capture of Salonika by the Greeks. Tchataldja is the name of the long line of fortifications about twenty-five miles from Constantinople and extending practically from the Black Sea to the Sea of Marmora. Thus the fortifications make a little separate territory of the city and surroundings of Constantinople—something like our District of Columbia about Washington, though without any separate political character. The battle spread out all along the line. It began at the northeastern end, near Derkos, a place located on the lake of the same name. Constantinople receives its water supply from this lake. At Tchataldja, as at Lule-Burgas last week, the Bulgarians found the Turks weakened by insufficient provision and more than ever disheartened by the successive defeats sustained since the war began. The Turks were repulsed from the principal points of the Tchataldja line. A horde of wounded, beaten, and demoralized soldiers has now fallen back to Constantinople, together with refugees from the near-by villages. Hence pillage and even massacre have been feared, especially among the hundreds of thousands of Christians in the capital. Conditions have improved because of the arrival of foreign war-ships—to one of them the members of the American School for Girls have been transferred. The presence of the foreign war-ships, and especially the conference of their commanders to agree upon methods of keeping order, have lessened the general alarm, and have given point to the notification of the foreign ambassadors at Constantinople that, if trouble occurs, they will immediately take whatever measures they may think necessary to protect the subjects of their countries. The armored cruisers Montana and Tennessee, now in reserve at the Philadelphia Navy-Yard, have been ordered to rush to Turkish waters to look after the interests of American citizens. The Montana and Tennessee are sister ships of 14,500 tons displacement and are among the speediest large vessels in the navy. An interesting and possibly historic event of last week was the transference of the Turkish Government's archives from Constantinople to Brusa, about fifty-seven miles to the southeast in Asia Minor. Brusa

was once the capital of the Turkish Sultans. Some of the harems in Constantinople have also been transferred thither—an even more picturesque and it is to be hoped equally significant event. It looks like the retreat of the Turkish social as well as political system before the advance of European civilization.

The Balkan War: The Advance on Salonika

At the end of last week the Greeks captured Salonika. This marks the close of the most brilliant campaign fought by the Greek army since classic times. In three weeks the Greek army has been able to overcome the supposedly impregnable Turkish defenses of the frontier and to fight its way, capturing town after town in Macedonia, to Salonika, the chief port of the Ægean Sea. Salonika is the second city of European Turkey. Next to Constantinople it has been the chief object coveted by the allies. It is not coveted by them alone, but also by Austria; for many years Austria has made no secret of her intention of proceeding southward to the Ægean: it is also no secret that if she had not felt so inclined of her own accord she would have been forced to it by Germany. The success of the Greek army has been doubled by that of the navy, which had already occupied the principal Ægean islands, and last week added to them the occupation of Tenedos at the entrance of the Dardanelles, an island famous in the Iliad story. A part of the Greek fleet was already in the Gulf of Salonika awaiting its prey. Of course the Greek papers are jingo, as usual, and declare that they will never give up any territory occupied by them; that remains to be seen. More significant is their declaration, first that the Turkish throne must be transferred to Asia Minor, and, second, that reforms for the benefit of the great population there must also be introduced. Last week's Servian advance was also extremely notable. The Turkish defeat at Kumanova was so complete that the pursuing Servians found the mountain passes to the south abandoned by the Turks; these passes, it was expected, would be the scene of desperate resistance. Thus one part of the Servian army was able to join the Bulgarians in their investment of Adrianople, the third city in Turkey-in-Europe; the other part has, it is reported, captured Monastir, the fourth city of European Turkey; it was formerly a Serb possession, and the majority of its inhabitants are still Slavs. In Albania the fortress of Scutari has not yet surrendered to the Montenegrins, who have, however, captured a number of other important cities. The Montenegrins have been welcomed by the Christian Albanians, but have been unwelcome to the Albanian Mohammedans. Divided religiously, the Albanians racially form a compact and distinct group, and aspire not only to autonomy but to independence—indeed, Germany, Austria, and Italy, it is said, have already agreed that Albania shall become an independent kingdom, under the Duke of the Abruzzi, brother of the King of Italy, as ruler. On the other hand, it is reported that Prince Ghirka, President of the Albanian National Commission, is to be proclaimed king.

The Balkan War: The Red Cross

Last week the American Red Cross appealed for funds to carry on relief work in Turkey. The appeal was signed by President Taft as President of the Red Cross, and by Assistant Secretary of State Huntington Wilson, Chairman of the Board of International Relief. As the appeal says, it is difficult to bring home to the people in this country the appalling suffering involved in a winter war in the Balkans. Communication is difficult there, and the cold is intense. Moreover, the fighting in the Balkan war is specially bitter and severe. To meet all this, the medical organizations available are entirely inadequate to care for the large number of wounded, who are in desperate condition. The British, German, and other Continental Red Cross Societies are sending parties of doctors and nurses with hospital supplies. But, because of the distance, the American Red Cross will not send expeditions; instead it earnestly appeals to the generosity of Americans to aid the sick and wounded. Contributions should be sent to the American Red Cross at Washington, or to Mr. Jacob H. Schiff, Red Cross Treasurer, 52 William Street, New York City, or to any other local Red Cross treasurer. We hope that the gifts from this country will be as liberal as possible, and that the American Red Cross will be an efficient aid in the general work of humanity in Turkey. An appeal for funds is also made by the American branch of the Red Crescent Society, an organization founded by the Turks on lines similar to those of the Red Cross. In the Red Cres-

cent appeal mention is made of the series of misfortunes which preceded the present calamity—the revolution and counter-revolution, the war with Italy, the cholera, the earthquake, and the devastating fires in Constantinople. The Greek Red Cross Society in Athens has an American committee to receive funds for the work of that society. A fund has also been established for aiding needy reservists to return to Greece and for assisting the families left behind here; the appeal has been strikingly successful. It may be added that not only have reservists gone back to the colors by thousands, but the would-be volunteers have had to be rejected in large numbers.

The Election in Cuba

The Presidential election in Cuba on November 1 attracted less attention than it deserves in this country because of the intense interest in our own political affairs. The choice of General Menocal, the Conservative leader who was defeated four years ago at the polls, is perhaps not of very much significance so far as his personal triumph over his Liberal opponent, Dr. Zayas, is concerned. That which is of great significance and interest, and that upon which the people of Cuba are to be cordially congratulated, is that once more a Presidential election campaign has been fought without serious disturbance; that the actual polling on election day took place in almost as quiet and orderly fashion as would be the case in New York or Massachusetts; and that a political revolution, from the party point of view, has taken place in entire conformance with law, and the result has been accepted quietly by the people of the island. It is true that there was some rioting in Havana a week or more before the election, and there were slight disturbances elsewhere; but there was certainly nothing like an organized attempt to settle political disputes by an appeal to arms, or to resist the will of the people. The significance of the absence of passion or rioting on election day is all the more noticeable because the defeated party contains the more radical and probably the more violent classes of voters. General Menocal evidently has the confidence of the business portion of the community and of the more conservative citizens generally. His triumph is largely a protest against various arbitrary acts on the part of the recent President, José Gomez; and it also seems to sustain the assertion made by the Liberals that Cuban finances have been mismanaged under the recent Administration, and that there have been at least suspicious circumstances relating to the financial conduct of members of the Government. General Menocal has much to do in order to restore the right relations between people and Government. But there is reason to hope that the affairs of the island are entering on a more hopeful condition than has existed since the withdrawal of direct control by the United States. Every year that passes without a breakdown of the republican form of government in Cuba adds to the confidence in the stability of that government, and to the hope that Cuba will little by little make itself a thoroughly self-respecting, independent, and efficient republic. That it will ultimately do so it is not unreasonable to expect, and so may the United States be justified in its unselfish attempt to establish Cuba on such a basis.

Career of Captain Brinkley

Captain Frank Brinkley, who died in Tokyo on the 28th of October, was one of the best known of the many able Westerners who went to Japan in the first decade after the visit of Commodore Perry, and who devoted their lives to the promotion of Japanese interests and prosperity. He was born in England in 1841, and sailed for Japan soon after the completion of his education. At the early age of twenty-six he was appointed to command the Japanese Royal Artillery, and four years later he became principal instructor in the Marine Artillery College in Tokyo. He afterward served as Professor of Mathematics in the Imperial Engineering College, and was appointed foreign adviser of the Nippon Yusen Kaisha, the most important steamship line in Japan. In 1881 he became the proprietor of the Japan "Mail," of Yokohama, and this influential English journal he managed and edited up to the time of his death. He also acted for many years as Tokyo correspondent of the London "Times." He was universally recognized as one of the leading authorities on Japan, and his knowledge of Japanese art in particular was wide and accurate. His "Japan" (London, 1901) and "Japan and China" (twelve volumes, London, 1903) were monumental works, and he was the author also of an Unabridged Japanese-English Diction-

ary and of the comprehensive article on "Japan" in the eleventh edition of the Encyclopædia Britannica. This article alone, if published separately, would make a good-sized volume. As a capable teacher, a judicious counselor, and a sympathetic interpreter of Japan to the Western world Captain Brinkley rendered valuable and distinguished service to the country of his adoption, and the late Emperor recognized such service by decorating him with the insignia of the Sacred Treasure and the Rising Sun. Captain Brinkley married early in life a Japanese lady, and his daughters, who are now young women, have been trained in England and are graduates of Girton College.

A Valuable Measure of Justice

The daily press reports a series of revised rules adopted by the Supreme Court of the United States, but applicable to all Federal courts. We hope that, in their spirit if not in their form, they may prove of value as a suggestion of reform to those of our State courts in which reform of procedure is needed. This revision is the work of a sub-committee of the Supreme Court appointed by the Chief Justice. The committee has had the advantage of expressions from the various Federal judges, bar associations, and prominent lawyers of the country. Our legal readers will look to law journals for detailed information respecting these rules. Their general object is to promote simplicity in proceedings, to expedite court procedure, and to prevent a reversal by appellate courts for purely technical errors in the court below. The matter of greatest popular interest is the rule respecting preliminary injunctions. It has always been the theory of the courts that preliminary injunctions shall not be granted without notice to the opposite party, unless immediate or irreparable loss or damage will result to the applicant before the matter can be heard on notice. But this theoretical rule has been suffered to fall into abeyance in practice, a mere statement in the papers before the court that such irreparable damage would ensue being often, if not generally, regarded as sufficient. Under the new rule the danger of such irreparable damage must be made to appear clearly from specified facts shown to the court under oath. It is further provided that the hearing on the injunction shall not be postponed later than ten days from the date of the order, and may be brought up upon two days' notice to the party obtaining such temporary injunction, if the party enjoined so desires. It is not probable that any rule issued by the Court will of itself prevent the injustice which has been perpetrated by the practice of issuing temporary injunctions without notice. But this rule of the Supreme Court has been obtained after much public discussion and much conference with both the courts and lawyers; and The Outlook thinks that there is reason to hope that it is not merely a rule authoritatively issued by the Supreme Court, but is also the expression of a purpose shared by the judges and the bar generally to put a stop to a custom which has grown up gradually and without deliberate purpose, and which has been increasingly felt to be unjust.

Home Mission Week

What are the churches going to do to bear their share of the burdens that modern social conditions have laid upon the people of this country? That, in substance, is the chief question that is to be presented to the churches next week. For three months there has been an organized attempt to call to the attention of the churches the pressing questions of home missions. These are not merely the questions involved in supporting struggling churches or itinerant preachers, as many people imagine; they are questions involving the life of the immigrant who finds a new home in a promised land; involving the great growth of cities, swamping the forces of religion with a moving, restless population; involving the lives of millions of Negroes in their movement toward new racial standards; involving the problems of the farmer and his wife, the woman earning her own livelihood, the child at the loom. Such questions as these have been presented in charts, diagrams, and posters. A great deal of material has been gathered together. The Rev. Charles Stelzle, 156 Fifth Avenue, New York City, is Executive Secretary of this Home Mission Week movement. He will be glad to furnish information on request to those who have not already been acquainted with the plan. There is not a church in the land that cannot in some way help to contribute to the solving of these great problems of our country. It is certain that if any task calls for the strength which religious faith supplies, it is this task of making this country a land of free, happy people.

A Change in the "Independent"

Our contemporary the "Independent" makes the following announcement, which has a special interest in these days of rapid change: "During the sixty-four years of its history 'The Independent' has been under the responsible control of two men as its proprietors, Henry C. Bowen and Clarence W. Bowen, his son. For its future direction and success his grandson, Hamilton Holt, will be responsible." Mr. Holt, who has been for many years the managing editor of the "Independent," has acquired Mr. Clarence Bowen's interest in the paper and becomes president of a corporation which has been formed to publish the paper. Dr. William Hayes Ward, who has been connected editorially with the "Independent" for forty-five years, remains the chief editor. The "Independent" has had a long and honorable career, and many distinguished names have been connected with its administration for nearly half a century. We offer to Mr. Holt and his associates, who are well equipped by training and experience for their work, our best wishes for the new journalistic era upon which they are entering. Intelligent and independent journalism was never more needed in the United States than it is to-day.

Craft Work and Convict Labor

Each year Congress is petitioned to pass a bill for "the protection of labor and industries from the competition of convict labor." Manufacturers throughout the country declare such competition "unfair and ruinous, demoralizing to all markets and business stability, convict-made goods being sold for less than the cost to us of manufacture." The Bureau of Labor has investigated 296 penal institutions with an average of 86,000 inmates. Of these 86,000, 10,000 were kept in absolute idleness; 21,400 were engaged in prison work—washing, cooking, cleaning; and about 3,000 were on the sick list. The remaining 51,000 were employed in some industry, the majority being "contracted out" to unscrupulous "bosses" who paid the prison authorities for their labor far less than that demanded of manufacturers by free labor. "To pay rent for a building and from one to two dollars per day for labor, in competition with free buildings and from twenty-five to fifty cents per day for convict labor, is ridiculous," writes a New York manufacturer. Were the sole end of imprisonment punishment, it would be well to forbid all work in penitentiaries, since prisoners dread nothing so much as being confined in absolute idleness. But modern science teaches that crime is a moral disease, the germs of which feed on idleness, and that the best reformatory results are obtained where convicts are given work that requires both mental and physical exertion—above all, tasks in which they become interested. According to this report of the Bureau of Labor, "prisoners have neither the incentive of gain nor love of the work. The best that can be said is that they prefer any kind of occupation to being confined in their cells." If penal industries are a continual menace to free labor and contribute little toward the moral improvement of convicts, might it not be advisable to introduce the handicrafts in these institutions? This would end all competition with mill or factory labor, as handmade goods can no longer compete with those manufactured by machinery. It would also benefit the prisoners by providing them with interesting work, which would exert a moral influence utterly lacking in their present occupations. The initial cost of such an innovation must necessarily militate against it, especially in those States in which labor is so profitable as to render convicts self-supporting. But it must be remembered that current expenses are only a part of the public burden; the initial cost of erecting penal buildings must be considered, as well as the apprehending and convicting of prisoners, the large proportion of whom have already "served their term," which shows that prisons, under existing conditions, are not conducive to moral regeneration. Indeed, many are moral pest-houses where contagion is rife. Especially is this true of jails. It being unlawful to compel unconvicted persons to labor, the State provides for them no work of any kind, and innocent persons are often detained many months in absolute idleness before the courts pronounce them guiltless. Could they employ this enforced leisure in learning one of the character-building crafts, they might later bless their unmerited confinement, instead of serving, as many do, a sentence for crime whose inception can be traced to the evil influences of the jail. Wherever handicrafts have been tried, results justify the assertion that ten years after their introduction into penal institutions statistics would show a great falling off in the number of convicts and a material decrease in expenditures, as

very few would return for a second, third, and fourth term, as is now so often done; fewer guards would be required, since the moral sense develops with such occupation, providing a greater safeguard to the community than all the punishments that man has devised. Many would be taken off the sick list, the curative power of craft work being now acknowledged by all physicians: gradually the efficiency of prison labor would increase, so that in the end the community would be taxed less instead of more for the support of these unfortunate brethren. One of the strongest arguments in favor of handicrafts is that so many manufacturers have been forced out of industries in which convicts are employed that *learning a prison trade no longer insures employment after release.*

International Ethical Movements

Bishop Brent, of the Philippines, is a religious leader who is also a statesman, and his recent Convocation Address has the breadth which is characteristic of a man who has the heroic and prophetic qualities of the missionary, not only abroad, but at home. Referring to the International Opium Conference held at The Hague at the beginning of the present year, and in which he bore a very influential part, Bishop Brent enumerates a group of international movements dealing with moral evils which are beyond the power of any single nation to combat, among them the African slave trade, the liquor traffic in Africa, and the opium trade. In dealing with these questions international action is no longer an expediency, but a necessity. For the unity of human life has ceased to be an academic idea and become a fact to be reckoned with for purposes of self-preservation as well as for other and nobler reasons, such as the protection and benefit of the weaker and less privileged. We are reaching the stage of national and racial intimacy when the problem or the opportunity of one people will be recognized, without dispute, to be the problem or the opportunity of all. The course of progress has been consistent—individuals grouping into families, families into clans, clans into nations, nations into federations, and now we are moving towards a more inclusive combination. The International Opium Conference was not artificial or forced; it came as a natural climax of a movement which originated as an effort on the part of the Chinese to rid themselves of a vice with which they were saddled. The committee appointed by President Taft nine years ago, when he was Governor of the Philippine Islands, to investigate the methods of opium control in countries of the East for the purpose of forming legislation for the Philippines, visited Japan, Formosa, China, the Straits Settlements, Burma, and Java. Their report was translated into Chinese, and was a factor in calling forth the Imperial edict of 1906 prohibiting opium-smoking in the Chinese Empire. In the same year Lord Morley declared in the House of Commons that the Indo-Chinese opium trade was "morally indefensible." The success of this movement led to the calling by President Roosevelt of the International Conference which met at Shanghai in January three years ago, and at which thirteen nations were represented.

From Moral to Religious Unity

From these evidences of moral unity Bishop Brent declares that it is but a step to the world movement in aid of religion, and reports the progress of the preparations for the World Conference on Faith and Order. He purposely avoids the phrase "reunion of Christendom" because that suggests recalling something lost, the bringing back of a treasure from the storehouse of the past. "The unity that is to be must come from above," he says. "It must be far superior to that which once was, if it is to endure." In the past men planned and won a definite unity, and their theory of unity was expressed in the organization of the church and of the empire. It was a unity which was successful in its adaptation to the times which gave it being. But the world has outgrown the phase of progress which it represented. It was too blind to diversity, too insistent upon uniformity, with a maximum of regard for the form and a minimum for the contents, and it grew to be scheming and tyrannical and corrupt. The Reformation stands, declared the Bishop, among other things, "for the salutary breaking of the existing Christian or ecclesiastical unity so far as its visible form was concerned." And Bishop Brent has a word to say which might profitably be read by those persons of his own communion who habitually deprecate the Reformation as violent and reactionary. "In a world of men no other course would have sufficed, conditions being what they were. Sometimes the standard of revolution is the only possible standard of

reform. In speaking as I do, I do not hold a brief for the individual excesses which followed in the train of the Reformation, but I would remark that only a world of gods or demigods could have done better." The unity which is now to be worked for must be manifested through holiness, catholicity, and apostolicity. Catholicity means the reaching out for every social group in a nation. Abstractly it is true that the Church's message rises above every distinction of class and conditions, but, Bishop Brent declares, the "defect of our own communion is that it is on too intimate, and possibly dependent, terms with respectability, though, as I believe, decreasingly so." The unity that is to be, Bishop Brent says, will be according to "God's now hidden will rather than to man's known idea. Many an advocate of unity expects the whole Christian world to come around to his way of thinking. That will not be the case. No human mind, no fragment of the Church, is big enough to hold in its integrity God's conception of unity." These are the words of a man of vision, who first launched the idea of a Conference on Faith and Order in his own communion, preached it from the pulpit of Westminster Abbey, and then persuaded the General Convention of that communion in the United States to give practical effect to his vision.

Women in Municipal Affairs

Women are taking a larger part in actual governmental affairs in Great Britain and Ireland than the average American appreciates. Under the various local government qualification of women acts they participate to a very considerable extent in local affairs. According to figures gathered by the "National Municipal Review," there are now in England and Wales three women serving on county councils, seventeen on town councils (two of whom are mayors of their cities), eight on urban district councils, one hundred and forty-five on rural district councils, and eleven hundred and seventy-five women who have been directly elected or "co-opted" as poor law guardians. In addition to the one hundred and forty-five women district councilors who act as guardians for the unions in which their districts lie, the number of parish councilors is considerable, although exact figures are lacking. In Scotland there are two women serving on town councils and seven on parish councils, while in Ireland there are three as town councilors, four as urban district councilors, and forty-four as rural district councilors, together with sixty-six who have been directly elected or co-opted, making a total of one hundred and ten women guardians. Women have been utilized to a very considerable extent in putting into force and effect the recent National Insurance Act, a measure for national health insurance and for unemployment insurance. There are also, according to the "National Municipal Review," two offices of health visitors open to women—health visitors and sanitary inspectors. Most of the "health visiting" in London is done by women who are qualified as sanitary inspectors.

The Farmer's Credit and the Cost of Living

Every one is suffering from the increased cost of living. As it concerns foodstuffs, the cost may be reduced in two ways. First, reduce the cost of producing the crops. Second, increase the production. By their educational facilities both the Federal Government and the State Governments have done much towards increasing crop production. With regard to reducing the cost of production, however, we have not done as much as has been done in Europe. A principal item in that cost is the interest paid by the farmer on the money he borrows. For borrow he must. We do not realize that each year our farmers have to have a borrowed capital of over six billion dollars in order to add between eight and nine billions to our National wealth. Their interest charge amounts to more than five hundred millions. Including commissions and renewal charges, the interest rate paid by the farmers averages no less than 8½ per cent. This is certainly high compared with the rates paid by our manufacturers and merchants. And yet the security to the lender offered by the farmer in his farm lands would seem to be as sound as that offered by our industrial corporations. The rate of 8½ per cent seems doubly striking compared with the 3½ and 4½ per cent paid by French and German farmers. Their lower rates are due to a system of popular agricultural banks, most of which are based upon the principle of co-operation among farmers, the united guarantees of the members of the banking association relieving any anxiety on the lender's part as to repayment of the money borrowed. This system was first put into operation in the Rhineland by the late Friedrich Raffeisen, Mayor of one of

the towns on the Rhine. Among others, President Taft has become convinced that the Raffeisen plan could be adapted to our conditions. As the establishment and conduct of such banks would be matters of control by the several States, Mr. Taft has commended the idea to the Governors of the States, and has invited them to discuss it with him in December at the White House at Washington, following the annual Conference of Governors, which occurs this year at the neighboring city of Richmond.

Land Mortgages

But the organization of these societies, formed to obtain personal credit, does not cover the entire field of agricultural co-operative credit. The rest is represented by what are known in Germany as *Landschaften;* that is, corporations formed to create a sound security in mortgages for the purpose of gaining a national market for bonds based upon farm land mortgages. In France this is done through the famous banking institution known as the Crédit Foncier. President Taft says:

> The chief advantage brought to farmers through such institutions are lower interest rates and easy amortization, whereby the borrowing farmer may repay his loan bit by bit, extending these payments over a long number of years. Thus his obligations are made proportionate to his annual receipts from the exploitation of his soil, and the danger of foreclosure is vastly reduced. To appreciate what this amortization plan would mean to the farmers of this country it is only necessary to consider the foreclosure records of some of our States.

As applied to America, uniform State legislation would be desirable to govern their organization and operation if a National success is to be secured. Hence another reason for the forthcoming White House conference. Mr. Taft also suggests that, "as a later step, it might prove advisable to urge the enactment by Congress of laws permitting the creation of National land mortgage bonds." While his other two recommendations will probably meet with deservedly favorable recognition, this last suggestion is likely to encounter the opposition immediately expressed by the New York "Times:"

> It is disheartening to find President Taft's reasonable and reasoned suggestion regarding agricultural banks turned into an unreasonable proposal that the National banks should assume that function. Those capable of advancing that idea have not grasped the rudiments of banking. There is a reason why National banks were not given the power which it is now proposed to confer upon them. The unlawful exercise of that power to a considerable extent explains the portentous fact that none of the several recent panics has caused any proportionate decrease in banking liabilities in the manner of earlier panics.

THE DEMOCRATIC VICTORY

I

WHAT DOES IT PROMISE TO THE COUNTRY?

The people have given the Democratic party a power of attorney to act for them in the National Government and in forty States for the next two years, probably for the next four years. What have the people a right to expect of their agent?

The people have a right to expect that the Democratic party will proceed to put in operation, honestly and courageously, the policies embodied in its platform as interpreted by its leaders in the campaign. The Outlook does not believe in those policies. But they should have a fair trial. If the result proves to be disadvantageous to the country, that will be a reason for changing them four years from now; but it will be no reason for criticising the men who, in obedience to the will of the people, put those principles in operation.

The people have a right to expect that the Democratic party will, as soon as the administration is organized, proceed with a radical reduction of the tariff; that in this reduction the ultimate purpose will be to get rid of all attempt to protect and promote American industry by taxation, and to make a tariff the sole object of which will be to get the largest practicable revenue for the Government with the least possible expense and friction in its collection. The people also have a right to expect that the party will proceed with this radical change cautiously and with an endeavor to produce as little disturbance in the business world as possible. We do not believe that such a radical change in the tariff can be honestly undertaken without producing a serious disturbance in the business world, but we shall be very glad if the event proves that we are mistaken.

In this revision the Democratic party has a perfect right to proceed schedule by schedule in order to prevent bargaining, and to avail itself of a non-partisan expert commission in order to obtain trustworthy information. We wish that it would do so. But we have no right to expect that it will do so. It

has made no promise to that effect, and its representatives have in their speeches condemned that method of procedure.

The people have a right to expect that the Democratic party will put in operation the processes of the law to break up monopolies wherever they exist, and to punish those who have created such monopolies wherever in so doing they have violated the law. This is the method which the Democratic party has proposed to the people for destroying monopoly, and the people have adopted the method. The Outlook does not believe that it will prove effective. But the people have a right to demand that it have a fair trial.

It is not uncommon in either English or American politics for a party, when given power, to employ methods which it criticised its opponents for employing. It is therefore conceivable that the Democratic party may decide to employ a bureau or commission to supervise the great corporations and so enable the Government to prevent the formation of monopoly; but there is no reason to anticipate this policy, which Democratic leaders have in public speeches condemned.

The people have a right to expect that the Democratic party will enact a Federal Workman's Compensation Act, and may reasonably hope that it will enact similar laws in the States which it controls, though a Federal platform cannot in strictness bind the party to State action; the people may further expect that the Democratic party will approve the rules respecting injunctions adopted by the United States Supreme Court, as reported on another page, and incorporate the substance of those rules in legislation; and the people have a right to expect that the Democratic party will prevent the abridgment of the right of laborers to organize for their protection if any one should attempt to abridge that right. But the people have no right to demand of the party such legislation for the promotion of social justice as prohibition of child labor, minimum wage and maximum hours for workingwomen, legislation for prevention of industrial accidents, and the like. There is no reason why the Democratic party, wherever it has the political power and the Constitutional right to act, should not borrow these policies from the Progressive platform and enact them into law; but the people have no right to demand that it do so, or condemn it for not doing so. For the party which promised to do these things they refused to intrust with power, and they gave power to the party which was silent respecting such legislation for the protection of wage-earners.

The people have no right to expect of the party any action tending to lessen the power of the bosses or to increase the power of the people—except in so far as the election of United States Senators by the people and preferential Presidential primaries may have some such effect. The Democratic platform is absolutely silent on this subject. So far as The Outlook knows, the Democratic speakers in the campaign were equally silent. The Democratic victory has strengthened the power of Murphy in New York State, of Sullivan in Illinois, of Taggart in Indiana—in short, of the boss in every State and probably in every district in the United States. The people by their vote have said either that they do not seriously object to boss rule, or that they disapprove the methods which the Progressive party proposed for getting rid of boss rule, or that they choose to postpone that issue till they have tried the Democratic method of dealing with the tariff and the trusts.

But the public expect and have a right to expect from the President-elect as much independence of boss rule as is possible to one who is the head of a party which is not and does not profess to be independent of it. They expect this independence of their President-elect, not from anything he has said, but from what he has done. Actions speak louder than words. And Governor Wilson's battle with a boss in New Jersey gives the people a right to expect that he will carry his battle with the bosses in the National Government as far as it can be carried without threatening his party with disruption.

The political issues of the future will be between a conservative and a liberal party—both democratic. The conservative party believes in a community of self-governing individuals; the liberal party, in a self-governing community. The conservative party believes in a government of limited powers, confining itself to the protection of individual rights of person and property, because it does not believe that the people are wise enough and strong enough to carry on a free government of comprehensive powers. The liberal party believes in a government of large powers, because it believes that the people are wise enough and strong enough to unite for the common welfare in a co-oper-

ative commonwealth. The people in this election, by a plurality—not a majority—have intrusted the government to the hands of the conservative party. They could not have found a better leader than Woodrow Wilson to represent them in the endeavor—though we do not believe that it can possibly succeed—to solve modern social problems by the methods of an individualistic democracy. Meanwhile it is permitted to hope that men of all parties, Prohibition, Socialistic, Republican, Progressive, Democratic, will spare no reasonable endeavor to secure both from Congress and from the State Legislatures legislation to promote social justice for men, women, and children of America who are dependent on their day's work for their daily bread, and to dissolve the unholy alliance between corrupt politicians and corrupt business.

II

WHAT DOES IT MEAN TO THE PROGRESSIVES?

There has been a perfectly natural growth and building up from the Progressive idea to the Progressive movement, and from the Progressive movement to the Progressive party. All three, in our judgment, are now permanently fixed factors in American political and social advancement, but, in any event, the Progressive idea has already had a victory in the impress it has made on the attitude and purpose of its opponents. When Governor Wilson, after his indorsement by the voters, expressed his hope that the thoughtful progressive forces of the country may unite, he did not use the word progressive in a party sense, but it is perfectly true that it was the birth of a Progressive party and a campaign by that party for social and industrial justice that drove the unprogressive section of the Democratic party to the rear and made possible the choice of a leader whose personal bent is toward the progressive idea, whatever may be said of the programme of his party's platform.

What the Progressive party has brought about, concretely as well as ideally, is remarkable. A great National party is not established in a day; the difficulties of organization in forty-eight States and innumerable counties and towns are formidable; the inertia of the average voter, and particularly of the Southern voter, is in a first campaign a serious obstacle. Yet at a bound the new party has taken second place, has distanced one of the old parties in the number of votes cast in the Electoral College, has polled more than four millions of votes in the popular election, and in hundreds of towns and local districts has put its candidates into office, and has established foundations upon which to build in the future. In more than four-fifths of the States it took either first or second place in the balloting of the three great parties. Progressive clubs and leagues will, we feel sure, everywhere make possible for the next four years full discussion of social needs and the right way to fight bossism and graft. Before the election the call had already gone out for a meeting in December to perfect and carry on the Progressive organization. Party, movement, and idea—all are for the future as well as for the present.

The Progressive campaign just ended has been one of education, and Progressive history in the near future will be that of more education. The proportion of men and women of trained intelligence in regard to human betterment who have become drilled officers, so to speak, in the Progressive army is large; the growth of the forces within three months is amazing; the prospect of new enlistment of convinced volunteers is limitless. In the reception of new political ideas the average man is slow of perception and cautious in movement, and the transition from excessive individualism to community of purpose takes time. But all who watched the recent campaign closely know that the movement for advance aroused interest among many thousands who never before went to political meetings, men and women who care nothing for "politics" but do care for clean streets in their village, clean business all over the country, clean and unbossed government locally and Nationally.

The Progressive "Contract with the People" was not an excited harangue nor a vague declaration; it was definite, specific, a pledge to remedy, by means plainly named, evils sorely felt. If other remedies are now applied and the evils disappear, well and good; if not, that contract will be ratified by the people.

The Progressive idea three months ago had become crystallized by strength of feeling. Those who held it were outraged by the "steam-rolling" methods at Chicago by which the majority of voters who had expressed a preference as to Presidential candidates were boldly robbed of their rights—a proceeding, we venture to say, never again

to be repeated in American political history. To what party, to what school of belief, should they turn? Not to outworn individualism, nor to impracticable Socialism. There was no party to which they could turn. So they created a new party inspired by the faith that the cure for the ills of democracy is more democracy, and that a government subject to the control of the people can be trusted with power sufficient to do the will of the people.

The four million men and women who voted for the Progressive party have a right to expect that the party organization which summoned them to the polls will continue for the purpose of interpreting the Progressive idea and developing the Progressive movement, in preparation for appeals to the people in the States and in the Nation whenever the occasion demands.

NOT A CASE FOR THE HAGUE

A correspondent of the Springfield "Republican" writes satirically apropos of the Balkan war:

> I have a faint recollection of having, at some time or other, heard or read of a place called The Hague. Does such a place really exist on the map of Europe, or has some cataclysm wiped it out of existence? It is connected, in some fashion or other, with peace congresses and with a permanent court of arbitration; at least, in my mind.

The Balkan war has illustrated and demonstrated the proposition, for which all conservative advocates of the Hague Tribunal have always contended, that there are international questions which cannot be submitted to arbitration. The Greeks, Montenegrins, Servians, and Bulgarians had no right to submit to arbitration the question whether they should be freed from the danger of the unspeakable Turk. It was their duty to free themselves from that danger just as soon as they had the power to do so. The right to life, liberty, and the pursuit of happiness is a right which no community may honorably and justly surrender at the bidding of any court, provided the community has the power to protect that right or its members.

"If it be possible, as far as lieth in you, live peaceably with all men." It was not possible for the people of the Balkan States to live peaceably with the Turks as their close neighbors. The message of Christ to them was, "I came not to send peace, but a sword."

BOOKS ON OURSELVES

The American who does not recognize himself when he reads the daily newspapers has a chance really to discover what manner of man he is by aid of a very considerable number of books of interpretation written by men who know America and the Americans, not from the standpoint of the morning and evening newspaper, not from the journalistic standpoint, but in perspective. Some of the things reported in the daily newspapers are true; but they are exaggerated by reason of the momentary prominence which they assume, and, instead of being spoken with proper emphasis, they are screamed through a megaphone. On the wide surface of human life as it is lived in America there is an immense amount of flotsam and jetsam, of eccentricities, oddities, and extravagances of all sorts and kinds. In other countries these matters are distributed over a great surface of local journalism, so to speak. In this country they are collected by the leading newspapers and put on the front page, so that the crimes, misdemeanors, accidents, and scandals of all the little villages from the Atlantic to the Pacific are spread out at great length in the "great dailies," which are indefatigable in seeking sensations.

The American has gone a long way since the publication of de Tocqueville's first standard work on America. The books that followed, like Mrs. Trollope's "Domestic Manners of the Americans" and Dickens's "American Notes," contained a good many facts, but not very much truth. They were too hasty; they were written without knowledge, and presented the facts without background. Mr. James Bryce's great work struck another note, and was an ideal piece of national interpretation, for which Americans will never cease to be grateful. During the past five years there has been a notable addition to the books which enable the American to understand himself. Mr. Brooks made a very interesting collection of foreign opinions in his volume "As Others See Us." Dr. Nicholas Murray Butler, in three extremely intelligent and thoughtful addresses delivered before the University of Copenhagen, defined the American in large but not indefinite terms; Dr. van Dyke followed with a group of lectures delivered at the Sorbonne on "The Spirit of America."

This autumn three delightful volumes are

added to this small but valuable library. Mr. Bliss Perry teaches from a very important Chair of Literature in Harvard University; but he is not a man of New England temperament, either of knowledge or of sympathy. He knows America, and he has the breadth of mind, the interest in human life, and the humor which have enabled him to enter into and to understand the American point of view and to sympathize with the American endeavor. His discussion of "The American Mind," "American Idealism," "Humor and Satire," and the "Individualism and Fellowship" of the American are luminous and humorous. They are the work of a man who is thoroughly at home in his own country, and who, although of academic training, tastes, and occupation, knows not only literature but life, and is quick to discern the possibilities of art when they are still more or less matters of promise in character and temperament. It is impossible to summarize the conclusions of a book at once so logical and so discursive as Mr. Perry's "The American Mind." Every page, however, gives one the impression that it was written by an American and not by a foreign discoverer, or by a native who looks at his own country from the foreign point of view. The absence of "tall talk," of the flamboyant note, and the presence of clear-cut sanity, precision of statement, and delightful humor give this book value far greater than that of many large volumes loaded with statistics.

Mr. Meredith Nicholson's path to reputation started from "The House with a Thousand Candles" and has been ascending ever since. His "A Hoosier Chronicle" was not only an interesting story, but an American document of high value. No one could read it without getting a sense of the neighborliness and informal helpfulness which are characteristic of the best American communities, and which express in near, intimate, and familiar ways Emerson's definition of America as "opportunity." "The Provincial American" of his new book is a person of simple background who has been kept in wholesome relations with realities through his whole childhood, and who grows up to be a man with an increasing consciousness not only of the pleasant things about his own home, but of his larger relation to the Nation, and of the fact that a man's home is not only the house he lives in, but the country in which he is a citizen. His description of General Lew Wallace—"our Hoosier Arab, our story-teller of the bazaars"—is a happy portrait of a typical American who was not a great writer, but who had a genius for telling stories to which people listened, and who was a resourceful, contagiously enthusiastic, and high-spirited and friendly personality. His account of Edward Eggleston is a chapter in American biography which throws more light on the American spirit than many pages of formal history; while "The Tired Business Man" is a protest against the excessive demands of affairs in this country, and an effective putting of the loss which a great many Americans sustain by impoverishing their lives for the sake of enriching their business.

Miss Repplier has the mind of an essayist; the habit of meditation, the grace of humor; the ability to say serious things easily and pleasantly. Her latest volume, "Americans and Others," contains two or three essays which are direct contributions to the American's knowledge of himself; and her whole volume might be filed as an exhibit of some of the best American intellectual qualities. She does not accept without qualification the current impression that Americans are entirely lacking in politeness. She is of the opinion that Americans are much too easily amused, and she supports her contention by referring to the current jokes which are provided for the entertainment of the country day by day, and to the comic supplements of the Sunday newspaper, which are "for the refreshment of the feeble-minded and calculated to blight the spirits of any ordinary intelligent household." She refers also to what might be called the standard joke forms—allusions to Philadelphia, Brooklyn, to Boston and Chicago, and also to the familiar jokes which have come down to us almost from colonial days, especially the connection of Washington and the hatchet. And she calls attention to the fact that the English do not joke about political corruption. It is to be hoped that the time is at hand when Americans will cease to joke on this subject.

The restlessness of the day in this country, of which many explanations are offered to a deeply interested Nation, is interpreted in terms of hope and progress in Professor Ross's "Changing America" and in "The New Democracy."

THE BALKAN WAR'S GREATEST BATTLE

WHO ever heard of Lule-Burgas? It might be the name of a person or a place or a thing. It is the name of a place, and the place is in Turkey, about fifty miles away from Constantinople, the capital. Lule-Burgas is a little town on the line of the railway running northwest through the Balkan Mountains to Sofia, the capital of Bulgaria, to Belgrade, the capital of Servia, and to Budapest, the capital of Hungary.

Unknown two weeks ago, Lule-Burgas has suddenly leaped into fame. For at Lule-Burgas a great battle has been fought. And not only a great battle in point of the numbers engaged on both sides; a great battle also in deciding the fortunes of a country—the Balkan peninsula.

As it always has had, so that peninsula still has Constantinople as its main city. For four centuries and a half Constantinople has been Turkish and Mohammedan. For most of this time the peninsula has been ruled by the Turks. But there is a mountainous region in the northwest called Montenegro (Black Mountain), which the Turk never could conquer. And there is a better-known region in the southeast—Greece, forming a peninsula by itself as an offshoot to the greater peninsula—which could not long endure the Turk as ruler, and nearly a hundred years ago obtained its complete independence. These examples were ever before the Christians in the northern part of the peninsula, the Bulgars and the Serbs. They can never forget that once they had empires of their own. But the Turk made an end of them at the battle of Kossovo in 1389. So the Turk was master of the Balkan peninsula for many years before he finally captured Constantinople in 1453.

The Bulgars and the Serbs are now free again—that is, those of them are who inhabit the kingdoms of Bulgaria and Servia, and, as such, are known as Bulgarians and Servians. But the race of Bulgars and the race of Serbs are not confined to those countries. Very many dwell in the Turkish provinces to the south. They are, of course, Christians. Indeed, in Turkey-in-Europe there are more Christians than Mohammedans. The Christians have been oppressed by the Mohammedans. They have always been oppressed. The men have been forced to pay unjust taxes, the women have been outraged or carried off to Turkish harems, the children have been kidnapped. And there have been wholesale massacres. Is it any wonder that the Bulgars and Serbs in Bulgaria and Servia have wanted to deliver the Bulgars and Serbs on the other side of their southern borders in Macedonia from such cruelty and compel the establishment of a decent government, or, failing that, to recapture a country once theirs and govern it? Is it any wonder that the Montenegrins had a similar desire as they looked across their southern boundary and saw how the Christian Albanians were being treated; or that the Greeks, as they looked north into Epirus, once theirs, and east into Macedonia, longed to help the hundreds of thousands of Greeks there?

So Bulgaria, Servia, Montenegro, and Greece decided to act in common, for what no one could do singly, all could do together. They waited until they thought Turkey was weaker than ever and they stronger than ever. Then, a month ago, Montenegro declared war and the others followed.

The Turkish army was caught unprepared. The Turkish soldier, says Mr. Ashmead Bartlett, the war correspondent of the London "Daily Telegraph," "proved himself as brave as ever" in his "stubborn determination and unparalleled hardiness." But the Turkish officials were "eaten up with pride and self-confidence, and, regarding all the Balkan States with the utmost contempt, believed the Turkish army to be invincible." Hence splendid human material was "sacrificed on the altar of stupidity, conceit, self-satisfaction, and the grossest ineptitude. . . . As long as I remained at Constantinople and was unable to see with my own eyes the true state of affairs, I was, perforce, obliged to accept the Turkish tales of their readiness for war, of their perfect organization, and of their immense superiority in numbers, until I came to share some of their confidence, judging by the deeds of the Turkish soldiers in the past that the Ottoman army must prove itself victorious in the end, even though it suffered some reverses at the commencement of the campaign. But from the very moment I arrived among the troops the great bubble burst and my great illusion was shattered. I found that the military authorities in Constantinople had deliberately deceived the outside world and had embarked on a gigantic system of frigid and

FROM SALONIKA TO CONSTANTINOPLE

calculated lying to keep the truth from coming out, hoping against hope that the bravery and determination of the Turkish soldier would pull them through at the eleventh hour."

But, even so, the struggle has been terrific. The decisive battle occurred last week at Lule-Burgas. Indeed, it began the week before. The war had not proceeded far enough for the four allies to join forces, so the Bulgarians fought alone against the Turks.

The Bulgarians won. Mr. Ward Price, war correspondent of the London "Daily Mail," who was with the Turkish army, tells about the Turkish front, stretching away for thirty miles "in an almost continuous battle line." But, before the struggle was over, the Bulgarians had routed two hundred thousand of those Turks. In the five days' fighting the Bulgarians captured, according to their own account, thirty-seven batteries of quick-firing guns, seized a number of locomotives and two hundred and fifty cars, and took several thousand prisoners.

As to the infantry, a chief feature, according to Lieutenant Wagener, war correspondent of the Vienna "Reichspost," was "the heroic assaults of the Bulgarians on the Turkish center. During the second day's fighting the Bulgarian infantry advancing at the charge were thrice hurled back. Yet, undismayed and unshaken by the appalling fire of the enemy, the Bulgarians started a charge for the fourth time, and finally captured the heights of Kavak Dere after a terrible fight at close quarters."

As to the artillery, a striking feature, according to Mr. Bartlett, was the superior handling by the Bulgarians of their cannon. As to the cannon itself, the Creusot gun, handled by the Bulgarians, "proved its immense superiority" over the German Krupp cannon, handled by the Turks. "But how far this was due to the weapon and how far to superior handling it is premature to say."

As to organization, "not a line of telegraph or telephone had been brought to the front," says the "Daily Telegraph" correspondent, "not a single wireless installation, although the Turkish army on paper possesses twelve complete outfits for its army corps; not an effort had been made to establish a line of messengers to connect the headquarters with the various army corps. Thus throughout the entire day Abdullah [the Turkish commander] remained without any information, except that which he obtained hours too late by despatching staff officers to his corps commanders.

"No one can blame Abdullah for the great tragedy," declares Mr. Bartlett, very emphatically. "It was not his fault. He was a victim of the vicious system of bluff, make-believe, and self-deception which has brought a crushing disaster on Turkey. Never have I seen a more pathetic spectacle than that of the commander-in-chief of more than one hundred thousand men as helpless as a blind man."

"I am convinced," concludes Mr. Bartlett, "that the Turk has been defeated more by

sheer starvation than by any other single factor." To this Mr. Martin Donahoe, war correspondent of the London "Daily Chronicle," adds: "On the way from Tchorlu I came across the half-devoured bodies of many horses."

Throughout the brief campaign, says Mr. Martin Donahoe, the Bulgarians have shown "astonishing celerity" in pursuit. "Their advance guard has never been far from the rear of the retreating army." Concerning the battle of Lule-Burgas in particular he adds that there was "no respite for the harried remnant of the Turkish army. 'Onward, ever onward!' cry its pursuers. The Bulgarian cannon thunders, insatiable death takes its toll hourly of the battle-tattered wreck of what once were soldiers, all of whose feeble energies are now devoted to fleeing for their very lives over the wide Thracian plain, up the steep and rocky slopes of Tchorlu to its wide plateau, and down the other side and across the stony valley which leads toward Tchataldja. The broken army is crawling. It can no longer run. Days and nights of awful suffering have reduced its gait to a mere totter."

Mr. Bartlett tells of "the paths blocked with fugitives of the three beaten army corps. Behind us we could hear—from the sound of guns bursting, of shells ever nearer our rear, and the incessant rattle of musketry—that a desperate rear-guard action was taking place, and the sound nerved us on to fresh exertions. . . . The scenes on the road baffle description. They recalled to mind a picture I had seen somewhere of the flight of the French army after Waterloo, or one of Napoleon's retreat from Russia. . . . On the high ground half-way to Tchorlu we had a good view of the countryside, which presented a most extraordinary sight. Along every road horses, men, guns, and ox wagons were pressing forward, all converging on to two roads which lead into Tchorlu. There must have been forty-five thousand stragglers scattered over the plain. . . . For three days all these men had been without a morsel of food, and many for an even longer period. Only soldiers possessing the wonderful constitutions of the Turks could have stood the strain."

To this Mr. Donahoe adds: "The state of the Turkish army in the last stage of its retreat was pitiable in the extreme. Hundreds of men, with the soles torn off their boots, walked with bleeding feet. The Ottoman soldier, as I saw him during those awful five days of torture, suffering starvation and defeat, always faced death cheerfully and uncomplainingly. Days without food, he died complacently, as if death from starvation was part of his every-day duty. The allies have beaten the Turkish army, but have not conquered the Turkish soldier. Every soldier during the awful retreat was ten times a hero."

Out of a reported strength of two hundred thousand men, the Turkish loss in killed and wounded at this battle is reported at about forty thousand. Many were taken as prisoners.

A yet severer loss was in officers. As a result of Lule-Burgas the Turkish army is no less than two thousand short of its proper quota of officers. In consequence, says Mr. Bartlett, "whole battalions were left like sheep without a shepherd. If ever officers are most necessary it is when troops get out of hand, as they did in this retreat; but without officers it is impossible even to attempt to restore some semblance of order."

The greatest loss of all, however, to the Turkish army, says Mr. Bartlett, "is the utter destruction of the morale of the Turkish soldier from privation and want of food and lack of all confidence in his leaders. . . . If the routed army disbands and falls back on Constantinople, abandoning the lines at Tchataldja, the situation in the capital will be extremely serious, for it must be remembered that these thousands of undisciplined soldiers have been starving for weeks and are certain to start looting at once if they have an opportunity."

Lieutenant Wagener adds that "the Bulgarian pursuit of the defeated Turkish army and the movement to outflank them on their line of retreat to Constantinople have already progressed so far that a Sedan may be prophesied almost with certainty."

The battle of Lule-Burgas, says Mr. Bartlett, "is the greatest military disaster any nation has suffered since Sedan. It has utterly destroyed the Turks' power to take the offensive again in the present war."

We cannot be surprised, then, at the announcement made by Mr. Frederick Palmer, the New York "Times's" special correspondent, that "the bells of every church throughout Bulgaria summoned the people this morning to a mass of thanksgiving. This was largely attended and was practically the only celebration of the victory at Lule-Burgas."

DRIVEN FROM THE CITY

A BUSINESS MAN'S STORY OF PERSECUTION

BY RICHARD SPILLANE

I AM a manufacturer. In the busy season I employ 275 persons. Like every other manufacturer, I have my fair share of troubles. They are incidental to my business. But there are some troubles that all manufacturers are burdened with about which the public knows nothing. They are not peculiar to New York or Chicago, St. Louis or Cincinnati, Boston or Philadelphia, San Francisco or Los Angeles, or any other great center of population. But they put a heavy handicap upon us. These troubles are due to the inefficiency, the sloth, the carelessness, the injustice, and sometimes the graft of city administrations. Without prejudice, let me tell you a few of my experiences.

My factory is in one of the great cities on the Atlantic seaboard. It is near the water. I own the land and the buildings which I occupy. Some few years ago my neighbors and I were informed that the city was going to condemn a portion of our land in order to open up a thoroughfare to the water. It was only a short strip, about six hundred feet in length. I was a bit interested, because I knew that, as my property was adjacent, I would be likely to have an assessment for the improvement. The matter was taken up in due course by the authorities, and a commission of three was appointed to condemn the six hundred feet of land. The first time this commission met I attended the session. The three gentlemen were on hand promptly at the hour set. They took their seats, and one of them, acting as spokesman, said:

"The first business before this commission is to elect a chairman, and the second to elect a secretary."

They proceeded to do so. Then the secretary read the order creating the commission and some other papers pertaining to it, after which the chairman announced that the next thing before the commission would be to examine the map of the property that was to be condemned. The map was not ready, and he instructed the secretary to have it prepared in time for the next meeting. The chairman then looked at his fellow-members and remarked that, as there seemed to be no other business before the commission, he would entertain a motion for adjournment. The motion was made and carried and the commission adjourned to meet again two weeks later. The session had lasted fifteen minutes. For each session each commissioner received a fee of ten dollars.

I was present at the second meeting of the commission. The map was ready and was examined by the three gentlemen. After an informal talk the chairman said that it would be necessary for them to go in person and examine the property, and, if it was agreeable to all, they would do so two weeks later. They then adjourned. The session had lasted eight minutes.

I attended various other meetings of the commission, some of which lasted ten minutes, and some twenty or twenty-five. So little was done and so little progress was made that I grew weary and discouraged. I inquired of the Assistant Corporation Counsel, who was looking after the legal end of the commission's work, how much the assessment on my three hundred feet of property would be. He replied that he could not tell exactly, but, judging from past performances, it should be about $1 a front foot, or $300 in all. I remarked that, if that was the case, I would not bother about coming to any more meetings of the commission, as I was willing to pay $300 for the improvement, and that I could spend my time to much better advantage in my factory than in attending the commission's meetings, which seemed likely to be protracted.

It was nearly two years later when that commission ended its labors. It took them all that time to condemn that six hundred feet of property. The fees of the three commissioners amounted to $1,900. Most of the six hundred feet of land was owned by two estates, one of which got about $23,000, and the other a little in excess of $20,000. Presently I received notice that my three hundred feet of property was assessed $5,900 for the improvement. I was astounded. I went to the Assistant Corporation Counsel and asked him if he recalled the conversation I had had with him in the early stages of the commission's work. He replied that he did remember perfectly, and I then asked him how he reconciled that $5,900 assessment with his idea of

$300. He replied that you never could tell what assessors would do, that I had no recourse. He remarked that I might as well be a good fellow and save myself a lot of bother by paying the assessment, or I would be penalized for sixty days after the assessment was entered on the books; interest at seven per cent would be charged.

I went to see my lawyer. I told him that the $5,900 assessment was a rank injustice, and he agreed with me. He said that he did not know very much about that section of the law, and advised me to consult an attorney whom he named who made a specialty of it. I went immediately to see this attorney. He was a very dignified and pompous gentleman. I appreciated, of course, that as I had been sent to him by another lawyer the two would divide the retainer between them. So I told this gentleman at the start that I did not propose to pay for his opinion. If he wanted to take the case on the terms I would outline, I would be glad to engage him; that I would give him $10 for listening to my story, but no more unless he was willing to take up the case. After I had related the circumstances, he asked me to come back in two weeks; but I protested at this delay, saying that the case was a simple one, and that I wanted action in less time than that; in fact, that I wanted to know whether I should pay the assessment or fight it. He said that he would communicate with me as soon as he could.

In two or three days he telephoned me to come to his office. He opened the interview by stating that he would require $500 immediately as a retainer. I reminded him of what I had told him at our first interview. He appeared somewhat chagrined, and replied that there was only a fair chance that the assessment could be upset, and that the best he would do would be to charge me $100 for his opinion, $500 as a retainer, and 50 per cent of whatever reduction he was able to obtain in the assessment. I replied that I thought his terms were excessive, and that there were other property-owners in the neighborhood who were assessed as heavily as I, that he could get their business also, and that the best I would do would be to pay him $100 down, $150 if he got the case reopened, and 25 per cent of whatever reduction he secured in the assessment. He turned on me with great scorn and said that he was not accustomed to receiving instructions from persons who came to him with cases, and that he would have nothing further to do with the matter.

I went back to my office and thought the thing over. I worried about it, more or less, for a week or so. Then I got a notice from a title company that held the mortgage on my factory property that the assessment of $5,900 had been levied, that it had to be paid within sixty days, and that if I did not pay it they would be compelled to foreclose the mortgage. I went immediately to see the head of this title company, whom I knew, and explained the situation to him. I told him that I intended to attack the assessment in court, and pointed out the injustice that not only I, but other manufacturers in the neighborhood, had been subjected to in the matter. A title company is a very cold proposition. The gentleman with whom I was talking said that my statements were very interesting, but that the title company would foreclose the mortgage if I did not pay the assessment or give them a bond of $5,000. I replied that I could easily furnish such a bond, and would hand it to him the following day.

When I went to the bonding company's office, I found that they did not do business in that particular line, and that, in fact, none of the surety companies would furnish me with such a bond as I required. I could get bonds for honesty, against burglars, and lots of other things, but not against the outcome of a suit of the kind I was going to bring. Somewhat crestfallen, I reported my lack of success to the title company man. He replied that it would be satisfactory if I gave a bond backed up by a deposit of $5,000 to the credit of his company. I went to my bank, explained the situation, and got a receipt for a deposit of $5,000, which I took immediately to the title company. The man there glanced at it and handed it back to me, remarking that the $5,000 must be deposited actually with the title company, and that they would allow me two per cent per annum interest while it was so on deposit. I answered that I was paying five per cent at the bank for the money, and I thought it was a pretty tough hold-up scheme. The title man answered calmly that I would either have to pay the assessment or deposit the $5,000 with them, or that they would foreclose. So I put up the $5,000.

I suppose most men would have let the thing end then and there, and would have paid the assessment, but I am somewhat of

a fighter. I went to another lawyer, a man of a good deal of prominence, who was holding a city office at the time. His term was about to expire, and he was going to resume his law practice, which had lapsed somewhat in his absence. I told him my story and made him the proposition that I would give him a retainer of $100, $150 when he got the case reopened, and 15 per cent of whatever reduction he secured in the assessment. He laughed at me. I left his office, and three or four days later he called me up on the telephone and asked me to see him. I did so. He said that he had been looking into the matter, and believed that there was a loophole by which he could upset the assessment. He wanted $150 down, $150 for reopening the case, and 25 per cent of all that he saved me. I stuck to my original proposition, which he finally accepted.

This lawyer succeeded in having the assessment set aside as excessive and unwarranted. That made it necessary for the whole matter to be taken up by the authorities. I was delighted. With the court order in my hand, I went to the title company and asked for the return of my $5,000. It was refused. Some other assessment will be put on the property, they said, and meanwhile we will hold your $5,000. And they held it.

But that assessment case was worth fighting about. When they dealt out the next assessments, mine was $600. I paid my lawyer his 15 per cent, his $100 retainer, and the $150 additional, but I saved about $4,000. Against that saving of $4,000 I had to charge up months and months and months of worry and trouble.

Now, the persons who own that six hundred feet of property received, as I have said, more than $40,000 from the city for the taking of their land for street purposes. But the city did not use the property in that way, after all. The city did not have money available at that time to open the street down to the water, and so the city rented that six-hundred-foot strip of land to one of the former owners for $100 a year. The lessee put up a big fence right close to my factory and used that city street as a lumber-yard. The spring after that fence was put up we had some heavy rains. The sewers were not able to carry off the water, and the flood came down the street, backed up against that fence, and swept over into my factory. My place was flooded to a depth of fourteen inches. The loss and damage thereby were considerable. I brought suit against the city and against the lessee. I got a judgment against the lessee of the city street for $1,000. The cost of the suit was about as much as the judgment, for the case was in court a long time. But when the Supreme Court Justice before whom the case was tried heard all the facts, he leaned over his bench and, pointing directly at me, said:

"The proper thing for that man to do whose factory was damaged through this outrageous use of a public street is to get an ax and chop down that unlawful fence."

That was pretty strong language for a Supreme Court Justice to use, don't you think? I did not know whether to get an ax and destroy the fence or not. I happened to meet the Comptroller of the city, whom I knew casually. He was also in the manufacturing business, but in another section of the town. I told him about the suit that had just ended in my favor, and he said:

"It won't be necessary for you to get that ax. Here is another way out of it. That lessee is paying the city $100 a year rental for that property. If you will offer me $110 per year for that six hundred feet of street that the city cannot use at present, I will lease it to you as soon as the other fellow's contract is ended, which will be soon." I saw the point, executed the lease, and paid the rental as quickly as possible. There was an awful howl when the other folks found out what I had done. I made them fix their fence the way it should be so as to prevent floods, and then I sublet to them that portion of the street which the city had bought and paid for but could not use. I made them pay me, not only the $110 a year that it cost me, but $400 additional, which gave me a little money toward making up the loss that I had suffered.

I use a great deal of water in my plant. I buy this water from the city, and my bills run from $3,500 to $4,000 a year. I need a great deal more water than I am now getting. For a long time I have been trying to get more. I have put in application after application to the Water Department. I am told that they have no money available to lay a larger pipe down to my place which will give me sufficient for my needs, but that, if I will dig the trench, they will see if they cannot scrape together enough eight-inch pipe to run the line. They tell me that I ought to be able to get the trench dug for $500. The lowest estimate that I can get from a con-

tractor is $900. I don't know whether to pay this $900 for the privilege of buying $5,000 or $6,000 worth of water, a year from the city or not. It seems like a hard deal. At present I have to keep a man in my place at night looking after the pump that fills the reservoir so that I will have plenty of water in the morning. I have to keep pumping twenty-four hours in the day to get enough water for my use, and this pumping costs more than $900 a year. Is it not ridiculous that a great city will not furnish facilities for a manufacturer to carry on his business?

You understand that I am only telling you a few of the things that embarrass me and embarrass every manufacturer. There is hardly a manufacturer that I know of—and I know hundreds—that has not as many reasons to complain as I have. Some of these things are so outrageous that they are almost unbelievable. For example:

I made arrangements some time ago with an electric light and power company to put in electric power in my plant. I had the equipment changed and everything was ready. I was expecting to switch from steam to electricity without any delay, but the power company informed me that the permit for stringing the wires to my plant was held up by the city department which has such things in charge. I waited a day or two, calling up the electric people every little while, but could not get any other answer. Finally I saw the head of the company, who made an investigation and told me that the stenographer in the branch office of the city department from which my permit was to come was away on her vacation, and that that was the reason alleged for the delay. I put on my hat and went over to that branch office. I found there four young men sitting with their feet on their desks reading the sporting pages of the daily papers. I told them what the electric power company had said to me, and asked if it was true. One of the men looked up and said that it was. I asked who was in charge, and another of the four answered that he was the chief clerk.

"Well, you seem to be a husky sort of individual," I said; "why can't you make out this permit?"

"That's not my business," he replied.

"Well," I replied, "tell me who is the responsible head of this department, so that I can go to him and find out why this permit is not issued."

He replied, gruffly, that I had better see the deputy commissioner, who was in charge of electric matters. After asking two more questions, I got the office address of this official and hurried over to see him.

I was kept waiting fifteen or twenty minutes, and then was taken in and introduced to a man who said he was in charge of the department of electrical matters. I told him that I was being held up on my electrical installation in my factory because his branch office would not issue a permit to the power company to string the wires; that I had been over there to find out what the trouble was, and had received the absurd explanation that the stenographer was away on her vacation, and that no permits could be given until she returned. The man swung around in his chair and looked me in the eye.

"Well, sir," he said, "absurd as you may consider it, that explanation is the plain truth. The fact is that the Budget Committee did not make any appropriation or allowance for a substitute for that stenographer while she was away on her vacation. Nothing can be done until she returns."

I was hot. I exclaimed that if this great city could not afford to pay for a substitute for that stenographer, I would be willing to help it out. I offered to get a stenographer immediately from any of the typewriting agencies, or to send one from my own office, and to bear all expense myself, so that the work of that branch of the department might be carried on until the girl got back from her vacation. The department official scoffed. Then I lost my temper. I rapped on his desk to emphasize what I had to say, and I fear that my remarks were punctuated with profanity. I said things about his department, about the four clerks in the branch office who had plenty of time to read sporting news but none to do the city's work, and about the position of the taxpayer who contributed large sums to the city government year after year and got such treatment from city employees as I had. He was red in the face when I finished, and so was I.

The next morning the electric people telephoned me and announced with triumph that the permit had been granted. I told them that it had been granted because I had gone after it myself. The electric people shouted with glee at my recital, and then told me that not alone my permit but forty-five others had come in that morning, all of them having

been held up on account of that one stenographer who was away on her vacation.

Before I moved into the plant I am now occupying I had a smaller factory about half a mile distant. I have been renting this old factory ever since to the same concern. The rental has been satisfactory, and I would have been content to keep the property if it had not been for the persistency with which I was pursued by grafting city employees. It is remarkable how many violations of the city ordinances an inspector can find if he has reasons of his own for discovering them. I made alterations in that old building until I was tired. I put in stairways and fire-escapes and cut doors and installed sprinklers until the place was hardly recognizable. Experts whom I employed to go over it announced it the safest factory of its kind in the entire city, and said that I had more than complied with every law and ordinance.

About two months ago an inspector came around, and a little later I got a notice that some more fire-escapes and another stairway were needed in the old building. I paid no attention to it, and got another. The next day the inspector came around to see me and mentioned that a violation had been put on my old factory. I told him that I had complied with every State and municipal law, and that I did not see the justice of this new demand. The inspector retorted that if I did not comply he would close up my factory. Then he smiled, and asked me why I did not have some sense and do as other people did. I asked him how much it would cost to have the violation taken off, and he replied that he thought he could fix it for $20 or $30. I told him that I would think it over.

My suit in court to have the violation set aside came up the next morning, but I had it postponed. About two weeks later the inspector came around again, and I told him that I had not yet made up my mind to pay him what he asked. He said that it would cost $40 to have the violation removed now, and that the next day it would cost $50, and that there would be an additional $10 for every day I delayed. I put him off again, however, and he went away in an angry frame of mind. Some days later, when the case came up in court, my lawyer and I appeared and were ready to proceed. The inspector was there also. He whispered to me that he was going to see that the Judge "handed it to me." When the case was called, my lawyer arose and said:

"Your Honor, apparently there has been some mistake about this case. My client is not the owner of this property."

The Judge called the inspector and asked him about it. He laughed, and said that I had owned that property for years. The Judge turned to my lawyer, and the latter produced the documentary evidence to show that I had sold the property prior to the last violation being placed upon it. I then related to the Court my experience with the inspector, and the Judge advised me to make a formal complaint against him to the head of the Building Department. I did so, but nothing ever came of it, and he is still in the service of the city.

Cities, if they only would realize it, are a good deal like landlords. A good, sensible landlord uses every effort to attract, to please, and to keep his tenants. The manufacturers are the life-blood of a city. They are among its best-paying tenants. A bad, corrupt, or careless city drives them away. It is like the landlord who makes his house undesirable for his tenants. Small towns and cities, as a rule, have active, wide-awake, pushing boards of trade or chambers of commerce. In big cities there is no end to the number of civic organizations. A good many of them ostensibly are for the purpose of attracting new industries and seeing that their comfort is looked after once they are located. As a matter of fact, I do not know of a single such organization in my city that accomplishes anything worth while. They pay good salaries to a staff of clerks who do just enough to hold their jobs. But I never would think of taking any of my troubles to the Chamber of Commerce or to the Manufacturers' and Merchants' Association. I did once, and had about the same experience that I had when I went into that branch city department to find out about the electric wiring permit.

The small city, like the owner of a new house, is eager to get tenants and to keep them. The big city has so many tenants that it is careless. It is so great that it doesn't fear competition. It seems to think that its vacant spaces will be filled up anyhow, and that those who are established won't dare move. It's the little places that offer the best inducements.

I have found it futile to complain to the government of the big city where I have been in business and paid taxes for so many years. Its officials change rapidly. Before you can get any satisfaction of your grievance there is a new set and you have to begin all over

again. There is as much delay as there is in the courts.

I've grown tired of this state of things. So have other big manufacturers in my neighborhood. I have been talking with a number of them. We have sent experts to other places—small towns that seem to have good transportation facilities by land and water. We have been inviting propositions, and have a lot of them. Also we have been looking for a large tract of unimproved land that will meet our needs. If we find what we want we'll all move in a body and build a new city—one of our own, that we'll run on a business basis. We'll attract still other manufactories. The State laws are ample for our protection and for the protection of our employees. We'll have just as few local ordinances as we can get along with. Then perhaps we'll be able to get along without the incessant trouble and annoyance that we have had to endure for so many years, and which we'll have to keep on enduring to the end of the chapter if we don't move.

COLON CAMPBELL'S MILL

BY G. W. OGDEN

SOME of us must make the black bread of life, and more of us must eat it. Old Colon Campbell, my father, had eaten the black bread many a year. But that is not the beginning. I shuffle my feet over this start like a poor wrestler. By and by I shall get my hold for a fall.

Mine was the heritage of bleak fields, rough hills, broken hedges, and buildings which leaned upon props like cripples upon their sticks, or stood shored upon false walls for every March gale to set them trembling in a palsy of racked joints. Still, I have not, rightly, come to that part yet.

Among our Campbells in Scotland there always had been a flockmaster and a miller. This had been the unvarying repetition for five hundred years. When Colon Campbell, my father, who was a mason by craft of hand, came to America, he tried to double the dignity of the family by becoming both a miller and a flockmaster in one.

But the man who holds his porridge in one hand, in the other his meat, may go hungry for want of a hand to feed himself. Colon Campbell had his hands full of enterprises, and none of them came to flower. He belonged rightly to the miller's branch of the family, and so his heart was in the mill, and its building and its fitting, which became his dream at the beginning, his blight at the end.

When Colon Campbell laid the foundation of that mill thirty years before his end, there was need for it in that community, and if he could have finished it at once he would have prospered. But it was not plotted in the book of life for Colon Campbell to stand beside the humming burrstones of his own mill, or for him to lave his hands in the warm stream running out from them, or to bear the dust of the wheat upon his coat. For thirty years he labored to complete the mill, which stood there so long upon the streamside at the bending of the road, hollow, gloomy, rotting piecemeal under its malicious curse.

Year after year he worked at it, putting into it all that he made by his trowel and hammer, all that he made from the yield of his fields, all the increase of his flock. Once it was burned to the foundation stones, once a tornado tore away its roof. But to all these warnings of the Almighty, as well as the friendly counsels of men, Colon Campbell closed his ears. He would have a mill.

The mill began long before my day. At the start of it all, the eldest son, Douglas, then but a lad, was blown up by powder in quarrying stone for the foundation. That did not stop the work, for such tragedies are foredoomed in the lives of men. Fire took the building before the roof was on, and then the work stood at the foundation again for several years, while Colon Campbell raised the walls of other men's houses to gain money for his unlucky mill.

Meantime the village which had once clustered around the mill site dwindled and died under the competition of a new one on the railway some miles away, to vanish like vapor in time. Still, Colon Campbell would have his mill. A new frame was lifted, a roof was spread over it, and then, during a long wait

for money to go on with the work, the tornado made sport of his labor. It was in the work of replacing the roof that Murdo, my second brother, was killed by a fall from the topmost girders.

When they bore him home, broken and bloody, mother reeled back against the wall under this heaviest wrench of all her domestic pain—for Murdo was her favored child—never to speak again in the two months she lingered with us, like a fire-stricken tree. After that she did nothing but stand in the open door, looking along the road toward the mill. There was nothing in her eyes but the horror which her dumb tongue could not speak. When winter came on, and she could no longer stand in the door, she died.

And so the curse of the mill multiplied. But Colon Campbell would not give it over, although he had no means through many a year to cover the bare rafters which clasped its top like the fingers of a bony hand. The rain and the snow fell into it, rotting it away piecemeal, while I, a growing lad, followed the sheep from fold to grazing land, from grazing land to fold.

They called him "Crazy Campbell" then, and we were avoided, like people with a plague. Boys of my own age used to halloo their taunts down to me from the hill-tops. It was a melancholy life for a lad, and the loneliness of those somber days sank into my soul. There was but father and I (I was Colon Campbell, too, called Collie at home) and old Granny Aines, who had followed my mother fresh-cheeked across the sea. She was withered then, and full of the notion of spooks, and of good people who worked witchery with the cream of nights.

What associates I ever had known were of Scottish stock also, for that was a settlement of them. There they kept the traditions, and many of the customs, of the old land alive, as many foreign folk do in this wide land until the old ones die and a new generation sweeps the clouds of old lands away. There were Russian Mennonites to the west of us, who did the same, going further than we did, refusing to marry or hold social intercourse with the Americans at all.

We Campbells had been cut off farther from the world by the blight of the mill and my father's unlucky ambition. I had a little schooling until they plagued me so that I ran home and refused to return. And then my father taught me of winter nights by the chimney-side.

My father kept his lands clear, for all the demands of the mill. "The Campbells never have owed any man," said he; "remember that, lad." And I remembered it. It had been a long time without a blow upon the mill, and men had begun to believe that Colon Campbell was cured of his folly, when one day he drew up material for the long-delayed roof, and that, at last, was finished.

"Now the wheels will soon turn," said he, proudly; "we need only the machinery and the dam." Then he began to brood over the changes time had made in mill machinery. Water power had been supplanted largely by steam, burrstones by rollers of steel. The more he thought of it, the stronger he became convinced that he must revise the plans of his life. In place of a mill dam he must have steam-boilers. Nothing else would serve for Colon Campbell's mill.

So there the gaunt mill-house stood, useless after all its slow years, useless after all its tragedy, its labor, and its pain. When the last beams were in at the top, those at the bottom were beginning to decay; when the last planks were on the roof, the foundation boards were warped and wried off by sun and wind. There it stood like an old coat with new patches, a fantastic creation of a fatal dream. Colon Campbell's strength, and the lives of his children, had gone into it for thirty years. Its toll had been gathered, not from the grain it ground, but from the hearts and the bones and the blood of them, which it wrung from old Colon Campbell and his kind.

And so, upon a day at last, my father, old Colon Campbell, gray as a sapless oak, rough-limbed and rugged from working in stone, hanged himself in the empty mill. There were no burrstones, no hoppers, no bins, to interfere with his dangling feet. So came the end of his long, hard-driving dream.

Then there remained of all the unlucky Campbell house only myself, with Granny Aines to keep my but and ben. The hollow mill had swallowed all the rest. It was enough for Colon Campbell, who had died without the grace of God, that he should be buried without it, men said. They cut him down and laid him beside mother, for that last bed was paid for. The Campbells never have owed any man, least of all for their graves. There is room for me there when my time comes, and my son, and my son's son.

I was a great lad, with a broad, fresh face

like a crock of cream, and shoulders to go into a man's coat and feel the cloth. It was dowie work going about the old place, having so many bitter memories hiding here and there beside crib, and stile, and winding sheep tracks across the wold. Many a day as I went about mending the broken hedges my sorrow bore me to the ground beside them, where I lay and felt my heart draw upon its strings as if it had been held to shrivel above a flame. But time is a good tonic, and I had plenty of it at my hand.

None came to me, for the gloom of the hollow mill-house was around me, like the mold upon the dead. I was a good flock-master, that being the Campbells' ancient pride, and at last I lifted my head, determined to go about my task like a man and rebuild the Campbell dignity and fortune in that place. There being no more the drain of the mill, I felt that I might well employ a man to work the fields and cure the hay while I cared for the flock.

So in time my buildings stood without their crutches, my full, trimmed hedges ran out as even as coped walls. "Now, if you had a lassie," said old Granny Aines. I blushed, turning my back upon her, hastening away across my fields.

For I had no lassie. And I felt that I should have none as long as the grim mill stood beside the stream, the monument of the Campbells' follies, the dread of all who knew its melancholy past.

That was springtime, and blue-eyed flowers on quaint, grassy stems grew beside the pools in the marsh meadow-lands. The grass was tender and sweet there, and I ran the sheep there for it, and for the water which the ewes desire at yeaning-time, for the thirst comes upon them strongly then.

That day the sun was warm upon my shoulders, making me lazy and like to stretch myself, as a man feels in a soft bed of a morning when there is no hurry to rise. Turning from petting the head of an old dam who had brought forth twins, I saw the flutter of a lassie's dress and the gleam of sunlight upon her hair. Her broad-brimmed bonnet she swung by its ribbons in her hand, heaped like a basket with hawthorn blossoms which grew at my woodside.

She was not one of the school to which I had gone some years past. Her face was strange to me. But the one who marched beside her I knew—Tom Reed, also of Scottish stock, who had played with me when we were lads. They came on toward me with some embarrassment, such as I had noted in most people who knew me and my story, and a blush was on her cheeks, and, like fire at a clear brookside, even to the margin of her eyes.

"We have been trespassing," said Tom, who had nothing to do but hang about after the lassies, I thought, now that he was learning to be a lawyer in the town.

"You are welcome," said I, gravely, stepping aside to let them pass, but with a strange fullness in my throat, for her comeliness cut away my courage like vinegar the breath.

"They only grow here," she faltered, half ashamed of their bold raid, lifting the hat with its snowy burden of bloom. A spray fell to the ground unnoticed as they passed along, hurrying a little as if afraid.

"You are welcome," again said I, and she was gone.

Beyond the stile I saw them from the downs, huddling together like frightened sheep, pointing to the old mill, at my house, turning their faces in the direction I had gone. But they could not see me; the copse-fringe was my friend. So she must be a stranger, and my grim story was one to make her shudder and put her hand upon his arm.

I went back that way as twilight was falling, and found the hawthorn spray. That night I held it in my hand, tenderly, as I would have held her glove or a strand of her gleaming hair, leaning beside my lonely stile, across which no lassie's foot had passed before. The moonlight was white as frost upon the gaunt old mill, glinting like a maiden's teeth when she smiles upon the broken waters at the swift stream's ford. She had passed across my forbidden lands; her feet had pressed the meadows where my sheep fed; that flower had rested in her hand. Ah, if its thorns had been driven into my flesh it could scarcely have given me more unrest! There was I, steeped in melancholy loneliness, a fair white flower in my hand.

"Ah, if I had a lass," sighed I, "if I only had a lass!"

I was quaint and rough about my ways, I know, and quaint in my speech and dress, for we Campbells of the mill had lived much apart from everything on our four hundred acres of mainly hill and down. I was no man to go out and find me a lass to my heart, with the family broad Scotch sticking to my tongue. For I had not used it enough

in the world to wear it smooth in the American way. Besides all that, there was the fearsome old mill glooming over me, and what lass was there who had heard of it would touch a Campbell's hand?

It could not remain long a mystery who she was. Lawyer Henderson, of the town, had come to live in the grand house which joined my lands upon the east, and she was his daughter. Tom Reed was learning the tricks of the law under Henderson's hand, and that made it plain how Tom came to be with her after hawthorn flowers at my woodside. From my hilltops I could look down upon her house and grounds—there was but a hedgerow between their land and mine—and there I saw her often, a good half-mile between us.

But she came no more across my meadows to my woodside, not even when the bittersweet, which most maidens love, turned under the autumn sun and frost like the coral of the sea. And there was no wood, neither hawthorn nor clambering bittersweet, upon Lawyer Henderson's land. I had told her that she was welcome, but perhaps gruffly, with my hat upon my great rough head. But she knew the story of the mill now; she feared to cross my fields.

Lawyer Henderson was a man who found sport in riding up and down the highroads and across such fields as he dared with hounds in pursuit of the few wee foxes which still found homes in the hills. Often he rode across my pastures and hills, trailing some poor old mother fox that had gone out to fetch food for her bairns. Sometimes it was only a foolish rabbit that the solemn-voiced hounds—they always remind me of a trumpet organ in a church—would start, but that seemed to answer just as well. They did not say to me as much as "By your leave," the lawyer and his town friends, but trailed through my lands with great freedom. Not that I cared, so long as they did not frighten my sheep. But it shows, as you shall see, that a man does not relish always the freedom with his own that he takes with another's.

There was snow that evening, with a wind that pulled at my belted greatcoat with savage teeth as I stood by the fold-gate counting in the sheep. One was missing, an old ewe—I knew her like I knew the face of Granny Aines—which I had noticed faltering in her way for a day or two. I thought that she had slipped away from them, in her poor animal way, to seek a place to die. "I will fetch her," said I, "to the straw and give her a warm bed this bleak and bitter night. It would be a sad thing for poor old Jennie to die out in the drifts."

So I marched back upon the sheep's track, my head bent against the blast, my dog scouting around and about me, seeking a smell of old Jennie. The flock had been browsing a bit of woodland, to trim down the undergrowth that day, which lay along Lawyer Henderson's place near his stables and lots. And as I went on that way I was thinking of Rob Burns and the storms of snow and icy wind which he put into his verses, for Rob Burns was a man who knew bleak fields and the sickness of a lonely heart.

From my woodside came suddenly the baying of hounds, and my collie stiffened in his tracks a moment at the sound, the hair on his neck raising like the bristles of a wolf. Then he was off in that direction as if he had been shot out of a cannon. I was after him as fast as my legs could take me. When I came up with him, he was rolling in a loud battle with two lean hounds, and in the hedge corner on Henderson's side lay poor old Jennie—she had pushed through, and the hedge closing after her had hidden the way of return—a third beast at her throat.

There was blood upon her fleece already; that much I saw before I wrenched away a stake which was interwoven into the hedge and laid the beast a blow across its neck. Its yowling growl was cut off in the middle of a word, you might say, and I flung the dead thing aside, gathering up old Jennie in my arms.

My collie, each slash of his long jaws like the blow of a sword, had sent his two foes limping away with lamenting cries before Henderson's men came running from the stable with pitchforks in their hands, threatening us. I had no time for them, for I was over the hedge and on my way with shivering, torn old Jennie hugged to my breast. She was dead when I put her down upon her bed of straw.

Well, the next morning came the constable for me, saying that I was arrested in the name of the State for upsetting its peace and dignity in trespassing on Lawyer Henderson's land and killing his brown hound dog. I went with him to the town, where I gave a bond to answer that I would appear and be tried in court before the judge next day.

Never had the Campbells had much to do with law, and it frightened me and worried me like a heavy load. I slept little that night, flinging my covers madly at times, sitting up with my head all hot from the fever I had drawn into it by my wild running thoughts. Still, when I began to reason the matter and cast it up from all sides, I cooled. And from cool I came to white anger against Henderson and his ways, determined to go before the judge and spread the matter plain.

In court they told me to lift my hand and swear when I asked to tell the judge how it all fell out. That done, they read to me a paper so full of twists and strange words that no man could understand unless he knew beforehand what it was about, reciting in its roundabout fashion all that I had done in behalf of the old ewe Jennie.

Then, "How is this?" said the judge. "Did you do all this, Colon Campbell?"

"On one side of it, sir," I answered, "what the paper says is true, but it has not a word of my side of it at all."

Lawyer Henderson, who sat at a near-by table, smiled at that, and others smiled, also the judge. "Have you no lawyer?" asked he.

"No," said I, "honorable judge, I have not."

"You need one," said he.

At that they laughed aloud, the judge with them. "Go ahead then, Colon Campbell," said he, "tell us your side, as you say."

Then I moved forward to come nearer to where he sat, my shaggy greatcoat still belted about me, my long hair over my ears, but feeling as much a man free to come and go as any of them there. For the Campbells never had owed any man, except maybe such debts as were paid by the sword. My cap and gloves I placed on the table, hooking my thumb, after a clumsy rustic fashion that I had, into my belt.

And then I told him about the old ewe Jennie, and how she had gone astray; how I sought and found her, and slew the brown hound dog. "She was seven, sir, and that, you know, is old for a sheep, and she had borne me nine. I could name them for you, as I could name the days of the week."

"No need of that, Colon Campbell," said he, smiling at the corners of his mouth. "Go on, tell me what happened to old Jennie."

"She was bleeding from the hound's teeth, and all a-quiver of fright and cold, and I put my coat between her and the storm as I bore her home. I was thinkin'," said I, "as I went along with old Jennie, of Rob Burns's song, which comes into my head often when I feel the winter wind beating snow upon my face."

"And what song is that?" says the judge.

"The one that goes—

> "'O, wert thou in the cauld blast,
> On yonder lea, on yonder lea,
> My plaidie to the angry airt,
> I'd shelter thee, I'd shelter thee!'

Only Rob Burns had it in mind for a lassie," said I, sorrowfully, lifting my eyes openly and frankly to the judge's face, "and I ha' no lassie. I ha' nothing to love but my ewes and their weans, and I ha' nothing more to love me. And old Jennie was a mither—a mother, I should say, sir—to my lambs, and it troubled me hoo"—I drew it out like an owl—"she could ha' gone astray."

I had lived so much alone since my boyhood that I did not know the world's way of saying things, much less that the things I was then speaking of are the things men do not commonly uncover, but bury them away shamefacedly, as if wanting love and starving for it might be a thing of sin.

"And you have no lassie?" said the judge, a fatherly, kind man, leaning forward to hear me speak.

"Never a one in this wide world," said I.

"The world is full of them," smiled he; "you have only to step across the hedge to find them, Colon Campbell."

I shook my head soberly. "There would be none left to mind the sheep," said I.

The sillies in the room giggled aloud at this. And the judge, amused himself at my serious face, said to me then: "And how did it fare with old Jennie in the end?"

"The poor soul died as I bore her along," I answered, a shake in my voice at the memory of her last struggle, "and I have laid her away in a grave with her fleece upon her back. And it is a great honor for a sheep that dies to be buried with its skin and its fleece upon its back, as you know very well, sir."

"No," said the judge, "I did not know it. And why is it such a great honor? Tell me that now, Colon Campbell."

"For when the life goes out of a sheep, he is worth no more than the skin upon his back. Good flockmasters skin them then, and sell the hides."

"I see," said the judge. "You are a good flockmaster, too, but you have a tender heart."

"The hound dog killed my ewe, and I killed the hound dog, and I cannot see the injustice of that," said I, perplexed. "Lawyer Henderson knows very well that I have said nothing, nor sent the constable after him with a paper, when he has rid across my pastures and hills with his dogs and his friends, killing my wee bit foxes, which he has done many a time, let him deny it if he can."

I faced him with accusing eye, and he turned red around his beard, not having the courage to meet me with a look. Again the sillies in the room giggled, and the judge looked sternly over them with a warning to be quiet. "So that is your side of it?" said he.

"That is my side of it," said I. "Trespass is trespass, whether it be to kill a fox or a murderous hound dog, it seems to me."

Hearing a stir at the table where Lawyer Henderson and the county attorney sat, I paused in my speech and turned my eye that way. Henderson's lass was there at his side, leaning down to his ear. He nodded, smiling, as she whispered, and spoke then to the county attorney. The lass, standing there as fresh as a pink wild rose, smiled to me, and my heart leaped as if it meant to spring from me and go fluttering, like a wounded pigeon, at her feet.

The county attorney stood. "An attorney has appeared to plead for Colon Campbell," said he, smiling to the lass, "and the State asks that the defendant be discharged."

"That is as it should be," said the judge, taking up his pen. "Only this, Colon Campbell, mind that you mend the hedge where old Jennie passed through to Mr. Henderson's field."

"This very day," I promised him, taking up my cap.

It was late in the evening when I came to the mending of the hedge, cold and raw, a thin snow blown into the tracks of the cattle and spread like a worn coverlet upon the frozen furrows. All of the growing earth seemed so dead that it might never wake again. I bore with me some withes and stakes to weave into the hedge where old Jennie had pushed through, and I bent to the work quickly, for darkness was coming fast.

I thought it must be a foolish fancy at first, and that I was turning daffy, like the lone sheep-herders turn upon the Western wilds, for how could a lassie's voice be blown to me upon that bitter wind across the lonesome wold? Yet I had not before been given to fancies or to frights, and I straightened my back, quarreling with myself for my weakness, when it came again, as clear as the whang of a bell upon a frosty morn:

"My plaidie to the angry airt,
I'd shelter thee, I'd shelter thee!"

And there across the hedge, not two rods off, I saw a lassie, the wild wind in her hair. Of course it could be but one.

She stopped quickly when she saw me, coming on then with a little laugh. "How you startled me!" said she. "Oh, you have come to mend the hedge?"

"It is done," said I. "It was but a little slip."

We stood, she on her side of the hedge, I on mine, the settling gloom around us. I could not see the fire of her cheek. I should have thanked her, I know, for her plea in my behalf that day. But I did not. There was an awkwardness between us, as between two who have much to say yet fear to speak. Yet she did not go away. My head was full of the song, and my heart was full of it. And I said to her: "Is that a song that you sing always when you walk about the fields?"

"No," she answered, holding her great fur muff to her cheek; "I have not sung it before in many a day. It was you, this morning, who put it into my mind, and the wind fighting me as I came along brought it to my lips. Do you sing it sometimes?"

I started, a bit frightened, I believe. "No," said I; "I roar like a wind in a chimney. But I can finger it neatly upon the bagpipes, and it is a tune that I love well."

"I have been trespassing on your land again." She spoke lightly, carrying her words upon a little laugh, which I was beginning already to learn was her way.

"It was no trespass; you are welcome," said I.

"But you could never guess where I have been."

Said I, thoughtfully, "There are no hawthorn blossoms now."

"No," she assented, "none."

"And the bittersweet," said I, "is all withered and brown."

"The bittersweet?" said she. "Do you care for it?"

"We made wreaths of it, mother and I, long, long ago," I answered. "It was mother who told me that its red was like the red coral of the sea."

"Very like it," she said, soft and low. "I have been down yonder to see your mill."

It made me jump, like a discovered hare,

and upset all my thoughts in a tangled heap. "*You* are not afraid of it, then!" I breathed.

"At first I was, like many foolish persons, but not now."

"Thank you, lass," said I, speaking, I felt, not so much for myself as for gray old Colon Campbell, whose life had gone into the mill-house by the laughing ford.

"It is a sad story," said she, with tender sympathy.

"They do not pity him here," I answered, sadly, and perhaps ashamed; "they say he was a fool. But he was a kind man, for all of the mill."

"I am sure he was," said she.

I was standing there almost a-tremble for joy. There was a lass who knew its story and did not fear old Colon Campbell's mill, and who could stand within arm's reach of Colon Campbell's son, neither shrinking nor afraid. At last the curse was lifted, at last the gloom of the mill was swept away!

"Do you walk this way often?" I asked, not knowing what else to say.

"Almost every day," said she, the great fur muff again to her cheek.

"And I pass here almost every day at this time, too, looking for holes in the hedge." Which was not true, but should be, from that day on.

"Then we may meet at the hedge again," spoke she, a little lift of pleasure in her tone. "But now I must go, it is quite dark."

"Stay just a bit," I pleaded; "I have something belonging to you which you lost in my meadow long ago."

"Something I lost?" she wondered. "It must not be mine; I do not remember losing anything in your meadow, ever."

"But here it is," said I, undoing my coat and fetching forth a small bill book, placing the treasure in her hand.

"Why, it is nothing but a dried thorn sprig!" said she, perplexed and somewhat vexed by what she must have thought a clumsy joke.

"A bit hawthorn bloom, all dry and withered from the fire of my heart," said I, stretching my two arms across the hedge appealingly. "I have carried it with me since it fell from your bonnet on that day."

It was dark, but not so dark that I could not see her press it to her lips; and no darkness, save the darkness of death, could have smothered from my ears the little sob that rose in her throat as she bent over the dried hawthorn bloom.

That night I roared like the wind in the chimney with my song, until Granny Aines came to my door to see what ailed me, and stood smiling when she saw my face.

"It will be well with this house now, Granny Aines," said I, holding my head high, as the Campbell of the claymore on the wall there must have held his when he came home from victory; "it will be well with this house now, and all within it, for I ha' found a lass."

TRAINING CITY BOYS FOR COUNTRY LIFE

SECOND ARTICLE

BY LYMAN BEECHER STOWE

ONE of the most successful farmers in the world to-day is Joel M. Foster, of the Million Egg Farm, at Brown's Mills, New Jersey. Mr. Foster is a city man, born and brought up in Scranton, Pennsylvania. When he started to raise chickens eight years ago, he had never seen a real chicken farm, and knew nothing about poultry culture except what he had read, much of which he subsequently found was untrue. He is now at the head of the largest egg farm and business in the world. He is making a big income, which represents fifty per cent a year on the investment. Before starting the Million Egg Farm, six years ago, Mr. Foster had given himself two years of costly and arduous education under that most relentless of schoolmasters—experience.

As the manager of his father's selling force in the International Correspondence School, Mr. Foster had had the best possible business experience before it became necessary for him, eight years ago, to exchange city for country life. He had always had what he calls "chicken-pox," and the prices broilers were bringing led him to believe there must be money in raising them. He rented a small farm, and for two years devoted his

energies to raising and marketing broilers and capons. At the end of that time he had lost over $4,000, exclusive of living expenses and the value of his own labor. While he could, to be sure, sell his birds at a handsome profit for three or four weeks in the year, the rest of the time he must sell at an actual loss in competition with the farmers. Besides this, 1,400 birds were burned in their brooder during the night and 700 others were killed by rats. Mr. Foster decided to retire from the poultry business unless he could find something more profitable than raising broilers.

He then made a tour of the successful chicken farms of the Eastern United States and found that they were specializing on the egg-producing branch of poultry farming. Accordingly he determined to make that his specialty, and selected Brown's Mills, New Jersey, as the best site for his second venture. He discovered by experiment that the single-comb white Leghorn is the best laying hen yet developed. Consequently he stocked the farm exclusively with this breed, and to this alone he attributes much of his success. The key to his success Mr. Foster sums up in the one word "system." No army was ever more thoroughly organized than this chicken farm. No yacht was ever kept more immaculate. No bank was ever more accurately and methodically managed. There is a system of inspection and reports by which Mr. Foster may know every day the record for the previous day of every bird of the approximately 90,000 on the farm. If any bird or group of birds shows the slightest indication of not being in normal health, the diet is at once changed or something is done to prevent sickness. Those that do fall sick in spite of every precaution are at once segregated in a kind of chicken hospital, unless their illness is severe, in which case they are promptly killed. Light, air, and cleanliness are as necessary to the health and highest efficiency of chickens as to human beings. Experiments are constantly being tried, but as soon as a given method has been proved by adequate tests to be the most effective, that becomes the prescribed method from which no employee may depart, on pain of dismissal. The most marked characteristic of the employees is their enthusiasm and pride in their work. Mr. Foster selects them for their love of the work rather than for their knowledge of it.

A youth applied for a job while I was there. He had two disqualifications, in Mr. Foster's opinion. He had had a two years' course in an agricultural school and he was from the country. If he had been a green boy from the city, he would have been more acceptable. Over two-thirds of the upwards of two dozen employees are from the cities. When they applied for their places, their chief recommendation was zeal to learn chicken-farming. Most of them are preparing to enter the business for themselves. This farm is really a great practical school in poultry culture, with a small and carefully picked body of students who are well paid while they learn. Monthly and half-yearly money prizes are given for the best work, and the wages rise uniformly and automatically in accordance with a fixed schedule.

Other things being equal, Mr. Foster employs green city youths, because he has found that they are quicker, have nothing to unlearn, feel more enthusiasm for their work, have more ideas and greater ambition. At first he had great trouble in keeping city boys. The foremen would discharge them for incompetence almost immediately. He found, on investigation, that their absolute ignorance of country ways and of even the nomenclature of the work led the foremen unthinkingly to conclude that they were stupid. He persuaded the foremen to give the boys more time to make good in. As a result the foremen themselves now prefer city youths to the "pinies," as the country lads of the New Jersey pine barrens are called. So far from having any trouble about scarcity of labor, Mr. Foster has had almost from the first more applicants than places.

Besides his regular advertising Mr. Foster runs a bureau of information on poultry culture, from which any person, whether a customer or not, may receive the benefit of his experience, either orally, by correspondence, or through printed matter. When I asked him how he justified on business grounds this wholesale assistance to actual and possible rivals, he replied: "Our output last year was two million eggs, and this is the largest egg farm in the world. The people of New York City consume three million eggs in one day. That suggests how remote is the danger of overproduction in the egg business."

Mr. Foster's experience is interesting as showing what may be done in farming under very exceptional circumstances rather than what may be expected under ordinary conditions. He started with the advantage of exceptional natural ability, ten years' expe-

rience in large business affairs, a matured judgment, and capital. During his first two years he practically established an agricultural school for himself and gave himself the most practical imaginable course in poultry culture. His present preference for city youths without agricultural education really means merely that he prefers to educate them himself along his own particular lines. Unlike almost any other farmer one could mention, he has the ability, the inclination, and the equipment to provide this education. Just as a relatively few youths can learn the practice of law by reading law in the offices of great law firms, or journalism in the offices of great newspapers, so a few can learn agriculture on such great farms as this, but for the great majority school and college courses are essential.

As is natural, the city boy's chief handicap in agriculture is his lack of manual skill. Because of this lack of skill he frequently takes up a specialty, such as fruit-raising or chicken-farming, or a combination of the two —something which does not require a good all-round farmer, and in which, consequently, his lack of handicraft skill will be of least disadvantage.

In order to help the city students to overcome this handicap as far as may be, there is at Cornell a placing-out office which seeks to send them to actual farms as farm laborers during the summer vacations. To find such work is not always easy. The average farmer has much the same suspicion of a college student as had the average business man a generation ago. Sometimes these suspicions are anything but allayed by experience. Several fellows from rich and conventional homes have, for instance, appeared for supper in dinner coats after their first day's work as farm laborers. Other city men have shown their inability to set aside false standards by indignantly refusing to sit at the same table with the other farm-hands. One student laborer quit work at 4:30 in the afternoon and left a half-loaded wagon of hay in the field with a thunder-storm threatening. When the incensed farmer demanded an explanation, he glibly explained that he had only agreed to work until five, and that it would be impossible to finish loading and to get the load into the barn by that time. He had the habit of the city time-clock worker. Another lad, whose officious efforts to be helpful were as successful as those of the proverbial clown who gets in everybody's way, was finally buried and all but smothered in hay by his exasperated companions. When he emerged, perspiring and spluttering, he threw up his place in high dudgeon. One of his professors, out of deference to his excellent class-room record, then gave him the job of caring for his lawn and gardens. After he had broken the lawn-mower, cut his hand in an unsuccessful attempt to mend the mower, and fallen headlong over some frail and expensive shrubs, he was excused to return to his books. He is now a particularly successful entomologist. That is what becomes of some of the inapt city aspirants toward farming. They become agricultural scientists, and sometimes good ones. Let it not be supposed, however, that these misfits are the rule. They are, in fact, very much the exception. Most city-bred students have enough common sense and enthusiasm to counterbalance in large measure their lack of the dexterity which comes of experience. Then, too, their better schooling often enables them to attack their tasks with more intelligence than the farm boys. Furthermore, as they know nothing about practical farm work, they have at least nothing to unlearn. They are open-minded, and the work has for them the interest of novelty, while the farm lad is too apt to look upon it as drudgery. A considerable number of the New York farmers who at first could with difficulty be induced to use any of these city students now not only accept them willingly but apply for them. All things considered, the farmers appear to prefer them to the ordinary farm laborers.

Not a few of the city-bred graduates of the Agricultural College at Cornell are already successful farm proprietors. Necessarily these men have had some capital or some financial help. With few exceptions, there has not as yet been time for those without means to save enough to become independent farmers. Some of these, however, have responsible and well-paid positions as farm managers, and will doubtless soon be in a position to start farms of their own. Among the first group is a man who graduated three years ago. With money given him by an uncle he bought a peach orchard on the Hudson. His crops have been exceptionally fine, and he has sold them particularly well. He is already making money. In the first place, he bought his orchard very cheap; and, in the second place, he has succeeded in selling at top prices. Some years ago the son of a rich New Yorker graduated from the Agricultural College and went to Oregon

to buy a farm. After he had "blown in" the liberal sum his father had given him for the purpose, he wired for more. "The old man," however, "was not so easy as that," and no more was forthcoming. For the first time in his life this gilded prospective farmer found himself face to face with that chilling but wholesome alternative, work or starve. Like others before him, he decided to work. His first job was in a lumber camp. Later he got the position of manager of a small orchard. Small as was the salary, he saved money. A year or two later he was among the first to scent the approach of an apple boom. He put all his savings and all he could borrow into apple land. He improved the land, the boom came, and at its height he sold his land for several times what he had paid for it. With the proceeds he bought a large farm, which he is improving, and which he likewise expects to sell when he has developed it to its highest point of productivity. This is hardly typical farming, but he is improving the land, improving himself, and making money. What more could one ask, and how many country youths have achieved this quick success? A rich Philadelphia youth who went through both the academic course and the agricultural, and made more of a name as a "swell" than a student, went also to Oregon. He bought a large fruit farm, improved it, and sold it at a handsome profit. He has now bought a still larger farm, which he expects to hold and to improve until he can make a similar profit on its sale. Two Chicago fellows after graduation bought an apple orchard in Wayne County, New York. Not satisfied with the prices they received for their crops, they organized a selling syndicate to sell direct to the consumer. They have their own agents in New York City. They are making money.

Another city-bred graduate has for four or five years owned and managed a large general farm in Wyebrook, Pennsylvania. He has had uniformly good crops, which he has sold at uniformly good prices. He keeps his books as carefully as would a first-class banker, and they show an encouraging balance-sheet. A New York young man, whose physique was such that city life was an impossibility for him, after graduating at Columbia took the short course in agriculture at Cornell, and then started a dairy farm in New Jersey. Either he did not know his business well enough or luck ran against him. At any rate, the mortality among his stock was abnormally high, and he lost money. Before he had lost much, however, he sold out and bought a peach orchard near Ithaca, New York, where, if he continues to be as successful as he has been thus far, he will within a few years recoup his losses on the dairy venture and begin to make money. Meantime his health is all the time improving instead of failing, as it would were he working in a city. Another New York man, who did not go to an agricultural college, but took a course at the farm school at one time conducted by Dr. George Powell at Briarcliff on the Hudson, went into poultry-raising on Long Island. He too was a man of frail health, under doctor's orders to live in the country. He started on a small scale, sold direct to the consumer, and succeeded admirably for several years. Finally his father, a rich man of large affairs, reasoning that, if his son could make a good profit with a small plant, he could make a better profit with a large one, furnished him with a large and expensive equipment. This large plant proved a white elephant. The undertaking became at once too large for him to manage the details personally. He had to hire a superintendent. The expenses mounted rapidly and the profits fell as rapidly. He had made the fatal mistake of trying to develop his business by revolution instead of evolution. The business is now ruined and most of the expensive plant idle. Fortunately, not many young men are in danger of having their agricultural ventures ruined in this particular way.

Of the eight city-bred farmers mentioned, two are succeeding through shrewd land speculation supplemented by success in the improving of land made possible by their agricultural training. Two more are succeeding largely through their shrewdness in organizing an effective selling syndicate. Another owes his success in large measure to the fact that he secured his land very cheaply and has sold his crops at exceptionally good prices. The success of another has been attained in no small part by his excellent business sense and systematic accounting system. Another is on the road to success chiefly owing to a rapid and timely shift from a losing to a profitable proposition. The only one who is not at present succeeding owes his lack of success more to the ill-judged generosity of a rich father than to his own mistakes. Before he was boosted into failure he was making a modest success largely by means of selling direct to the consumer. The manner of the

success of Mr. Foster and these other men shows the advantage of a combination of city business instincts with country knowledge and training. They are applying city business methods to country business problems. They are buying in the lowest market and selling in the highest. They are keeping their books as carefully as do their fathers in their city offices. Where the middlemen demand too much they are cutting them out altogether and doing their own selling direct to the consumer. While farming is now almost a learned profession, it is nevertheless first and foremost a business to which must be applied the same principles as to any other business.

Agricultural training is now being used as a means of character development for dependent and lawbreaking city boys. A majority of the lawbreaking boys in the State of New York, exclusive of New York City, who are caught and convicted, are committed to the State Agricultural and Industrial School, at Industry, near Rochester. This school is situated on a farm of over fourteen hundred acres. Here are more than seven hundred boys, ninety per cent of whom are from cities and large towns. There are no walls or physical restraints of any kind. The boys live in widely separated cottages, presided over by a man and his wife. It is two and a half miles from the most northerly to the most southerly of these cottages. Nineteen of them are located each upon a farm of fifty to one hundred and twenty-one acres, and have about twenty-five boy inhabitants, who cultivate the farm under the direction of the man in charge. Each such farm has its own farm buildings, barn, piggery, hennery, dairy, cows, and miscellaneous pets, such as ducks, cats, squirrels, and rabbits. On each farm there is also an orchard. Each boy is given the opportunity to have also his individual garden, in which he may plant what he chooses as he chooses, and do as he sees fit with the fruits of his labors. At an annual fair held in the fall the boys of these various farm colonies compete for prizes and premiums just as do farmers at town and county fairs. Here they display everything from prize colts to pet crows in living things, and from sofa cushions to intricate pieces of machinery in manufactured articles. Also the boys who have been particularly successful in the management of cows, chickens, or pigs prepare and read papers before the assembled boys, telling how they succeeded.

The boys are in school half the day, and the other half they work on the farm. In school they have systematic instruction in agriculture under expert supervision by way of supplementing by theory their practical experience in the daily work of the farms. They conduct, in connection with their school work, scientific experiments in testing seeds, soils, and fertilizers. In addition to all these activities, agricultural experts give them illustrated lectures during the winter.

Although Superintendent Briggs started this work only seven years ago, several of the pioneer boys are now renting and managing farms. Before many years some of these will undoubtedly become full-fledged farm-owners. One of them, who has been working a farm on shares for several years and saving money to buy one of his own, was one day confronted by a lawyer whom his besotted father had employed to find him and force him to return to the city. The boy was eighteen, and his father wanted to put him to work in a factory and appropriate his wages until he was of age. Superintendent Briggs and the boy between them made the lawyer see the matter in such a light that he reported to his client, the father, that the boy could not be found. This noble parent was deprived of this particular means of financing his dissipations. Another paroled boy is renting and managing a farm belonging to one of the supervisors of the school. This is the more remarkable as there is a large percentage of blooded stock on the farm. Men naturally do not intrust their blooded stock except to those in whom their faith is great. Not long ago a paroled boy returned to ask permission to marry the daughter of the wealthy farmer for whom he was working. His success had not been exclusively agricultural.

Over thirty-three per cent of the boys who have left are now on farms. Perhaps a majority of the others would be if they had been free to choose their occupation. Many of them were made to return to the cities by their parents; and in many such cases the only motive of the parents was that of the father just mentioned—exploitation. There are one hundred paroled boys now working on farms. Of their own choice they have gone into the country rather than back to the city.

The supervisors testify that the city boy's usually keener interest goes far to counteract his lack of manual skill. In the case of the younger boys, for whom the lure of the city

streets has not become a fixed habit, the great majority enjoy the work, and gradually their city ambition to own saloons gives place to the desire to own farms. The glimpses I caught from time to time of youngsters surreptitiously embracing pet calves and prize colts suggested that teachers and supervisors were not the only, nor perhaps even the strongest, living influence in shaping these new tastes and ambitions. Seven years ago this great institution was surrounded by prison walls in the city of Rochester. The boys were marched about their barren yard under rigid military discipline. They were being suppressed, but not developed. The changed conditions are typical of the times and of the new use of agriculture as a means of character development.

What the State Agricultural and Industrial School is doing for the lawbreaking boys of the State, the Lincoln Agricultural School, at Lincolndale, New York, is doing for homeless and worse than homeless New York City street boys. They come directly from the Catholic Protectory, whence they have been herded in off the streets of the metropolis. Of the many hundreds at the Protectory two hundred of those who most need or most want agricultural training are sent to Lincolndale to work and study on a beautiful farm of six hundred acres near the northerly boundary of Westchester County. Practically all are boys who have amply won the manly distinction of being classed as "tough." Practically all come from homes which have in one way or another been wrecked by untoward city conditions. Here the aim is to give them a new start in life under favorable country conditions. The Christian Brothers of the Church of Rome are doing the work. Brother Barnabas, an inspired leader of men and of boys, is at the head. The fact that Abraham Lincoln is the great exemplar of the school is typical of the breadth and tolerance of its spirit.

During the four years of its existence dairying has been made the specialty. Model dairy barns were constructed and fine herds of Jerseys and Holsteins purchased. At first a full complement of men—experienced men—were employed. Gradually, as the boys learned to work, the men were discharged and replaced by boys. The boys now do all the dairy work except the supervision. Not only has the popular belief that boys spoil cows been proved a fallacy, but the boys are getting materially better results than did the men. The older boys work on the farm regularly and go to school in the intervals, while the younger go to school regularly and work on the farm in the intervals. There is, of course, time for play, just as there is at Industry and at all schools which get results. Just as at Industry, agriculture is systematically taught in the school, and the boys are allowed to have individual gardens and to do as they please with their produce. Some of them sell their vegetables to the institution at the prevailing market rates.

Brother Barnabas was led to realize the necessity for this training by long years of patient effort in securing country homes for New York boys. He had to implore reluctant farmers to take them for the good of the cause. Farmers now implore him to send them boys. He has many more applications than boys to fill places. His object is, first, to help the boys; and, second, to help solve the farm labor problem of the State. As soon as one boy is placed in a community there come from the neighborhood a dozen to twenty-five requests for others. In former days the result of placing a boy in a given community was sometimes to make it difficult, if not impossible, to place others in the same locality. A farmer once asked one of these untrained city boys to draw a pail of water at the pump—the pump being the most conspicuous object in the dooryard. The boy picked up the pail and wandered about without apparent goal or object. The word pump meant nothing to him. There are no pumps on Avenue A in New York. Another farmer asked one of Brother Barnabas's raw recruits to go to the barn and get a whiffletree which he would find leaning against the wall. After a long search the boy returned with a butter firkin. When the farmer and boy do not even speak the same language, the difficulty of bringing them into sympathetic touch can be readily enough understood.

The boys that go out onto farms from the Lincoln School not only know a pump when they see one, but they frequently know more than the farmer himself in some useful directions. A fifteen-year-old boy recently persuaded the farmer for whom he was working to buy a clipping-machine and let him clip his cows, to lay a cement floor in the cow barn, and to paint the barn. The farmer thought these absurd notions, but he liked the boy so much that he complied. When the physicians in the neighborhood learned of these improvements, they recommended

the milk of this particular dairy for the babies and the invalids, and the farmer was soon able to raise the price of his milk from eight to fifteen cents a quart. Another boy from the Lincoln School persuaded his employer to let him cultivate the potato-patch as was done on the school farm. As a result, the yield was one and one-half times greater than the best previous crop from the same patch. A fourteen-year-old boy who had not yet left the school took care of a small herd of dairy cows for two weeks while the farmer was away. As he had been taught to do, he cleaned out the barn every morning and washed off each cow with warm water both night and morning. By the time the farmer returned the milk yield of the herd had been doubled. The farmer remarked that he wished he had stayed away longer. Naturally enough, he wants the boy to come and work for him when he leaves the School. It is part of the policy to send the boys out onto ordinary farms from time to time, so that they may know and understand ordinary as well as model farm practice before they take up farming as a livelihood.

Twelve of the Lincolndale boys went last fall with Mr. Ryan's prize cattle to the State Fair at Syracuse. Mr. Ryan has since said that they are more efficient than any men he can hire, and that he proposes to substitute them for his men as fast as he can get them. Don't forget that most of these coveted agricultural workers were tough street boys from the dregs of New York City.

Based upon his experience, Brother Barnabas estimates that at least seventy-five per cent of these boys will be permanently successful in life. Hardly more than ten per cent of those sent out by ordinary child-caring institutions become successful. Why may not some of our great men of the future count among their ancestors these sons of the cities' failures and outcasts?

At the National Farm School near Philadelphia the modern miracle to which I referred in my first article is being performed. City Jewish boys are being made into successful farmers. The primary object is to raise up agricultural leaders for the Jewish immigrants in the congested centers. To decoy these people out onto the land without such leaders is to bring them to ruin and starvation. Even the few who have done agricultural work in Europe are not trained to meet successfully American conditions. This is a school of agricultural handicraft supplemented by theory. It is situated on a farm of about four hundred acres. The minimum entrance age is sixteen; the regular course is four years, but students may secure a certificate at the end of two, and many take this shorter course. The farm is run entirely by the students under the supervision of the instructors. The produce is sold for from ten to twelve thousand dollars a year, which is about a third of the cost of running the school. There is no tuition charge, but when a boy comes from a well-to-do family, as sometimes happens, his parents usually make a donation to the institution. The school is free to all races, classes, and conditions of boys, but, as it was founded by Rabbi Krauskopf, of Philadelphia, for the special purpose mentioned, it naturally has attracted Hebrew boys almost exclusively. It was opened fourteen years ago. There are now one hundred students. Of the graduates, eighty per cent have gone onto the land and succeeded at least well enough to stick.

Every graduate has had some theory and more practice in almost every branch of farming. He is prepared to make an immediate livelihood on the land. Some of the boys from the Ghetto in New York City, which would seem a sufficiently hopeless recruiting ground for agricultural material to daunt the most sanguine, are doing particularly well. They have brains enough to counterbalance very largely their clumsiness with their hands. During their month's summer vacation most of the boys work on farms, and wherever they go there come applications from surrounding farms for more of them. The idea of American farmers clamoring for young city Hebrews as farm workers is a little difficult of belief, but it is a fact. Both for temporary and permanent positions Superintendent Washburn has seventy-five per cent more applications than he has applicants.

Ten of the graduates are now successful on farms of their own. One of these, with his father and grandfather, bought a fruit farm in New Jersey. They have been notably successful both in growing and marketing their crops. A number of these farm-owning graduates have been helped in the purchase of their places by the Hebrew Aid Society, which is a branch of the Baron de Hirsch Foundation. A number have gone out to a 6,000-acre tract of irrigated land in Utah, which some Jewish capitalists have purchased and are selling at twenty-

three dollars an acre, payable in installments. Several more are about to go to this Utah community.

There is a fifty-acre farm on the National Farm School tract which is each year managed on shares by the best junior and the best senior. Besides their experience in actual commercial agriculture, these two students clear between three and four hundred dollars apiece during the year. They have, of course, the great advantage of the best expert advice, absolutely free. Of the eight boys who have thus far won this opportunity, four are already successful farm proprietors. A graduate of the Farm School has charge of the Jewish agricultural community at Woodbine, New Jersey. He is literally fulfilling the mission for which the school was primarily established. Another who specialized in horticulture after his first two years is now the manager, on a liberal salary, of a great private estate. A graduate who had specialized in dairy work was given charge of the dairy department of a big farm in the Middle West. By scientific feeding he increased the milk output threefold within six months.

And when this work was started, what said the ever-ready prophets of disaster? They made these four inspiriting predictions: First, Jewish boys from the cities will never go to an agricultural school; second, if they do go, they will not stay; third, if they do stay, they will never become farmers; fourth, if they do become farmers, they will never succeed.

It is commonly believed that the farmer gets too little for his produce, the consumer pays too much, and the middleman either gets too much or there are too many of him, or both. If this is so, the city boy who goes into the country with an agricultural training will inevitably tend to modify this undesirable state of affairs. In learning country life he does not lose city instincts. He acquires the art of growing things; he inherits the art of selling them. For instance, a certain city-bred farmer received one day this wire from the commission merchant to whom he had shipped a car-load of peaches: "Peaches arrived badly damaged. What shall we do?" He replied, "Sell for best price obtainable." He was credited with about one-third what he should have received for good fruit in good condition. When the next car-load arrived, he was on hand to see it unloaded. The fruit was in perfect condition. He said to the clerk in charge, who, of course, had no idea who he was, "Have you had much trouble with fruit being damaged in transit?" "No, very little," replied the clerk; "but we never received but one car-load in such good condition as this one, and that came from the same party last week." With this information he returned home, where he found awaiting him this second telegram from the commission merchant: "Second car-load also badly damaged. Please wire instructions." He did not wire, but went in person to the office of the commission merchant, and left the office with a check for two car-loads in perfect condition.

The city-bred farmer learns to be painstaking and industrious without losing his quick wits and shrewdness. He learns to love the quiet joys of the country, but he demands the comforts of the city. He is neither a "city swell" nor a "country rube," but he has the good qualities of both. The proverbial antagonism between city and country has been disastrous to both. The cities have exploited the country and the country has resented modern improvements as "city notions." The city-bred farmer with his inherited city sympathies and his acquired country sympathies can have no part in this senseless prejudice. His influence must ever be for co-operation between the community whence he came and the one in which he lives.

Farming is the last of the great series of industries to adopt modern business principles. Many, perhaps most, farms are still isolated units. The business methods of many farmers measured by modern standards are archaic. No wonder they are not receiving what they should for their products. But the farmers are now getting into line and beginning to keep step in the double-quick march of modern industrial progress. The old farming is everywhere giving way to the new, and no class of men are so well fitted to lead in this advance as those who are city bred and country trained. These men have not only high ideals of what country life should be, but the traits and the training to realize these ideals.

Just as Hercules's opponent Antæus doubled his strength every time he touched mother earth, so the men of the cities renew their strength when they return to the land. Likewise exhausted lands are renewed by the scientific agricultural methods of the city-bred and country-trained farmer. In short, the bringing together of exhausted city men and exhausted country lands means the renewal of both.

THE SPECTATOR

IT was the middle of August, and the Spectator was buried in the throes of a summer vacation. He had chosen a trip through the Southwest, featuring the so-called "bad lands" of Arizona, the mining sections, and the great cattle country. It was here that the story-writers had found the heart of Western romance. The Spectator wanted to confirm some of their statements about bad men, Indians, and far-riding cowboys.

So it was that the Spectator went straight to the throne of the great Southwest, where the Queen of Copper reigns supreme. Here the little mining town of Bisbee, Arizona, supports its transient population from the enormous mines of the Copper Queen and Calumet and Arizona. It is a town of one industry—everything pertains to copper. As one looks for the first time upon this little cluster of barren mountains, it seems as if the Creator had left it branded forever with the stamp of utter and irredeemable sterility. All the producing germs of nature seem to have passed it by unnoticed. But how perfect is the mask! Beneath this arid cover lie millions of dollars' worth of copper yet unmined.

A thousand feet underground the Spectator was shot on a lightning-speed elevator. One has strange sensations when nearly a quarter-mile beneath the surface of things. But here were endless mazes of tracks, shaft-tunnels, and stope-holes. In the dim yellow light of torches men were working and sweating everywhere. A new little world of strange phantom shadows, hideously disproportioned figures, and damp-smelling air was opening its tragic secrets. Here was man at the very bowels of the earth knocking at its treasure trove. Stepping gingerly through mud-thick tunnels, peering in at gaping black stope-holes, the Spectator followed his Stygian guide, a husky, dirt-besmeared young engineer, to the region of the ore veins. Here the chugging of steam-drills, the shriek of spent power, and the occasional boom of the blast told at what heavy price the earth was releasing its buried wealth.

Work is spelled with a capital letter in a mining town. It is written by the sweat of men's brows, and is the product of brawn and muscle pitted against the tragic elements of the earth. In the larger mines the cycle of work goes on as constantly as the revolutions of the earth upon its axis—twenty-four hours a day, seven days a week, and fifty-two weeks a year. There are no Sundays, no holidays. Night shift relieves day shift with the regularity of clockwork. Men work and sleep, and wake again to work. There are few, if any, real pleasure sources or amusements. So great is the percentage of labor, one seems to forget that beneath it all lie some of the greatest scientific minds in the country. Back of every muck-stick, and in every ounce of ore that is raised to the surface, there is the solution of some stupendous engineering problem. Silently, inconspicuously, the brain has paved the way for labor.

One afternoon the Spectator borrowed a bronco and rode out to a cattle range. When he reached the rancho he had the thirst of a thousand deserts in his throat. The good-natured ranchman led him to a strange-looking earthen jar that hung in full exposure to the blistering sunshine. One would have expected to find a very warm drink in such a place, but the water was as cold as ice. The device is called an *olla*, and the cooling of the water is produced by rapid evaporation. The vessel is made of adobe clay by the Mexicans, and its porous composition permits the water inside to seep slowly through, so that as fast as it reaches the surface the moisture is evaporated. It is only in very dry climates that the device is feasible. But on the desert, where ice is an unknown luxury, the *olla* is almost indispensable.

The Spectator was about to continue his journey across the desert into Mexico when something in one of the cattle pens attracted his attention. Three *vaqueros* were engaged in sawing off the horns of a great Mexican bull. "He killed another of my hybrid bulls this morning," explained the ranch-owner. "He's an arena fighter that I bought from a matador at Juarez." The animal was indeed a fighter. It took a heavy stock and reams of thick rope to hold him while the three *vaqueros* relieved him of his dangerous antlers. When the task had been completed, they turned him loose and we all watched him lumber off towards a small water-hole. He was evidently the maddest bull in all Arizona, and intended to let the other denizens of the range know as much.

Bellowing forth terrific challenges, he approached the half-dried pond. On the farther side stood a big Texan longhorn, defensively returning the challenge, and hoofing showers of sand and mud upon his back. Pitifully ignorant of the loss of his horns, the Mexican plowed

around the water-hole to begin the customary preliminaries of battle. Roar after roar of hungry rage now split from his throat. Foot by foot he pawed the earth toward his opponent. Clouds of sand flew into the air over his lowered head, and the other steers and cows drew back and formed a circle, looking passively on. Suddenly the roaring ceased. The Mexican's great muscled hind legs pushed into the ground and shot him against the Texan. With a dull thud his unprotected head crashed between the long-pronged antlers of the Texan, and met the temples between. For a moment both animals reeled sidewise from the terrific shock. Then the Mexican drew out, parried with imaginary horns, and stove again at the temples of the Texan. This time his charge was more lateral, and there were no antlers to deflect the piercing prongs as they plowed a long, ragged gash into his great virile neck.

With a shriek of pain, the wounded bull pulled back, staggered, and fell to his knees. Dazed and mystified, he recovered himself, lowered his tail between his legs, and backed slowly away. The Texan did not flank him as he crept down to the water-hole and drank heavily. The crimson flow oozed from his neck and diffused pinkly into the thick, muddy water. After drinking gallons, the poor fellow slunk away on the desert. The wound had not been fatal, but it had made him realize, for the first time, the loss of his horns. Like some dethroned monarch, he must now roam the range, hopelessly bereft of his power.

The Spectator now wanted to see something of prehistoric man. In the Forest Reserve, just south of the Navajo country, there is a cañon that harbors a deserted village of cliff dwellings. A day's journey brought one to this prehistoric setting. There is nothing that so fills the human mind as a great yawning crack in the earth. Add to this the sight of strange little huts, inhabited thousands of years ago by squat, animal-like cave men, and one's thoughts go racing back across the chasm of time to the Stone Age and things even more primitive. Tucked into the walls of the cañon, in long, regular tiers, were the cliff dwellings. Jutting ledges of rock hung over each tier, affording protection from the elements and making the refuge impregnable to beast or savage. In crude masonry of stone and mud the little structures had passed through the centuries, immune from the disintegrating forces of nature. Thus had they housed a tribe of savage cave men thousands of years before. A strained, latent silence fills the cañon. It is a silence that magnifies the slightest sound, playing with it, tossing it back and forth in a series of mocking echoes. Even a whisper goes hissing through the acoustic space.

A stone loosens from the cliff and trickles into the hole. Instinctively the observer searches the door of each little hut. In the hidden recesses his imagination conjures up the vision of a dwarfed figure leering out at him from the darkness. Again he drifts back through the æons of time, and, for the moment, he is a cave man himself, looking across the street at his primitive neighbors, and wondering what Mrs. Cave Woman is cooking for dinner, or what Mr. Cave Man is talking about as he gossips with yonder neighbor. The stage is set, the curtain is up. Lacking only are the quaint little actors, and these imagination alone can supply.

In exploring one of the dwellings the Spectator found a small, dried-up cob of corn. It was buried deep in the dust of the floor, and was as hard as rock. There is a vague possibility that this might have been carried into the hut by some wild animal, but, as there were no ranches within many miles of the place, and as the cliff dwellers were supposed to have raised their own maize, he decided to retain the find as a genuine relic. Subsequent explorations failed to reveal anything in the nature of arrow-heads or other implements which the cliff people were supposed to have used in their crude manner of existence. A little later, however, the Spectator saw something in one of the huts that made him hold his breath in terror. Silhouetted in the darkness behind the open door was a long, bearded face. In the face were two eyes which blinked with solemn, passive curiosity. "A cave man!" thundered the Spectator's thoughts, and, with a feeling that some neurotic illusion was playing with his sense of vision, he blinked desperately back at it. Then the face actually began to move. The long, straggly beard tilted upward, and across the abyss came a weird wail of mournful sound. In the desolate cañon the cry seemed like the bleat of some abandoned soul calling back through the ages of the past. Then, slowly, the figure moved forward, and in another moment the shaggy body of a wild buck mountain goat strutted calmly forth and trotted off down the trail.

A sudden desire now seized the Spectator to return to the little town he had left that morning. He wanted to see his fellow-man. The prehistoric atmosphere of the deserted cliff dwellings had set him thinking, and it is not good for a man to think too much in Arizona. Was the Spectator descended from anything that lived in a cliff hut? He wondered.

THE NEW BOOKS

Drifting Diamond (The). By Lincoln Colcord. The Macmillan Company, New York. $1.25.

It is refreshing to come upon a story of adventure written with such animation, freshness, and energy of imagination as Mr. Colcord's original and absorbing tale of the sea and the diamond which had the touch of fate upon it, which carried disaster across the world; and the evil genius of which was finally exorcised by the faith and conscience of a good woman. The plot recalls Stevenson simply because it is impossible not to think how Stevenson would have enjoyed working it out. But there is nothing imitative in Mr. Colcord's style; it is highly individual, full of the personality of the writer. He gives a description of a typhoon which makes the reader feel that he is in personal danger. It is not often that descriptive phrases convey such a sense of reality, or that descriptive language, instead of piling up a great mass of words, so vividly puts one in the very center of the confusion of nature. Altogether "The Drifting Diamond" is an uncommonly interesting and promising piece of writing.

Cry in the Wilderness (A). By Mary E. Waller. Little, Brown & Co., Boston. $1.30.

Much of the popular success of Miss Waller's writing is due to her comprehension of life and her insight into character. She is also gifted with the rather rare power of imparting her thoughts without sacrificing their vitality or individuality. "A Cry in the Wilderness" is a novel with a plot, and the touch of mystery persists to the end. The story is not easy to read, for it is complex and sometimes involved. But it is interesting in its variety: New York City, with its toiling, commonplace masses; Canada and New England, with their characteristic people, poetic or matter of fact; and, above all, the wonderful surgeon, Dr. Rugvie, who untangles difficulties, saves lives, and puts courage into disheartened souls.

Phœbe, Ernest, and Cupid. By Inez Haynes Gillmore. Henry Holt & Co., New York. $1.35.

It is hard to find any one who does not know Phœbe and Ernest and Mr. and Mrs. Martin, but even their best friends, most versed in their engaging ways and manners, will be glad to meet them again in a book. Cupid plays the star part in this set of stories, and Phœbe and Ernest pass through the usual vicissitudes of romance before they are safely landed within their own new homes and begin to exercise the same yet different influence that radiated from the center filled by father and mother Martin. Wholesome, merry, absolutely true to life are these tales.

Inheritance (The). By Josephine Daskam Bacon. D. Appleton & Co., New York. $1.30.

Another tale of mysterious parentage. Nurse Palse brings "Master Hugh" up to know he is a gentleman, and by her shrewdness and devotion secures his position in the family of a country doctor near New York, though the boy is English, as she is also. The author uses her familiarity with England and the English to delightful advantage, and one responds heartily to the little touches that make her pages sparkle with wit. Hugh Gordon grows up to become the doctor's successor, having passed through a curious London experience as "the heir," cleverly described by the appreciative author. A wholesome love story grows slowly but surely in the unsuspecting hearts of the hero and heroine, and we close the book glad to feel that it is not in the least necessary to concoct a disagreeable, problematic situation in order to write a good story.

May Iverson Tackles Life. By Elizabeth Jordan. Harper & Brothers, New York. $1.25.

The stories about the school-girl May Iverson continue in a new volume, which will doubtless be widely read. Their cleverness is their greatest fault, for it entirely destroys the illusion that a real girl is writing. The comments on Henry James, for instance, are far too acute to be May Iverson's unassisted. The pranks played at the convent school are just as irresponsible and funny as they should be, but we still await the long-desired new book for girls.

Newspaper Reporting and Correspondence. By Grant M. Hyde. D. Appleton & Co., New York. $1.50.

The author has the double advantage of newspaper experience and of being an instructor in a school of journalism—that at the University of Wisconsin. He here attempts to tell the cub reporter how to write and handle a news story. His points are practical, although sometimes rather primary. Many who are not ambitious to become reporters may find in the book instructive and entertaining side lights on newspaper methods.

On Hazardous Service. By William Gilmore Beymer. Harper & Brothers, New York. $1.80.

Just the kind of book to interest boys and young men, because it is full of thrilling adventure in war times. The stories of the brave and often reckless deeds of the scouts and spies, both of the Federal and Confederate forces, in the Civil War, including those of two or three women spies, are here related from first-hand information and made into readable and exciting narrative. The colored illustrations are by Howard Pyle and others.

Scientific American Reference Book, 1913. Edited by Albert A. Hopkins and A. R. Bond. Munn & Co., New York. $1.50.

A new edition of a valuable reference book, illustrated by hundreds of pictures. The editor tells us that the "Scientific American" receives about 15,000 inquiries every year, and this

book is intended to meet the desire for accurate information indicated by this enormous number of questions. It covers an exceedingly large number of topics, and gives facts and statistics not only about commerce, invention, manufactures, and science, but about other matters only indirectly connected with those topics.

Lip-Reading: Principles and Practice. By Edward B. Nitchie. The Frederick A. Stokes Company, New York. $1.50, net.

The head of the New York school for the hard-of-hearing unfolds the mystery of lip-reading so that it can be mastered without a teacher. His own attainment of ability to interpret the thought conveyed by a phonograph whose tubes have been placed in his ears, while "without conscious effort the vision of the moving lips of the speaker passes before the mind," the listener's eyes being closed, illustrates what is possible for his pupils in the art. The volume is the only authoritative work in this country upon its subject. Its chapter on the eye as substituted for the ear, and its suggestions to friends of the deaf, have value for all. Its forty pages of capital "stories for practice" indicate a tactful manner of alleviating toil.

Great Adventure (The). By Louise Pond Jewell. The F. A. Stokes Company, New York. 80c.

This little book puts in the form of an experience the faith that life is continuous and death the great adventure, to be looked forward to with glad anticipation. It is equally free from sentimentality and from cant, and is, in our belief, as harmonious alike with the best philosophy as it is with the prophetic and inspirational teachings of Jesus Christ. It is a book not merely of comfort in sorrow, but not less so of inspiration to life. We hope that in any new edition the publishers will omit the picture, which is the only false thing in the book.

Making a Business Woman. By Anne Shannon Monroe. Henry Holt & Co., New York. $1.30.

Equipped with common-sense courage, and "downright tired of being poor," Miss Gale broke with the traditions of her family and went to Chicago to be a business woman. She had taught school, but really couldn't see why she would not make a success in business, if the boys she taught could do it. The narrative of her early struggles and later prosperity is told in extremely colloquial style. She soon overcame her inability to use slang, and fell into all the popular and commercial English that seems to be necessary. The story is really absorbingly interesting. The comments upon business methods and the insight into human motives are keen and true. When she refused to enter into shady transactions, even after she was a prosperous advertising agent, the man who was trying to secure her aid always fell back upon the belief that "women couldn't understand big business, anyway." In a panic she had the advantage of men because she could economize as they could not. She could nibble a sandwich, while a man must order porterhouse steak for himself and his friends. "He instinctively humors himself, while a woman instinctively denies herself," says the wise observer. If her real estate deals seem rather phenomenal, one can adjust the matter in one's mind by remembering that they would be only usual transactions in a man's business life. The book is worth reading, combining much solid, wholesome sense with a smaller amount of amusing and perhaps imaginary incident.

Colonial Homes and Their Furnishings. By Mary H. Northend. Little, Brown & Co., Boston. $5.

As befits the subject, the publishers have given this volume a fine and almost sumptuous form; the illustrations are not only beautiful examples of old gardens, old furniture, china, silver, glassware, and the other fittings of the home, but they do very directly and charmingly present collectively the choice types of all these things. The homes so presented range from the primitive "lean-to" up to the noblest specimens of Colonial architecture as shown in great mansions. The author has evidently spent much time and much loving and pleasurable study in examining famous and beautiful houses and collections of Colonial articles, and in every way she has made a book worthy of the subject.

Dancing and Dancers of To-Day. By Caroline and Charles H. Caffin. Dodd, Mead & Co., New York. $4.

This finely decorated and illustrated volume treats almost exhaustively the topic of "the modern revival of dancing as an art," with many portraits of such recent dancers and posers as Genée, Isadora Duncan, Ruth St. Denis, and other exponents of the art. Chapters on such topics as Court Dances, the Russian Dance Drama, Folk Dancing, Eccentric Dancing, and the Origin of the Dance show that the authors' intention is to cover the subject in all its modern aspects and not merely to make a picture-book.

Woman in the Making of America. By H. Addington Bruce. Little, Brown & Co., Boston. $1.50.

The biographical facts collected by Mr. Bruce quite support the high tribute he pays to the women who took an active and courageous part in our early National history. Beginning with the founding of the colonies, the procession of noble women sweeps through the years up to the present day. It is well that some of these names should be recalled to mind; others are perfectly familiar to all. Heroines of pioneer life in the West are followed by those of our Civil War, North and South. Just at this point, where the North has been too silent, the author's record of sacrifice among the wives and daughters of the North and West will be peculiarly appreciated. Never so vocally expressive as the South, we have done too little honor to the brave, helpful women who, though the war was

not at their doors, suffered as keenly as human hearts could suffer in those dark days. The public work they did has always been recognized, but the individual sacrifices and the poverty endured has not been generally known because of the more dramatic losses borne by their Southern sisters. The woman of to-day is too much in evidence to need exploitation. The author touches briefly but adequately upon the multiform activities of her life—philanthropic, religious, political, social, and educational. He defends the woman's club from its diminishing number of critics, giving a just view of its purposes and accomplishment. In organized charity women, he says, do far more than their share, even when associated with men on the boards. With de Tocqueville, the author says: "If I were asked to what the singular prosperity and growing strength of the American people ought mainly to be attributed, I should reply—to the superiority of their women."

New Immigration (The): A Study of the Industrial and Social Life of Southeastern Europeans in America. By Peter Roberts, Ph.D. The Macmillan Company, New York. $1.60.

This book is exactly what its title and subtitle suggest—a careful review of the quality, industrial activities, and conditions of life in the United States of the Slavs, Poles, Hungarians, and other peoples who have made up the bulk of immigration for the past quarter of a century. It is written on the basis of a thoroughgoing personal investigation, and with a consistent effort to present the facts rather than to develop theories, although Mr. Roberts frankly voices his belief that the defects he finds in "the new immigrants" are due as much to the conditions of their environment in the New World as to any inherent shortcomings, and that their development into wholly desirable citizens depends chiefly on our treatment of them. It is a book well calculated to arouse a sympathetic interest in these newcomers to our shores, so alien from us in customs and points of view; and it is, moreover, a most readable book, with its wealth of illustrative anecdote from the tenement, the factory, the mine, and the logging and railway camp.

History of the United States (A). Vol. III. The American Revolution, 1761-1789. By Edward Channing. The Macmillan Company, New York. $2.50, net.

The distinguishing feature of this study of the American Revolution by the well-known Professor of History in Harvard University is the emphasis laid on the importance of the economic factor in determining alike the causes and the outcome of the War for Independence. It was not out of any intense desire for freedom of political action that the Revolution developed, but because of indignation, not wholly justified, at the belated action of the home authorities in enforcing their customs regulations, and thereby hampering the free-and-easy and extremely profitable trade relations the colonists had been having with the outside world. Similarly it was not so much American victories in the field as the economic distress occasioned in England by the long-continued limitation of commerce and industry that compelled the mother country to consent to peace on terms of separation. This view, of course, has been advanced by other writers, but never with the array of confirmatory evidence which Professor Channing submits. The economic factor again is emphasized by him in his discussion of the events leading up to and rendering well-nigh inevitable the development of an effective union under the Constitution, the formation of which is described by him with illuminating carefulness. Necessarily, perhaps, this elaboration of the prosaic details of colonial policy, trade relations, manufacturing activities, and the like, renders his study at times difficult reading. But there can be no question of its substantial worth and contributory helpfulness to our understanding of the great era with which it is concerned.

Henrietta Maria. By Henrietta Haynes. G. P. Putnam's Sons, New York. $3.50.

Henrietta Maria, daughter of Henry IV of France, became Queen of England as the charming but unfortunate consort of Charles I. Her life is now described by Henrietta Haynes, who shows much sense of historical perspective. As we read these pages the pathos of the whole political situation of the time, as misunderstood by both Charles and Henrietta, becomes increasingly apparent.

Margaret of France, Duchess of Savoy, 1523-74. By Winifred Stephens. The John Lane Company, New York. $4.

In French history there have been three royal women named Margaret. What is more, they marked three successive generations. And, what is perhaps most interesting of all, they influenced three phases of French literature. They were Margaret of Angoulême, Margaret of Savoy, and "La Reine Marguerite." The first was the sister of Francis I; the second, his daughter; and the third was the daughter of Henry II and Catherine de' Medici. The first was one of those inconsistent Renaissance persons whom she herself describes in her "Heptameron," who went to church in the morning and spent the afternoon telling doubtful stories. The third Margaret, equally gifted—the wife of Henry of Navarre, later Henry IV—was equally fond of revel and adventure—just as Dumas *père* describes in his well-known romance. Concerning the first and third Margaret much has been written, but little concerning the second. This seems strange, for, if not as original as the others, the second Margaret was perhaps as remarkable. Certainly she was as admirable. If we are not mistaken, the part of the present volume which will most interest readers is the

account of Margaret's childhood on the banks of the river Loire, the description of the Courts of Francis and Henry, and the appreciation of Ronsard and the other poets and *littérateurs* of a period which, curiously enough, was both cultured and barbaric. Margaret may be counted among the makers of modern Italy, for she married Emanuele Filiberto, Duke of Savoy, the founder of the royal Italian house. That means that she—now the Italian Margherita—and Emanuele were the progenitors of the present house of Savoy.

Chile and Her People of To-Day. By Nevin O. Winter. L. C. Page & Co., Boston. $3.

Mr. Winter has already instructed us concerning Mexico, Brazil, and other Latin-American countries. He now instructs us concerning Chile. The book is timely. We hardly yet realize that the Chileans are the real Yankees of the South, and that they have proved to be the best soldiers in Latin America. Mr. Winter tells us that the latter fact is due to the temperate climate, the mountainous character of the country and its isolation, and the admixture of blood with the unconquerable Araucanians, who of all the aborigines of South America most nearly resemble the North American red men. Furthermore, because of its natural formation, Chile has developed into the strongest maritime nation of the South American continent. The author even prophesies that Chile is destined one day to be the master of the southern seas. Then its fertile valleys, "where every product of the temperate climate grows, and where immense herds of cattle may be fed," and its vast nitrate fields, doubtless destine it to greatness on land as well as on sea. Chile also promises great development in manufacturing. In fact, adds Mr. Winter, "Chile is more likely to become a commercial nation than any republic of South America." The great lack is commercial, not political. Mr. Winter admits that the Chilean Government is "a government of a few of the leading families;" that "elections are sometimes almost farcical."

Engraved Gems. By Duffield Osborne. Henry Holt & Co., New York. $6.

A book to absorb the attention of the technician and tyro alike. Signets and talismans and intaglios have helped us not a little in our knowledge of classic times. This for two reasons. First, because of all the monuments of antiquity they have come to us in the best state of preservation; and, second, because they have been particularly and intimately related to the lives of the men and women of old. We are not surprised to learn in these pages that even in ancient Rome there were collectors—Julius Cæsar himself was a collector—while from Lorenzo de' Medici to the present time the rulers of Europe have prided themselves on their collections. The present volume is not merely a history of gem-engraving, giving us, as it does, with clearness the characteristics and developments of each period from the Greek scarabs, made for the Etruscan market, to the gem-engraving of to-day; it also describes interestingly the deities and other personages liable to be found on engraved gems. Finally, it gives a detailed account of the technique of the subject. The illustrations are mostly confined to the end of the book. The index is ample and is supplemented by a useful alphabetical list of various attributes and aspects of the sacred or sacrificial animals and of the trees and flowers which were subjects of engraving. Thus the book is replete with information for old and young; indeed, for the latter a condensation might be made with profit and published at a popular price.

Bismya, or the Lost City of Adab. By Edgar James Banks, Ph.D. G. P. Putnam's Sons, New York. $5.

Dr. Edgar James Banks is director of the University of Chicago Oriental Exploration Fund. In the discharge of this function Dr. Banks has unearthed Bismya—the lost city of Adab—supposed to have been the oldest city of Babylon. The city of Adab was first occupied, says our author, perhaps ten thousand years ago. At that time the Persian Gulf, he claims, covered much of Babylon and the city was far nearer the shore than at present. Centuries before the Hebrew exiles were scattered over Babylon Adab had turned to mounds of clay. With the exception of Tello, where for many years the French have been excavating, no Babylon ruin, we learn, has yielded so many and so beautiful objects of art, or so many tablets, weapons, utensils of all sorts—even children's toys! They indicate what life was in Babylon thousands of years ago. The story of the recovery of this oldest of the civilized towns should appeal not only to the scholar but also to the general reader, for the account of adventure and restoration has been told in a decidedly popular way.

Egyptian Days. By Philip Sanford Marden. Houghton Mifflin Company, Boston. $3.

To Dr. Ebers's, to Miss Edwards's, to Mr. Hichens's, and to other notable accounts of Egypt must now be added Mr. Marden's. The present volume is notable because it is very practical. It is not so practical as to be called "a mere guide-book," and, on the other hand, it is not a work too oppressively devoted to the archæological and historic aspects of Egypt. Nor is it a detailed description. It is a simple account. It gives a concise summary. It excludes matter unnecessary to the untutored. It does not attempt to tell too much, and, above all, it does give the author's atmospheric impressions. It has evidently been designed for the special needs of those who are planning to visit Egypt for the first time. But those who have visited Egypt may read it with pleasure and profit.

LETTERS TO THE OUTLOOK

THE JAPANESE

I have read with great interest, if not with entire agreement, Mr. George Kennan's article, "Can We Understand the Japanese?" In the course of it he says to his Japanese friend: "I wish you would explain to me this suicide of defeated soldiers after an unsuccessful fight. *The practice is wholly unknown to us in the West*, and it strikes me as extremely wild, irrational, and fanatical." I would be glad if you would let me point out that the practice of self-sacrifice of life for the sake of honor is by no means unknown to Western races, and has never earned in the estimation of Western peoples the epithets he attaches to it. It has not been unusual for the captain of a sinking ship to prefer to go down with his vessel when he might have saved his life. We may regret the loss of a brave man in such circumstances, but the regret is more than tempered with pride at the reminder that the nobler qualities of manhood still survive in our race. And the motive is clear enough. Mr. Kennan should find this case useful for the further development of his argument, but I doubt if it will help him much in the proof of the conclusion he assumes. The fact that in a few cases he has been able to arrive at an explanation of things he admittedly did not understand when they happened hardly convinces one that he has attained to an adequate comprehension of those unexplored "regions of thought and emotion" to which Lafcadio Hearn alluded in "Japan: An Interpretation." EDWARD F. STRANGE.

London, England.

I did not think, and I did not say, that "self-sacrifice of life for the sake of honor" is wholly unknown to us in the West; nor did I apply to it the adjectives that Mr. Strange quotes. What I did say was that "suicide of defeated soldiers is wholly unknown to us in the West," and that, I think, is true I cannot recall a single case. Commanding officers, responsible for defeats, have occasionally committed suicide in the West—as did the admiral who directed the unsuccessful attack on Petropavlovsk, Kamchatka, in 1854—but such suicides are due to a fear of the consequences of defeat, a reluctance to face an inquiry into personal conduct or management. This is not the cause of military suicides in Japan. Soldiers in Western armies may possibly have committed suicide to avoid capture, but I have never happened to hear of such a case. So far as I know, it is a practice confined strictly to the Orient.

Mr. Strange's second point, viz., that I have not yet "attained to an adequate comprehension of the unexplored regions of Japanese thought and emotion," is perfectly true. I have not yet finished my exploration of such regions; but the progress that I have made thus far encourages me to believe that when I shall have explored completely I shall understand completely. Mr. Hearn and Mr. Strange seem to think that there is something eccentric, if not esoteric, in the Japanese character—something that it is impossible for the Western student to comprehend. I doubt this very much. When we shall have learned fully and accurately the circumstances and influences that have formed the Japanese character, we shall be able to understand that character. There is no human mind, Oriental or Occidental, that is inscrutable. Upon this point I may venture perhaps to quote a distinguished Englishman who had long experience in the East and who found Orientals to be not only understandable but likable. In an article published in The Outlook in August, 1909, Sir Andrew H. L. Fraser, formerly Lieutenant-Governor of Bengal, said:

"There is a sense in which every mind does, or can, seclude itself from every other mind; but this is true of Western as well as of Eastern hearts and minds. If one man chooses to keep another at a distance, he can do so. Or if two men are indifferent to one another, and have no desire for intimate acquaintance, it is most natural that they should not know or sympathize with each other. This is undoubtedly true of the East; it is also true of the West. It may perhaps be more common, but it certainly is not more natural, in the former than in the latter. I make this statement in the most distinct and emphatic manner, as the result of my thirty-seven years' experience of India, where I have known the people in their own homes and have had many dear and intimate friends. Both the Eastern and the Western are human. This is only to say that what they have in common is far more than that in which they differ. This statement cannot be denied. If it be admitted, however, it becomes unreasonable to assert the impossibility of touch and sympathy between the Eastern and Western mind or heart." ("Sympathy with the Oriental," by Sir Andrew H. L. Fraser, The Outlook, August 14, 1909.)

This agrees perfectly with the results of my own experience in Japan, and I find it hard to believe that such experiences are wholly exceptional. GEORGE KENNAN.

Baddeck, C. B., Nova Scotia.

CHRISTMAS IS COMING

This is the season of the year when the Consumers' League makes its annual plea for early Christmas shopping. In the hurly-burly of strenuous metropolitan life there are so many daily duties crowding upon each other and so many pleasant distractions that we are apt to procrastinate in selecting Christmas gifts unless the warning note of the Consumers' League reaches us above the noise and strife.

Do Christmas shoppers appreciate the real hardship and distress that is often incurred when saleswomen are working under an undue strain during the last few weeks before Christmas? It is not only saleswomen who suffer from the dilatoriness of shoppers, but the whole army of packers, bundlers, delivery clerks, and wagon boys. Moreover, if the selection of gifts is left until late in the season, merchants are delayed in sending duplicate orders to manufacturers for the articles that have proven most popular. As a result "hands" are kept speeding up and working overtime in factories and work-rooms until nerves are racked, muscles ache, and spirits droop. The natural result of this over-fatigue means for many a wretched young girl serious injury to her health.

Is it worth while for the sake of giving pleasure to a few friends to do so at the expense of the health and happiness of such large numbers of our community?

MAUD NATHAN, President.
The Consumers' League of the City of New York.

TO HUSBANDS

[Some time ago The Outlook reprinted practical advice given by a St. Louis patrolman to a wife whose domestic trouble with her husband had brought the two before a police court. At the time we suggested that it would be a capital idea for some woman to give equally terse advice to husbands. From the letters received in reply we select one which combines most of the suggestions made by all the writers.—THE EDITORS.]

Don't be impatient with your wife because you find her tired when you come home. Don't tell her she didn't need to work so hard, and that if she did work and get tired it is her own fault. Show a little sympathy and give her a bit of praise, instead.

If you feel that you should advise her to be more conservative of her strength and to leave some things undone until such time as she has gained strength to do them, say this to her after she has become rested.

Show her that you'd rather have a less perfectly appointed house, a less sumptuous dinner, one or two more ready-made school dresses for the daughter of the house, etc. That she is your companion, not your slave; and that you want her companionship, not her bounden duty. That her companionship means a happy mind and bright thoughts, and patience with you if you are a bit tired and tried.

If she is ill or worried about herself, consult a physician. No one knows how many women worry about their physical conditions, yet say nothing. And women nowadays have *nerves*.

If she wants money, let her have it if you can (I hope she knows the true value of it); if you can't, tell her the reason why.

And don't let generosity run away with common sense in money matters.

Consult together. Don't give her all the things she wants whether you can afford it or not, and then come home bankrupt and blame it onto her because she required so much.

There is nothing like children to bind husband and wife together.

Don't annoy a woman by talking to her of your business worries, unless she is an unusual woman and really wants to know them.

Avoid mothers-in-law—they are a jealous lot; also maiden aunties, who are mothers-in-law by proxy.

Let a woman have her way in little things. Guide and advise her, protect her; for that's your obligation.

Don't be jealous. Don't give cause for jealousy. Remember, the one who is jealous is usually, if not always, the one in fault. To be more forceful, the one who is jealous is the one to be watched.

Don't both get provoked at the same time. It wouldn't be a bad idea to agree, as part of the marriage contract, that the one who spoke the first cross word should have the end of his tongue cut off. And, finally, and in all seriousness, and covering all phases of this big, big question, here's this to ponder:

"A house divided against itself cannot stand."

And this:

"A soft answer turneth away wrath."

And, last but not least:

"Do unto others as you would . . ." M. B.

ULSTER AND HOME RULE

Why does The Outlook persist in reiterating the fallacious statement that "Ulster is opposed to Home Rule"? To speak of the northern province as being even Unionist is a misnomer. Ulster embraces thirty-three constituencies. Of these, sixteen return Unionist or anti-Home Rule representatives, while seventeen are held by Home-Rulers. Ulster, therefore, is about evenly divided on the issue of Home Rule. Take even Belfast: in three contested divisions of the city, out of a total registered vote of 31,342, the Unionists polled 16,111. In two contested divisions of Antrim, another stronghold of Unionism, the successful Unionist candidates polled only 8,829 electors out of an aggregate registered vote of 17,416. Nor is the northern province, it may be added, overwhelmingly Protestant, as many suppose; for, apart from Belfast, with its population of 255,000 (which includes 85,000 Catholics), Ulster is Catholic, not Protestant; the census figures (1901) standing at 699,202 Catholics and 627,674 Protestants, showing a Catholic majority (outside of Belfast, as stated) of 71,528. Bigotry should be laid aside and the simple truth stated when writing of Ulster vs. Home Rule.

Ouray, Colorado. T. J. QUINN.

BY THE WAY

"In a month or so, judging by the past winters within my recollection," says a contributor to the "Farm Journal," "we may expect some cold weather, with more or less snow and sleet." This is not intended as a gentle satire on the generalities of the weather prophets, but merely as the text for advice to farmers to get their telephone lines in good condition for winter. Such work will soon become difficult or impossible, and the advice is timely.

Chile yields to no other country in the extent of her unbroken coast line, which extends from Peru to Cape Horn, a distance of about 4,000 miles. The Chilean Government is now engaged in making this great coast safe for mariners by erecting lighthouses, at dangerous points, along its entire length.

Amid the general chorus of grumbling at the high price of meat there is one dissenting note—that of the "Ladies' Home Journal," which in its current number says, "We rejoice at the high prices of meats, and fervently say, 'May they soar higher and yet higher!'" Americans eat too much meat, the "Journal" thinks, and high prices will lessen the consumption. People who accuse this popular magazine of catering to conventionality should give it credit for courage on this question.

One of the delights of the man whose hobby is the collecting of paintings is that, sooner or later, most of the collectors get tired of their treasures and auction them off, so that other collectors get a chance to own them. The newest opportunity of this sort will be the sale of Mr. Emerson McMillin's collection, which includes Corot's famous "Orpheus and Eurydice" and four other Corots, a Millet, four examples of Troyon, eighteen pictures by George Inness, and many other notable canvases.

A novelty in picture-making is produced by cutting out of black paper a silhouette which is placed between two pieces of semi-transparent silk or fine-meshed netting, and hung up in a place where the light will fall through the mesh. Striking effects are produced in this way, and advertisers as well as artists have caught up the idea.

In a recent lawsuit regarding the ownership of a play a stage director testified that in thirty-two years' theatrical experience he had never heard of a play being produced as originally written. "The chief duty of a stage director," he said, "is meddling with manuscripts. I have even heard of stage directors who tried to improve on Shakespeare by revamping his works." As Shakespeare himself was a stage director, one wonders whether he took liberties with his own works in presenting them.

A teacher, says the "Christian Register," asked a class of children what a skeleton was; and a little boy replied, "It's bones with the people rubbed off."

The advance of civilization in New York City was recently marked by the opening of a new public playground and gymnasium in Fifty-ninth Street, not far from San Juan Hill and Hell's Kitchen. The gymnasium will be open in winter as well as summer. Wholesome activities provided by playgrounds and gymnasiums in every congested ward of our great cities will help to keep the boys from "shooting craps" on the corners and later developing into gamblers with records like "Lefty Louis" and "Gyp the Blood."

Chicago is to some extent eliminating the smoke nuisance. Her average locomotive now emits smoke the density of which is only 14.92 per cent, while the percentage three years ago was 23.3. These percentages are based on the supposition that zero would represent no smoke at all, while 100 per cent would mean dense black smoke all the time; the present condition therefore shows a decided improvement.

An ingenious housekeeper tells an exchange that an easy way to knead dough is to run it through a meat-chopper, with which nearly all households are supplied. "If a stiff biscuit dough is run through this three or four times," she says, "it is well worked."

A reader questions the use of the word "replica" in the phrase "a replica of Hudson's ship." A replica, properly speaking, is a duplicate copy, by the artist himself, of a work of art. But the term is acquiring a larger use, as is evidenced by the fact that the Oxford English Dictionary includes a secondary definition of the word as "a copy, reproduction, facsimile," and quotes Kipling and other authors as using the word in this wider sense.

An English firm has brought out a new luminous varnish for automobiles, which is said to render a car, without being fitted with lamps, visible for a long distance on a dark night.

King Alfonso of Spain has so far refused to follow the usual custom of the Spanish Court of residing at the Escorial during the summer. He is reported as saying lately, with grim humor, in explanation of his refusal, "I shall spend quite enough time at the Escorial when I am dead, and do not intend to stay there until I have lost the right to choose my residence." The Escorial Palace, it will be recalled, contains within its vast area the mausoleums which form the final resting-place of Spanish royalty.

Since 1900 726,000 acres of tillable land in New York State have been withdrawn from cultivation, says a pronouncement by the Automobile Trade League. The League makes this statement to emphasize the necessity of good roads to the farmer as well as the automobile-user. Better highways will make the land profitable again by bringing the farmer close to his market, is the argument.

The three big American electrical corporations, according to a trade journal, employ nearly 95,000 persons, and have a weekly pay-roll of nearly $1,300,000 at present—the highest figure ever attained so far.

"If there is one tenet to which British self-complacency has clung with more desperate energy than another," says an English author, Mr. Charles Thomas-Stanford, in a recently published book "About Algeria," "it is that our people are the only successful colonists. . . . A motor drive through the rich plain which encircles Algiers will send our long-cherished belief a-packing to the limbo of dead British prejudices." The author describes with special enthusiasm a visit to a farm whose equipment included two motor cars and an aeroplane!

The Balkan War: A Crisis

The war in the Balkans has now reached a crisis. In five weeks a struggle which had its beginnings over five centuries ago has taken on an entirely new aspect. In this issue of The Outlook the reader will find, in the following order: a paragraphic account of the events of the war during the past week; an editorial article descriptive of Constantinople, in the suburbs of which the Bulgarians have already taken their position; an editorial by Mr. Roosevelt entitled "The Story of the Balkans," tracing the course of the forces which have been at work during the centuries; and an illustrated article on "The War of Five Nations," by Mr. S. V. R. Trowbridge, who was for some time a resident in Turkish territory and was an eye-witness of Turkish atrocities. The reader will also find the two maps—one of the Balkan Peninsula, the other of the environs of Constantinople—useful for reference in connection with these various accounts of the war. After barely more than a month of war, the Sultan has sued for peace. Last week Turkish emissaries at Sofia, the Bulgarian capital, presented this note to the Bulgarian Foreign Minister:

> The Ottoman Government having approached the great Powers of Europe to ask their mediation, we are charged to inquire of your Excellency if Bulgaria is disposed to accept this mediation, and, if so, to what conditions her acceptance will be subject.

At the outset of the war most military critics were inclined to believe that the Turks would be ultimately, if not immediately, the victors. Instead, the Turks have not won one important engagement. Indeed, they are in danger of being driven out of Europe, for last week the Bulgarian armies captured six out of the twenty-six Tchataldja forts, extending from the Black Sea to the Sea of Marmora, about twenty-five miles from Constantinople and forming its outer defense. Furthermore, without waiting to take the other forts, at the end of last week some of the Bulgarians forged ahead and managed to get past the Forest of Belgrade to a point on the Black Sea close to the entrance to the Bosphorus, and thence to Therapia, the summer resort of Constantinople, used as a place of residence for some of the foreign ambassadors. Therapia is only eight miles from the walls of the capital. The small map of the environs of Constantinople, printed in connection with an editorial description of the city, will indicate the course of the Bulgarian advance. This progress of the Bulgarian troops will doubtless affect the Bulgarian Council of Ministers, assisted by the agents of the Powers at Sofia, in deciding just what conditions Bulgaria will make if she agrees to suspend fighting. These, it is stated, will be the capitulation of the Turkish army at Tchataldja, the entry of the Bulgarian troops into Constantinople, and the surrender of the Turkish garrisons at Adrianople in Thrace and at Scutari and Janina in Albania. But an armistice is not peace, and if Turkey is to conclude peace with Servia, Montenegro, and Greece, as well as with Bulgaria, the Ottoman Government might as well be prepared to lose its remaining territory in Europe, except possibly Constantinople. This would mean a permanent occupation by the troops of the allied states of the territory now occupied by them. That is to say, Bulgaria would move southward and occupy at least all the province of Thrace, thus adding immensely to her territory. Servia would move west and south, occupying part of Novibazar to the west, and all of old Servia and of Macedonia to the south, and not stopping until she comes to the Ægean Sea, thus about doubling her present size. Montenegro would doubtless expect to get the district and ports now occupied by her in North Albania, and Greece the territory (her own ancient Epirus!) now occupied by her in South Albania, especially as its population is Greek

by race and by religion; Greece would probably also acquire the eastern end of Macedonia, now occupied by her troops. But the great port of Macedonia, Salonika, would, so it is said, be made a free port. And, what is more, Constantinople would be internationalized—that is to say, would be under the control of all the Powers acting together, or of the Balkan Confederation. Furthermore, the free passage of the Dardanelles would be assured. An examination of the map printed on page 607 in connection with Mr. Roosevelt's editorial on "The Story of the Balkans" will help to make this statement clear.

The Balkan War: The Servian Complication

Diplomatically last week seemed the most critical of the Balkan war. Servia was the cause of a vexing complication. Her armies continued their operations, on the east at Adrianople and on the south advancing towards Salonika, while on the west an attempt was made to penetrate Albania. All of these movements were marked by the enthusiasm kindled by the capture in old Servia of the ancient capital of Uskub. More than five hundred years ago it was the capital of the most famous ruler in Servian history, Stephen Dushan, who ruled the Balkans from the Danube to the Ægean. Some years prior to his death in 1356 he also extended his empire through part of Albania to the Adriatic. With the capture of his old capital, the Servians dreamed of a restoration of his empire and in particular of getting a port or ports on the Ægean or Adriatic. Cut off from both of these seas, Servia is in economic subjection to the countries surrounding it. This is an intolerable position, particularly as Servia's neighbors are inclined to impose such duties upon her products as practically to regulate her export trade. She needs and should have a seaport of her own. But any Servian approach to the Adriatic draws a bar across the line of what Austria has for many years announced as the path of her own advance, namely, southward to Salonika. Hence the Servians last week acted as if they might not be unwilling to turn from fighting the Turk to fighting the Austrians. In such a conflict Austria could count upon the support of her colleagues in the Triple Alliance, Germany and Italy. But the Servians doubtless thought that they would have the support of the members of the Triple Entente—Russia, of course, and then England and France. To the relief of every one, the possibility of a European conflagration has now apparently been removed by the sober second thought of both Servia and Austria. In order to gain one of the Albanian ports the Servians would have to cross Albania from east to west, subduing the Roman Catholic and the Mohammedan portions, precisely those which would be most impatient under any possible rule by Greek Catholic Serbs. Thus, such a Servian attempt would endanger Balkan peace rather than insure it. But, even if the attempt could be successful, the Albanians, as we have seen above, have the right of the first settlers, for they have never been entirely conquered by Greeks, Romans, Slavs, or Turks, while the Servian claim is but the claim to a port that was hers for only a few years five and a half centuries ago. Fortunately, a port of the Ægean is just as near geographically, and easier to get diplomatically. If Servia obtains it—and she should—it will be due not only to the equities of the case and to European pressure, but especially to Austria's timely realization of what the Serbs outside and inside of Servia might accomplish if some great movement should bring them all together. The Austro-Hungarian Government knows that it controls in its own dominions about five million Serbs, and that of all its provinces Croatia and Slavonia have been the most discontented and mutinous. They, with Dalmatia, Bosnia, and Herzegovina, are almost purely Serb in population. What if they should secede from the Empire and incorporate with a new Servia already doubled in size? Against such a possibility Austria finds it wise as well as right, while conserving her own interest, to help Servia in hers. In so acting Austria has solved the latest Balkan problem, and, what is more, the latest European problem.

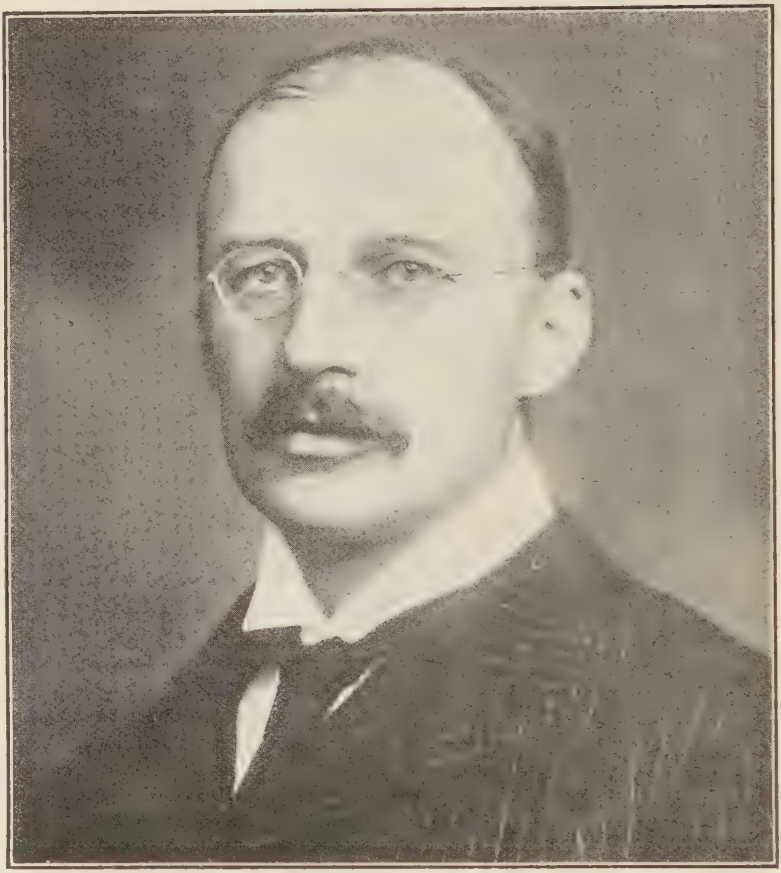
The Balkan War: Albania

But what would become of Albania?—that province which two years ago began the agitation that led up to the present war. If Albania should become a semi-independent principality, as has been intimated, the natives, according to those who know the country, would probably advance as rapidly as have the Bulgarians. Like the Basques in Spain, the Albanians are a native stock. They are, as Mr. Roosevelt points

out in his editorial, really the old Illyrians, and are doubtless to-day what they were in classic times, a hardy, rough, mountain race. Much of their country is as independent of the Turk as is Montenegro. Though the Albanians have always been the flower of the European Turkish army, in return for their allegiance the Sultan has had to be very careful how he taxed them, or whether he taxed them at all! Of all fallow and backward races the Albanians are said to have the greatest possibilities. If an independent government could introduce schools, build roads, and check tribal feuds, there would soon be, it is believed, another progressive little nation in the Balkan Peninsula, able to exist for its own sake, and strong enough to resist being a tool for any Power to use for its own interest. With this prophecy of the future it would seem as if, in carrying out the principle of "the Balkans to the Balkan peoples," the national existence of the Albanians should be secured. In religion the Albanians are mostly Mohammedans. But they also number about four hundred thousand Christians; those in the north are Roman Catholics, those in the south are Greek Christians. Those in the north are known as the Malissori tribes. As soon as they discovered that the Montenegrins wanted not only to deliver them from the Turkish yoke, but also to capture their country, they left their neighbors to invest Scutari as best they might, declaring that their alliance with them did not signify that they wanted to become their subjects. But, whether Mohammedan, Roman Catholic, or Greek, the Albanians are a sufficiently homogeneous people to demand a national existence. Accordingly their chiefs have met at Avlona, one of their principal ports, and have proclaimed their country's independence. Pending recognition by the Powers, a committee has been formed among those chiefs to conduct Albanian affairs. This event has been emphasized by the departure of many Albanians from this country, and of several hundred more who have signified their intention of leaving. They declare that they are not worried about the fate of the Ottoman empire, but they are worried lest Albania should be divided up by the Balkan States in case of Turkey's defeat, and hence they are going back to Albania to save it by force of arms, if need be, from foreign annexation. Thus, while a new force has risen in Europe—one of the great events of our time—the Balkan Confederation, consisting of four little nations, which for five weeks have conducted one of the notable wars of history, the war may end in the recognition of a fifth nation among them.

Uproar in the British Parliament

Last week a scene occurred in the British Parliament at Westminster that reminds one of the recent scenes in the Hungarian Parliament at Budapest. The event had to do with the Irish Home Rule Bill. A Conservative member introduced an amendment reducing the $30,000,000 proposed to be transferred to the new Irish Government to $12,500,000. If the amendment carried, it would defeat the most important financial feature of the Home Rule Bill. To the consternation of the Liberals, the amendment did carry, and they thus found themselves suddenly in a minority. They were assailed by cries of "Resign" and "Dissolve" from their Conservative opponents. On the following day, instead of resigning, Mr. Asquith, the Liberal Prime Minister, moved to rescind the amendment. The Speaker, Mr. Lowther, declared that he could find no precedent for rescinding a decision of the House arrived at in the discussion of a bill. Mr. Asquith thereupon said, as reported, "If the decision remains unreversed, or, on reconsideration, is found to be the deliberate judgment of the House, it will be impossible for the Government to proceed with the bill." On this many men from both sides attempted to speak, but their sentences were drowned by shouts and derisive cries. The Speaker finally adjourned the House for an hour to give the members an opportunity to cool down. And this in sober England! As soon as the House reconvened the same scenes were repeated, and after more appeals for order, the Speaker at length adjourned the House until the next day. Then ensued a remarkable scene. Documents and order papers flew across the floor from side to side; Mr. Churchill, First Lord of the Admiralty in the Liberal Cabinet, was hit by a book. There was an ugly rush from side to side, but the cooler members held back their colleagues from a battle of fists. It took a Labor leader to quiet his more aristocratic brethren; the peacemaking voice of "Will" Crooks was raised in the familiar song "Should Auld Acquaintance be Forgot." Other peacemaking members



SIR CECIL ARTHUR SPRING-RICE

Who succeeds the Right Hon. James Bryce as British Ambassador to the United States

quickly took up the strain and restored good humor to some extent. The House separated without further violence. As to the future, the Liberals declare that two remedies may be applied. First, the Speaker can suspend all disturbers, or, second, the Government may apply "closure" whenever debate is made impossible and carry resolutions by mechanical majorities without discussion. It remains to be seen just how this latter means would operate in the case of the snap vote which defeated the Government. This defeat was due to a surprising absence of Government supporters rather than to any particular change of opinion. The whole episode, however, is interesting not so much because of its Irish as its English significance. It indicates, first, that the "mother of parliaments" has lost a traditional and celebrated dignity and restraint. Second, this would appear to have been the work of aristocrats, not democrats.

Ambassador Bryce and His Successor

When Mr. Bryce came to this country as Great Britain's Ambassador six years ago, he was welcomed not less as a friend of America than as publicist and statesman. He retires at the age of seventy-five, leaving behind him here the cordial liking of the people and the country whose political development he has so well interpreted. As The Outlook long ago pointed out, Mr. Bryce, de Tocqueville, and von Holst stand in the esteem of thoughtful men as the three foremost interpreters of American life and growth. His literary achievements, extending

from "The Holy Roman Empire" of his early days, a work whose authority and accuracy have remained unimpeached for fifty years, down to his just-published book of travel and observation in South America (which contains, by the way, the clearest description of the Panama Canal we have read), cover a remarkably wide range of knowledge, and all are written with lucidity and poise. His appointment as his nation's representative in Washington was regarded as an ideal one on both sides of the water, and he has consistently and unfailingly done everything possible to strengthen the amicable relations of the two countries. It is natural that those English papers which are disturbed over the admission of American coastwise vessels to the privileges of the Panama Canal without tolls should incline to see a connection between that matter and Mr. Bryce's retiral. The sufficient answer has been the statement, apparently authorized, that Mr. Bryce's intention to withdraw from the diplomatic field was communicated to his Government last year. Even now, at its urgent request, he will remain at Washington for some time. Mr. Bryce's successor will be Sir Cecil Arthur Spring-Rice, who made an extremely favorable impression at our capital as a secretary of legation in 1889. He came to this country during Mr. Roosevelt's administration on a special mission said at the time by the press to have had a bearing on proposed friendly intervention between Russia and Japan, and has served Great Britain as Minister in Persia and Sweden. He is well known and highly esteemed throughout Europe and in the United States. In the earlier part of his career he was private secretary of Lord Granville and Lord Rosebery in the Foreign Office. He is a scholar as well as a diplomat; he received honors at Eton and Oxford, and is of that fine type of English gentleman that combines culture with achievement and knowledge of the world with high ideals.

José Canalejas

Spain has lost her strongest man. Her Prime Minister, José Canalejas, has been assassinated. It would have been better for Spain had any other man been assassinated. For here was one who, almost the first in the history of Spain, had been able to throw off the century-old yoke and give to the Peninsula some semblance of modern liberal civilization. We are accustomed to think of Spain as a priest-ridden country religiously and as a reactionary country politically. And this is in large degree true. But, as ten men would have been sufficient to save Sodom, so in Spain there have been a few men of light and leading. And Canalejas was the best of them, because he knew how to make his ideals count in actual deeds. Alone of Spanish statesmen, who have long chafed under the rule of the Church, Canalejas understood how to shape public opinion both outside and inside Parliament until that body should pass the famous "Padlock Bill," under which the religious orders can no longer rule Spain as they have done. That this should bring about a diplomatic rupture with the Vatican was natural; that there should even be some reaction in a country so inveterately Catholic as is Spain was also natural. But the Premier saw straight. He did not deviate, but remained unmoved by all the thunders from the Vatican and by all the perils which lay nearer home. Fortunately, he had won the confidence of the youthful King. And because of this royal confidence Canalejas was able to govern Spain during the past three years as Spain has never yet been governed. If he tried to deliver his country from religious bondage, he also labored for the economic good of the people. He may have been mistaken in some things—indeed, it is perhaps due to the severity of his execution of the strike law that his assassination occurred; others think it is an echo of the resentment at the execution of Ferrer, the Barcelona Anarchist, an event, however, which occurred before Canalejas came into power. The good deeds of Canalejas will remain unquestioned, and to those already recounted should be added his firmness, in the face of a tortuous European diplomacy, in conducting his country's foreign interests out of the maze of such diplomacy to a conclusion which enlarges and betters Spain's colony in Morocco. The loss of such a man only emphasizes the fact that the most irresponsible and least useful person may in an instant remove from usefulness the most responsible and the most useful.

Mr. Roosevelt on the Future of the Progressive Party

If any question existed either about the permanence of the Progressive party as a National force or as to the value and substance of what it has already accomplished, such doubt should certainly be dispelled by Mr. Roosevelt's statement of last week. Mr.

Roosevelt sustained his declaration that the Progressive party has come to stay, and that, "so far from being over, the battle has just begun," by pointing out that what has been actually accomplished in the few months since the new party was founded is "literally unparalleled in the history of free government under representative institutions." His summary of the difficulties encountered and the results actually accomplished by volunteers hastily brought together is both complete and convincing:

> Without much money, without any organization, against the wealth of the country, against the entire organized political ability of the country, against the bitter hostility of ninety per cent of the press of the country, against the furious opposition of every upholder of special privilege, whether in politics or in business, and with the channel of information to the public largely choked, the Progressive party has polled between four and four and one-half million votes, has hopelessly beaten one of the old parties both in the electoral college and in the popular vote, has carried several of the important States in the Union, and has taken second place in the Nation and either first or second place in some thirty-seven of the forty-eight States.

That the rank and file of the Progressive party is determined and enthusiastic was seen in the great meeting at Boston on the evening of November 9. At Tremont Temple a throng of thousands cheered as heartily as those other thousands did at the Madison Square Garden Progressive meetings. An overflow meeting at Faneuil Hall was equally enthusiastic. The addresses by Dean Kirchwey, of the Columbia Law School; of Winston Churchill, of New Hampshire; of Matthew Hale, the chairman, and others, were all in agreement in declaring that the struggle for human rights and social justice is to be continued, and that every effort must and shall be made to perfect the organization of the party. This sentiment was (we are quoting from an anti-Progressive paper) "uproariously applauded by the whole audience," and resolutions were adopted pledging the party to no compromise. A practical token of the earnestness of the meeting was shown by the subscription on the spot of over eight thousand dollars for the future campaign.

The President on the Election

In the New York "World" of Thursday of last week there appeared an interview with President Taft giving his views as to the significance of the election and as to what may be expected as a consequence of the change of the Government from Republican to Democratic control. In this interview he states that he is not greatly disappointed as to the result of the election. He has been glad to have had the opportunity of being President because he believes he has been enabled to help his country toward improvement. The progress that the country has made, he believes, has been, not through the great and notable measures, but through the less important and obvious statutes and changes. He regards the changes that have been made in the civil service as illustrative of this fact. He says that he had certain plans which he could have carried out if he had been re-elected, and could thereby have promoted the general comfort and happiness. With regard to the programme of the Progressive party he shows little patience. He says of it that it contemplates the impossible, and that if the country could stand the shock that would come to it upon adoption of the programme, he would like to see the attempt made "in order that the people might learn the hollowness and impracticability and the sham character of many of the promises upon which such progress is promised." Of the Progressive leaders who advocated this programme, he says that they are a class of men "who do not deserve to figure in any more honorable light than the quacks do in the practice of medicine." He urges the Republicans, therefore, to look forward to the time when many will recover from the "Bull Moose fever" and when the country will have become disappointed with the Democrats, so as to take advantage of the opportunity for the restoration of the Republican party to power. With reference to Mr. Taft's characterization of those who advocated the Progressive platform, it might be well worth while to notice that these "quacks" include such men as Dr. Benjamin Ide Wheeler, President of the University of California; Dr. Albert Bushnell Hart, Professor of History at Harvard University; Dean William Draper Lewis, of the University of Pennsylvania Law School; Dr. Frank J. Goodnow, Professor of Administrative Law and Municipal Science at Columbia University; Dr. George W. Kirchwey, Professor of Law in the Columbia Law School; Dr. Flavel S. Luther, President of Trinity College; Dr. Samuel McCune Lindsay, Director of the New York School of Philanthropy and President of the Academy of Political Science in New York; Professor Charles

McCarthy, the Legislative Librarian of Wisconsin: Mr. Herbert Knox Smith, until recently Commissioner of Corporations in Mr. Taft's Administration. The names are selected at random.

The New York Public School Imbroglio

New York City newspapers have given the country recently some startling accounts of a serious conflict between certain important officials of the city government and certain educational experts of high standing employed to investigate and report on the city public school system. The public mind has been confused by certain details of this controversy which have been given a prominence wholly disproportionate to their importance. In an endeavor to clear up this confusion we here give a brief history of the transactions which have led to the conflict. A little less than a year ago the Board of Estimate, which passes upon all expenditures of money by the city government, appointed a special committee to study the city school system and make recommendations for modifications or improvements. This committee—consisting of Mr. Mitchel, President of the Board of Aldermen; Mr. Prendergast, Comptroller of the city; and Mr. Miller, President of the Borough of the Bronx—about ten months ago engaged Professor Paul H. Hanus, of Harvard University, to make this scientific study or investigation of the public schools. As the subject of the inquiry is so vast, involving the expenditure of over thirty-five million dollars annually and the yearly education of seven hundred thousand pupils, one man could not undertake the work alone. Ten educational experts were therefore chosen to act as assistants to Dr. Hanus. One of these assistants was Professor Moore, of Yale University, whose special share in the inquiry was to study and report upon the Board of Education and its functions. Professor Moore spent more than forty days in the city of New York studying at first hand the Board of Education and its work. His report was finally completed and sent to the Committee of Inquiry of which President Mitchel was the head. Mr. Mitchel and his colleagues did not approve of Professor Moore's report, severely criticised it, called upon Professor Moore to modify it, and, upon what seems to us Professor Moore's very proper refusal to modify it except on instruction from Professor Hanus, President Mitchel and his associates rejected the report. Some of the newspapers have stated that the report was suppressed. This, of course, is incorrect, as the report has been printed in full in the "City Record" and is accessible to any citizen. What President Mitchel and his associates did was to decline officially to receive the report. We think this was a mistake. They should have received it and should have shown the public in what particulars they believe it to be inaccurate and unjust. The report on its face shows that it is based upon a careful and accurate study of the facts. Professor Moore's conclusions from these facts may be unsatisfactory to President Mitchel and his associates, they may even be erroneous conclusions, but we do not believe any educational expert of high standing in the country can be found who will be willing to modify his conclusions in order to make them agree with the conclusions of any other expert or any official of the city. President Mitchel and his associates on the Committee of Inquiry, having denounced Professor Moore's report, have now selected two other experts to make a study of the Board of Education and report upon it. Professor Frank J. Goodnow, of Columbia University, and Dr. Frederic C. Howe, the expert on municipal government who has often been a contributor to The Outlook, will make a new investigation and a new report to take the place of Professor Moore's. The final result ought to be awaited with great interest not only by the citizens of New York but by men and women interested in educational matters throughout the country.

Professor Moore's Criticisms

In the meantime it is worth while noting some of the most important defects which Professor Moore finds in the administration of the New York public schools. The first is that New York City administers its schools by a Board of Education of no less than forty-six members. This is too large a number, says Dr. Moore, and he cites the examples of other cities as showing that a change is necessary—for instance, Philadelphia has changed the number of its school board from forty-two to fifteen; St. Louis, from twenty-one to twelve; Boston, from twenty-four to five; and Atlanta, from fourteen to seven. The difficulty with a large board is not so much that it spends its time in speech-making as that only a few

members really take part in the discussions. A large board must always lack "unity, comprehension of its work, and energy in the performance of it," for such a board "invariably splits up in factions;" "its members do not know each other well enough to discuss their common function together;" and "the result is a non-progressive school administration." The second reason why the New York City system is unsatisfactory is because the Board of Education does not possess the means for managing its schools. As to finances, "each committee of the Board estimates the separate needs of its division, the Finance Committee reviews them, the Board adopts them, the Comptroller's staff suggests changes in them, the Board of Estimate and Apportionment modifies them, and the Board of Aldermen then may reduce them;" indeed, the city's fiscal authorities seem to hold that the school system is only "a subordinate department of the city government." The Board of Aldermen, Professor Moore even declares, "has frequently taken upon itself the duty of requesting or recommending to the Board of Education what action it should take in matters which are purely educational in their character"—concerning, for instance, "the locating of schools, the renting of buildings, the establishing of high schools, the appointment of teachers, the fixing of the course of study, and the printing of schoolbooks in union shops." Mr. Moore adds:

> The Board of Estimate and Apportionment, by controlling the appropriations of the Board of Education . . . in effect administers the school affairs of the city, deciding and determining what subjects shall be taught, what supplies shall be furnished, what enlargements and improvements shall be made, and if it wishes to stop progress and effectual education, rendering the Board of Education a mere rubber stamp.

There are other interesting features of Professor Moore's report—for instance, the question whether the members of the Board of Education should be paid or not, or whether it should not be represented by a general manager, thus ending "the ancient jealousy between the Board of Education and its own director," the general manager naturally to be the Superintendent of Schools. Dr. Moore's judgments confirm the position taken last year by The Outlook with regard to the proposed New York City charter as it affected education. We then said:

> (1) The substitution of a paid Board of Education for a voluntary Board is contrary both to reason and to experience.
>
> (2) The transfer of power to choose teachers and plan courses of study from officials whose interests are solely educational to a body whose interests are political and financial is vicious.
>
> (3) The proposal that the expenditure of money for schools be subjected to the discretion of the general financial board of the city is contrary to public policy.
>
> (4) The proposal that the safeguards now imposed by the State Civil Service Law be abandoned is a menace to the schools.

Dynamiting as a Profession

The revelations which have been made at the trial of the dynamite conspirators at Indianapolis are astounding, not merely because of the number of crimes of violence committed in many parts of the country, but because of the all but incredible heartlessness and cruelty of these men, who cared no more for the destruction of innocent human lives than a boy would care about killing flies. The story told by the informer McManigal, corroborated in parts by other witnesses, involved in this wholesale destruction of property and injury of human life not only the McNamara brothers, who are already under conviction for the "Times" explosion at Los Angeles, but also the present secretary-treasurer of the Iron Workers' Union, Herbert S. Hockin, other officials of the union, other labor officials, and paid agents of assassination. Of course it would be entirely improper to express an opinion upon the weight of this evidence while the case is still before the jury; but if half of what McManigal has said is true, the perfidy and murderous spirit of the conspirators have never been exceeded. Their utter disregard of the common demands of conscience and sensibility, for instance, is exemplified by the fact that McManigal was accustomed, whenever he "pulled off," as he phrased it, a successful explosion, to send back to his wife from whatever place he happened to be a souvenir spoon. In his story of the "Times" explosion McManigal says that McNamara admitted that after he had placed the dynamite he went upstairs and tore away a gas jet so that the explosion would be followed by fire. When he was asked if he did not know that there were people in the building and that some of them would be burned to death, he calmly replied: "Yes; but what difference does it make?" Those who still believe that the only way to settle industrial disputes is by war, in which the capitalists may be expected to use the

methods of blacklisting and turning operatives out into the street and the like, while the unions may, as a matter of course, use violence to carry through their ends, should face such stories of planned and plotted violence as have been disclosed here, and such extremes of utterance as the Industrial Workers of the World have employed within the last year, and should recognize the instant necessity of combined action to deal with labor differences in a sane, peaceful, and conciliatory way.

New York's Harbor Endangered

The whole country has an interest in the question whether the harbor of New York is to be made available for the new style of steamships. The present piers are not long enough for the great steamers which are now being built, and any further extension of the piers into the Hudson River is regarded by the experts as undesirable, because liable to interfere with river navigation. Such extension can be made only by permission of the Federal Government. Permission has been asked, and the board to whom the matter was referred recommended that a privilege be granted to make temporary extensions until the matter can be dealt with in a final manner. The Secretary of War has refused to approve this recommendation. The ground of his refusal is that the time has come for putting an end to temporary makeshifts; that if New York City desires to retain its commercial position it must take the matter up seriously, with the purpose of making permanent provision for the new style of steamship. New York's merchants will not retain for the city her commercial supremacy unless they succeed in keeping her abreast of the commercial progress of the age. It ought to be possible for an efficient city administration to bring about a thorough discussion of the various plans, and reach some practical conclusion; and it ought not to be impossible for an efficient city administration so to put the necessity of action before the people as to turn apathy and indifference into interest and purpose. It appears to be certain that the great steamships constitute a type, if not the type, for future ocean travel; and if in some way New York City does not provide berths for them they will go elsewhere. We are glad to record that Secretary Stimson's decision has stimulated action on the part of New York. A committee of the Board of Aldermen, headed by Mr. Mitchel, its President, has recommended to the Board of Estimate that eight docks, each 1,000 feet long, be built on the Hudson between Forty-fourth and Fifty-sixth Streets, cutting inshore as far as needed. This would be enormously expensive, but the committee believe that the importance of the undertaking to the city would justify the cost. Two possible harbors are suggested in the newspapers—New London, on the Connecticut shore, and Montauk Point, at the extremity of Long Island. How seriously these alternatives are being considered by the steamship companies we do not know.

Divorce Legislation in England

The cable gives us a fairly comprehensive account of the report, just issued, of the Royal Commission of Divorce in England which was appointed in 1909. The majority report is signed by eight of the members, including the former President of the Probate, Divorce, and Admiralty Division of the High Court of Justice, and two women members. There is a minority report signed by the Archbishop of York and two others. The majority report recommends six grounds for dissolving marriage: adultery, willful desertion for three years, cruelty, incurable insanity after five years' confinement, habitual drunkenness found incurable after three years, and life imprisonment under a commuted death sentence. The report further recommends that the Court be empowered to exclude the public in whole or in part from any matrimonial case, and to order the suppression of the publication of anything in connection with the case in the interest of morality. It also provides that there shall be no report in any case published until the case is finished, and pictorial reproductions of the parties and witnesses in a divorce case should be prohibited. The majority report rejects unconquerable aversion, incompatibility of temper, and mutual consent as grounds for divorce. It recommends certain important reforms in divorce procedure, which is now so complicated and expensive as to make proceedings for divorce practically impossible for the poorer classes. It takes the radical ground that husband and wife must be placed on an equal footing, and that whatever grounds are

permitted to the husband for obtaining a divorce from his wife must also be available to the wife in a suit against the husband. The minority report disagrees with the most important recommendations of the majority report, on the ground that they tend to loosen the marriage tie and to disintegrate the family, and it cites the experience of America, where divorce has been easier and wider than in England, and where now there is a reaction in favor of greater restrictions, as a strong reason for opposing the recommendations of the majority.

Just Grounds for Divorce

The Outlook agrees, without any qualification, with the fundamental propositions of the majority of this Commission: that the grounds for divorce should be the same for the wife as for the husband; that court proceedings should be made such that divorce should not be less available for the poorer classes than for the rich; and that divorce should be permitted by the State for other grounds than for adultery. We can see no adequate reason why a wife should remain bound to a husband who is guilty of habitual cruelty or incurable drunkenness or who is sentenced to a life imprisonment. It is to be hoped, however, that if the report of this Commission is accepted, and these grounds of divorce are recognized by the English law, the English courts will not be so lax in interpretation of the law as some American courts have been. It is said, we believe on adequate authority, that in America a husband has obtained a divorce from his wife on the ground of cruelty, because she neglected to sew on his shirt buttons; and a wife has obtained a divorce from her husband because he never took her out for a ride; and it is notorious that willful desertion has been often made an excuse for divorce where the parties have voluntarily separated. Such laxity as this, however, is to be charged up, not against the law, but against the courts and against the public sentiment which has sustained the courts in such administration of the law.

The Panama Exposition

Although it will be nearly three years before the great Exposition at San Francisco is opened to celebrate the inauguration of the Panama Canal, the work of preparation has already reached a point which justifies the hopes of the directors and of the people of San Francisco that this Panama Exposition will exceed in brilliancy any previous exposition in the world's history. This country has already successfully created three International Expositions or World's Fairs, which have made a steady and logical procession from the Atlantic coast towards the Pacific. The first exposition, in Philadelphia in 1876, celebrated the creation of the United States as an independent Government; the second, in Chicago in 1893, emphasized the discovery of America as a great continent; the third, in St. Louis in 1904, marked the progress of the American people across that continent from the Atlantic to the Pacific; and the Panama Exposition, in 1915, will display to the world the complete union of the two oceans, not merely by the construction of the Panama Canal, but by the settlement and development of the Pacific coast and the great mid-continent spaces which less than a century ago were wild and desolate waste places. The climate of San Francisco and its geographical situation alone promise wonderful opportunities for such an exposition, and there is every indication that the energy and just pride of Californians will develop these climatic and geographical advantages to their fullest extent. The directors of the Panama International Exposition have chosen as the Director of Exhibits Captain A. C. Baker, of the United States Navy, retired. Captain Baker's distinguished services in the navy have given him an intimate familiarity with the architecture, industry, education, and social life of most of the civilized countries of the world; moreover, he has had practical official experience in connection with the Chicago Exposition in 1893, the Paris Exposition of 1900, and the St. Louis Exposition of 1904. At the Paris Exposition he was Vice-President of the Class Jury, Vice-President of the Group Jury, and a member of the Superior Jury. In a personal letter to The Outlook Captain Baker tells us that it is the purpose of the directors of the Exposition to make it not only a beautiful spectacle in its setting and development, but to assure the fact that its dominant note shall be educational. In the arrangements of the exhibits the classification will be selective rather than collective. This selective principle has been adopted as a result of the experience at preceding World's Fairs in this country. At Philadelphia in 1876 the number of exhibits was very large; at Chicago in 1893 the num-

ber was almost unmanageable; at St. Louis in 1904 the volume of exhibits "produced a condition approaching mental nightmare." It is therefore the purpose of the directors of the Panama Exposition at San Francisco to make every exhibit not only the best possible of its kind, but a real index of historical and educational progress. If the people of the United States give their support to this Exposition, as we believe they will, it ought to be a great agency for industrial, social, and educational progress in this country and for the strengthening of cordial international relations of the United States with Europe on the one hand and with the Orient on the other.

Engravings and Etchings

Mr. FitzRoy Carrington, a partner in the firm of Messrs. Frederick Keppel & Co., of New York City, and an authority on engravings and etchings, has been appointed curator of the Department of Prints in the Boston Museum of Fine Arts. He will also deliver at Yale University a course of lectures on prints, a chair having been endowed for that purpose. Mr. Carrington will also continue to edit the "Print Collectors' Quarterly," which is to be taken over by Messrs. Keppel & Co., and published by the Boston Museum. All this forms an interesting event in the world of art. It is Mr. Carrington's hope that a Society of Print Lovers in America may be formed. We hope so, too. Indeed, it would seem as if it had already been formed by the happy co-operation between the Boston Museum of Fine Arts and Harvard University. It would be well if a representative collection of prints might be established in every great city. The example of the Boston Museum should be an incentive to others. Its "Bulletin of Fine Arts" states that "the print department of this museum has now more than sixty thousand prints, a collection which shows the history of the art from its beginning, and contains examples of the work of all the great masters." There is no reason why Boston should have sixty thousand prints and New York and Chicago not so great a collection in quantity and quality. Then, too, Boston has the advantage of having access to both its own museum treasures and those at the Fogg Museum at Harvard. This may stir the people in general, and particularly the art patrons, in any community to some attempt at imitation. In our largest collections there should be a good print made of nearly every important etching or engraving.

THE PHILIPPINES AND THE DEMOCRATIC PARTY

When the news of the Democratic victory in the Presidential and Congressional elections reached the Philippine Islands, the political leaders of the Philippines, who have long been agitating for the independence of the islands, had a great celebration. Indeed, it is reported that a gathering of twenty thousand Filipinos in Manila "indulged in the wildest jubilation," and that, for the first time since his capture as an enemy of the United States, Aguinaldo, the leader of the Filipino insurrection, appeared in public and made a political speech.

This was not a celebration by the people of the Philippines as a whole. The population of the Philippine Islands consists not of one race or of a number of races in the same stage of progress toward civilization, but of a variety of races, including people well advanced and people in a very primitive stage. Among those who have been most influenced by European standards are the Tagalogs. It has been chiefly a group of Tagalog leaders who enjoy political contests and the exercise of political power that have agitated the question of independence. Whether independence for the Filipinos is regarded as desirable or not, the demand for it on the part of Filipino politicians, with the support of many who live in Manila, is not identical either with the demand for it on the part of the Filipino people, or with evidence that the Filipino people are ready for independence.

It is plain, however, that, so far as these Tagalog leaders are concerned, the election of a Democrat to the Presidency of the United States, together with the election of a Democratic majority in Congress, has given the impression that the United States is about ready to promise that it will withdraw from the Philippines and leave the Filipinos to their own devices. It is not strange that such an expectation on the part of Tagalog leaders should be the cause of rejoicing among them; for if the United States were to withdraw, it would be these leaders and members of their race who would succeed to power over the islands.

It is a good sign, this ambition on the part of the Tagalogs and their leaders to secure

power and accept responsibility. An unambitious people is never a strong, efficient people. It is good for the Tagalogs to rejoice at what they regard as their certain prospect of advancement to authority. The question is whether they are deluding themselves with a false prospect, and whether they should be intrusted with the care of hundreds of thousands of their fellow-Filipinos.

That there is ground for this expectation on the part of the Tagalogs is shown by the fact that the Democratic platform favors "an immediate declaration of the Nation's purpose to recognize the independence of the Philippine Islands as soon as a stable government can be established, such independence to be guaranteed by us until the neutralization of the islands can be secured by treaty with other Powers." What this means specifically may fairly be inferred from the report of the Democratic majority in the Committee on Insular Affairs at the last session of Congress. That majority approved a bill which would provide that after July 4, 1921, the United States would relinquish all sovereignty over the islands. It is true that the President-elect, Mr. Wilson, has not, so far as we know, committed himself to this specific plan, but has been content with saying that it is our duty as trustees on behalf of the Filipino people "to make whatever arrangement of government will be most serviceable to their freedom and development."

The Outlook reiterates its belief that the independence of the Philippine Islands, or even a promise of independence at a specific date, would not be conducive to self-government in the Philippines; that it will be "most serviceable to their freedom and development" for the United States to continue the process of education which has been carried on since the Spanish War; that the present available evidence indicates that the people of the Philippine Islands are not yet ready for any considerable enlargement of the franchise or of the expansion of their legislative powers; that the maintenance of order, the protection of life and of property, the firm establishment of institutions of liberty, must for some time be under the responsible guidance of the United States in as great a degree as at present; that there is no reason why the people should not look forward to the time when they will take larger responsibilities upon themselves; and that there is no reason to believe that the time will ever necessarily come when the people of the islands will be, or will wish to be, any more independent of the United States than Canada at present is independent of Great Britain.

The United States has assumed responsibility for the Philippine Islands, and it cannot rid itself of that responsibility by evading any duties that have come in the course of the years. If the Nation should grant independence to the Philippines, the United States would not be absolved from moral responsibility for any disaster that might come in consequence. It is conceivable, of course, that a Democratic Congress might pass a bill such as that recommended by the Committee on Insular Affairs. We hope it is not possible for Mr. Wilson to sign such a bill; but if such a promise as is involved in that bill were made to the Filipinos, we do not see how the United States could honorably refuse to keep it.

The Philippine question has not been a conspicuous question in the past campaign. The American people have not given any indication that they have changed their minds with regard to the right policy toward the Philippines. If such action as is contemplated in the Democratic platform and the proposed Philippine Bill is taken, it would seem to be irrevocable. We do not believe any party has the right to take such irrevocable action in so great a matter without a clear command from the people.

WHAT SHALL WE DO WITH LIFE?

"Science" publishes an interesting report of a recent address by the President of the British Association for the Advancement of Science on "The Nature, Origin, and Maintenance of Life." Recognizing the difficulty of defining life, repudiating the notion that it is synonymous with soul, declaring that "the more obvious manifestation of life is 'spontaneous' movement," Professor Schaeffer argues, with a great variety of scientific illustration, that science is pointing toward a solution of the long-vexed question. What is the origin of life? The non-scientific reader will not easily follow Professor Schaeffer's scientific arguments. The scientific reader may be referred to the issue of "Science" for September 6, 1912. It must suffice for our purpose here to state the author's conclusions in his own words:

"We may fairly conclude that all changes

in living substances are brought about by ordinary chemical and physical forces."

Or again: "We are led to regard it [life] as having been produced, not by a sudden alteration, whether executed by a material or supernatural agency, but by a gradual process of change from material which was lifeless, through material in the borderland between inanimate and animate, to material which has all the characteristics to which we attach the term 'life.'"

Or again: "Is there any valid reason to conclude that at some previous period of its history our earth was more favorably circumstanced for the production of life than it is now? I have vainly sought for such reason, and, if none be forthcoming, the conclusion forces itself upon us that the evolution of non-living into living substances has happened more than once—and we can be by no means sure that it may not be happening still."

These speculations concerning the origin of life are curious and interesting, perhaps even profitable. But they have nothing to do with living a moral and religious life. They are like the question of the small boy to his father: "What was there before there was anything, and how did it happen?" It was not necessary for the boy to get a satisfactory answer to his question in order to be a good boy. It is not necessary for us to understand the origin of life in order to live good lives as reverent children of our Father in heaven.

Whatever is the origin of matter and of life, it is certain that man has not originated them. But man can direct them; and morality consists in giving a right direction to them. If a man discharges a pistol, he does not create energy, he releases the energy which is stored in the gunpowder and directs it what to do. If he directs it to defend his wife from the assault of a ruffian, he performs a moral act. If he directs it to kill a rival, he performs an immoral act. If a man signs his name, he does not create life; he uses life, which is a form of energy. "Our life," says Professor Schaeffer, "is not a single indivisible property, capable of being blown out with a puff like the flame of a candle; but is the aggregate of the lives of many millions of living cells of which the body is composed." When a man signs his name, he releases and utilizes the energy which is stored in certain of these cells. If he uses it to sign a check which will send some of his money to feed famine-stricken China, his act is moral. If he uses it to sign some other man's name to a check in order to rob him of his money, his act is immoral.

What is the origin of life, or whether it ever had an origin, is a curious and interesting question. But there is no doubt that man can direct this energy to fulfill his will. His character depends, not on the origin of life, but on the use he makes of it. The question as to the origin of life is not a moral question. We can direct life into useful channels and employ it for the betterment of our fellow-men, whatever opinion scientists may entertain as to its origin.

Nor is the origin of life a religious question.

Whether matter produces life, or matter is a form of life, or the two have existed from eternity, or one or both have had a supernatural origin, are not religious questions. The answer which philosophy makes to these questions has no necessary effect on the religious life.

Moral philosophy affirms that man can direct life into wise channels—that is, he has intelligence; and into beneficent channels—that is, he can be moral. Religion affirms that the life of the universe is directed into wise channels by an intelligence more far-seeing than man's, and into beneficent channels by a benevolence greater than man's. Belief in morality is not belief that man can originate life, but that he can direct life. Belief in religion is not belief that God originated life; it is the belief that he directs life. Creation is not making something out of nothing by a divine fiat. It is making order out of chaos by an intelligent direction and control. The declaration in Genesis i. 1, that "in the beginning God created the heaven and the earth," does not mean that he made something out of nothing. It is a summary of the creative process described in the rest of the chapter. "How long the pre-existing waste and emptiness of chaos existed, and how long the darkness prevailed over the primal waters before the quickening spirit or breath of God brooded over its surface, we do not know."[1] We revere, not an imaginary Being who in some distant epoch made something out of nothing and started a universe on its career; we revere a Being who is constantly directing this life of the universe so as to fulfill his beneficent purposes—a Being who directs all the life in the universe, from that which is

[1] Hastings's Dictionary of the Bible. Compare also International Critical Commentary.

manifested in a globule of water to that which is manifested in the orderly movements of uncounted millions of worlds.

As the life of the body is the aggregate of the lives of many millions of cells of which the body is composed, so the life of society is the aggregate of the lives of many individuals of which society is composed. As man can direct the lives of these cells in the body to a predetermined end, so men can direct the lives of these freely acting individuals in society to a predetermined end. On this faith in the power of man to direct life not only all individual morality but also all social reform is based.

As great men have a power to direct the free life of society in wise channels and to right ends, not by physical force but by moral inspiration and guidance, so there is an Intelligence higher than the highest and a Benevolence greater than the greatest which can and does direct the free life of society toward methods that are wise and toward results that are right. Call it God, call it what you will, there is a directing power in life that

> "shapes our ends,
> Rough-hew them how we will."

We cannot always understand what this Being is doing; we cannot always comprehend his designs, any more than the child in his pinafore can understand all that his father is doing or comprehend all his father's designs. But we can see that there is a design in history as there is a design in nature. And we revere the Eternal, not because he is the Creator of life, but because we can see that he is directing life to ends that we see are intelligently planned and that we believe are beneficent in purpose.

It is not important that the passenger in a steamship should know how the steam in the boiler is generated. It is very important that he should know whether there is an intelligent pilot on the bridge who can guide the ship in safety, or whether the ship goes whithersoever the forces of wind and waves carry it. It is not important that we should know what is the origin of either matter or life, or even whether they ever had an origin or whether both have existed from eternity. It is very important that we should know whether we are machines blindly obeying the wires that pull us and whether the universe is a bigger machine without a ruler.

Morality is founded on faith in ourselves; faith that we have an intelligence and a will which enable us to direct our lives according to our predetermined purpose. Religion is founded on faith in God; faith in an Intelligence higher than our own and a Benevolence greater than our own, directing life to the fulfillment of a predetermined purpose.

Morality and religion do not depend on the question, What is the origin of life? Both are founded on the faith that life can be wisely directed by intelligence and rightly directed by benevolence.

THE STORY OF THE BALKANS

EDITORIAL BY THEODORE ROOSEVELT

NO one can understand what is happening in the Balkan Peninsula to-day without a little knowledge of what has happened there during the last fifteen hundred years.

At the beginning of the fifth century the great Roman Empire tottered on the brink of its fall. It had become Christian, but Christianity had not been able to stop the corruption that was eating into it. The emperors had long abandoned old Rome—the Rome on the Tiber—and had made their capital at the new Rome on the Bosphorus, the city founded by Constantine, where the old Greek city of Byzantium already stood. Soon after the opening of the fifth century the barbarians swarmed across the border, and in the West the Roman Empire speedily came to an end until revived in wholly different form by Charlemagne. But in the East it persisted for a thousand years longer, gradually becoming a Greek rather than a Roman Empire, and often taking the name of Byzantine, from the Greek town which Constantine changed into the Rome on the Bosphorus. This new Rome became for many centuries the most wonderful city in the world. It has generally been called, after its founder, Constantinople. But the name of Rome still haunts these eastern European regions where the Romans once held sway. To this day the Moslems of Asia speak of the Turkish Sultan as the Lord of Roum, and his European possessions are

THE BALKAN PENINSULA

often called Roumelia, while one of the nations which has emerged from beneath the retiring Turkish sea is called Roumania.

When, fifteen hundred years, ago the barbarians crossed the Imperial frontier, there were three peoples dwelling in the Balkan Peninsula. These were the Greeks, who spoke the Greek tongue; the old Illyrians, whom we now call Albanians, along the Adriatic, north of Greece; and the Romanized colonists and natives, including the Roman settlers whom Trajan had established across the Danube in Dacia after its conquest. The barbarians who pressed into the Eastern Roman Empire and the Balkan Peninsula were not Teutons, like those who overran Britain, Gaul, Spain, and Italy, but Slavs. Both the Slavs and the Teutons were Aryan-

speaking peoples of the European type. But there also appeared in the Balkan Peninsula wilder peoples, horse nomads from Asia and from the steppes through which the Volga runs. These people were closely kin to the Magyars and Finns, and more remotely to the Turks and Tartars. There were several different tribes among them, but the most important were the Bulgarians.

These invaders overran the entire Balkan Peninsula, but were never able to take Constantinople itself. The Slavs, under the name of Serbs or Servians, founded a great empire, and so, at one time, did the Bulgarians. The Emperors of Constantinople waged constant war with both nations; one of their number was called the "Bulgarian Killer" because of what he did. The Serbs became Christians, but kept their native Slavonic language, and, until the advent of the Turks, their empire as well. The Bulgarians became Christians, too, but they disappeared as a separate empire; and, moreover, they became fused with the mass of the Slavs they had conquered, and the resulting mixed race, though Bulgarian by name, was much more Slavonic than Bulgarian by blood, and grew to speak a Slavonic language.

Then, in the fourteenth and fifteenth centuries, the Turkish hordes entered Europe and finally conquered the entire Balkan Peninsula. All the separate subject peoples were merged in the common lot of slavery, save that some of the Slavs, notably in Bosnia and Herzegovina, became Mohammedans and identified themselves with their conquerors, and most of the Albanians followed the same course. There was always more or less national feeling left among the Servians and Roumanians, though the representatives and heroes of this national feeling were able to make their protest against the Turks chiefly as bandits. But the Bulgarians at that time seemed to have had every particle of national feeling stamped out of them, and were of little more consequence than so many cattle.

After the subjugation of the Balkan Peninsula, the Turks continued their aggressive and conquering career in Europe for over two centuries, Hungary becoming a part of the Turkish Empire, as well as portions of what were then Southern Poland, some of which are now Austrian and some Russian. As a result of the Turks' final repulse from Vienna, however, the Turkish tide began to recede, although not without many returns.

In the nineteenth century the old nations of the Balkans began to reappear once more. Greece became independent. Servia and Roumania by successive stages gradually became independent also. One little end of Servia had always remained independent. This was Montenegro, whose inhabitants are simply mountain Serbs, who in their rugged fastnesses preserved their liberty when all the rest of their nation went under the yoke of the conqueror. By constant warfare the Montenegrins finally became what were probably the most formidable fighters in all the world; and no state has ever had a more heroic history. Albania has gradually become practically independent of the Turks. But the Albanians have had no kinship of feeling with the other Balkan peoples, and no such sense of unity among themselves as the other Balkan peoples have had. They are predominantly Moslem, but some of the tribes are orthodox, belonging to the Greek Church, and some are Catholics. They have fought a great deal among themselves. They have been willing and eager to furnish the Turks with formidable soldiers to keep down the other Balkan peoples, but they have not rendered much more than a nominal obedience themselves to the Turks, and at times and in certain places have oppressed the Turks of a given region as horribly as the Turks have oppressed any of the Christian races.

The last nation to emerge was the Bulgarians. This was after the close of the Russo-Turkish War in 1878. In that war the Montenegrins fought, and the Servians fought. The Roumanian army came to the help of the Russian, and by its strikingly gallant feat of arms in taking the Grivitzka redoubt struck the decisive blow at Plevna. But the Bulgarians did no fighting of any moment. The Turks committed the most horrible cruelties in Bulgaria, outrages so dreadful that all Europe rang with them. But the Bulgarians did not appear as among the formidable foes of the Turks. Their country was given its freedom only by the Russian army. Every one, friend and foe alike, regarded the Bulgarian peasant—and the peasant was the typical and almost the only Bulgarian—as a dull, patient ox of a man, an object of rather contemptuous pity, and never of respect or fear. Such was his condition when peace was made; the cause of civilization being set back because the Western Powers, in their jealousy of Russia, refused to allow some of the Russian conquests to be freed from

Turkish misgovernment. There was a good deal of speculation as to what the different new nationalities would do, but nobody dreamed that the Bulgarians would play a leading or important part. The Roumanians, the descendants of Trajan's colonists in Dacia, had won their spurs. The Servians had a history and a literature. The Greeks were in every way striving to connect their new kingdom with the glorious traditions of classical time. But the Bulgarians had disappeared as a nation long before the Turks came into Europe. For centuries they had been nothing but the patient, hard-working, tortured serfs of one master after another. Nobody thought that they could rise.

But it soon became evident to keen observers that the furnace of centuries had toughened the Bulgarian into a man of marked and forceful type. No other nation has traveled so far and so fast as Bulgaria has traveled in the last third of a century. Americans have just cause to feel proud that Robert College gave to many of the leading Bulgarian citizens their education, so that it has played a peculiar part in the making of the Bulgarian nation. The dreadful experiences through which the Bulgarians had passed for more than twenty generations seemed to have purged the dross from their natures, and to have left nothing but tempered steel behind. They possessed great sobriety and steadfastness of character, and in an unfortunate little war with Servia early showed that they were also of an unexpectedly good military type. They were very patriotic. Every Bulgarian, even the poorest, felt the keenest devotion to his country. Moreover, it must be remembered that patriotism with the Bulgarian did not mean a mere emotion to be appealed to by a Fourth of July oration, nor even the emotion of a higher type which makes good men and good women try to do their civic duty. To the Bulgarian patriotism meant a fierce intensity of conviction, a passionate clinging to independence and national success as the one alternative to the most frightful slavery. For many centuries the Bulgarian had crouched helplessly under the Turkish whips. Anything he earned beyond a bare living was usually taken from him by his oppressors. And when at long intervals a few of his number, like maddened slaves, rose in aimless revolt, the vengeance wreaked on the whole nation was terrible, and that vengeance fell with appalling cruelty upon women and children quite as much as upon men. It is but thirty-five years since the Bulgarians submitted to atrocities such as in America have never been endured except by victims of Indian outbreaks. Every Bulgarian, rich or poor, became a soldier, carefully drilled, well trained, commanded by men who made military science a study of the most practical kind. Every Bulgarian was prepared at any moment to fight the Turks, and toward the Turks he felt a personal hatred such as the member of no civilized nation feels for that of another. He knew that war might come at any time, and he knew that, if beaten, it would probably mean that his home would be destroyed, his parents butchered before his eyes, his wife or sister or daughter dragged off to infamy and outrage, his younger brother or his son put to death with dreadful torture. If he were a man of middle age, he had as a child seen things like this done to his own family or to the families of his neighbors; if he were a young man, he had heard about them from the older men and women.

Under these circumstances the whole Bulgarian nation was an army, and an army of the most formidable kind. There was in the national character both a toughness and a sobriety that rendered the people willing to take a long look ahead, and carefully and laboriously prepare as their foresight demanded. Patient, self-reliant, possessing prudent caution in preparation, great speed and decision in action, and iron resolution—no wonder that the Bulgarian people has borne itself so wonderfully, that the Bulgarian army has shown such extraordinary qualities.

Not the rise of Japan itself has been more striking and unexpected than the rise of Bulgaria. Whatever may be the decision of the European Powers regarding the Balkan war—a decision which it is too much to be feared will probably be governed largely by selfish political considerations—the sympathy of the people of both Europe and America ought to be wholly with the people of the Balkans in their heroic struggle for liberty.

CONSTANTINOPLE

If you want to see more kinds of people than anywhere else, go to Constantinople and watch its twelve hundred thousand inhabitants. One can hardly enumerate the different kinds—there are so many. Perhaps it is sufficient to say that the location of Constantinople would be enough to attract them.

The city lies where Asia comes closest to Europe. It is a splendid site. As you come to it by sea you have the long approach through the Ægean Sea and the Dardanelles Straits and then through the small Sea of Marmora. Then there, in front of you, lies a strait, the Bosphorus, connecting with the Black Sea, and out of that strait goes a great inlet, the Golden Horn, into Europe. And there, on its seven hills about that strait and inlet, lies the imperial city. That sight you can never forget—the myriad mosques and minarets and cupolas and cypresses and fountains. And another and later sight you can never forget—all these illuminated as you look down from the heights above the city on the occasion of the celebration of the Sultan's birthday.

You will doubtless take your baggage to the European quarter, Pera, high up and away from the quarters immediately about the port. Pera is the home of the foreign embassies and legations and modern hotels—places of attractive appearance if you want a change from the Oriental sights which you may have been seeing. But, if you do want more of a mixture than Pera affords, descend into Galata, the mercantile and shipping quarter. Like Pera, it is on the northern shore of the Golden Horn. Here you will find a combination of the Occident and the Orient, representing all the compact vice that one can imagine, and making you feel that you want either to return to Pera, or cross the bridge into Oriental Stambul, or cross the strait into Asiatic Scutari; for, with their narrow, poorly paved, winding alleys, their tiny shops and bigger bazaars, their unkempt, crafty-looking people, and their incredible number of dogs and donkeys, Stambul and Scutari are the genuine Constantinople—places without foreign admixture. There you get "the real thing."

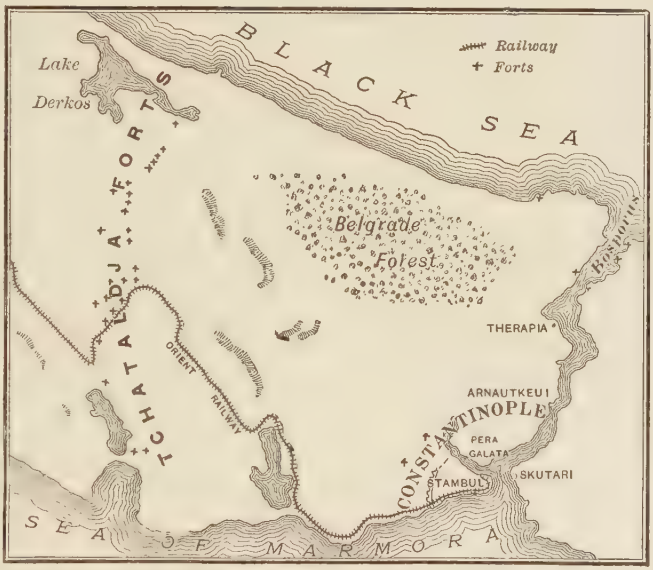
Constantinople has not always been governed by the Turk. We do not realize that underneath all its Turkish veneer it is still the greatest of Greek cities. It was founded in the sixth century B.C. by the Dorian Greeks. It was called Byzantium. It became a great trading-place and its trade reached all over the Hellenic world. Then, to turn names about, as Constantinople it was for a thousand years the capital of the Byzantine world.

In old Constantinople one will still find some walls which were standing when the town was known as Byzantium. It is strange that any of these walls should be standing, for think of the races that have contended for the city's possession!—the Persians, the Macedonians, the Athenians, the Thracians, the Gauls, the Romans, the Turks. Yet the most famous of all the walls are not those of the old Greek age, but of the Byzantine age—the walls of Santa Sophia. The church called Santa Sophia was founded by Constantine when he conquered Constantinople nearly sixteen hundred years ago. But his church was burned, as was that built by Theodosius. Then Justinian put a third church on the original site. That is the church we see to-day. When Constantinople became Turkish, in 1453, Santa Sophia became Mohammedan. From a certain point in one of the galleries, if you look sharply enough at the gold arabesques of the arch of the apse, there will gradually appear to your vision the faint outline of a great figure with outstretched arms. It is the mosaic Christ, worked, when the church was built, into the substance of the wall, and later overlaid with the gold-leaf of Mohammedan conquerors. The Bulgars have long hoped one day to erase that gold as conquerors in their turn. If they should enter Constantinople, the Turks, it is said, have vowed to blow up the mosque rather than to surrender it to the Christians. But whether Christian or Mohammedan, it is one of the noblest temples ever erected to religion.

If Constantinople is a mixture of races, it is also a mixture of religions. While its population is mostly Mohammedan, it includes several hundred thousand Christians. Of these most are Greeks, although the number of Armenians is very large. Then there are the Protestants of Europe and of America who may be engaged there in diplomatic or educational work. There are also many thousand Jews.

Because of this clash of religions our thoughts are more with our co-nationalists,

the American Protestant Christians, in the city than with the fate of the city itself. The Americans there are merchants, missionaries, diplomats and consular officers, and teachers; of the last named there are about fifty. The Turk has never introduced education to any great extent. Interesting as have been some of the mosque schools and extremely interesting as have been some of the Arab universities, the Turk as such has not been noted for his educational advance, and in Constantinople our institutions stand out the more strongly marked because of this. In Constantinople, as elsewhere, the Turk is a soldier and a tyrant. He signalized his entrance into the city by the murder of thousands of Christians, and he signalized his entrance into Europe by becoming the oppressor of subject races which under him were never more than bondmen. In country and city alike the Turk has not been a civil administrator. But there are plenty of instances of administration in Constantinople. Officialism is evident on every hand; that Turkish officialism—picturesque, yes, but for the most part greedy and predatory. Greedy and predatory indeed! The Turkish Government has been well declared to be a device for wastefully squeezing money out of the poorest class, to be spent, most of it, on the Sultan's harem and palaces and the rest on ironclads and rifles, and for permitting everybody with arms in his hands to seize his neighbor's fields and carry off his neighbor's daughter whenever he takes the fancy.



CONSTANTINOPLE AND ITS VICINITY

In its foreign relations, however, that officialism has been forced to pay some attention to the demand of foreign nations that there shall be institutions of learning protected and maintained by them in the Turkish Empire, and hence we see our own institutions at Constantinople. Robert College, located on a noble headland north of the city, has as its President the Rev. Dr. Charles F. Gates, and the American College for Girls, now located at Arnautkeui, outside the city, has Miss Mary Mills Patrick at its head. The buildings of Robert College, which was incorporated under the laws of New York State in 1863, represent an outlay of about four hundred thousand dollars. There are approximately five hundred students in the institution at the present time. Many Bulgarian leaders and statesmen have been educated there. The College recently received a bequest of $1,500,000 from the late John S. Kennedy, of New York City. What Robert College does for young men the American College for Girls endeavors to do for young women, and, as every one knows, there is pathetic necessity in Turkey for an enlightened "woman's work for women." Other Protestant institutions in Constantinople are the Friends' Mission School, the Church of Scotland Mission, the Scotch Independent Free Church Mission, and the Gedik Pasha School. The last-named institution is under the direction of the American Board. Its total enrollment is at present about two hundred and fifty pupils—Turks, Armenians, and Greeks. It has more Turkish children than any other foreign school in the Empire. The school is in Stambul, on the southern slope of one of the seven hills facing the Sea of Marmora. Finally, a peculiarly American institution is the handsome Bible House, where Bibles, religious literature, and schoolbooks are printed.

The Roman Catholic schools in Constantinople for the training of both sexes are numerous, large, and efficient. Next in efficiency come the Greek schools, and after

them the Armenian schools. There are also Turkish schools, in which the moral training is clouded from the start by the views of the Turks as to concubinage and polygamy.

As the accounts of the Turkish reverses in the Balkan war have excited bitter feeling among the Mohammedans in Constantinople, there may be grave peril because of the clash of religions. But the British, French, Russian, German, Austrian, Italian, Dutch, and Spanish war-ships now in the harbor can, in case of necessity, land a force of several thousand men. Perhaps this force will be able to meet any emergency.

A more immediate peril would seem to be the misery of the hordes of disorganized, beaten, and hungry Turkish troops driven back by the Bulgars into the capital. It will be difficult to keep these thousands from pillage. Indeed, Dr. Dillon, the correspondent of the London "Daily Telegraph," says: "The scenes now being enacted in Constantinople rival those of Dante's 'Inferno.' Hunger, typhus, and cholera will kill a number roughly computed at a quarter of a million, despite the promptest and most efficacious aid. It is a satisfaction to report that the authorities are endeavoring to take the best possible sanitary measures, flooding the streets twice daily and issuing the most urgent warnings against mixing with the refugees, against eating uncooked fruit or drinking unboiled water." A Constantinople despatch says: "Already there are twenty-five thousand refugees in the city, and they continually are being added to by fugitives from all the devastated places in Thrace. Their misery and want are appalling, and demand a charitable effort which cannot be on too large a scale. A great many are camping in the open spaces of the city, and even in the cemeteries. They are to be found in isolated corners on the shores of the Bosphorus and in the woods, absolutely without the necessaries of life. They have no shelter and no fuel, and there is no milk for the innumerable babies. The hunger and privation they are suffering is indescribable. An epidemic of cholera, which threatens to spread to terrible proportions, renders speedy assistance all the more imperative." Our Ambassador, Mr. Rockhill, has cabled the State Department that there are fourteen thousand sick and wounded in the capital who are not prisoners of war. Seventeen cases of cholera he reports have been brought to the city by soldiers.

All this disaster has been mostly brought about by a nation which Turkey thought she had once conquered and by a people which Turkey has long ruled by rapine and massacre, that ancient Bulgarian people which came into the Bulgarian peninsula in the sixth century, seven centuries before the Turks came there (1358). As early as 976 the Bulgarian Czar, Shishman, was known as the "Emperor of the Slavs." Turkey may remember that this is not the first time that Bulgaria and Servia have been before the walls of Constantinople.

If the Bulgarian monarch enters Tsargrad —as the Bulgars call Constantinople—it should mark one of those turning-points in history like the Turkish capture of Constantinople; it should mark a new future for the city, just as Constantine's entry did and just as Mohammed's entry did.

What is to be the Constantinople of the future? Will it be occupied by the Bulgars? Will it remain Turkish? Or will the Powers step in and say to the Bulgars, "You may act as if you had taken Constantinople, but you must not actually come into the city because of the peril to the foreign residents"?

Whatever takes place, it is to be hoped, in the first place, that the control will be Christian and not Mohammedan. It is to be hoped that the Turk will have to step back into the Asia from which he came, and that his political and social system will return to the Orient from which it sprang. If the Turk is retiring to Asia, why should not Constantinople and the passage between the Ægean and the Black Seas be neutralized, just as Tangier opposite Gibraltar has been neutralized? Why should not Constantinople and the region immediately about it become a free city, just as Hamburg is a free city? Why should not its freedom be guaranteed by the Balkan confederacy or even by the Concert of Europe? A Balkan Constantinople might not be as pleasing to the Powers as would a European Constantinople, but it certainly would be more pleasing to them than would a purely Bulgarian Constantinople or a Greek Constantinople; while a Russian Constantinople or an Austrian Constantinople would seem to be out of the question. A late report indicates that Austria is ready to agree to the neutralization of Salonika. If so, how much readier ought she to be to agree to the neutralization of Constantinople?

THE PRESIDENT-ELECT

IT has sometimes been said that popular government, while it raises the average of the people, tends to exalt mediocrity, and to shut out from the position of leadership the men of exceptional ability and training. As a consequence, so it has been asserted, the extension of democracy in place of monarchical or aristocratic forms of government will result in putting the ordinary man with ordinary training into places calling for the extraordinary man with special gifts and special education. It has been said, moreover, that people who enjoy the rights and privileges of self-government tend to undervalue the trained and talented mind. The recent election, however, affords ample evidence that a self-governing people welcomes the candidacy of exceptional men and recognizes the value of exceptional training for the public service.

The man whom the American people have selected to be their next President is a man of special gifts and of unusual education. During the past campaign the Democratic candidate was not infrequently spoken of as Doctor Wilson, and some of the members of his party objected to the use of this title, seeming to believe that it would be regarded by the American people as a term of reproach. Nothing could be further from the truth. The American people have shown by their system of public education that they believe profoundly in the value of education. They are proud when any of their public servants prove themselves to be scholarly. The fact that they have learned to value men for their intrinsic merits and are willing to put the rail-splitter Lincoln at the head of their Nation has not led them into the error of imagining that personal merit is enhanced by lack of scholarship. The fact that Woodrow Wilson is an eminent historian, a professor, and a college president is not the reason why he was elected, but it has been recognized as adding to his qualifications for the high office for which he has been chosen.

For years Woodrow Wilson has been a student of American history and of American institutions, and of his book on "Congressional Government" it has been said by as high an authority as Professor Ford, of Princeton University, that it has achieved a place in general literature beside Bryce's "Holy Roman Empire.'

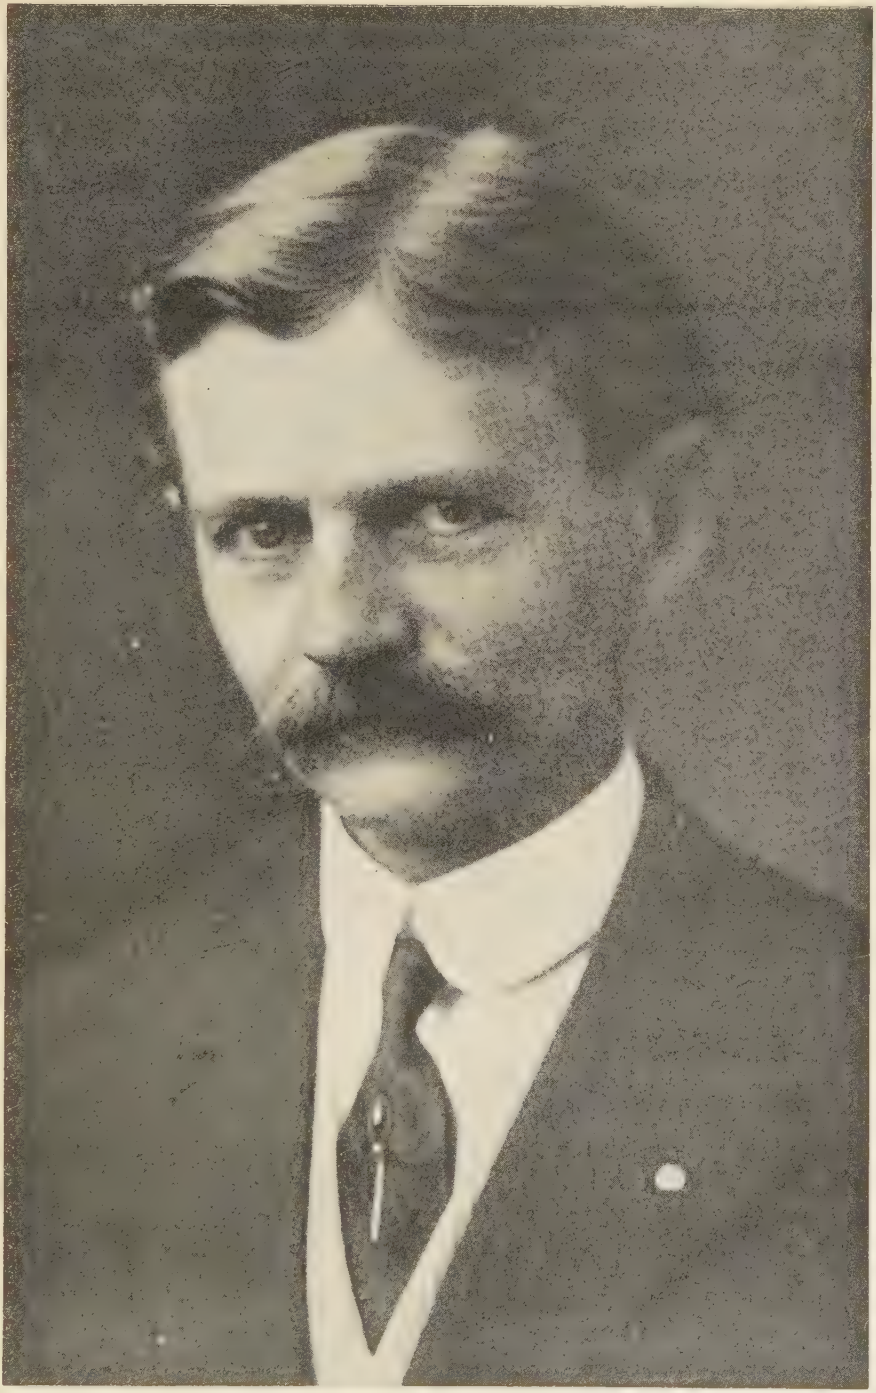
The modern teacher, and especially the modern instructor of college classes, is not one who selects the facts to be given to his pupils and tells his pupils what to think. He is rather a guide, who shows his pupils how to find out the facts for themselves, and to form intelligently their own opinions. It is this kind of teaching that Dr. Wilson has advocated. He has been a strong believer in the value of scholarship and free inquiry. It has therefore not been a great change for him to move from the position of teacher to that of leader of public opinion. In many respects, in fact, one who has been a college president, as Dr. Wilson has been, has had special training for public life; for he has been trained in leading the discussion of public questions, and at the same time he has been trained in administrative work.

During the campaign his public speeches have had the characteristics that one might expect from this training. They have not partaken of the character of debate, and they have not told much of what he expects or hopes to do specifically as a public officer. They have, however, done a good deal to show his general attitude toward public questions and toward great governmental policies. Briefly stated, this attitude has been that of one who believes that the way to advance to better conditions is very largely by the restoration of conditions that once prevailed. As Professor Ford, who has already been referred to, says in an article in the "Review of Reviews:" "Instead of

COPYRIGHT BY PACH BROTHERS

WOODROW WILSON

President-Elect



THOMAS R. MARSHALL

Vice-President-Elect

holding that the Constitution needs to be changed with the times, Woodrow Wilson holds that the need of the times is to go back to the Constitution." The experience of the President-elect in public office is practically confined to two years as Governor of the State of New Jersey. During that time he has had the friendly co-operation of some of his political opponents in the Legislature, and thus has been able to secure the passage of legislation, recommended by his predecessor, which has brought credit upon that State. He has also been recognized as an opponent of one of the machine bosses in his own party. In this brief period he has thus had experience as an executive which will be of value to him in the Presidential chair.

Woodrow Wilson is the first Southerner to be elected to the Presidency since the Civil War. Though not a Southerner by residence, he is a Southerner by birth. He was born at Staunton, Virginia, on December 28, 1856. His father was the Rev. Joseph Ruggles Wilson, a Presbyterian clergyman. His family is of Scotch-Irish origin, and has been American for about a hundred years. His maternal as well as his paternal grandparents came to this country in the nineteenth century. With the exception of a brief time studying and practicing, he has been most of his time north of Mason and Dixon's line in college and university work—first at Johns Hopkins as a graduate student, then as professor at Bryn Mawr, Wesleyan, and Princeton. When Dr. Patton resigned as President of Princeton, Woodrow Wilson was chosen in his stead and remained President until he resigned to become Governor of New Jersey.

THE VICE-PRESIDENT-ELECT

Indiana has long been considered one of the "pivotal" States. Indeed, it has been said that to be brought up in Indiana is equivalent to becoming a trained politician. The Democratic party this year has followed the usual custom in choosing its candidate for the Vice-Presidency from a section of the country not represented by the head of the ticket. Thomas Riley Marshall, the next Vice-President, will thus owe his office in part to political expediency. In part, however, he will owe it to his own record as Governor. He has made a reputation as the advocate of a set of measures which bear the stamp of progressive influence. Nevertheless, Mr. Marshall himself is of a distinctively conservative type. The following excerpt from his speech of acceptance illustrates his attitude towards American questions. He is speaking of three grades of citizens:

> The first grade is made up of the favored few, their hangers-on, and their beneficiaries, who think the eagle is upon the dollar, not as an emblem of liberty, but as an emblem of power. . . . The second grade consists of those whose outlook upon life has been enlarged by the civilization under which we live, who have been taught by the school and the college, by the press and the magazine, who appreciate the good things of life. . . .
>
> The third grade of citizens it pleases me to call old-fashioned, Constitutional Democrats. These are they who believe that the equality of mankind does not consist in an equality of brain and brawn, but in an equality whereby every man, native and foreign-born, has an inalienable right to exercise all of his ability in getting on in the world just so he realizes that in getting on he owes it to himself, to his family, and to the Republic to see to it that he gets on honestly, and that he does not prevent any other man from obtaining the reward of his honesty and enterprise.

Mr. Marshall's belief in the maintenance of traditional political institutions, coupled with his experience with a Legislature that has passed progressive laws, has led people to call him "a Progressive with the brake set." His speeches have been marked with homely and even colloquial phrases. Mr. Marshall is a native of Indiana, and is fifty-eight years of age.

THE GOLDEN RULE TRUST

BY HERBERT G. STOCKWELL

A MANUFACTURER, one of four whose sales added together aggregate about three-fifths of all of the business in that line, went to his lawyer and said:

"My principal competition here in New York comes from a Chicago concern whose salesmen are taking orders right at my own door for goods at a price less than it costs us to produce them, while we are returning the compliment to them in Chicago. Is there no way by which we can stop this ruinous competition?"

The lawyer could think of no plan which, under the present conditions, he could advise as lawful, except the complete amalgamation through outright purchase by one or all of the other plants. Objection was immediately raised to this plan because it involved the necessary loss of the individuality of each separate plant.

"Any other form of consolidation might be attacked by the Government. You cannot combine to restrain trade—that might constitute conspiracy," said the lawyer.

"But," he added, "*I don't see why you cannot restrain your own trade to profitable territory.*"

"Yes, I could do that; but my Chicago rival would then drive me out of business. If I withdrew from his territory, he would at once get better prices there, and he would continue to prevent me from getting better prices in New York. I would be ruined if I did not respond aggressively to his tactics."

My readers who are engaged in business of National importance know that this remark could be made by hundreds of men who are in similar positions.

In the current report of the Chief of the Department of Mines of Pennsylvania appears the following: "It is a fact beyond dispute that there is a tremendous waste of investment in coal-mining property, and that the business will never be profitable or safe as it should be until some way is found to curtail the production;" and the report goes on to predict that until the business is organized on a reasonable basis the operators will "continue to indulge in a cutthroat warfare."

TOO EXTENSIVE BUSINESS GRABBING UNPROFITABLE

That is the condition which exists in many lines of business. Trade is being gobbled everywhere, with small profit to all unless a complete dominance of the business is created. But when the control is effected through combination the danger arises that its lines may run counter to law.

What can be done about it? Are we really in such a precarious condition that we cannot move for fear of violating the law?

A stock broker exclaimed to a friend: "What are we coming to? We don't know who it is safe to do business with. The Government ought to do one thing or the other: either let us alone or give us a list of the honest corporations and the dishonest ones."

When storm arises and the ship is being tossed about, the first thought of the mariner impels him to take his bearings.

An honest man is the same to-day as yesterday, and a thief is just as much of an outlaw as though no statutes had been recently placed upon our books.

We know whether our acts are honest because basic law is founded upon commands which in childhood were sunk deep in our hearts.

The law has not changed in this respect, although with growing business more and more liberal interpretations have been framed by our courts until we come to feel that we can do anything honestly that may be argued by our lawyers as legal.

When the conscience is aroused at some palpable overstepping of the bounds and the offenders are brought to account, we all utter cries of distress at our mystification of the law, forgetting that the basic principles have not changed since "the memory of man runneth not to the contrary."

COMMON KNOWLEDGE OF RIGHT AND WRONG

In the pursuance of our ordinary business affairs we need no written instruction as to whether any given act is right or wrong.

Most men, in the beginning, conduct their growing business with due regard to the rights of others; but when the ambition to become "National distributers" seizes us we enter into fields unknown. Our former trade charts are now useless. We grab at business here, there, everywhere—without due regard to the cost of obtaining it, or the concessions which must be made to wrest it from those more favorably situated.

We thus, by gradual steps, descend into methods which, if carefully explained to us at the outset, would have appeared so contrary to our conceptions of common sense and right conduct that we would have shrunk from entrance upon the programme.

Once in the midst of the game, the excitement blinds our eyes to anything other than the goal of large business, which we obtain as best we can under the prevailing rules. We find ourselves at a point sooner or later in which we seek legal advice for the purpose of ascertaining how near we can steer our course to the line beyond which it would be dangerous to go.

Is it necessary for us to be known as "National distributers" before we can extract complete satisfaction from business? Must we leave the safe, profitable, and useful local life for the uncertainties of the world-wide struggle?

A TRUST OFFICIAL SUGGESTS THE GOLDEN RULE

In a small gathering of a few of the largest manufacturers in the world, in Europe last spring, the chairman of one of the meetings uttered a remark to the effect that the most successful way of doing business on a large scale consists in the observance by competitors of the Golden Rule.

The first flashes of our mental cameras obtain from this scene little more than caricatures. It seems broadly humorous to hear a man of such wealth and prominence, one who has succeeded in forging his way to the front rank of business generals, say to an assembly of his successful associates that each should think and act towards his rivals, under every circumstance, in exactly the same manner as he would like the others to think and act toward him.

But let us step over there and snap the shutter again from another view-point. We have now a picture taken in a different light. All of the comic has disappeared, and we see the minds of these princes of trade and commerce seriously groping for some way by which they may rescue business from its present insufficiently profitable turmoils.

All too meager are the details of the idea of him whose tongue launched it forth. But let us see if we cannot fathom the depth of its heart and brain, crediting his utterance with sincerity, and bring to light a working plan for the remodeling of the larger business enterprises.

A NEW KIND OF TRUST

As the most convenient form for the accomplishment of our problem, we will assume the creation of trusts, each one composed of all manufacturers producing similar articles, a "Golden Rule Trust" for coal, another for steel, another for flour, all commerce being conducted under the supervision of trusts. The by-laws of each trust will provide that every member must carefully take account of the condition of his business, with special regard to its location and the geographical territory in which reasonably profitable business may be secured by fair means, beyond which zone he would, to secure business, be compelled to adopt ways and means in violation of the principles of the Golden Rule.

Instead of snatching business from our associates, like small children with their toys, each member would seek just as much business as he could properly and profitably handle, and no more. Would this constitute good business?

Instead of reaching out for unprofitable business, we could then devote our energies to increasing the demand for our product in our own territory. We may find many places in which the trade has not been properly attended. Then there are many new ways of using old products, and new demands are springing up constantly. Would this be good business?

We all know how easy it is to fall from the sublime into the ridiculous. Some incident, insignificant in itself, transforms our expressed attempt toward the ideal into low comedy. Popular idols, seemingly secure on their pedestals of public favor, may be toppled over by one false move or by the trivial exhibition of some personal idiosyncrasy. It seems strange that the sublime and the fame of heroes may be ruined by the insertion of

one poisoned drop in the otherwise sweet compound.

CONSPIRACY TO REFRAIN FROM CUTTHROAT METHODS NOT ILLEGAL

But let us accept the Golden Rule idea at face value.

If a group of manufacturers assembled together and entered into agreements to maintain prices and restrain trade, such agreement would constitute, in the eyes of the law, conspiracy against the public good.

Suppose, now, that the members of the same group of competitors should each impose upon himself the same restrictions, *with different motives*. What a different result would be produced! It is no violation of law for a manufacturer to resolve that he will cease doing unprofitable business and will henceforth confine his business to the zone in which he feels competent to supply the wants of the people living in that zone who will pay him a reasonable price for his goods. If his competitor follows the same course of reasoning, or the same motives, at once there is established the practical results aimed at by all trusts organized in violation of law.

DIFFERENCE BETWEEN "GOOD" AND "BAD" TRUSTS IN THE MOTIVE

In other words, the Golden Rule Trust produces better business for each of its members through the operation of the Golden Rule than can possibly be obtained by seizure through the form of unlawful and immoral trusts. The difference between a Golden Rule Trust and an unlawful trust is not greater than the difference between many good acts and bad acts, it being possible to perform the same set of acts from different motives and produce widely different results.

If a manufacturer, instead of consuming vast energies in trying to wrest from his competitors a share of their natural business or trying to defend his business from such wresting by plots and counter-plots, would devote his time to the development of new and useful varieties of his product and to the opening of new markets in his own natural distributing territory, he would find greater satisfaction in the result of the year's business.

I know several men at the head of large enterprises who would be glad to adopt such methods if their competitors could be persuaded to do so at the same time.

It must not be supposed that members of the Golden Rule Trust are to be arbitrarily and permanently confined to any geographical territory. The better knowledge a man obtains of his business and his customers, the more carefully he manages his business. With smaller volume and larger profits, he could devote more time to bettering the business condition of his plant, his employees, and his customers. By gradually increasing the quality of his product and lowering the cost of production, the business would naturally expand into enlarging territories, but only in a healthy way.

"MINIMUM PRICE" REMEDY

A business friend suggested to me that we shall never have industrial peace and prosperity until our Government should step in and fix a minimum price on every article of commerce. He explained further:

"If the law should declare that no sales should be made at a price lower than the standard set, competition would not be restrained, because it would be a question of how near the bottom price a manufacturer could go. The great advantage which would accrue to all would be that with a minimum price we should all be protected from those men who, not knowing anything about what their goods cost them to manufacture, sell for any price that will bring them the business."

Under present conditions, it cannot well be imagined that our Government could or would undertake the colossal task, even if it were found to be within its proper purview; but I see no reason why each manufacturer should not carefully ascertain the cost of his product and refuse to sell goods, in any event, below cost.

Many of our business troubles would undoubtedly be wiped away if we were to refrain from operating our factories at a loss. It would be better for manufacturers who are so doing to acknowledge manfully their inability to manufacture goods and sell them at market prices with profit, take the loss that would result from a sale of the business, and go into some other field.

"What! Go out of business? Absurd!" I hear some say. Would you think it wise or foolish for a doctor who could not gain a living to try something else? You would commend his good sense in abandoning the

occupation for one for which he was better fitted.

In taking this step, those who are operating wholly or partly upon borrowed capital in any form would but place themselves in a class of honest men who refuse to dissipate the money of others in the losses of the business.

While there is much that is fanciful in the idea of a trust based upon the Golden Rule, I see a great deal of cold common sense in the idea that the practice of ordinary honesty by manufacturers to themselves, their creditors and customers, would bring us all out of darkness by a shorter route, and that normal business conditions will thus be more quickly restored than can be accomplished through any other instrumentalities.

THE CALL

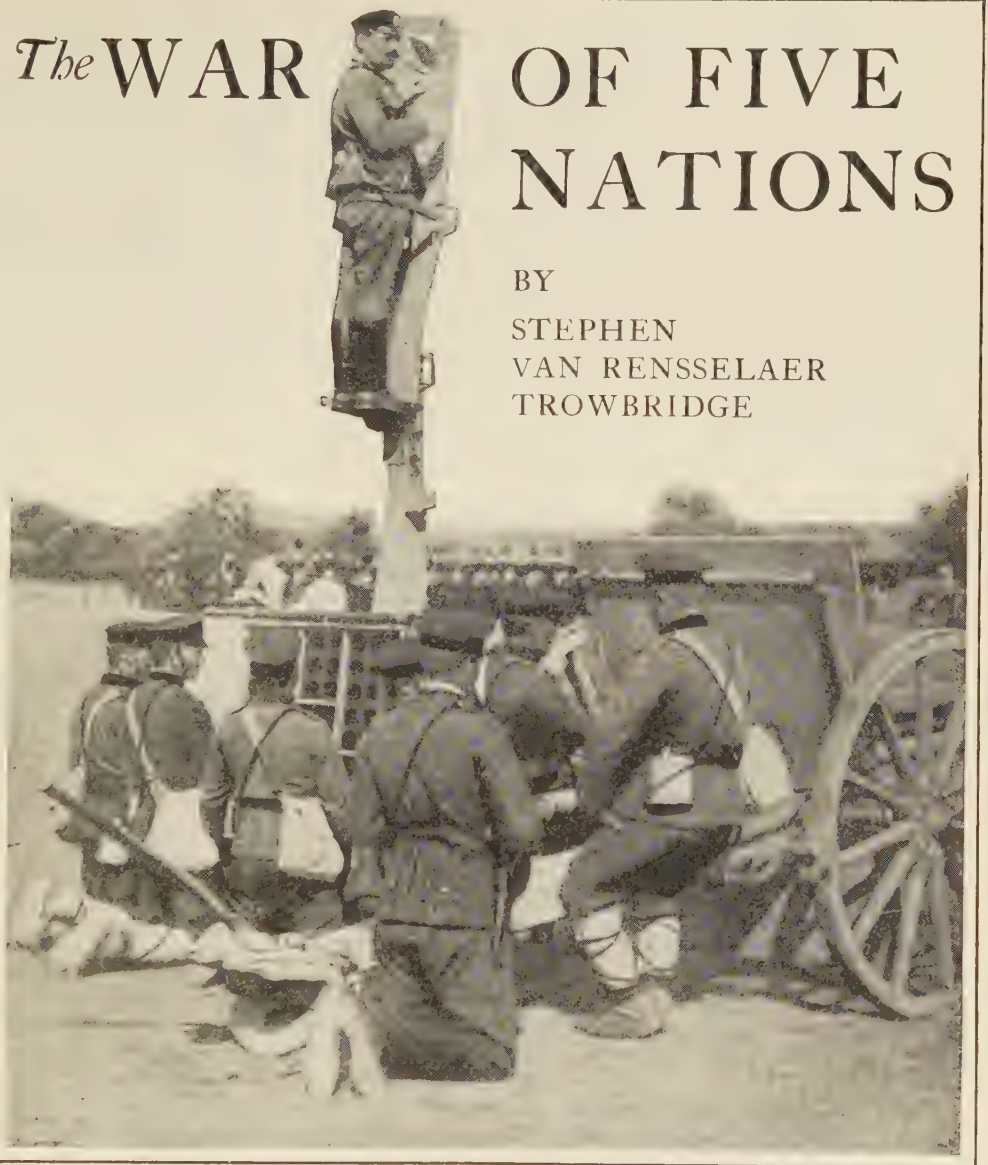
BY PRISCILLA LEONARD

Help lighten the load!
Humanity stumbles ahead on its road,
Urged on o'er the deserts, beset by the goad;
Men bend under burdens of hunger and care
And women must suffer and toil and despair;
Yea, even the children, astray in the strife,
Are bowed by the weight till they weary of life.
Hark! unto each soul that is hero, not slave,
How clear sounds the call to arise and be brave,
Help lighten the load!

Help lighten the load!
With all of the strength that the heart can command,
With all of the power of brain and of hand,
With wills set to sacrifice, struggle, and dare,
With love that seeks ever each burden to share,
With unflagging endeavor that stops not to ask
The length of the journey, the cost of the task,
Come, sons of the kingdom! Come, children of God!
And along the dark path by the world's anguish trod
Help lighten the load!

The WAR OF FIVE NATIONS

BY
STEPHEN
VAN RENSSELAER
TROWBRIDGE



BULGARIAN ARTILLERY OFFICER WATCHING THE RESULT OF EACH SHOT

IN the struggle which has been going on for the control of European Turkey my sympathies are not altogether with the Serbs and Bulgarians. Some of my classmates from school days in Constantinople are now captains and majors in the Bulgarian army. But I have many personal friends among the officers of the Turkish cavalry and artillery, and I know their ability and manliness. The fact remains, however, that the misgovernment of the Turks, especially during the past thirty-four years, has gone beyond endurance. The Slavic peoples of the Balkan Mountains have risen up in their indignation and the shock of battle has already startled Europe.

I can imagine the intense excitement which prevails these days in Robert College in Constantinople, where Turks, Russians, Greeks, and Bulgarians meet in the same class-room and upon the same athletic field. Even in the uneventful years there was a suppressed excitement, a profoundly strong racial and religious animosity, among the students. I can

MAP OF THE BALKAN STATES

remember very well how, when the Turkish Government was sending four transports full of troops to defend the frontier in the Caucasus, the Slavic students secretly made an enormous Russian flag, and just as the transports were passing up the Bosphorus in front of the College this immense Russian flag was unfurled from the roof of the building and flaunted in their faces. A Turkish general arrived upon the scene within a few hours, and the President had to apologize for the reckless behavior of the students.

Certainly the reconquest of those beautiful mountain provinces for Christian control appeals to the sentiment and chivalry of Christendom. Five centuries have passed since the allied armies of the Bosnians, Serbs, and Magyars met the advancing hosts of Turks upon the fatal field of Kosovo. The battle raged from dawn till evening, and at length the Turks prevailed. They were led in one final, furious attack by Bayezid, the Sultan's son, who rode into the midst of the enemy brandishing a mighty iron mace. This defeat broke the back of Servian freedom and left the Mohammedans the masters of the land. The Christian nations of Europe sought to retrieve the loss by joining in a great crusade. But the stout squires of France under the gallant Count of Nevers, the flower of German chivalry, and the knights of Hungary suffered an overwhelming defeat, in which thousands were slain and over ten thousand taken prisoners. Somewhat more than a century later, in 1529, the Ottoman armies under Suleiman the Magnificent swept to the gates of Vienna, humiliating bishops and princes alike, as town after town capitulated. But Vienna itself endured the desperate siege, and at last heavy storms so hindered and discouraged the Turkish troops that the order to retreat was given. The bells from St. Stephen's tower rang in joyful chimes, and the vast congregation which had assembled in the cathedral joined in the solemn strains of the "Te Deum."

This repulse which the Turkish armies met at Vienna may be said to have been the first turn of the tide. Gradually the nations of Europe began to assert themselves, and Turkish prowess turned to luxury and self-indulgence. At last, in 1877, Russia boldly invaded the Balkan provinces and captured Plevna, the strategic point in the campaign, after a memorable siege, in which Osman Pasha with an army of forty-three thousand Turks bravely held at bay for five months the Russian army of three times that number. From Plevna the Russians advanced upon Adrianople and pressed on in the storms of winter to the very walls of Constantinople. This rapid and effective invasion resulted in the Treaty of San Stefano and its revision by the Powers at Berlin, recognizing the independence of Rumania, Servia, and Montenegro, granting autonomy to Bulgaria, and ceding the Caucasus to Russia. Since then the Balkan situation has not essentially changed, except that Bulgaria has asserted and secured her independence of Turkey, and has been recognized by the great Powers.

A remarkable crisis has now developed as the result of the oppression and extortion under Abdul Hamid and the recent failure of the Committee of Union and Progress. Four Christian nations, Montenegro, Bul-

FOUR KINGS AND A SULTAN

garia, Servia, and Greece, simultaneously demanded of the Porte autonomy for the Macedonian provinces. They included in this ultimatum certain civil reforms, long promised but never fulfilled, and the appointment of a Christian governor for that entire district. The Porte's refusal to comply with these peremptory demands has resulted in the declaration of war by the four Christian states, and the Turks have accepted the challenge in a defiant and desperate mood. Five nations are at war, three kings are at the front, and more than a million men in arms! The Turkish reserves who have been ordered to the front from the Asiatic provinces declare that they will take no prisoners of war, which is a grim way of saying that they will give no quarter.

The war will probably be a short one, because winter is coming on, and winter in the Balkan is like winter in the Canadian Rockies. Another reason which may cut short the war is the financial pressure. These nations have no reserve wealth. Turkey and Greece, in particular, are on the verge of bankruptcy. But the war will surely be a desperate and bloody one. The hatreds and feuds of centuries have accumulated, and there are four

frontiers where fighting has commenced. The fanaticism of the Turk is matched against the rekindled fire of the Crusades.

The Serbs and Bulgarians entered the Balkan country, south of the Danube, in two separate migrations during the seventh century. The Serbs are distinctly a Slavic race, akin to the Russians, while the Bulgarians are probably of Tartar origin. The Bulgarians have taken into their language and literature much that is Russian, and their ancestral home was on the banks of the river Volga. These two nations were overwhelmed by the advance of the Turks in the fourteenth century, and from that time on to 1878 they suffered from Moslem arrogance and extortion. Then, with the golden opportunity of the Russian invasion, they made their bold stroke for liberty, and their patriotism to-day is most intense. Under their own constitutional governments these states have enjoyed prosperity and progress.

But what of the little kingdom of Montenegro, which precipitated the war? Many Americans did not even know of its existence until two weeks ago. And yet that little nation of mountaineers has had a most romantic history. It is the one nation in the Balkan peninsula which has maintained its independence against the Turks throughout five centuries! Mr. Gladstone, speaking in 1895, gave them this glowing tribute of his admiration:

"In my deliberate opinion, the traditions of Montenegro, now committed to his Highness Prince Nicholas as a sacred trust, exceed in glory those of Marathon and Thermopylæ and *all the war traditions of the world.*" Indeed, the passes of Montenegro, the "Black Mountain," have been a Thermopylæ westward of which the Turks have never ventured. The Venetian Republic was repeatedly saved from Moslem invasion by the reckless courage of those mountaineers. Perhaps you remember Lord Tennyson's lines:

"They rose to where their sovran eagle sails,
They kept their faith, their freedom, on the height,

ON THE GREEK BORDER

Chaste, frugal, savage, armed by day and night
Against the Turk, whose inroad nowhere scales
Their headlong passes. . . .
O smallest among peoples, rough rock-throne
Of freedom! Warriors beating back the swarm
Of Turkish Islam for five hundred years,
Great Tsernagora! never, since thine own
Black ridges drew the cloud and broke the storm,
Has breathed a race of mightier mountaineers.

The origin of the Montenegrin state is of itself a dramatic story. When the combined armies of the Balkan princes were defeated by the Turks on the field of Kosovo in 1389, some of the Servian nobles, rather than suffer the humiliation of paying homage to the Turks, took refuge in the fastnesses of the Black Mountain and dared the enemy to scale the heights. What Zeitun has been to

CONSTANTINE, CROWN PRINCE OF GREECE, AND HIS SOLDIERS

the Armenians, what the fastnesses of the eastern Alps have been to the Tyrolese, the heights of Montenegro have been to the Slavonic outlaw chiefs. When Mohammed II, the conqueror of Constantinople, advanced against Montenegro, he was met by Stephen, "the Black Prince," was routed in a narrow defile, and forced to beat an ignominious retreat into Macedonia. In 1623 Suleiman Pasha advanced from Scutari with 80,000 Moslem warriors at his back, with the determination of finally annexing Montenegro. The capital was taken, the monastery was sacked, and a tribute was imposed upon the people. But nature was once more on the side of the mountaineers. The Pasha soon realized the truth that in such a wild and rugged place "a small army is beaten *and a large one dies of hunger.*" The bare rocks afforded no subsistence to his host, and he was forced to retreat.

ALEXANDER
Crown Prince of Servia

Nor have the Montenegrins devoted themselves exclusively to war. In 1493, only twenty-three years after Caxton set up his press at Westminster, Prince George established in the fortress of Obod the first printing-press of eastern Europe. Type of extreme beauty was obtained from abroad, and the first volumes ever printed in Cyrillic characters were issued from the Montenegrin press. Portions of that ancient press, broken by the Turks in a fierce assault, may still be seen in the churchyard at Obod.

Small wonder, then, that the Montenegrins have once more taken the field against the Turks. The city of Scutari, in Turkish territory, has been captured after a series of fierce encounters. The allies have pressed forward the invasion with energy and rapidity. The Bulgarian army in particular has shown dauntless courage and good military tactics. Salonica in the south and Adrianople in the east are the strategic centers of the war.

DANILO
Crown Prince of Montenegro

But what will be done by the great Powers of Europe? Have not Austria and Russia been watching with covetous eyes for half a century the fertile plains of Macedonia? Are they going to permit these upstart nations to capture so large a prize? These are the questions that are stirring Berlin and Vienna and St. Petersburg to-day. For beyond Macedonia there is the greatest prize of all—the fair and commodious harbor of Constantinople, the straits of the Bosphorus, and the command of the future highway to India. I think there is no better way of describing this situation than by a quaint Oriental parable:

There was once upon a time a beautiful silken carpet of many colors and of glossy sheen stretched to view upon the floor. Around the border were gathered merchants from many nations—the Russian, the Englishman, the German, the Italian, and many others. They admired the texture and estimated the value of the antique rug, but all the while their eyes were fixed upon a flashing diamond which had been cast upon the rug at the very center. There seemed to be an unwritten agreement among the merchants that no one should step on the rug, but that if any could reach the gem without trespass and without too much commotion he would be entitled to possess it. For a long time they wandered around the border, casting long-

TURKISH INFANTRY GOING TO THE FRONT

ing glances, but hiding their ambition beneath expressions of courtesy. Finally the idea occurred to the tall merchant wearing the astrakhan cap of the north to commence rolling up the edge of the rug nearest him, and so to come nearer the center without "trespass." This he commenced to do, at first furtively and then with greater vigor. Soon the other merchants began to roll up their corners, until now it is only a question which will reach the diamond first.

This is the tangle of European politics and the all-absorbing question of the Near East which the Balkan war has now thrown into vivid outline.

But it is a mistake to suppose that this is altogether a war of territorial aggrandizement planned by the unruly and restless Balkan governments to gratify their peoples' ambitions. It is a war for the emancipation of the Christian population of European Turkey. The greater part of the six million inhabitants of Macedonia are of Servian, Bulgarian, and Greek stock. The Turks are the military and agricultural overlords. And during five centuries the miserable population of that peninsula has been exploited for the support of the Ottoman régime. During the thirty-two cruel years of Abdul Hamid's tyranny that Christian population suffered unspeakable indignities. They were taxed twenty-five per cent of their produce; they were compelled to give up their daughters for the Turkish harems; they were repressed from any attempts at education; they were forbidden to read any books or papers; they were imprisoned in the vilest dungeons; they were fleeced and harried and crushed, until the wonder is that they have survived.

Contrasted with the bitterness of this oppression, the commercial prosperity and good order of free Bulgaria, directly across the border, was too much to be borne. Especially the recent outrages upon certain Bulgarian villages aroused intense feeling on both sides of the Balkan range. The conflict could no longer be averted.

For a time the Young Turk revolution had filled all with a momentary enthusiasm, and racial hatreds subsided. It seemed as though even religious freedom might be granted. But the Young Turk régime proved to be a military oligarchy bent upon governing "Turkey for the Turks." It is true they achieved certain great results. Liberty of travel, the freedom of the press, and certain military reforms were established and guaranteed by the new constitutional government.

But back of the Cabinet and House of Deputies there was the "invisible government" (to use Senator Beveridge's phrase) sitting in secret in Salonica and dictating absolute orders at its own caprice. During the disastrous war with Italy the Committee of Union and Progress lost prestige and finally broke down. This was the opportune moment for a coalition of the Balkan states. And they were not asleep. But the remarkable thing is that those states have reached a working agreement. Only a supreme common purpose, "to drive the Turks, bag and baggage, out of Europe," can account for the alliance which has been made.

I have said that the master motive in this war is the emancipation of the Christian peoples of European Turkey. This makes it virtually a religious war. And it is so regarded not only by the Turks, but by the Montenegrins and their allies. The flags of six Bulgarian regiments were blessed by the bishops of the national Church in the presence of a vast gathering. Before making his entry into Berana the Montenegrin general held a solemn religious service in celebration of the victory. A special service was held in the cathedral of Sofia, at which the Archbishop invoked God's blessing on the Holy War. Similar services have been held in the churches throughout the country. Meanwhile the Sultan has gone to the Top Kapou Palace to pray, over the relics of the Prophet treasured there, for the success of the Ottoman arms. The Mussulman Bulgars have crossed the frontier and are sacking the Christian villages of Bulgaria, slaying as they go. The ties of a common ancestry and a common language are not sufficient to restrain the impulse of Mohammedan hatred. A still clearer piece of evidence is the part which the Albanians are taking in the war. The Albanians are naturally the political enemies of the Turks. Their insurrection has but recently been suppressed. They were grievously harassed by the Hamidian régime, and still more by the rigorous policy of the Young Turks. Their own language was denied them in their schools, and they were not permitted to elect any officials of their own race. Politically they had every reason to turn against the Turks. But they have rushed to the front, waving the green standards of Mohammed, and falling upon the Montenegrins with terrific effect. They are fighting in the faith of Allah, and their

A COMPANY OF BULGARIAN INFANTRY

mullahs chant the Koran as the regiments march to battle. In Ourfa in 1895 a *mullah* read from the Koran while the Armenian victims were bound hand and foot and were done to death in the market-place. In the city of Adana, in 1909, one of the leaders in the attack was a doctor of the Mohammedan law, who carried an old-fashioned battle-ax and chanted from the Holy Koran as he hastened through the streets. Let me quote a few passages from Rodwell's translation of the Koran, from the "Chapter of the Spoils:"

"Fight, then, against the unbelievers till strife be at an end, and the religion be all of it God's."

"Believers! when ye confront a troop, stand firm and make frequent mention of the name of God, that it may fare well with you. Obey God and his Apostle."

"Make ready, then, against them what force ye can, and strong squadrons whereby ye may strike terror into the enemy of God and your enemy."

"O prophet! stir up the faithful to the fight. Twenty of you who stand firm shall vanquish two hundred; and if there be a hundred of you they shall vanquish a thousand of the infidels, for they are a people devoid of understanding."

"No prophet hath been enabled to take captives until he had made great slaughter in the earth."

And from the forty-seventh Surah, the chapter on Mohammed

"But whoso believe and do things that are right, and believe in what hath been sent down to *Mohammed*—their sins will He cancel and dispose their hearts aright."

"When ye encounter the infidels, strike off their heads till ye have made a great slaughter among them, and of the rest make fast the fetters!"

With such an iron creed as this, do you wonder at Mohammedan fanaticism?

And there is another influence which has had its powerful effect in producing this religious antagonism. Back of the prejudice of to-day, back of the hatreds which hinder the work of the missionary, back of the feeling which refuses the Red Cross and creates the Red Crescent, *there is the period of the Crusades!* Oh, the pity of it! The Moslems have never forgotten the Crusades.

We glorify the Crusades and read into them all the chivalry and romance of sacred legend. We think of Peter the Hermit's fervor and Godfrey's prowess, and we glow with enthusiasm as we read the story of Bernard of Clairvaux. But what were the Crusades, after all? Were they not a bloody and relentless war? Did not King Richard permit outrages upon his Saracen prisoners? And was not Saladin a nobler man than Richard? If the Crusades could only be wiped out of history, the evangelization of the Mohammedan world would be far more readily accomplished. How can we speak to the Mohammedans about tolerance and peace and love, when they can turn at any moment and cite St. Bartholomew's Night and the Spanish Inquisition, the torture of the Jews in Russia to-day, and the iniquities of the Crusades which were done in the name of Christ? I think the reader must begin to feel what a difficult task the missionary to the Mohammedans has upon his hands. And have we not great reason to thank God that, in spite of these handicaps, in northern India and Java and Sumatra thousands upon thousands of Moslems have recently turned to Christ, and even in the troubled land of Turkey many secret believers have found the joy that is in him? This may seem far from the Balkan situation. But it is all one great problem for Christendom to solve.

America's clear opportunity is in taking the lead in the Red Cross work. The impetus of this world-wide and humane movement has come from America. The Red Cross of Christ was vainly carried amid the spears and lances of Richard's knights, but it shall be taken in loving ministry by American nurses and doctors and missionaries to Slav and Turk who lie stricken on the battlefield.

Life Stories of the Other Half

BY JACOB A. RIIS

AUTHOR OF "HOW THE OTHER HALF LIVES"

WITH DRAWINGS BY WLADYSLAW BENDA

These stories have come to me from many sources—some from my own experience, others from settlement workers, still others from the records of organized charity, that are never dry, as some think, but alive with vital human interest and with the faithful striving to help the brother so that it counts. They have this in common, that they are true. For good reasons, names and places are changed, but they all happened as told here. I could not have invented them had I tried; I should not have tried if I could. For it is as pictures from the life in which they and we, you and I, are partners, that I wish them to make their appeal to the neighbor who lives but around the corner and does not know it. JACOB A. RIIS

WHERE HE FOUND HIS NEIGHBOR

"GO quickly, please, to No. — East Eleventh Street, near the river," was the burden of a message received one day in the Charities Building; "a Hungarian family is in trouble." The little word that covers the widest range in the language gives marching orders daily to many busy feet thereabouts, and, before the October sun had set, a visitor from the Association for the Improvement of the Condition of the Poor had climbed to the fourth floor of the tenement and found the Josefy family. This was what she discovered there: a man in the last stages of consumption, a woman within two weeks of her confinement, five hungry children, a landlord clamoring for his rent. The man had long ceased to earn the family living. His wife, taking up that burden with the rest, had worked on cloaks for a sweater until she also had to give up. In fact, the work gave out just as their need was greatest. Now, with the new baby coming, no preparation had been made to receive it. For those already there, there was no food in the house.

They had once been well off. Josefy was a tailor, and had employed nearly a score of hands in the busy season. He paid forty-four dollars a month rent then. That day the landlord had threatened to dispossess them for one month's arrears of seven dollars, and only because of the rain had given them a day's grace. All the money saved up in better days had gone to pay doctor and druggist, without making Josefy any better. His wife listened dismally to the recital of their troubles and asked for work—any light work that she could do.

The rent was paid, and the baby came. They were eight then, subsisting, as the society's records show, in January on the earnings of Mrs. Josefy making ladies' blouse sleeves at twenty-five cents a dozen pairs, in February on the receipts of embroidering initials on napkins at fifteen cents apiece, in March on her labors in a downtown house on sample cloaks. Three dollars a week was her wage there. To save car-fare she walked to her work and back, a good two miles each way, getting up at 3 A.M. to do her home washing and cleaning first. In bad weather they were poorer by ten cents a day, because then she had to ride. The neighbors were kind; the baker left them bread twice a week and the butcher gave them a little meat now and then. The father's hemorrhages were more frequent. When, on a slippery day, one of the children, going for milk, fell in the street and spilled it, he went without his only food, as they had but eight cents in the house. In May came the end. The tailor died, and in the house of mourning there was one care less, one less to feed and clothe. The widow gathered her flock close and faced the future dry-eyed. The luxury of grief is not for those at close grips with stern poverty.

When word reached far-off Hungary, Mrs.

Josefy's sister wrote to her to come back; she would send the money. The widow's friends rejoiced, but she shook her head. To face poverty as bitter there? This was her children's country; it should be hers too. At the Consulate they reasoned with her; the chance was too good to let pass. When she persisted, they told her to put the children in a home, then; she could never make her way with so many. No doubt they considered her an ungrateful person when she flatly refused to do either. It is not in the record that she ever darkened the door of the Consulate again.

The charitable committee had no better success. They offered her passage money, and she refused it. "She is always looking for work," writes the visitor in the register, for once in her life a little resentfully, it would almost seem. When finally tickets came at the end of a year, Victor, the oldest boy, must finish his schooling first. Exasperated, the committee issues its ultimatum: she must go, or put the children away. Dry bread was the family fare when Mrs. Josefy was confronted with it, but she met it as firmly: Never! she would stay and do the best she could.

The record which I have followed states here that the committee dropped her, but stood by to watch the struggle, half shamefacedly one cannot help thinking, though they had given the best advice they knew. Six months later the widow reports that "the children had never wanted something to eat."

At this time Victor is offered a job, two dollars and a half a week, with a chance of advancement. The mother goes out housecleaning. Together they live on bread and coffee to save money for the rent, but she refuses the proffered relief. Victor is in the graduating class; he must finish his schooling. Just then her sewing-machine is seized for debt. The committee, retreating in a huff after a fresh defeat over the emigration question, hastens to the rescue, glad of a chance, and it is restored. In sheer admiration at her pluck they put it down that "she is doing the best she can to keep her family together." There is a curious little entry here that sizes up the children. They had sent them to Coney Island on a vacation, but at night they were back home. "No one spoke to them there," is their explanation. They had their mother's pride.

It happened in the last month of that year that I went out to speak in a suburban New Jersey town. "Neighbors" was my topic. I was the guest of the secretary of a Foreign Mission Board that has its office in the Presbyterian Building on Fifth Avenue. That night when we sat at dinner the talk ran on the modern methods of organized charity. "Yes," said my host, as his eyes rested on the quiverful seated around the board, "it is all good. But best of all would be if you could find for me a widow, say, with children like my own, whom my wife could help in her own way, and the children learn to take an interest in. I have no chance, as you know. The office claims all my time. But they—that would be best of all, for them and for us."

And he was right; that would be charity in the real meaning of the word: friendship, the neighborly lift that gets one over the hard places in the road. The other half would cease to be, on that plan, and we should all be one great whole, pulling together, and our democracy would become real. I promised to find him such a widow.

But it proved a harder task than I had thought. None of the widows I knew had six children. The charitable societies had no family that fitted my friend's case. But in time I found people who knew about Mrs. Josefy. The children were right—so many boys and so many girls; what they told me of the mother made me want to know more. I went over to East Eleventh Street at once. On the way the feeling grew upon me that I had found my friend's Christmas present—I forgot to say that it was on Christmas Eve—and when I saw them and gathered something of the fight that splendid little woman had waged for her brood those eight long years, I knew that my search was over. When we had set up a Christmas tree together, to the wild delight of the children, and I had ordered a good dinner from a neighboring restaurant on my friend's account, I hastened back to tell him of my good luck and his. I knew he was late at the office with his mail.

Half-way across town it came to me with a sense of shock that I had forgotten something. Mrs. Josefy had told me that she scrubbed in a public building, but where I had not asked. Perhaps it would not have seemed important to you. It did to me, and when I had gone all the way back and she answered my question, I knew why. Where do you suppose she scrubbed? In the Presbyterian Building! Under his own

"WE HAD SET UP A CHRISTMAS TREE TOGETHER, TO THE WILD DELIGHT OF THE CHILDREN"

roof was the neighbor he sought. Almost they touched elbows, yet were they farther apart than the poles. Were, but no longer to be. The very next day brought my friend and his wife in from their Jersey home to East Eleventh Street. Long years after I found this entry on the register, under date January 20, 1899:

"Mrs. Josefy states that she never had such a happy Christmas since she came to this country. The children were all so happy, and every one had been so kind to them."

It was the beginning of better days for the Josefy family. Weary stretches of hard road there were ahead yet, but they were no longer lonesome. The ladies' committee that had once so hotly blamed her were her friends to the last woman, for she had taught them with her splendid pluck what it should mean to be a mother of Americans. They did not offer to carry her then any more than before, but they went alongside with words of neighborly cheer and saw her win over every obstacle. Two years later finds her still working in the Presbyterian Building earning sixteen dollars a month and leaving her home at five in the morning. Her oldest boy is making four dollars and a half a week, and one of the girls is learning dressmaking. The others are all in school. One may be sure without asking that they are not laggards there. When the youngest, at twelve, is wanted by her friends of the mission board to "live out" with them, the mother refuses to let her go, at the risk of displeasing her benefactors. The child must go to school and learn a trade. Three years more, and all but the youngest are employed. Mrs. Josefy has had a long illness, but she reports that she can help herself. They are now paying fourteen dollars a month rent. On April 6, 1904, the last entry but one is made on the register: the family is on dry ground and the "case is closed."

The last but one. That one was added after a gap of eight years when I made inquiries for the Josefys the other day. Eight years is a long time in the Charities Buildings with a heavy burden of human woe and failure. Perhaps for that very reason they had not forgotten Mrs. Josefy, but they had lost trace of her. She had left her old home in Eleventh Street, and all that was known was that she was somewhere up near Fort Washington. I asked that they find her for me, and a week later I read this entry in the register, where, let us hope, the case of the Josefys is now closed for all time:

"The Josefys live now at No. — West One Hundred and Eighty —st Street in a handsome flat of six sunny rooms. The oldest son, who is a cashier in a broker's office on a salary of $35 a week, is the head of a family. His brother earns $20 a week in a downtown business. Two of the daughters are happily married; another is a stenographer. The youngest, the baby of the dark days in the East Side tenement, was graduated from school last year and is ready to join the army of workers. The mother begins to feel her years, but is happy with her children."

Some Christmas Eve I will go up and see them and take my friend from the Presbyterian Building along.

This is the story of a poor woman, daughter of a proud and chivalrous people, whose sons have helped make great fortunes grow in our land and have received scant pay and scantier justice in return, and of whom it is the custom of some Americans to speak with contempt as "Huns."

KIN

EARLY twilight was setting in on the Holy Eve. In the streets of the city stirred the bustling preparation for the holiday. The great stores were lighting up, and crowds of shoppers thronged the sidewalks and stood stamping their feet in the snow at the crossings where endless streams of carriages passed. At a corner where two such currents met sat an old man, propped against a pillar of the elevated road, and played on a squeaky fiddle. His thin hair was white as the snow that fell in great soft flakes on his worn coat, buttoned tight to keep him warm; his face was pinched by want and his back was bent. The tune he played was cracked and old like himself, and it stirred no response in the passing crowd. The tin cup in his lap held only a few coppers.

There was a jam of vehicles on the avenue and the crush increased. Among the newcomers was a tall young woman in a fur coat, who stood quietly musing while she waited, till a quavering note from the old

"PRESENTLY THERE FLOATED OUT UPON THE EVENING
THE FAMILIAR STRAINS OF 'OLD BLACK JOE'"

man's violin found its way into her reveries. She turned inquiringly toward him and took in the forlorn figure, the empty cup, and the indifferent throng with a glance. A light kindled in her eyes and a half-amused smile played upon her lips; she stepped close to the fiddler, touched his shoulder lightly, and, with a gesture of gentle assurance, took the violin from his hands. She drew the bow across the strings once or twice, tightened them, and pondered a moment.

Presently there floated out upon the evening the familiar strains of "Old Black Joe" played by the hand of a master. It rose above the noise of the street; through the rattle and roar of a train passing overhead, through the calls of cabmen and hucksters, it made its way, and where it went a silence fell. It was as if every ear was bent to listen. The crossing was clear, but not a foot stirred at the sound of the policeman's whistle. As the last strain of the tune died away, and was succeeded by the appealing notes of "'Way Down upon the Suwanee River," every eye was turned upon the young player. She stood erect, with heightened color, and nodded brightly toward the old man. Silver coins began to drop in his cup. Twice she played the tune to the end. At the repetition of the refrain,

"Oh, darkies, how my heart grows weary,
Far from the old folks at home,"

a man in a wide-brimmed hat who had been listening intently emptied his pockets into the old man's lap and disappeared in the crowd.

Traffic on street and avenue had ceased; not a wheel turned. From street cars and cabs heads were poked to find out the cause of the strange hold-up. The policeman stood spellbound, the whistle in his half-raised hand. In the hush that had fallen upon the world rose clear and sweet the hymn, "It came upon a midnight clear," and here and there hats came off in the crowd. Once more the young woman inclined her head toward the old fiddler, and coins and bank-notes were poured into his cup and into his lap until they could hold no more. Her eyes were wet with laughing tears as she saw it. When she had played the verse out, she put the violin back into its owner's hands and with a low "Merry Christmas, friend!" was gone.

The policeman awoke and blew his whistle with a sudden blast, street cars and cabs started up, business resumed its sway, the throng passed on, leaving the old man with his hoard as he gazed with unbelieving eyes upon it. The world moved once more, roused from its brief dream. But the dream had left it something that was not there before, something better than the old man had found. Its heart had been touched.

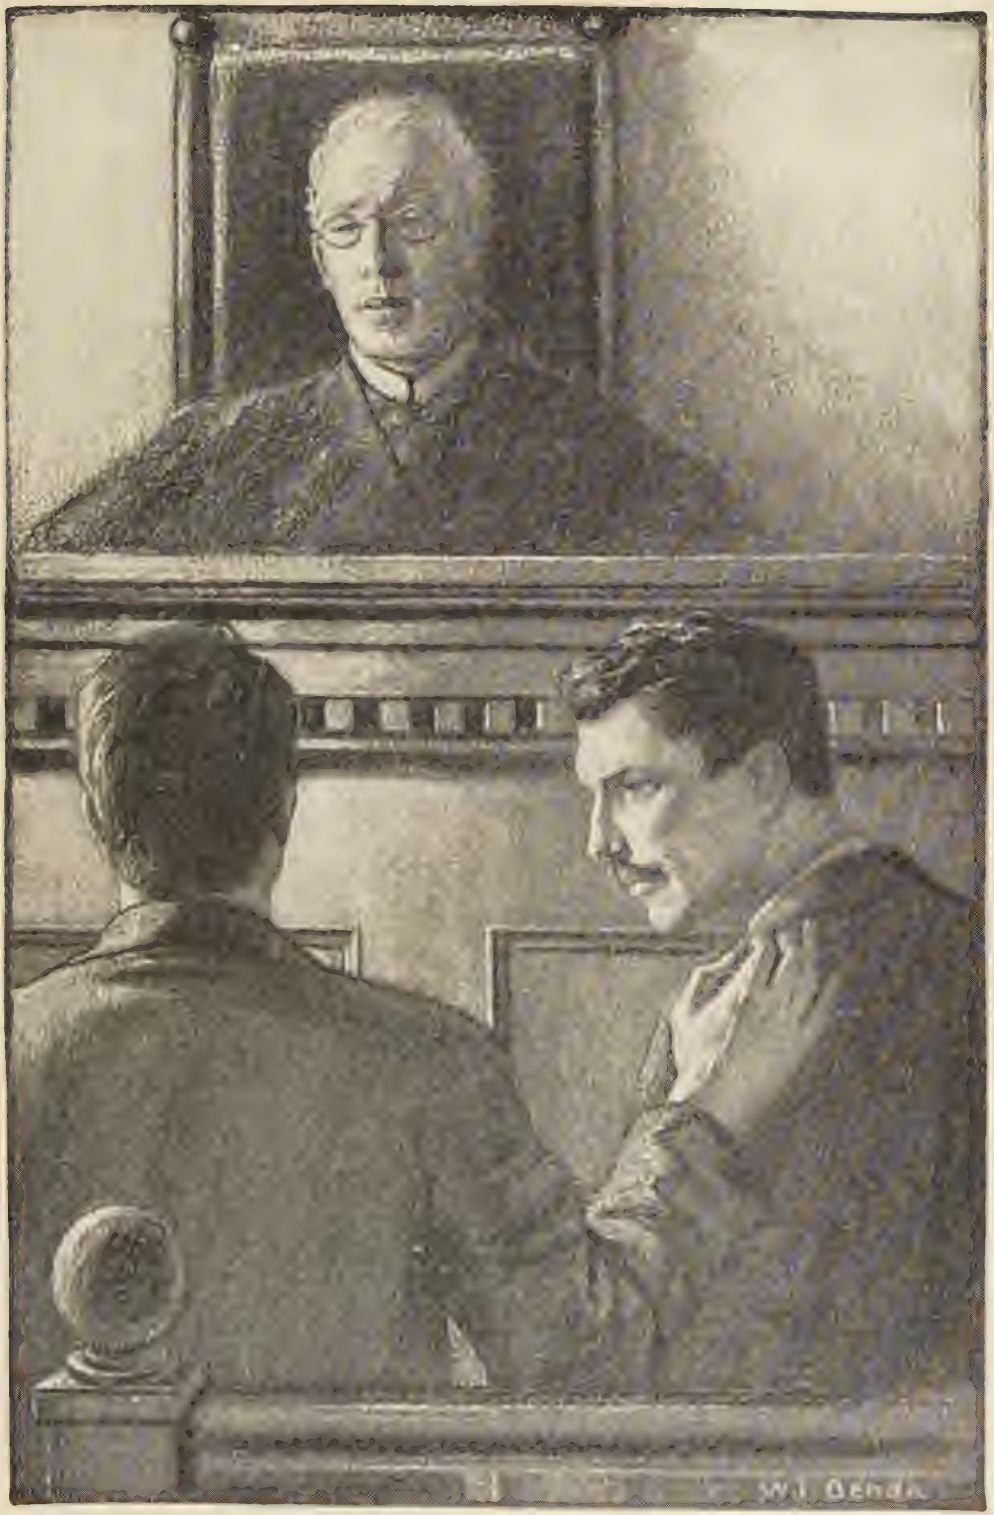
HIS CHRISTMAS GIFT

"THE prisoner will stand," droned out the clerk in the Court of General Sessions. "Filippo Portoghese, you are convicted of assault with intent to kill. Have you anything to say why sentence should not be passed upon you?"

A sallow man with a hopeless look in his heavy eyes rose slowly in his seat and stood facing the judge. There was a pause in the hum and bustle of the court as men turned to watch the prisoner. He did not look like a man who would take a neighbor's life, and yet so nearly had he done so, of set purpose it had been abundantly proved, that his victim would carry the disfiguring scar of the bullet to the end of his life, and only by what seemed an almost miraculous chance had escaped death. The story as told by witnesses and substantially uncontradicted was this:

Portoghese and Vito Ammella, whom he shot, were neighbors under the same roof. Ammella kept the grocery on the ground floor. Portoghese lived upstairs in the tenement. He was a prosperous, peaceful man, with a family of bright children, with whom he romped and played happily when home from his barber shop. The Black Hand fixed its evil eye upon the family group and saw its chance. One day a letter came demanding a thousand dollars. Portoghese put it aside with the comment that this was New York, not Italy. Other letters followed, threatening harm to his children. Portoghese paid no attention, but his wife worried. One day the baby, little Vito, was missing, and in hysterics she ran to her husband's shop crying that the Black Hand had stolen the child.

The barber hurried home and sought high and low. At last he came upon the child sitting on Ammella's doorstep; he had wandered away and brought up at the grocery; asked where he had been, the child pointed to



"PLEASE, YOUR HONOR, LET THIS MAN GO!"

the store. Portoghese flew in and demanded to know what Ammella was doing with his boy. The grocer was in a bad humor, and swore at him. There was an altercation, and Ammelia attacked the barber with a broom, beating him and driving him away from his door. Black with anger, Portoghese ran to his room and returned with a revolver. In the fight that followed he shot Ammella through the head.

He was arrested and thrown into jail. In the hospital the grocer hovered between life and death for many weeks. Portoghese lay in the Tombs awaiting trial for more than a year, believing still that he was the victim of a Black Hand conspiracy. When at last the trial came on, his savings were all gone, and of the once prosperous and happy man only a shadow was left. He sat in the court-room and listened in moody silence to the witnesses who told how he had unjustly suspected and nearly murdered his friend. He was speedily convicted, and the day of his sentence was fixed for Christmas Eve. It was certain that it would go hard with him. The Italians were too prone to shoot and stab, said the newspapers, and the judges were showing no mercy.

The witnesses had told the truth, but there were some things they did not know and that did not get into the evidence. The prisoner's wife was ill from grief and want; their savings of years gone to lawyer's fees, they were on the verge of starvation. The children were hungry. With the bells ringing in the glad holiday, they were facing bitter homelessness in the winter streets, for the rent was in arrears and the landlord would not wait. And "Papa" away now for the second Christmas, and maybe for many yet to come! Ten, the lawyer and jury had said: this was New York, not Italy. In the Tombs the prisoner said it over to himself, bitterly. He had thought only of defending his own.

So now he stood looking the judge and the jury in the face, yet hardly seeing them. He saw only the prison gates opening for him, and the gray walls shutting him out from his wife and little ones for—how many Christmases was it? One, two, three—he fell to counting them over mentally and did not hear when his lawyer whispered and nudged him with his elbow. The clerk repeated his question, but he merely shook his head. What should he have to say? Had he not said it to these men and they did not believe him? About little Vito who was lost, and his wife who cried her eyes out because of the Black Hand letters. He—

There was a step behind him, and a voice he knew spoke. It was the voice of Ammella, his neighbor, with whom he used to be friends before—before that day.

"Please, your Honor, let this man go! It is Christmas, and we should have no unkind thoughts. I have none against Filippo here, and I ask you to let him go."

It grew very still in the court-room as he spoke and paused for an answer. Lawyers looked up from their briefs in astonishment. The jurymen in the box leaned forward and regarded the convicted man and his victim with rapt attention. Such a plea had not been heard in that place before. Portoghese stood mute; the voice sounded strange and far away to him. He felt a hand upon his shoulder that was the hand of a friend, and shifted his feet uncertainly, but made no response. The gray-haired judge regarded the two gravely but kindly.

"Your wish comes from a kind heart," he said. "But this man has been convicted. The law must be obeyed. There is nothing in it that allows us to let a guilty man go free."

The jurymen whispered together and one of them arose.

"Your Honor," he said, "a higher law than any made by man came into the world at Christmas—that we love one another. These men would obey it. Will you not let them? The jury pray as one man that you let mercy go before justice on this Holy Eve."

A smile lit up Judge O'Sullivan's face. "Filippo Portoghese," he said, "you are a very fortunate man. The law bids me send you to prison for ten years, and but for a miraculous chance would have condemned you to death. But the man you maimed for life pleads for you, and the jury that convicted you begs that you go free. The Court remembers what you have suffered and it knows the plight of your family, upon whom the heaviest burden of your punishment would fall. Go, then, to your home. And to you, gentlemen, a happy holiday such as you have given him and his! This court stands adjourned."

The voice of the crier was lost in a storm of applause. The jury rose to their feet and cheered judge, complainant, and defendant. Portoghese, who had stood as one dazed, raised eyes that brimmed with tears to the

bench and to his old neighbor. He understood at last. Ammella threw his arm around him and kissed him on both cheeks, his disfigured face beaming with joy. One of the jurymen, a Jew, put his hand impulsively in his pocket, emptied it into his hat, and passed the hat to his neighbor. All the others followed his example. The court officer dropped in half a dollar as he stuffed its contents into the happy Italian's pocket. "For little Vito," he said, and shook his hand.

"Ah!" said the foreman of the jury, looking after the reunited friends leaving the court-room arm in arm; "it is good to live in New York. A merry Christmas to you, Judge!"

(The next installment of these "Life Stories" will appear in The Outlook for December 28)

A FEW BOOKS OF TO-DAY

BY HAMILTON W. MABIE

READERS who are in search of men rather than books will find them in Mr. Albert Bigelow Paine's "Mark Twain" (Harpers) and the "Letters of George Meredith" (Scribners). The two men are as far apart as the Thames flowing through London Town and the Mississippi running amuck through half the continent. Meredith was the most sophisticated of English novelists; no finer intellectual force ever made itself felt in English fiction; nor has a more penetrating analyst of character appeared in that fiction. One may quarrel a hundred times with his art, with the soundness of his psychology; one can never question the sheer brain power of the author of "The Egoist," nor escape the fascination of his distinction. He is the exponent of a culture which has wholly escaped provincial limitations without loss of that power of portraiture which lies in intimate contact with near and familiar things.

Will some one explain why there are no Meredith clubs? There is as much matter for discussion in the novels as in Browning's poetry, but there is not the same gay courage in attacking the Meredithian problems. Possibly the novelist does not yield himself so easily to generalization as the poet; possibly he demands a closer scrutiny than the majority of readers can give his work; possibly his analysis is more searching than Browning's, and the lines of character which it develops are neither so distinct nor so strongly massed as in the poet's studies.

It is significant that nobody is interested in the geography of Meredith's stories; and this is because they have no local backgrounds. Thackeray will bear the aid of maps, and Dickens stands almost in need of a London directory; Mr. Hardy's moors are so potential in some of the novels that we are eager to "locate" them, and Mr. Phillpotts has come very near putting guide-books to Dartmoor in our hands; but the Meredith novels are in a country of their own. Even the Meredithian cares little where the novelist lived, or what his manner of life was; the relations between his books and his readers is intimate, but curiously impersonal. These two substantial volumes are far more communicative with regard to the man than a formal biography could be. Meredith does all the talking, and he does it naturally, frankly, and with no lurking consciousness of posterity in the back of his mind; and so he gives us unconsciously the atmosphere of his mind. There is no professional pose, no sense of making a contribution to epistolary literature, in these intimately informal letters; but there is the tireless use of a faculty of observation which was at times uncanny in its sharpness of sight, the flow of deep feeling, a delightful habit of friendliness, and many bits of self-revelation:

> One result of my hard education . . . has been that I rarely write save from the suggestion of something actually observed. I mean that I rarely write verse. Thus my Jugglers, Beggars, etc., I have met on the road and have idealized but slightly. I desire to strike the poetic spark out of absolute human clay. And in doing so I have the fancy that I do solid work—better than a carol in midair.

Meredith's criticism was not awed by great reputation, and he was in agreement with

Carlyle and FitzGerald in his feeling about the verse of Tennyson's middle period:

> The "Holy Grail" is wonderful, isn't it? The lines are satin lengths, the figures Sèvres china. I have not the courage to offer to review it, I should say such things. To think—it's in these days that the foremost poet of the country goes on fluting of creatures that have not a breath of vital humanity in them, and doles us out his regular five-feet with the old trick of the vowel endings—The Euphuist's tongue, the Exquisite's leg, the Curate's moral sentiments, the British matron and her daughter's purity of tone—so he talks, so he walks, so he snuffles, so he appears divine. . . . The man has got hold of the Muse's clothes-line and hung it with jewelry.
>
> But the "Lucretius" is grand. I can't say how much I admire it and hate the Sir Pandarus public which has corrupted this fine (natural) singer. In his degraded state I really believe he is useful, for he reflects as much as our Society chooses to show of itself. The English notion of passion, virtue, valor, is in his pages, and the air and the dress we assume are seen there. I turn to Rabelais and Montaigne with relief.

These letters are as individual and at times as irritating as the novels, and they are also as interesting. They will not be read in their own light and for their own quality, as are the letters of Gray, of Lamb, of FitzGerald, but they will find their place beside the novels, and that means long life and very good company.

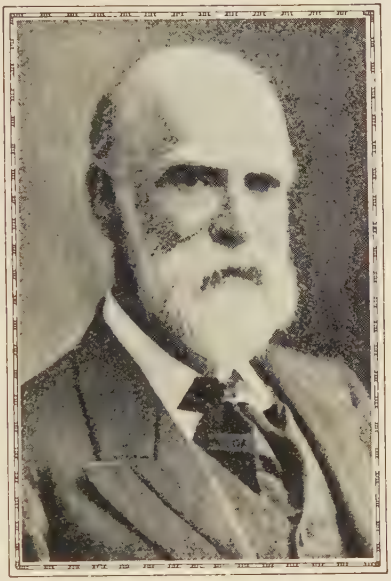
Mark Twain, on the other hand, developed his biographer and gained the effectiveness of autobiography without the labor of writing it. Mr. Paine stuck to his task with Boswellian persistency. But he was too deeply interested to be judicious in the matter of space, and the record runs to great length. It is easy to understand why Mark Twain was difficult to edit. He was so full of vitality, so unexpected in thought, so bizarre and often so grotesque in phrase and mood, that to report him adequately it seemed necessary to report him in full. But he needed to be edited in life, and he needs it now that he is gone. For many years his beautiful and devoted wife was his editor, and in her going he suffered an incalculable loss. Her exquisite nature was not only a foil for his coarser fiber, but a standard of taste and of speech. With fine discernment she called him "Youth;" and to the end of his days, under the shadow of a sorrow which searched him like fire, his was the spirit of youth.

For the best of Mark Twain, man and writer, was his report and illustration of those pioneer qualities which are characteristic of young societies. It was the Mississippi that floated him to fame, and to the life of the great river, and his unhackneyed and highly vitalized report of that rough, free, pictorial life, the readers of the future will turn for the genius of a man who won the world because he offered it a kind of writing that it had never had before. He was more unliterary than Whitman, who assumed the literary pose even while he denounced it. There is no evidence that, so far as his manner of speech was concerned, Mark Twain owed anything to books. Later in life he knew and loved certain writers, Browning among them; but neither his material nor his style was gained by reading; when he was asked, as everybody was asked a few years ago, what books had helped him most, he promptly replied, "My own books." He said frankly that he had never tried to help the cultivated classes; that he had neither the gift nor the training for it; that he always "hunted for bigger game—the masses," and that he had tried to entertain them and let them go elsewhere for instruction.

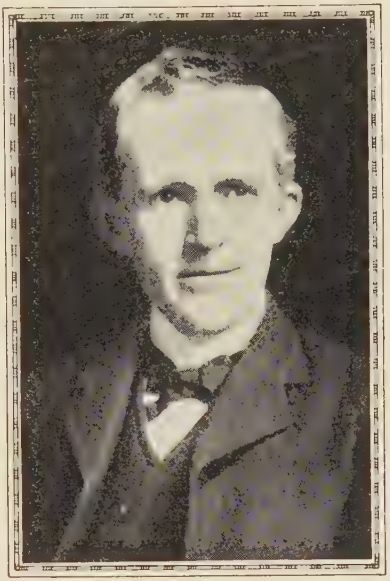
His instinct was sound, and it gained both audiences; for he was a natural force in literature, and there are few qualities which attract cultivated readers more than naturalness and force. Andrew Lang declared that he did not lay down "Huckleberry Finn" until he had read the last page; and that story and its companion, "Tom Sawyer," met the tests by which he judged fiction: vivid and original portraiture of life, and character naturally displayed in action; if there is "an unrestrained sense of humor in the narrator, we have a masterpiece." It would not be easy to put the elements of Mark Twain's genius and art with more precision.

For he had art, if by art we mean the most vital and effective use of material for presentation. It was not the art of the great novelist, nor of the "little masters" like de Maupassant; it was an instinctive sense of what is characteristic in time and place, observed, chosen, and dramatized in a spirit of buoyant, independent, and self-respecting humor. No man could be more at home with his people and with his readers than Mark Twain, and he wrote as if there were not another book in the world.

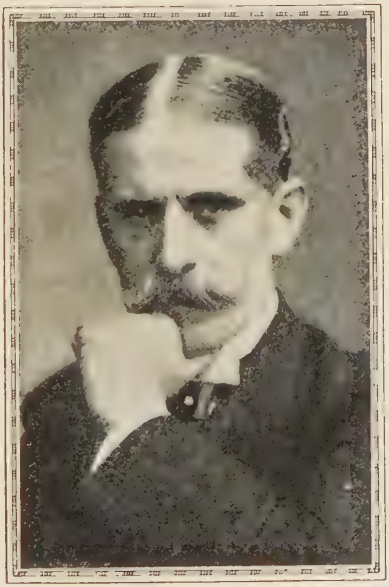
The indifference to conventions, the feeling that whatever was most easy and convenient was best, the deep-seated sense of the right of a man to be himself, which were the special qualities of the pioneers, were characteristic of Mark Twain, with the humor



JAMES BRYCE



SAMUEL M. CROTHERS



HENRY VAN DYKE

BRANDER MATTHEWS

which was the resource of men who had to make the best of things and took things as they were without apology or regret. When Mark Twain brought these qualities to bear on older and richer forms of life, he was often broadly humorous, but he sometimes made fun of things he did not understand.

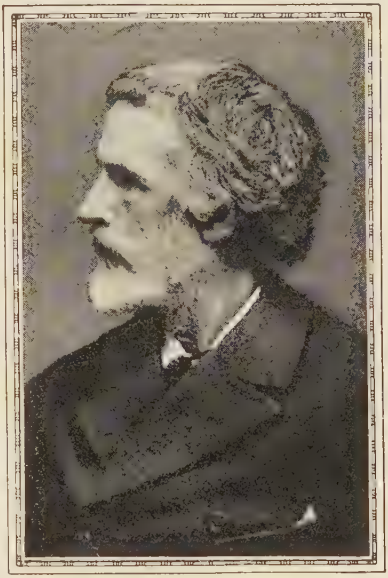
Mr. Paine had a big subject, and he has dealt with it with a fine sense of its bigness; he says many admirable and illuminating things about his subject; he has very happily brought out the central integrity and fineness in a nature unfolded, as was Lincoln's, in a coarse age; it is unfortunate that he did not look oftener at the clock.

There are biographies of nations as well as of individuals, and it is not impossible to select from the literature of some races a little group of books which may be said to contain the autobiography of the nation. So when one comes upon such a study of a group of peoples as Mr. James Bryce's "South America: Impressions and Observations" (Macmillan), he has the sense of dealing with national personalities. Mr. Bryce was never a dry-as-dust recorder of facts. From the days when he wrote "The Holy Roman Empire" he has had a sense of the vital qualities of which the historical record is an expression. His latest excursion in the field of racial observation has produced a book which Americans ought to read, since, as a rule, we know less about our neighbors in South America than about our neighbors in Europe, or even in the Far East, and South Americans seem to know a great many things about us which are not true. Mr. Bryce deals with this wide field and its vast diversities of scenery and character with a unifying vision; so that he is able, without straining his facts, to give us a kind of typical South American, with the love of the sonorous phrase, sensitiveness to friendliness and affront, a strong sense of personal dignity, courage, and the mercurial temperament. It is especially interesting to read his observations on the absence of the race problem. In this country, one touch of black blood makes the possessor black; in South America, one touch of white blood makes the possessor white. Taking into account all the facts, Mr. Bryce is of opinion that when two stocks are fused, the one more advanced than the other, it does not necessarily follow that the result is an inferior race; that control by a superior race has a very depressing effect on the inferior race; and that race repulsion is not so deep-seated as peoples of Germanic descent take for granted. What Mr. Bryce has to say about the attitude of the South American toward the Monroe Doctrine has also great interest for Americans, and he defines an attitude toward the South American peoples which it is to be hoped the policy of this country will always express: "It is as the disinterested, the absolutely disinterested and unselfish advocate of peace and good will that the United States will have most influence in the Western Hemisphere, and that influence, gently and tactfully used, may be of incalculable service to mankind."

The author of the "Canterbury Tales" is a very remote figure from the standpoint of to-day; but he is one of those men of the past for whom the present has not only great admiration, but a very friendly feeling. It is impossible to treat Chaucer simply as an English classic. He escapes from his books and becomes one of the most delightful personalities among English writers. It is true one cannot sit down to enjoy him without some preparation of language study; and while the difficulties between Chaucer and the modern reader are easily surmounted, it is also true that a great many modern readers who would enjoy Chaucer have not the time to surmount them. So "The Modern Reader's Chaucer" (Macmillan) is one of those ventures which have for their end the well-being of all lovers of good English and good poetry. Mr. J. S. P. Tatlock and Mr. Percy MacKaye, the editors, both men of exceptional equipment for the task, adhere closely to the original text, and have rendered in modern English the complete poetical works of the earliest English poet of the first rank and one of the greatest English story-tellers. It was a delicate task, requiring not only scholarly equipment, but the sense of language. Fortunately both qualities were at the command of the editors, and the result is a rendering of Chaucer which removes the difficulties without letting the quality of the work escape in the process. Moreover, "The Modern Reader's Chaucer" is a noble book in form, with a series of thirty-two illustrations in color from the paintings of Warwick Goble, which are satisfying to the eye and are an aid to the imagination.

It is quite clear that essays still find readers, in spite of the popularity of those predigested books which are made to be read automatically. The essay demands a certain amount of attention; the reader of many

H. G. WELLS



GEORGE MEREDITH

JEFFERY FARNOL

GEORGE B. McCUTCHEON

current novels can open the story and let his mind go off and attend to other matters, but the essay reader must listen. He is a desirable reader, because he expects to be on good terms with his author and to give as well as take. And this autumn he has a goodly list of attractive books to choose from; a few companionable volumes may direct attention to an alcove in the library of American literature which has an old-time air of quiet.

Those who enjoy reading about themselves in a large, impersonal way—and who does not?—will find close observation, clear thinking, and unforced humor in Mr. Bliss Perry's chapters on "The American Mind" (Houghton Mifflin). Mr. Perry teaches from a chair of Literature in Harvard University which has high traditions, but, like his predecessors, he is a man of letters first and a professor afterwards, though it is only fair to remember that the once popular idea of the dry rigidity of the professor was as wide of the fact as are most popular ideas. One has only to recall Professor Lowell or Professor Holmes or Professor Lounsbury to see how sorely the popular idea needs revision. To have knowledge and be able to impart it without pedantry is a desirable quality, because it involves the possession of that sense of common human interests which enables a man to enjoy an unscholarly poet like Chaucer as thoroughly as one enjoys a great scholar like Professor Child, who knows a great deal more about Chaucer than Chaucer knew about himself. And the man who is going to write intelligently about Americans must be able to understand Whitman as well as Lowell and to find great qualities in Mark Twain as well as in Emerson. He must also have a large endowment of humor, that solvent of the problem of contradictory traits and that liberating quality of nature which enables its possessor to escape from the subtle snobberies of old-established ways and maxims and to see men and conditions in what Mr. La Farge called the free logic of life.

Mr. Perry brings the keen New England observation and the sound New England training to bear on his subject; but he has the American, not the New England, mind, and he knows that there is some "risin' ground" beyond the Mississippi. His analysis of the American mind, temperament, and ideals, his study of the National background and racial inheritance, his comment on literature, art, business, and character, are keen, shrewd, and penetrating. And he has, moreover, the delightful quality of being interesting. His discussion has a note of frankness, a quality of intimacy, which make his criticism especially valuable; and his book has a breadth of view and a largeness of feeling hardly suggested by its modesty of size and manner.

To see the American at close range and also from afar, and to have a pleasant time in the process, one has only to read Mr. Meredith Nicholson's "Provincial American" (Houghton Mifflin) and Dr. S. M. Crothers's "Humanly Speaking" (same publishers). The author of that wholesome Central Western story "A Hoosier Chronicle" has the humor which is diffused through the air of the continent and expresses itself in ease of mind in facing homely ways of living and familiar turns of speech; in a sense of comfort in the integrity of simple, normal things, and freedom from a disposition to apologize when such things are ranged against the ways of a more sophisticated world.

The humor of Dr. Crothers is, so to speak, more local and special; it deals confidently with the larger aspects of things, but it hits most shrewdly when it touches the particular weaknesses and intellectual frailties of the time, as in the essay which gives the volume its title. Some of the most delightful chapters are based on recent European experiences, and the fresh humor with which Old World conditions are gently but firmly "jolted" is very refreshing. It would not be easy to bring together two pieces of writing which are better foils than Mr. Nicholson's portraiture of the provincial American and Dr. Crothers's quietly ironical account of the suffering which crude, vulgar America inflicts on the sensitive nerves and shuddering ears of refined, sweet-minded, and well-bred Europe. Mr. Nicholson in "The Provincial American" has much to say about the American, but he does not trespass on Mr. Perry's ground; he is concerned with local conditions and special aspects of life to-day. He has a free, direct, wholesome way of looking at things, and he is very much at home in his time and country. He celebrates the home-bred American, not in the tone of pugnacious advocacy, but with the conviction that he is a wholesome product of wholesome conditions, and has amply justified his right to his share of sunshine and

soil. His picture of a "Provincial Capital" is pardonably sympathetic in line and color, as Americans who are fortunate enough to know Indianapolis will agree; and what he has to say about Smith's absence from church, the tired business man, and the novels that run into the hundred thousand is pointed and worth considering whether one agrees or not.

The happy blending of keen insight and the wit which is neither caustic nor destructive, but a kind of high light on the mind, gives Dr. Crothers's essays a substance of serious thought and a manner of quiet and unaffected gayety. Such a discussion of the excessive overwork for righteousness, the moral overstrain from which many people are suffering, and which has prompted the suggestion of the organization of a Society for the Prevention of Reform, is more effective than most philosophical warnings or physiological protests.

The title of Mr. E. V. Lucas's modest collection of short papers, "A Little of Everything" (Macmillan), is one of those happily descriptive titles which not only describe the contents of a volume but characterize their point of view. As the editor and biographer of Lamb and a writer of essays himself, the author of these pleasantly discursive papers has reminded many people of Elia; but, while the later writer has the genial interests of the earlier essayist, he is in no sense an imitator. He is too quietly himself, too obviously at ease with his subjects, to hold other than a direct relation with them. The note of domesticity runs through this volume and makes it companionable; while its easy assumption that simple, familiar things are as interesting as remote and dramatic things gives the reader a comfortable feeling of being at home with the writer. If Mr. Lucas has not added to the sum total of human knowledge, he has added to the pleasure of being alive, not only by much keen observation and by the use of very good English, but by making us aware of the essential interest of common human relationships and happenings.

A conscientious student and a successful university teacher, Mr. Brander Matthews, the author of "Gateways to Literature and Other Essays" (Scribners), always gives his work a background of scholarship, but his manner is so easy and agreeable that the reader is never made conscious of any attempt to instruct him. On the contrary, Mr. Matthews has the conversational habit and talks like a well-read man who finds literature even more entertaining than the various kinds of sport which loom large in the talk of men before the open fire.

This volume contains, among other interesting chapters, the admirable address on Fenimore Cooper, the importance of whose work and its literary quality Mr. Matthews brought home to Americans at a time when "The Spy" and the "Leather-stocking Tales," which are read in every civilized country, had begun to seem a little provincial and old-fashioned.

We have read Mr. John Burroughs so long and with such profit that his friendly warning in his preface that the reader of "Time and Change" (Houghton Mifflin) must expect serious business in that volume seems superfluous. We are accustomed to listen to Mr. Burroughs without any desire to interrupt even when we differ with him; for a man so vigorously sincere, of such habits of original observation, and of such intellectual integrity is always stimulating, although he may not always be convincing. Mr. Burroughs has been so faithful a reporter of nature that his work, even in its descriptive phases, has rarely escaped the sense of the presence of mysterious forces slumbering or in action behind the beautiful aspect which the world wears to the poet and its rewarding fruitfulness to those who strive with it. The underlying unity of these chapters on "The Divine Abyss," "Primal Energies," "Scientific Faith," "The Gospel of Nature," is suggested by the writer's statement that while he was an evolutionist in the quality of his mind before Darwin, it has not been an easy matter for him to become an evolutionist in the concrete, and that these essays are "the outcome of the stages of brooding and thinking" through which he has passed in accepting the evolutionary "doctrine of the animal origin of man."

Lowell once said of certain foreign novels that the sign on the old inns, "Entertainment for men and beasts," would well describe them. Catering for the beasts still continues, and of late there is evidence that it is popular with a certain class of readers. Two or three popular novelists are manufacturing stories which profane the mysteries for commercial reasons, and a few periodicals are experimenting with American readers to discover how far they can cater to the taste for passion for passion's sake without being brought before the courts for indecent exposure. It is idle to talk about the freedom of art in

connection with these tales; they are not on speaking terms with art. Speaking frankly, they are commercial ventures in indecency.

Such stories as Mr. Theodore Dreiser's "Jennie Gerhardt" and "Sister Carrie" (Harpers) are obviously sincere studies of a side of life of which the world of sheltered women needs to know more. The temptations to which lonely girls earning a pittance in great cities are subjected are not understood by the mothers who send them like sheep among the wolves who prey on innocence and ignorance. It is not pleasant to look at the diseases of society, but it is wholesome and necessary, and Mr. Dreiser's stories are free alike from a moralization which the facts supply and from any coloring of relations which inevitably turn into a shabby drab as time goes on.

As much may be said of "A Man's World," by Albert Edwards (Macmillan), though the illicit relations are too obviously obtruded and made wearisome before one has done with them. This, too, is the work of a sincere and honest-minded man, and is perhaps the most vivid picture of the under-world of poverty, vice, and criminality from an American hand. It is entirely out of the atmosphere of the "worthy poor" philanthropy; it is a dramatic record of work in the slums, and it is startlingly unconventional. The unconventionality is pushed so far that it becomes, perhaps unconsciously, a kind of pose. It is so easy to caricature the church in its attitude toward this problem that it is hardly sportsmanlike to take such a "pot shot." It helps to dramatize the situation, but it does so at the sacrifice of essential truth. What this story does is to set vividly before the imagination a group of young men who are so close to the organized misery of the submerged tenth that they are in revolt against church and society, and are so absorbed in the work of immediate, personal relief that they have lost patience with a society which does not take off its coat and put everything else aside until the dark places have been lighted and the foul places cleansed. "A Man's World" is not a pleasant story; it is, in fact, a disturbing novel; for that reason complacent and easy-going members of society will find it, like some medicines, distasteful but wholesome.

Heredity and environment are very disturbing factors in the problem of human responsibility, and the old-time gayety with which the good were set off from the evil and the functions of Omniscience assumed with easy-going assurance is found to-day only among a few survivors of individualism or among literalists who are untroubled by imagination or sympathy. It is not easy to be patient with so persistent and wanton a mischief-maker as Stella in Mrs. Mary Hallock Foote's story of the early emigration to Oregon of a body of belated Puritans in 1848. Satan has entered into the heart of this beguiling and wayward West Indian, who is as devoid of conscience as a panther, and as light-footed in prowling about the camp of the believers. The hand of fate is on her, and the penalty for her misdeeds ought to have fallen on her ancestors. She has the vitality of a wild creature, to whom all laws which govern human relationships are wisps of straw. "A Picked Company" (Houghton Mifflin) is the most ambitious novel Mrs. Foote has written, but it is not the best story.

There is too much digression in Mr. H. G. Wells's elaborate study of the mind of the college woman in "Marriage" (Duffield), an able and interesting analysis of the struggle of two honest-minded people, who love one another, not only to live together comfortably, but to realize the possibilities of happiness in life. The problem is simple enough in form, but extremely difficult to work out: a man of scientific temper and training, absorbed in research work, drops in an aeroplane on a lawn on which a pretty girl, who has left a goodly list of debts behind her in her college town and has the habit of spending freely well established, is playing croquet, falls in love with her, carries her by sheer force out of an engagement already made, runs away with her, and marries her. The problem of bringing a man absorbed in scientific work, and a woman who loves him but cannot keep within his income, on normal terms with life is worked out with a thoroughness which at times gives one the sense of assisting at a clinic; but the analysis is interesting and the problem is solved in terms of human happiness and not by resource to the cheap and easy solution of the divorce court.

The problem in Mr. James Lane Allen's "A Heroine in Bronze" (Macmillan) is very different, and is happily conceived and solved in terms of art rather than of science. The American college girl, sketched with the sympathetic skill of one of the most accomplished and poetic of American writers, is a high-spirited, clean-minded, warm-hearted woman, whose femininity has all the old-time and all-time wealth of proud devotion which has made the great

romances beautiful. At a time when business, politics, social reform, and sex-perplexities give a good deal of current fiction the atmosphere of social or economic studies, it is refreshing to come on a story of so uncompromising romantic temper and interest as "A Heroine in Bronze." There is no plot, there are only two characters, there are no dramatic incidents; there are, on the other hand, an intellectual problem which is also an artistic problem, and a very finely sketched background; a luminous picture of New York as the home of a vast and varied humanity; and the drama of dawning love, moving slowly to confession and surrender, is enveloped in an atmosphere as warm and fragrant as the atmosphere which envelops "A Kentucky Cardinal" and "Aftermath." There are phrases of such pure verbal music in this story that one re-reads it for sheer delight in the beauty of its English.

And there is the same quiet reassertion of the reality of interest in the romantic novel in Mr. Maurice Hewlett's "Mrs. Lancelot" (Century Company). The situation is highly characteristic: an English Prime Minister whose practical efficiency and detestation of idealism in all forms reminds one of Robert Walpole, a colorless husband with the habits and temper of a high-class Government clerk, a poet whose soul is all song and for whom conventions are base compromises, and "between them that tender, conscientious, pale, and slim woman, Mrs. Lancelot . . . listening now to her heart, now to her conscience, distracted, worn thin, pitiful, but always lovely and kind; a woman, not a saint, a martyr, but not a champion."

It is a very pretty problem, and Mr. Hewlett deals with it after his usual fashion, and so confuses our sympathies with our convictions that we are ready to welcome any solution of a situation which has been impossible from the beginning. The Duke is drawn to the life; but poor Mrs. Lancelot gets no chance for her soul with the three men, and in the end disapproval dies in the sense of what awaits her when the Poet has an unlimited chance to talk to her.

It is a relief to turn from Mr. Hewlett's deeply designed complication to Mr. E. V. Lucas's delightfully normal and familiar story of every-day incident, told with charming ease in "London Lavender" (Macmillan). The very title brings the streets of the old town before the imagination, with fragrant suggestion of the sounds of ancient fields and woods that humanize its "central roar." This book is not a novel, any more than "Over Bemerton's" was a novel, but both are chapters out of that human experience of which novels are made, selected and reported by a delightful essayist who knows how to stick to his text even when he is most discursive. There is always a suggestion of romance in the air, and love stories now and again look in for a moment and then go their happy ways, leaving an aroma behind them. The reporter nods occasionally, but when author and reader are on such friendly terms that is only an incident of intimacy.

The lack of art in Richard Dehan's story "Between Two Thieves" (Stokes) is emphasized by its unusual power. It has the proportions, the frankness and fullness of detail, and much of the compelling vigor of some of the Russian novels. It is epical in scale and often epical in the rhapsody into which the style runs on slight provocation. It is a lurid panorama of the relations of France and England prior to and during the Crimean War, with brilliant but partisan studies of half a dozen historical characters: Napoleon III, the Duc de Morny, Raglan, Palmerston, the Duke of Cambridge, and other actors in the field of European politics. The thieves are Napoleon and an English army contractor; and the victim is England, fooled by an adroit intrigue and betrayed by an unscrupulous trader. The plot is worked out on a colossal scale; the style veers sometimes towards Carlyle and sometimes towards Dickens, and runs into pages of fierce invective, of brutally frank descriptions of orgies and amours. The story shows great research and appalling labor; it overflows with vigor and leaves reticence out of account; it is overcrowded and overheated; it is packed with vitality and contains the substance of half a dozen novels. Some English critics put it beside "Marriage" and give the two stories the first place among the novels of the season. But "Between Two Thieves" is powerful rather than great; it is a mass of rich material rather than an organized work of art.

It is a relief to get away from the atmosphere of crime and greed and animal satiety into the pure though rather thin air of Mrs. Mary S. R. Andrews's "The Marshal" (Bobbs-Merrill), the romantic tale of the little boy on whose head the hand of the great Napoleon rested long enough to dub him a marshal of

France. The story of the peasant boy who grew up in the companionship of one of the old soldiers of the great Emperor, and whose career was shaped by his devotion to the Napoleonic tradition, is told with the sympathetic quality which carried "A Perfect Tribute" to so many readers; and the high light of idealism shows a very different Napoleon from the corrupt intriguer of Richard Dehan's novel, which is also a romance.

If the strain of faith imposed by Mrs. Andrews's charming idyl of knightly devotion is a little too severe, one finds the quality of humor in Mr. W. J. Locke's "The Joyous Adventures of Aristide Pujol" (Bobbs-Merrill). The author of these lightly touched tales is a gift of Providence to an age so beset with problems that it almost fears to smile. But no one need fear the contamination of frivolity from Mr. Locke's stories; they are as full of gentle integrity and pure human kindness as if they had been put out by the Society for the Promotion of Happiness. They fill the reader with envy of the charm of unconventional goodness of heart.

And those hard-headed people who want to drive Santa Claus back to a region as cold as their own hearts, and who resent Christmas cheer and bells and lights as survivals of a superstitious age, will find much to enlighten them in the story of the attempt of a little Western town to abolish Christmas as a matter of economy, told with much quiet humor in Miss Zona Gale's "Christmas" (Macmillan), an old-fashioned tale set in a new environment and told with fresh feeling. The literal-minded who feel that the realities of life are symbolized by "butter and eggs and a pound of cheese," and that sentiment and poetry are the refuge of the weak and self-deceived, will do well not to read this unassuming and winning tale of human nature getting the better of Mr. Gradgrind in a community that set out to be worldly wise and was saved by a sudden outbreak of human instincts as deep as life itself.

The collection of short stories and of "half-told tales" which comes from the hand of Dr. Henry van Dyke in a very companionable volume, under the title "The Unknown Quantity" (Scribners), commands attention both for its substance and its form. There is a background of larger life behind all Dr. van Dyke's work; there is always a sky over his landscapes; there is always the play of spiritual laws and forces in his world. In these tales the element of mystery, which envelops daily experience like an atmosphere, becomes a determining element, and appears as a definite factor in the unfolding of character or the working out of events. The thread which unites these stories, the preface tells us, is the sense of mystery that runs through life and constitutes the unknown quantity, the incalculable element. The something around and within us which baffles and surprises us Dr. van Dyke brings before the imagination in a series of dramatic incidents which tell their own story, and, with the instinct of the artist, are not blurred with suggestion or solution. The two Canadian tales are in Dr. van Dyke's happiest vein of telling characterization by phrases of condensed descriptive force. The half-told tales are new expressions of the gift for paraphrasing life in terms of spiritual suggestion which have imparted to much of the work of this accomplished writer the quality of interpretation. In point of workmanship these stories deserve special commendation; they are models of the style which gains as much by restraint as by fullness of phrase; every word contributes to the general effect.

Those who read stories for the excitement of watching the play without the trouble of going to the theater will sit until the curtain falls on Mr. George Barr McCutcheon's latest story, "In the Hollow of Her Hand" (Dodd, Mead & Co.), a novel which does not stop until it reaches its destination, and which has the distinction of presenting a situation which is new to this generation of fiction readers. And Mr. Lincoln Colcord spins a sea tale of extraordinary vivacity and vividness in "The Drifting Diamond" (Macmillan), an impossible tale told with a vigor of phrase which promises well for the future of this young writer. Miss Mary Johnston's "Cease Firing" (Houghton Mifflin) will not escape the attention of those who found "The Long Roll" overloaded as a story but eloquent with an epical quality as a narrative of great events associated with great figures.

Among the new American writers, Mr. Jeffery Farnol has already found a large place among the lovers of spirited, adventurous stories, unconventional in tone and acted out of doors. His story of the adventures of "The Amateur Gentleman," now being published in serial form, promises to justify the reputation which may be said to have been established at the publication of "The Broad Highway."

MARY LYON
Founder of Mount Holyoke College

A PAGEANT OF PROGRESS

BY ELIZABETH CRANE PORTER

SEVENTY-FIVE years ago, when the trustees of Mount Holyoke met to discuss important questions as to the policy of the institution which was for the first time in history to offer girls the same education that their brothers had, Mary Lyon, the author and instigator of the whole venture, was not present. She waited near at hand, in an anteroom, ready for consultation. Because she was a woman it was not seemly that her guidance should be too plainly seen.

This fall, before an audience of thousands, seven hundred young women gave a pageant on the campus at South Hadley that was more significant than most of them dreamed. The College was celebrating its seventy-fifth anniversary, and all the great universities and colleges of this country and many from abroad were bringing their cordial acceptance of woman's scholarship and their honor to the college whose founder made it all possible. The whole celebration, with its academic processions, the choirs, and the addresses, was impressive and worthy of the occasion, yet what one remembers is the pageant. It was the living representation of what every one was feeling.

In an open-air amphitheater that slopes away to a wide lawn bordered with stately maples in their most beautiful autumn red and orange the students came in procession down from the hill, across the bridge, to the green, where two fairy sentinels sat at the foot of twin elm trees. The pageant represented the liberal arts and sciences, and each department of the College had a section First came a master of ceremonies and a troop of fiddlers in jolly countrymen's garb and then the groups of girls, each preceded by heralds and standard-bearer, passed slowly.

THE TELEGRAPH, SWIFT MESSENGER OF THOUGHT—DEPARTMENT OF PHYSICS

but with no breaks or interruptions, before the audience. For the Bible Department was the Queen of Sheba, gorgeous with her slaves, and the three Magi and their attendants. Then some graceful Greek figures, from Homer and Sappho to modern soldiers, posed and went on. Suddenly loud trumpeting announced a marching crowd of thirty or forty Roman boys and girls, who escorted Augustus and Agrippa to the center of the stage and solemnly chanted the rhythmic cadences of the "Carmen Sæculare."

For hours the audience sat rapt, too interested even to applaud, as the young figures, lithe and graceful in their perfect ease and lack of self-consciousness, posed and danced or sang or stepped slowly across the greensward. The beauty of the spectacle was not only in the color and grace of the tableaux and dances. It was a remarkably intelligent whole. One felt that each girl knew just why she wore the costume she did and pulled with the rest of her college to make the pageant a success. Yet there was in the atmosphere a happy abandon and a friendliness that let the audience into the spirit of holiday-making that dominated the College.

The fact that the whole institution had worked on the plans, instead of making the pageant a mere heterogeneous display, only gave it variety and vitality. It was well held together by the colors of the standards and heralds, and yet diversely interesting at every step. Miss Louise Jewett, of the Art Department, should have much credit for the original idea and for the effect of the whole. Yet to the combined and co-operating ingenuity of different members of the faculty much of the individual effectiveness was due.

Chemistry, for instance, does not seem much of an inspiration for pageantry, but one of the most charming moments of the afternoon was when thirty or forty "elements," clad in pale colors, came dancing gayly on the field in confused and rollicking groups till at a gesture from Mendelejeff, the discoverer of the periodic law, they formed into groups of solid colors and danced in the harmony that has become a commonplace in our conception of matter. When Radium, in her dance, suddenly threw away her scarfs of glittering silver and was transmuted into Helium, the charm of science had its most beautiful expression. The scene was real poetry.

For the Mathematics Department were long files of scholars, all perfectly costumed—Ahmes, an Egyptian priest of the fifteenth century B.C., Hypatia herself, Hindus, Arabian philosophers, and mediæval friars. Physics and Astronomy were also presented historically, from fire-worshipers and Chaldeans to Benjamin Franklin stolidly bearing his kite and followed by personifications of the material and intellectual gifts of these sciences to humanity. Loveliest of them was a fairy-like little figure in green, who represented the "swift messenger of thought," and stood smiling at the audience with her model of a telegraph pole over her shoulder.

Next came a crowd of creatures that depicted Geology, Botany, and Zoölogy. There were orchids, algæ, fungi, and ferns attending Flora, straight from Botticelli's "Primavera," and a curious group of fruit flies, which actually, said the programme, illustrated Mendel's law "concerning the appearance of characteristics, dominant and recessive, in successive generations." The characteristics to be noted here were red and white eyes!

The English Department, which at Mount Holyoke concerns itself chiefly with writing courses, presented a graceful tableau of modern Muses, surrounded by groups personifying rhythmical prose and meter. They were followed by the Department of English Literature, with a long procession of characters from our literature and its history, beginning with Deor, the Anglo-Saxon bard, whose lament over his master's neglect of him still lasts from heathen times. Arthur and a lovely Guinevere, Tristan and Iseult, Sir Galahad and a Grail maiden, Robin Hood and some of his merry men with falcons on their wrists, moved side by side with the Canterbury Pilgrims, several Shakespeare people, and the whole rout from Comus, persecuting the ringleted and shrinking Lady and her gallant brother.

Famous portraits then began to appear, delightfully picturesque and remarkably like the originals, from Van Eycks to Sorollas. After them paraded many dignified ecclesiastics and potentates of history, ending with a stern, fat little Napoleon, who came and stood with folded arms and mournfully sank her head on her breast. Then to the strains of "Die Wacht am Rhein" was given in spirited dumb show the apple scene from "Wilhelm Tell." When the hat of Austria had gone past, a chorus of English country maidens in costumes of lovely dull colors danced on to the music of their smocked minstrels, and tripped gayly through several old glees and

rounds. The tone, volume, and finish of the choral work were remarkable, but only what is to be expected at a college that maintains always a choir of two hundred and keeps it to a standard rare in this country.

Shortly another set of heralds announced the Economics people, who began with some primitive men and ended with a prophecy for 2000 A.D. At the pastoral stage of this résumé of the life of man appeared a flock of sheep that docilely grazed and were driven across the green with apparent ease. Their obedience was characteristic of the care with which the whole affair was carried out. At the dress rehearsal, the girls said, it took fifty minutes to drive and coax the frightened animals through their part. So on the day of the performance they were penned all day and their meal hour made to synchronize with their appearance. They were so intent upon the fresh campus pasturage that neither the music nor the crowd could trouble them.

MARY EMMA WOOLLEY
President of Mount Holyoke College

Then came Jeanne d'Arc, lean and tired, but exalted of countenance, and Dante and Beatrice after her. Don Quixote, on a raw-boned old white horse that has served generation after generation of college girls on their Wednesday drives, ambled gently across, pursued by Sancho Panza on a tiny donkey. Molière then conducted rehearsals for scenes from three of his plays before Louis XIV—a ludicrous bit from "Les Précieuses Ridicules," one from "L'Avare" and from "Le Bourgeois Gentilhomme." Last of all came a queer file of women. The pageant had shown poetically the present-day range of the college girl's training. Some of the recent alumnæ now came, showing how she had looked every year since 1837, from the slender silhouette of to-day back past the leg-o'-mutton sleeves, the hoopskirts, and the waterfalls of different years to the modest bonnets of Mary Lyon's time. The final tableau, as the seven hundred, a wonderful mass of color against the October woods, sang their Holyoke song, was a moving symbol of what young womanhood means to-day.

When the procession passed between the ranks of visitors before disbanding, the perfection of the costuming was even more evident than before. Details often neglected, such as shoes, and anachronisms such as eye-glasses, had all been seen to, and the effect was noticeably finished.

And it was no wonder. The College had been working on the pageant since last spring, and every girl then in college had a part. The plan as to color, device, and the central idea for each group was left to the faculty of that department, who sent to the central committee the list of the girls they would need. The plans and lists were revised and harmonized by the committee, and then each girl in college received a slip explaining her part and her costume. On the other side of the slip was a pledge for her to sign, saying that she would take full responsibility for the costume, and that, if she found she could not be at college that day, she would inform the authorities at once. This individual responsibility was what made the thing "go," and made the remarkable effectiveness of the production.

The girls either made or hired their own costumes, under the direction of the faculty, who drew designs and furnished samples and helped in the research necessary for many of

the details. Any time after college opened you could see girls running across the campus to some faculty's room "to see if she was all right" as a monk, or a Roman matron, or St. Thomas Aquinas. And the thought was worth while. No carping classical critic, for instance, could have found any fault with the "Carmen Sæculare." The head-dresses and draperies of the actors were strictly according to the prevailing fashions of 17 B.C., as gathered from bas-reliefs and decorations; and the toga, whose real shape it seems is unknown, was the cause of much experimentation.

Probably the best part of the affair, beautiful as it was as a spectacle, was its effect on the girls. "To understand that programme," as one visitor said, "would be a liberal education," and no girl could have lived in that atmosphere for months and had a share in the preparation without getting something different from the not uncommon undergraduate attitude of jesting indifference to academic work. The kind of interest that people seldom acquire before they graduate is the usual thing at Mount Holyoke this year.

Back of the amphitheater where the pageant was given, in a quiet grove in the center of the campus, is Mary Lyon's grave. Nothing was said about her that afternoon, but every one was thinking of her. As a Japanese speaker quaintly said, when he later brought greetings from the Orient, "her benevolent spirit" must have been happy. Far more than seventy-five years of women's enlightenment lie between the time when Mary Lyon waited in an anteroom while her trustees debated and the day after the pageant in 1912 when Mount Holyoke conferred honorary degrees. The recipients were of the best type of women, and they all deserved the distinction, but to the audience they represented more than their individual achievement. Women have traveled a long distance in seventy-five years when a college can find—and for the most part from her own alumnæ—such women as these to honor: the distinguished head of a reformatory for women, an author of scholarly reputation, a notably successful woman archæologist, the presidents of two of Mount Holyoke's daughter colleges—one in South Africa and one in Ohio—and the head of the new Federal Children's Bureau.

No less typical of the modern woman is the President of the College herself, the woman whose steady, self-reliant grace makes any occasion notable. To one meeting her socially President Woolley shows herself to be of the sort that remembers, apparently, every one she has ever met, and, more than that, says always the elusive right thing—the phrase that other people compose wrathfully a half-hour after its occasion. By alumnæ and the public she is honored as the woman who has achieved what Mount Holyoke has long needed—a respectable endowment. And to the students she is the woman who can make them want to do what they have angrily determined they never will do, the woman whose wish is enough reason for action, the woman who, when she asks them not to discuss some matter, creates a silence on the subject more inflexible than a solemn oath. They want to please her, but, as she invariably explains why she wants things done, she makes them think, too.

The pageant and the rest of the celebration, to any one who knows Miss Woolley's work, were instinct with her unobtrusive direction. In a real sense it was a personal triumph for her after her first ten years of administration, but more than that was the larger fact that she is keeping the spirit of Mary Lyon and fulfilling all her hopes.

SANCHO PANZA—DEPARTMENT OF ROMANCE LANGUAGES

ABOVE RUSHED A HUGE VOLUME OF SMOKE, SHOWERING MILLIONS OF SPARKS AS IT WENT

THE TRAIL OF FIRE

BY JOHN BERTRAM KELLEY

WITH DRAWINGS BY THOMAS FOGARTY

"DO you think there's a silver lining there, Tom, or would you call that one of the exceptions?" I leaned against a boulder and idly flapped a handkerchief about my head and neck to the discomfiture of a swarm of black flies.

My partner threw down his grub-hoe, combed the early flies out of his rough iron-gray beard, and stared thoughtfully at the southern sky. He spoke casually, as though his opinion were of little weight, anyway. "Son," he said, "it would take some prospecting to find the silver lining behind that cloud." He picked up his grub-hoe and knocked some pieces of rock from a vein he had uncovered. "Not bad-looking truck," he remarked, putting them into his pocket. Once more he studied the black cloud to the south. It was growing suspiciously thick and appeared to be gaining speed. At times it would rise lazily, then heave slowly to the east, then stop to settle for a moment. The old prospector scanned the sky. In all directions lay the haze of forest fires over the parched bush. "It looks bad to the south there, son, but if a wind comes up from *any* direction, I guess hell will seem like a refrigerator after this bush. She's just a nest of sleeping fire now, and she's so dry that the frogs are dying of thirst in the water-holes. I reckon we'd better feed and then hike for Porcupine after we cache the outfit."

Even as we buried the blankets, dishes, cooking utensils, all our precious movable equipment, the sleeping fires that lay all about us were roused. An hour passed, and in that hour sprang up a wind such as had never in the memory of man torn through the northern bush. It varied from moment to moment—now from the south, suddenly from the northwest—it twisted and shrieked, fanning and spreading and uniting a thousand fires. Great trees, torn up by the roots, crashed through the underbrush on all sides of the cabin. Occasionally the fire, leaping clear of the smoke, seemed to precede it, red, merciless, tearing through the spruce, snatching the tops of the dry tamarack and hurling them through the air to ignite the tinder-like bush five hundred yards away. Back fires started. The wind seemed to blow from everywhere. The hissing of burning spruce trees grew louder, sharper, more frequent; it became a roar.

We watched it quietly from the cabin door. We had made our plans if the fire should reach us. In times past swamps on the outskirts had protected our claim, but the wind alone could protect us now. We smoked in silence, our lightest and most precious possessions in a pack-sack between us. A rabbit raced around the corner of the house, seated himself a dozen yards away, and watched us, trembling. A moose swept by, snorting wildly. At that instant old Tom made a grab for the pack-sack and ran down a little trail that led into the swamp. Following closely, I saw a hundred little fires breaking into life about us, though the main fire was half a mile away. Above rushed a huge volume of smoke, showering millions of sparks as it went.

The trail led to the well, a hole slightly more than six feet deep and containing about five feet of water remarkable in the vicinity for its coldness. Into this well the old man dropped the pack-sack, sliding in after it with a shiver. For a few seconds I watched the oncoming wall of fire sweeping toward us; then I too dropped into the well.

It was not good to look at as it came, preceded by a thick, inky, turpentine smoke, but in the well we were comparatively safe from the actual fire. That a tamarack top might come into the well we knew, but we had to chance that. The air in the small space between the water and the level of the ground seemed sweet and pure in contrast to the smoke-laden air outside. The water was bitter cold as we ducked to avoid the hail of sparks.

High above, the tops of the spruce trees burst into flame. Great snake-like flames leaped from tree to tree. Trees crashed to the ground with the ear-splitting crack-crack of artillery. With a roaring, hissing noise, like that of many locomotives in a tunnel, the fire rushed over the well. We plunged our heads into the water. A tree fell across the opening above us. Instantly

a thousand little flames raced along the trunk, scorching our heads and necks. Coughing and choking, we managed to throw enough water with our wide hats to extinguish the fire. The air was unbearable; it was so dry it cut our lungs. Then came the smoke, heavy, impenetrable. We choked and coughed continually, swinging automatically forward and backward—under the water, into the hot dry smoke, and back under water. We tore off our shirts, wound them about our heads, and, still choking for breath, wildly flung water over them. Minute after minute dragged by. The air was rent by a reverberating boom as a powder-house a mile away blew up. It meant at least a dozen lives. Black hopelessness pressed down on us. Smoke rolled over us ceaselessly; the ground was carpeted with glowing embers, with tiny creeping, shooting flames. The icy water, while prolonging our struggle against suffocation, was slowly paralyzing us.

At last came the temptation to put an end to the strangling misery by slipping down into the water. It would be easier, but with my partner beside me I couldn't quit. Without uncovering my eyes, I knew how he looked; knew he was standing beside me fighting for life, refusing to consider whether he had a chance of saving it or not.

A feeling of indignation swept over me. I might be killed, but I wouldn't give up! I would not be found huddled up in the bottom of a well. I fought grimly for breath, half mad with the idea that it was a personal issue between me and the Lord of the Universe. I fought angrily, spitefully. I kept muttering that a man took a lot of killing, that I could tough it as long as my old partner did.

The smoke became cooler and less thick. Sometimes for a few seconds it rolled past on one side or the other, giving us a chance for a long breath. Old Tom seized the charred tree-trunk above his head and swung himself out of the well.

"Son," he said, "a couple of hours of that sort of thing is enough."

"I guess I'm well enough chilled to keep for some time myself," I remarked, coughing and panting as I looked around.

The completeness of the transformation of the country was disconcerting. It took us a few seconds to get our bearings as we walked slowly to where the cabin had stood, for the sheet-iron stove was the sole remaining proof that there had ever been a shack. To the north the fire, swept along by a seventy-mile gale, leaping from side to side, mowing down monster trees, consuming underbrush, small trees, and the little dwelling-places of man, rushed on its course, leaving in its wake the skeleton of a forest, skeletons of little and big animals, and the skeletons of men.

The smoke-laden wind had turned cold, so we stood close to a glowing log as we took off our long boots and wrung out our socks. Then I remembered the pack-sack, went back to the well for it, and wrung my socks again, while the old man stood by, shivering and profane. We pulled on our cold, wet shirts, and started for the settlement, climbing over countless fallen trees, feeling that we were walking swiftly, though we barely moved. Trees fell about us, several almost on top of us. We were cold, dazed, miserable. The strain had left us half sick, half ashamed of the fight we had made for our lives.

On the township line we met a big Finn. He was running back and forth, moaning, nursing one hand with the other. He showed us its burned back, then continued to walk about, sobbing and whimpering. Old Tom regarded him with disgust. "If you're going to Porcupine with us, stranger, you'd better shut up and come along." He led the way slowly, breathing heavily, while the Finn brought up the rear, whining. The eyes of all of us, inflamed by the smoke, became harder and harder to keep open. Every few steps we had to throw back our heads to get a glimpse of the trail.

A leaden-gray twilight settled about us. The smoke swept past, cool and light. The air was filled with carbon dioxide. The black, smooth ground, the great black trunks of trees standing at a distance from one another, the black broken logs stretched on the ground, the whole hedged about with a dead, gray shroud of smoke, made me feel that we alone remained on the unwholesome remnant of a destroyed earth. With the extinction of all life about us, we were miserably impressed with our insignificance as we crawled over great hot tree-trunks and tried to follow the altered trail with eyes more than half blind. The Finn thought only of his burned hand, which seemed to be the extent of the damage inflicted upon him by the fire. He wept, begging us to hurry, until finally, seeing that he was not regarded as an object

"THEN I TOO DROPPED INTO THE WELL"

of sympathy, he strode angrily past us and moved strongly and swiftly down the trail.

The disappearance of the big log camps that had stood near the trail on cleared ground, offering nothing to feed the fire, and the gruesome discovery that what looked like three little logs were the charred bodies of men, prepared us to find Porcupine in ruins. The old man led the way in silence. He was having a bad time forcing himself to walk. He seemed almost overcome by dizziness; he coughed ceaselessly, doubling up after the effort of climbing over a tree-trunk, and spitting blood after his worst attacks. Feeling that I was following at a terrific pace, I shambled behind him. I was oppressed by an inability to fulfill a persistent desire to fill my lungs. Every few steps my mouth would be pulled open, a little air would rush into my lungs, and a fit of coughing follow.

Evening was upon us when we arrived at the smooth black area of land cleared by man for his houses, and during the past two hours cleared of man and his houses by fire. There was nowhere the faintest trace of a house. The lake at the north end of the town was obscured by a great cloud of smoke sweeping out of the swampy shore. Besides a hideous smell of burned flesh there was no clue to the whereabouts of the several thousand inhabitants of South Porcupine. It was inconceivable that they had all perished. We walked listlessly to the lake shore, where, seated close to a fire, was a little group of men. There were no greetings. They all knew us and were glad to see us alive; still, they were themselves too miserable to say so. Everything was burned, they said, nothing left of any of the towns. Most of the inhabitants had stood in the lake, and so escaped burning. They thought that several hundred had been drowned by the crowd pushing those farthest out into the water that was beyond their depth. This and much more of the same sort the group told us in callous, monotonous tones, as though it all made little difference. Their friends had burned and drowned before their eyes; their own lives had been spared by luck they could not understand. What had become of the survivors they neither knew nor cared. The terrific sweeping force of the fire had stunned them.

We left the group and started for North Porcupine, the settlement at the other end of the lake. "There's bound to be a crowd somewhere, Tom; I shouldn't wonder if the North End had slid by." The old man nodded his answer. He had not spoken for two hours, but had gone on doggedly, his big sloping shoulders drooping more and more, his whole body shivering. The eyes of both of us were puffed and aching, requiring

a backward jerk of the head for a momentary glance at the trail, then closing heavily again.

Half-way around the lake we came upon a gathering of foreign laborers, prospectors, mine managers, and brokers, among whom were several shivering and half-blind women. They spoke in low, dead voices. The North End, they told us, had been saved as by a miracle. The fire had swept by on both sides of the town, taking only one street as it went.

They all fell silent as a big motor boat approached. It brought a doctor in a white collar and well-pressed clothes, who obviously had not been in the fire. This man jumped ashore and began to select passengers for the boat. Every one crowded about him, eager to get out of the desolated bush. The doctor helped the women into the boat first. Foreign laborers, mostly Finns, set up a shout and rushed into the boat, throwing the women into the water. Without a word the prospectors and mining men fell upon the Finns, and a moment later the women were again in the boat, shivering, but for the most part calm. They had suffered much that day.

After the outburst the doctor had easier work. He set about filling the boat with the men who were least able to walk. His eye fell upon my partner and me; and we must have been a sorry sight, standing together, shivering, our eyes tight shut, our shirts torn and hardly tucked in at the belt. He came quickly to the old man.

"You'd better get into the boat," he said.

Tom started. "Come on, son," he said.

"He can walk all right," said the doctor, "but you get in; everybody's waiting."

The old prospector stopped short. "If he can walk, why, I guess I can too." His voice sounded thin, and the words were followed by a fit of hard, dry coughing.

Startled, I spoke brusquely: "Don't be a fool, Tom." Anger masked a great uneasiness. "You needn't worry about me. I'll be 'round the shore nearly as soon as you are. So don't stand here with those women freezing in wet clothes."

Attacked from this angle, the old man surrendered, and a moment later I stood watching the boat as it shot out into the high chop, swung north, and, with wind and waves behind it, headed up the lake.

The gathering broke up; little groups took the trail to the North End, till presently I found myself alone. I kept wondering why the doctor thought that old Tom couldn't walk. It was all rot; the old man had come out of the bush like a moose—and yet there had been something strange. It was like him to say nothing. The longer I stood thinking about my old partner, the farther the mile to the North End seemed. I looked for a place to lie down out of the wind. I would sleep there and go to town in the morning. Then the thought of old Tom waiting for me at the "first call" decided me. I started up the trail, now nearly obscured in darkness, stumbling often, swearing extravagantly. Finally, half dazed with exhaustion and a peculiar numbness, I walked into the crowded bar-room and sank into the barber's chair.

Men who happened to have been in the little settlement that had been spared crowded about me. Many of them I knew. All of them knew me as the partner of the grim old veteran of the bush. "Where is Tom?" they demanded. "Doc took him in a boat; thought he'd be here," I answered, wondering.

At that moment the doctor in the white collar entered. He came up to me and congratulated me on my escape. "Where's Tom?" I asked. "He's all right," he answered quickly and turned away. He said something to a young fellow who stood a little apart from the group. I couldn't hear what it was, though I felt he was talking about me.

"Where's Tom?" I fairly shouted, but he left the building, and the young fellow came over and told me to come with him, assuring me that Tom was being cared for.

He took me to the upper end of the town. The street swarmed with homeless people walking back and forth, talking in groups, beaten, hopeless, tragedy depicted in nearly every face. Authentic rumors came in steadily of horrible deaths of men and women in some of the mines. Any one who had been in the fire and had come out alive was hailed with wonder, so all-overwhelming the disaster had been. Man after man stopped me, some of whom I knew well and some not at all. They acted as though a ghost had come among them. An old friend threw his arm about my shoulder.

"I never knew you were lucky before," he exclaimed.

"I'm feeling blamed lucky just now, Jim," I told him. "All you've got to do to keep me going is to feed me on bits of dry wood; I swallowed about half that fire."

A little later I was steered into a shack and

was put into a double bunk that already contained three survivors, two of them badly burned, the other one exhibiting symptoms similar to my own. "Kind of a cemet'ry special," grunted one of the bandaged ones. We exchanged stories of our escapes. At the close of each story the auditors remarked feelingly, "Well, you were lucky."

With night the doctor came, put a few drops of boracic acid and cocaine in the inflamed eyes, a few drops of whisky into the parched throats, and went his way. More and more of the injured were crowded into the shack, until every inch of floor space was covered with rolling, groaning men. The owners of the cabin sat on the table talking in low tones. Now and again the door opened to admit members of a hurriedly organized rescue committee who were going about in search of facts concerning those who had come out of the bush and the probable whereabouts of those who had not come out. A train of box cars had already taken eighteen hundred people out of town. Several had died on the journey, the story ran. People tried to persuade me to take the next train. I told them Tom and I would go together in the morning. But I could get no information regarding his whereabouts.

The next morning, in spite of much opposition, I rose early and went out to find my partner. I met a procession of stretchers being carried to the station. I knew most of the men on them. The streets were deserted except for a small group of people in front of the theater. I crossed the street and joined the group who were reading a typewritten list of the dead, which had just been pinned to the door. I read the list slowly; on it were the names of many of my friends. Near the bottom was the name of my partner. Certain that there was a mistake, I turned to the man near me, remarking that there were probably a good many errors on the list, and pointing to old Tom's name as an example. "That's no mistake, stranger; I helped lug his box to the station myself," the man said. "He and his partner got in wrong yesterday, and the doc says that the young one will go out in a box by to-morrow."

Again the feeling of rebellion which had come over me in the well swept every other sentiment from my mind. "If the doctor said that, he lied." I spoke quickly, trying vainly not to cough. "And you tell him that you saw old Tom's partner walk to the station and go out on this train." I walked up the hill to the station, choking, and terribly lonely for the old man.

LOUIS GLAVIS IN CALIFORNIA

BY HAROLD FRENCH

Louis Glavis is the young man who, by his charges against Secretary Ballinger, started what is known as the Pinchot-Ballinger controversy. We are sure our readers will be interested in this account of Mr. Glavis's more recent public service.—THE EDITORS.

WHEN young Louis R. Glavis, special land agent of the Federal Government, presented to the judicial consideration of President Taft certain evidence indicating a plan of the Department of the Interior to turn over the wealth of Alaska to the Morgan-Guggenheim interests, he was summarily dismissed from the service for having circulated "mere unfounded suspicions" reflecting upon his superior officers. Whereupon, "this rash boy, Glavis," retired to the simpler life as an honest horticulturist. But Glavis was by no means forgotten.

When the apple blossoms of his Hood River orchard were unfolding in 1911, he received a summons from the State of California to appear before its Governor, Hiram W. Johnson, and show cause why he should not be transplanted to the post of executive officer of the newly created State Conservation Commission.

Betwixt the Sierras and the sea was a new world to win for the people. In this realm of natural riches were certain assets belonging to this sovereign State which were well worth a billion dollars to its public owners. The Conservation Commission proposed to control the development of its water supplies, forests, minerals, and reclaimable lands for the benefit of the whole people. And as

LOUIS R. GLAVIS

an administrator they wanted a man who had not only "made good," but who could make better records. The urge of social service was too strong for Louis Glavis, and so he consented to be drafted as a soldier of the good government of this progressive commonwealth.

As far back as 1887 a State Board of Forestry was established and $29,500 was appropriated for its maintenance; but the idea that the State should attempt to regulate the ruthless greed of the organized land-grabbers was deemed an unwarranted intrusion upon the rights of vested interests. Backed by the powerful influence of the Southern Pacific machine, the resources of the State were the spoil of speculators, who obtained valuable timber lands for as low as $1.25 an acre, which they devastated with utter disregard for the future welfare of the State. As the denudation of the watersheds progressed, the recurrence of ruinous floods awakened a growing sentiment in favor of regulating the basic industries of the State in the interest of all the people.

When Dr. George C. Pardee became Governor of California in 1903, he impressed upon the Legislature the fact that the future prosperity of the State would depend upon the conservation of its forests and water supplies, and by persistent efforts he secured appropriations sufficiently liberal to permit the performance of effective work by the State Forester. But his conservation projects were again held back by the blighting influence of the machine. The Southern Pacific had no use for a Progressive Governor, and the then all-powerful Boss Herrin recalled Pardee from his post at the close of his term. During the next four years the very word "conservation" was read out of the party's dictionary.

Then came the popular revolution against the rule of the railway, and Hiram Johnson was inaugurated Governor of California in January, 1911. With all his uncompromising energy he urged the Legislature to create the State Conservation Commission. On April 8, 1911, a law was enacted for the purpose of establishing a commission which should be empowered to regulate the utilization of water supplies for power purposes,

and another commission was authorized to investigate and report to the Legislature upon the development of irrigation and reclamation projects, as well as to investigate forestry, the exploitation of mineral lands, and kindred subjects. Three commissioners were appointed to supervise the revising of existing statutes and to recommend the enactment of laws which would make their work for the conservation of the natural resources of the State more effective. A fund of $100,000 was placed at the disposal of the commissioners, who were authorized to engage the services of experts to gather data and to work out the problems of this ambitious programme.

Among the three commissioners whom Governor Johnson appointed was his predecessor, the pioneer Conservationist, former Governor Pardee. He had attended the memorable Irrigation Congress at Spokane in 1909, when Louis Glavis appeared before that body of progressive public men and submitted his case against Secretary Ballinger to Gifford Pinchot. From that time he took a deep interest in the career of the young monitor whose timely warnings prevented the deeding away of public domain to privileged promoters. When the Commission required the services of an administrative secretary, Dr. Pardee proposed the name of Louis Glavis for the office, with the unqualified approval of his colleagues, and on the 1st of July, 1911, he commenced his new career of usefulness to the public.

The first notable achievement of the State Conservationist was the drafting of a bill establishing a water power commission, a water-wheel within the motive wheels of this new engine of regulation. Mr. Glavis studied every phase of the utilization of water power to generate electricity, and presented his arguments for the creation of this special commission in such cogent form that the Legislature adopted the plan, which became a law on January 2, 1912.

One of the greatest assets of the Golden State is, at the present time, the least developed in proportion to its value. Engineers have estimated its water rights to be worth hundreds of millions of dollars a year to the people of this favored State. The vast and sparsely settled Sierra Nevadas are limitless storehouses of water deposited in Nature's snow-banks. These gradually liquidating reserves linger throughout the summer in this lofty wilderness of glacier lakes and sky-piercing peaks, ranging from eight thousand to over fourteen thousand feet in elevation. Fully five hundred miles in latitude this series of Sierran catchment areas extends, while the width of its alpine zone averages from thirty to forty miles. On either side of this region of perpetual snows cascading rivers carve their courses through granite gorges down to the desert below the eastern escarpment, or to the fruitful foothills of the great interior valleys. For the purposes of generating electrical power, irrigating and reclaiming lands, and furnishing copious supplies of water for domestic needs, these snow-born torrents have a commercial value which will soon bear a proportion of sixteen to one to the average annual production of gold in this State. A miniature Sierra guarding the Pacific coast contains between its contours, which range between two thousand and eight thousand feet in elevation, many streams capable of doing much useful work for millions of people.

Far-sighted speculators, anticipating the ultimate utilization of these water supplies, have not failed to file claims appropriating exclusive rights to retain these sources of energy long in advance of the necessity of their development. A hydra-headed water power trust was intrenching itself at every strategic point and reaching out for the monopoly of the water supply of this great commonwealth. In many instances dummy locators and the makers of fraudulent entries have rendered yeoman service to their financial fiefs. Mr. Glavis did not propose to hurt business in any way for bona-fide appropriators of water rights, but he did take a decided stand that the State should clip the claws of the power trust. In drafting the Water Commission Act he urged the incorporation of clauses that would compel applicants for water rights to file specifications and drawings showing just what use the water would be put to if appropriated. Such entries are now leases, limited to forty years' duration and subject to forfeiture if construction work is not begun in good faith within six months after location. The State now receives a rapidly increasing revenue from such licenses in the form of fees and charges of ten cents for every horse-power generated above a minimum of one hundred units. Should any companies enjoying the privileges of these string-attached water rights enter into a conspiracy to limit the output of electricity for the purpose of

increasing rates or preventing the lowering of prices, the Conservation Commission is empowered to revoke their rights unconditionally.

Glavis is of the dynamic type. Once started, his mental mechanism runs right ahead at a steadily accelerating efficiency. He was not content with regulating the future appropriations of water rights, for he has since followed up his first success by preparing to cancel all water filings held purely for speculative purposes. After checking up the records of water and power site locations, Glavis found that about ninety-five per cent of these franchises were rendering no real service, nor was there any evidence of intention on the part of the appropriators to improve their holdings within the next few years. Accordingly, he is ready to recommend to the next session of the Legislature that these undeveloped water rights should be canceled. It may be expected that Mr. Glavis will encounter some serious opposition from the present possessors of these valuable privileges, who will bitterly resent the prying of such prizes from their grasp. If Mr. Glavis succeeds in winning the support of the State Legislature, and the Commission is authorized to revoke these unutilized franchises, the State will come back into the full possession of water rights which will be readily worth hundreds of millions of dollars during the next decade.

In the spring of this year Mr. Glavis practically presented the State of California with over a million acres of land which his collective employers did not know that they owned. This statement may seem a little strong, but it is quite as true as though the dispossessed heirs of a princely estate had suddenly had the title deeds to their lawful heritage thrust into their hands.

In the early days of the American occupancy of California the Federal Government granted two sections in every township in the State for the support of its schools. A grand total of 5,699,503 acres was conveyed to California in this apportionment of public lands. Many of these sections were situated in early Mexican grants, or have since been included in Federal Forest reserves. Wherever these school lands could not be legally claimed the National Government gave applicants scrip in lieu for these lands, permitting them to exchange these tracts acre for acre in the Federal domain. Under the free and easy rein of the régime of "the good old days" the grossest forms of graft were perpetrated with impunity. The State sold its valuable school lands as a beggar would barter jewels. Tracts of timber land covered with compact ranks of redwoods and magnificent pines, worth in many districts a cent a square foot, were practically given away for $1.25 an acre. In later years this rate was doubled after the richest pickings had been plucked. When the Conservation Commission began business, it was commonly believed that all of its school lands had been grabbed and were irrevocably beyond recall.

When Mr. Glavis got "on the job," he wanted, first of all, to know just how much real estate the State of California really owned. Upon consulting the Surveyor-General, that official informed him that his predecessors had left the records of this department so tangled that there was no evidence to show what had become of the school lands. Under the dominance of the railway régime the powers that were preferred that the people should not know what property they still owned. Therefore the records were regarded as undecipherable.

Glavis promptly decided that it would be worth while to conduct a systematic examination of the surveys and land sale records of every township in the State. He detailed Special Agent H. T. Jones to direct a force of expert record searchers, who were required to trace the filings of all entries of land in every township of the State according to the disordered but decipherable maps and documents in the offices of the Surveyor-General. At the same time Mr. Glavis conducted a similar search at the United States General Land Office at Washington. For four months Glavis and his associates worked unremittingly at this complicated task until they had segregated the surprisingly large total of 1,175,064 acres of school lands which, for various reasons, particularly ignorance of their existence, had never been located. At the recent minimum price of $2.50 an acre for which such property sold, the value of this new-found land to the State was worth nearly $3,000,000.

But, as much of this area is still covered with marketable timber, or possesses other elements of value for agricultural purposes or the development of mineral or water resources, the Conservation Commission has caused the repeal of the laws sanctioning the sale of school land on such terms. In the

future it will probably be sold for a fair price or leased for rentals which will materially reduce taxation. Some of these sections are surrounded by National Forest reserves, and according to the Federal laws governing such locations, these tracts may be exchanged for an equal area of timber land in other portions of the public domain. Blocks of such land will be formed into State Forest reserves, serving many useful purposes, if the plans of Mr. Glavis are carried out. Ripe trees may be cut in accordance with the practices of scientific forestry, yielding considerable revenue to the State and serving as a check on the rising price of lumber to the extent of affording welcome relief from the excessive charges of a monopoly.

In addition to these two most notable achievements of Mr. Glavis, the conservation of water and the discovery of forgotten school lands, he is now hard at work on other noteworthy projects.

He is actively co-operating with the National Government in its Conservation work, and has interested the Secretary of the Interior, Mr. Fisher, in fathering a Federal water power bill restricting the appropriation of water to applicants who are prepared to develop their franchises for the purpose of serving the actual needs of the public.

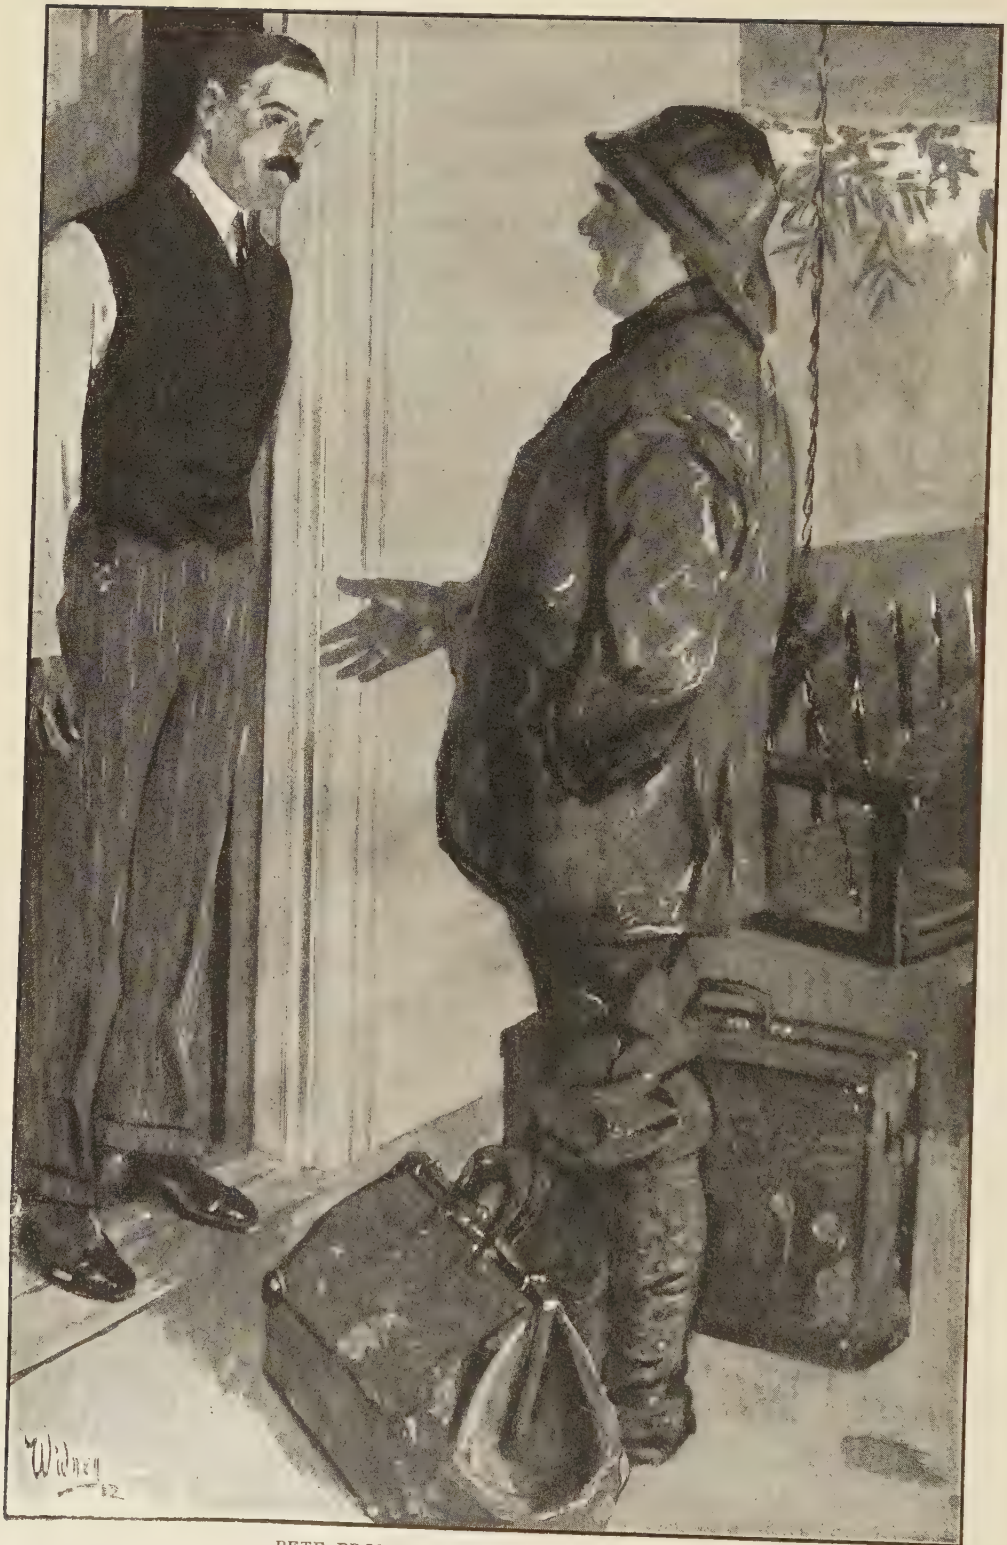
The next session of the California Legislature will have to pass upon a number of bills which Mr. Glavis and the Conservation Commission will present. It is his intention that all leases of water rights should be regulated in the interest of rate-payers.

The Commission expects to induce the National Government to reduce its stumpage charges for timber-cutting in its Forest preserves from $2 to $1 a thousand feet. At this rate, competition in the lumber business will be encouraged to the extent of breaking the power of the monopoly, and at the same time affording a much larger revenue to the Nation at large by the increased business which its Bureau of Forestry will transact.

Although Mr. Glavis will ask the Solons of Sacramento to legalize his plans to regulate the cutting of timber on private lands, this radical departure will not antagonize many owners. Even the lumber kings, whose private interests he is interfering with, are learning that in the long run they have more legitimate profit to gain by co-operating with the Conservation Commission than by opposing its measures for the common welfare. Already Mr. Glavis has won over many prominent lumbermen to indorse his plans for planting young trees where timber has been cut, for the purposes of forestalling a future shortage of lumber, of better protecting the water supply, and of preventing devastating floods. And now that the State is stepping in to enforce precautionary measures which will minimize the millions annually lost by forest fires, the owners of timber lands are no longer calling such protection "paternalism."

Another activity of this vigilant Commission will be the improvement of inland waterways so as not only to render the rivers of the State more navigable, but to reclaim vast areas of rich alluvium along their courses by the construction of levees. During the present session of Congress a bill was introduced authorizing the expenditure of thirty-three million dollars for the improvement of the channels of the Sacramento and San Joaquin Rivers. The Government was asked to appropriate one-third of this amount, the State of California was to furnish a second third of this fund, and the property-owners of this great interior valley would subscribe the remainder. Although Congress was not convinced that the country at large would become the beneficiary of this investment, Mr. Glavis is still hoping for better legislative luck next time.

It is not difficult to hazard a guess as to what Glavis may accomplish for Conservation in California during the next few years. The sale or leasing of the school lands, which he resurrected from the records, mummified in the morgues of officialdom, should net the State many millions of dollars. Considerable revenue will be derived from the utilization of water power, and as this inexhaustible natural resource is developed with the growth of manufacturing and the extension of electric traction and lighting, the wealth-yielding possibilities of this public possession will be inestimable. But more than any utilitarian consideration of promoting wealth is the conservation of human welfare. And, again, it is safe to foresee that the health and happiness of the humblest citizen of the Golden State will be an important part of the programme which Louis Glavis and the Conservation Commission will carry out, to the end that California will be a better State to live in than ever before in all its romantic history.



PETE PROMPTLY INTRODUCED HIMSELF

JOY SELLING

THE FUN PETE CROWTHER HAD PLAYING THE GAME ON MARTIN

BY ELMER E. FERRIS

WITH DRAWINGS BY G. C WIDNEY

THE LAST OF THE PETE CROWTHER, SALESMAN, SERIES

THE rain was coming down in torrents and dashing in vicious gusts against the hotel windows. Inside the writing-room Pete Crowther was bending over the table intently examining a railway time-card. "He can't leave the Junction till 10:30 to-morrow," he muttered; "and that will put him into Brownsville at 11:30. The only way I can head him off is to drive over. Gee, it's fierce such a night as this!"

He glanced through the window out into the darkness and storm, and then at the cheerful fire blazing in the open fireplace. For a moment he was tempted to stay in the hotel and take his ease, but suddenly he struck the table with his fist. "Nit; it's me for Brownsville!" and he hurried out into the office to find the landlord.

"Say, Reilly, you and I are about the same size; won't that rubber hunting suit of yours fit me?"

"I guess so. Why?"

"I want to rent it for to-night. I've got to drive over to Brownsville. I'll express it back to-morrow."

"You can't rent it, but you can borrow it. Who's going to drive you to Brownsville to-night?"

"I guess Smith will."

"Yes, I guess he will—not."

A few minutes later Pete presented himself at the livery stable.

"Hello, Smith, how's business?"

"Pretty dang quiet to-night. Ain't this a soaker, though?"

"Yes. I've got a job for you."

"Well?"

"I want to drive to Brownsville."

"Come off, Pete! It's twenty-two miles, and darker than pitch. There ain't no team could keep the road to-night."

"Oh, that span of bays could. I've been out nights as bad as this. Be a sport, old man."

"Why, dog-gone it, Pete, a horse couldn't see a foot ahead of him, and the mud is up to the hubs. I bet the bridges are out, too."

"See here, Smith, there's fifteen dollars in it for you if you land me at Brownsville in the morning, and if we can't get through I'll pay you what you say is fair."

"I'll call Dan and see if he wants to drive you. I'll offer him half."

Dan came into the office, looking dubious. "I don't believe we could make it, Pete," said he.

"Look here, Dan, you've got a reputation for nerve. You ought to be willing to tackle it if I am."

"Well, all right; but we will probably get upset in the mud. The bays and the road wagon, I s'pose?" said he to Smith.

"Yes."

After they had pulled out from the stable and plunged into the darkness beyond the outskirts of town Dan grew inquisitive. "Why in the deuce are you taking this drive to-night, when you could go over to the Junction on the morning train and get into Brownsville before noon?"

"That's a fair question," laughed Pete. "You see, there's a man over at Brownsville that's going to buy a big stock of goods for a new store. Martin has got a pull on him, and if he sees him before I do he'll sell him the stock. Martin went over to the Junction this evening, and will get to Brownsville at 11:30 to-morrow. See?"

"Gee, it's a dog's life to travel on the road, ain't it?"

"That depends on your dog. Take Jack there at the livery stable; now he's got his work cut out. He watches the barn and barks up the bus teams when they start for the train, and about once a day he goes up the street and whales the tar out of any dog that stands up to him, and the result is that Jack has got doghood. But take that dog up at the hotel; he lays around in front of the fire and doesn't do a thing but eat and sleep, and he's so fat he can't even run; why, he's no dog. It takes activity and scrapping to make a dog, and it's that way with a man."

"All the same, I could get plenty of activ-

ity without taking a drive such a night as this."

"Yes; but about once in so often a man ought to tackle a job that has got a kick to it—something that makes him fight for it, like this team trip—then he won't get soft. Gee, I like the flavor of that mud!"

"Say, Pete, there's a fellow in town that's organizing a labor union, and last night, over at the hall, he said that the way things are run nowadays everybody is trying to beat everybody else, and what one man gits he takes away from some one else. Ain't that about so? Here you are driving all night to beat Martin, and he is going to try and beat you, and one of you is goin' to git it in the neck, sure."

"What of it, so long as we play fair? If I drive all night and get the order, won't I earn it? And if Martin doesn't get it he won't starve; he's got a good trade. There's enough chances for all of us, Dan, if we go to it. A man has got to earn it, that's all. That labor organizer was giving you hot air."

"All the same, Martin will feel sore if you beat him to it, and so will you if you lose out."

"Oh, not so very sore. Martin put one over on me last month. He sold Cameron his stock and I got left; but did I grouch around? Not on your life! I had done my best, and I dropped it. It used to give me a pain every time I saw a competitor, but I've got over that good and plenty. It's this way, Dan: The woods are full of competitors. Everybody has got them—preachers and doctors and merchants and liverymen—everybody, and the sooner a man makes up his mind that his competitor has got as much right on earth as he has, why the better for his peace of mind. See?"

"You ought to hear Smith cuss whenever Barton gets a livery customer away from him," said Dan. "Why, he almost throws a fit every time he sees Barton."

"So much the worse for Smith. The thing to do with a competitor is to let him alone, or he will get on your nerves. You take it from me, a man never gets anywhere by knocking his competitors."

"That fellow over at the hall last night said that business these days is war. He said we are all fighting each other instid of working together. Ain't that so, Pete?"

"Oh, maybe there's something in that so far as the big corporations and their employees are concerned, but with the average man, like you and me, that isn't so unless we make it so. If a fellow bucks up to his job and keeps trying to find better ways to do his work, and keeps hustling, he won't get any more war than is good for him; but business isn't war—it's a game, and a man ought to be a sport and play it the way the baseball men do. They don't make a personal matter out of it and hate the man that plays on the other side. Business is a bully old game too. There wouldn't be so much fun in life if you took all the game out of it. That's what makes a man dig his toe corks in. If I don't beat Martin to it to-morrow, why I'll give him a run for his money."

"Ain't you in favor of labor unions, Pete?"

"Why, sure. Laboring men are up against organized capital, and they've got to organize to protect themselves; but organization isn't the whole thing. You take it from me, organization can't get something for nothing and get away with it. Lots of these fellows spend so much time standing on their rights that they never come across with the goods. Organization can't take the place of hustling."

"Whoa!" cried Dan, suddenly. The wagon was settling rapidly upon Pete's side. He sprang out into the mud, and sank nearly to his boot-tops while he braced himself against the wagon, trying to prevent an upset. Dan steadied the horses and handed Pete the lantern. After the wagon was righted Pete wallowed ahead of the horses to investigate. "There's a bad wash-out this side of the road," he called. "I'll go ahead, and you follow the lantern."

After getting past the wash-out Pete clambered back into the wagon. The horses toiled slowly ahead, while the rain continued to pour down in torrents. The conversation grew more desultory, and finally ceased altogether as both men and horses braced themselves for a contest of endurance against the storm. It was about midnight when they came within the sound of a rushing stream.

"We must be coming to Ten-Mile Creek," said Dan. "This is half-way to Brownsville."

The horses suddenly came to a halt and refused to respond to Dan's urging. "Something's the matter up in front," said he. "Hold the lines, Pete," and, seizing the lantern, he sprang from the wagon and went on ahead.

"It's all off!" he called. "The bridge is washed out!"

Pete jumped out of the wagon and joined Dan at the edge of the stream. The bridge was entirely washed away, with the exception of a single stringer, which had withstood the force of the current, but seemed in momentary danger of giving way.

"The team couldn't wade it, eh, Dan?"

"Nix! It's over ten feet deep. It's back to Dover for us, Pete."

"Not on your life! I'm going to walk across on that stringer."

"Yes, you will!"

"Sure! When I was a kid, I could walk a board fence for a hundred yards without falling off. I bet I can walk that stringer. Is there a farm-house near here on the other side?"

"Yes, Mr. Thomas lives near the creek—first gate on the left."

Pete took the lantern in one hand and his grip and sample-case in the other, and approached the end of the stringer.

"Hold on, Pete! Thomas has got a big dog that's an ugly brute, and he'll jump you, sure. Here's an iron wrench with a knob on the end. You can paste him one with this."

"Good idea," said Pete, as he slipped the wrench into his coat pocket. "I feel a little like fighting, anyhow. I'll take it out of that dog's hide if he gets too fresh."

The current dashed swiftly against the stringer, overflowing it in places, as Pete made his way cautiously across.

"Good luck, old man!" called Dan, when he saw that Pete had safely reached the other side. "Look out for that dog!"

When Pete reached the gate and turned into the farm-yard, he had proceeded but a few steps when he was suddenly greeted with the furious barking of an angry dog. He dropped his grip and sample-case and drew the wrench from his pocket just as he caught sight of a huge animal bounding toward him with the evident purpose of attacking him. Pete ran toward the brute and shook the lantern in his face, and quickly dealt him a sharp clip upon the side of the head The dog sprang backward with a snarl, but checked himself and charged again,

"NOT ON YOUR LIFE! I'M GOING TO WALK ACROSS ON THAT STRINGER"

hurling his whole weight full at Pete's throat. Once more Pete shook the lantern in his face, and this time brought the iron knob down squarely upon his skull with such force as nearly to stun him. Meanwhile he kept up a vigorous "Hello!" toward the farm-house. At this instant a light appeared at the window.

"What do you want out there?" cried Mr. Thomas.

"Call off this dog or I'll knock his block off!" shouted Pete.

The farmer whistled and called the dog, who retreated sullenly toward the house.

"Who be you, and what do you want?" called Mr. Thomas again.

"My name is Crowther. I'm a traveling man, on the way to Brownsville. I want to get in out of this rain. See?"

The farmer opened the door and admitted Pete. "Wall, I swan!" he exclaimed, as he caught sight of his mud-bespattered guest. "What are you drivin' for sech a night as this? Where's your team?"

"The other side of the creek. The bridge is washed out."

"I s'pose you want to stay all night."

"Nit. I want you to drive me to Brownsville."

"Not by a darn sight! I've got rheumatiz, and I wouldn't do it, anyway, sech a night as this."

"Haven't you got a hired man that would like to make a few dollars?"

"My man likes to make an extry dollar, and he owns a team, but I bet he wouldn't git up and go out in this storm."

"Let's go up to his room and see."

The farmer took the lantern and led the way upstairs into a sleeping-room.

"Say, Jake," he exclaimed, as he shook the sleeping man vigorously, "there's a traveling man here that wants to go to Brownsville."

"All right," grunted Jake, drowsily; "tell him he kin go."

"But he wants you to drive him," persisted the farmer, giving him another shake.

"Let him go to the devil!" muttered Jake. "Lemme alone."

"I don't want to go to the devil; I want to go to Brownsville. See?" interposed Pete, as he stepped to the bedside. "Look here, Jake, there's fifteen dollars in it for you."

At the words "fifteen dollars" Jake opened his eyes and turned over.

"Cash?" he inquired.

"Sure. See here," and Pete produced a roll of bills. "I'll peel off three of these fives if you land me at Brownsville in the morning."

At the sight of the money the hired man sat up in bed. He glanced at the window, against which the rain was dashing in copious sheets. "It's a deuce of a night to drive in," he muttered.

"Sure it is, and that's why I'm offering you so much money. Do you suppose I'd pay you fifteen dollars if it was moonlight and a macadamized road? Not on your life!"

Pete's money argument produced its effect.

"Can I take your buckboard if I drive my team?" inquired Jake of Mr. Thomas.

"Yes; but you ought to pay me a dollar and a half for the use of it."

"All right. I'll have the team around in about twenty minutes." And Jake jumped out of bed and began to pull on his clothes.

"Do you have to take many trips like this?" asked the hired man after they had pulled out from the farm-yard.

"Oh, I guess about once in six weeks I get into some such mix-up."

"You ought to have pretty good pay. What wages do you git?"

"That's right to the point," laughed Pete. "Well, I get a salary of $300 a month and my expenses paid, and I make commissions, about $1,000 a year, besides."

"Aw, quit your kiddin'!"

"It does sound like it," admitted Pete, "but I'm giving you straight goods."

"Gosh, I wish I could make half of that—I'd be satisfied. I bet you don't work any harder than I do, either."

"How many hours a day do you put in?" asked Pete.

"I git up about half-past four in the morning, and git through about nine at night."

"How much wages do you get?"

"Thirty dollars a month, and I own this team and make about fifteen dollars a month with it."

"How much do you save?"

"Oh, about thirty-five dollars a month. I've got $600 out on interest, and this team is worth $300."

"You've got a pretty good start. What are you going to do—buy a farm after a while?"

"I don't know. I like horses, and I'd rather do teaming than anything else."

"Not a bad business, either. There's a fellow named Joe Ryan that does the teaming for our company. He owns his teams. He used to be one of our porters at forty-five dollars a month, but he got to teaming and worked into that job. The bookkeeper told me that Joe cleans up over $250 a month. That's going some, eh?"

"I've been thinking about some such job as that," said Jake, eagerly; "but how is a feller going to git at it?"

"You have to lay for your chance and keep hustling," advised Pete. "You take it from me, a man can just about land what he goes after if he plugs hard enough. Maybe I could get you a job with our company as porter, and then you might work your way in with Joe. It would be up to you to make good."

"I'll work like blue blazes if you git me in there."

"I'll see what I can do, and let you know."

It was 6:30 in the morning when the team pulled into Brownsville.

"Shall we go up to the hotel?" asked Jake.

"Nit. We'll drive right up to Stevens's place. I'll inquire where he lives."

After getting directions they proceeded up to Mr. Stevens's residence. Pete alighted and unstrapped his grip and sample-case and handed Jake fifteen dollars. "You go down to the hotel and feed the team and get a warm breakfast, and tell Mac to charge it on my bill."

"Don't forgit about that job, Mr. Crowther," admonished Jake as he shook hands in good-by.

"Sure not. I like the way you do things, Jake. You will hear from me."

When Mr. Stevens appeared at the door, Pete promptly introduced himself.

"Where did you accumulate all that mud?" inquired Mr. Stevens.

"Oh, driving from Dover."

"What, last night?"

"Sure. I was out all night."

"And you want to sell me a stock of groceries," laughed Stevens.

"You're a good guesser," grinned Pete.

"Come in and clean up and take breakfast with us," invited Stevens. "I'm sorry to say that you won't get anything else out of me. You can't sell me any goods. I am going to buy my groceries from—"

"Bond-Mathews & Co.," interrupted Pete with a smile, "and Martin is coming in on the 11:30. That's why I drove over last night. You know, we Dodd, Garrells people are a wide-awake outfit. We keep just that far ahead of our competitors. See?"

"Oh, I guess you have got a good company," admitted Stevens; "but, you know, my brother-in-law has bought from Bond-Mathews for years, and I am personally acquainted with Martin."

"Sure, and he's a good fellow and has got a good company. There's only one better, and that is Dodd, Garrell & Co. Well, I'll take breakfast with you, anyway."

Pete at once became an object of interest to the family, as he described in his jovial way the adventures of the night before.

"Any one would think that you had been taking a joy ride," smiled Mrs. Stevens.

"That's about what it was," asserted Pete. "When a man has got good health and a rubber suit, it's great sport to rough it in a storm, especially when he lands on a breakfast like this. Yes, I will take another muffin, please."

During breakfast Mrs. Stevens had occasion to go into the pantry, and through the open doorway Pete caught sight of a can of Aragon baking-powder upon the pantry shelf.

"You see, Mr. Stevens," said he, "every big company has got some special feature in its business that's a winner. One reason why we do such a big business is because we are the people that put out the Aragon goods. Those Aragon goods, you understand, are the class. When you see that word 'Aragon' on a package—no matter what it is, cocoa, baking-powder, extracts, canned goods, or anything else—why, you can bank on its quality; it's aristocratic stuff. Why, when people use Aragon goods once, you can't get them to change. Take Aragon baking-powder. Now—"

Mr. Stevens and his wife broke into a laugh. "My wife has been telling me that, no matter where I buy my stock, I must put in Aragon baking-powder and cocoa and extracts. We have used them in our family for two years."

"I might have known it!" cried Pete, enthusiastically. "These muffins now—light as a feather! Well, that's good. I'll sell you our Aragon line, anyhow. Mrs. Stevens will back me up."

"I certainly will," said she; "and you ought to get something for your long drive."

After breakfast, when they withdrew to

the sitting-room, Pete caught sight of a violin box upon the piano. "May I look at your fiddle?" he asked.

"Certainly. Help yourself."

Pete took out the violin and tuned it. After drawing the bow across it a few times he began to inspect the instrument carefully.

Stevens tipped a wink at his wife.

"Where did you get this fiddle?" asked Pete.

"From my father, and he got it from his father."

"You've got a corking good fiddle here."

"Yes; we were offered eighty dollars for it last month."

"Nit; don't take it."

"Certainly not. It isn't for sale. Play us something, Mr. Crowther. My daughter will play your accompaniment."

Pete needed no second invitation, and they were soon making the air vibrate with waltzes, two-steps, and marches. Between selections Pete vented his enthusiasm over the violin. "If you ever get ready to take $100 for it, give me the first chance, will you?"

"Yes; but you won't get the chance. We will never let that violin go out of the family."

Pete placed the instrument back into the case.

"Speaking about those Aragon goods," said he, "it's a big thing for a new store to get a reputation for classy goods, and the beauty of that Aragon line is that, while the goods are the finest quality, the prices are no higher than other companies charge for ordinary goods, and they cost you less than these brands that are advertised so much. I want to show you the line, Mr. Stevens. The best stores in this State are pushing them. They will give any store a reputation. Let's take your price lists now and compare them with some special prices that I'll make you if you will put in the whole Aragon line. We will begin with baking-powder, cocoa, and extracts—you want them, anyway."

An hour later Pete had taken Mr. Stevens's order for the entire Aragon line, including canned fruits, soaps, olives, pickles, teas, cigars, tobaccos, and a miscellaneous line of other fancy groceries.

"There, that's all!" insisted Stevens. "I declare, you've got about half of my order. The rest of it goes to Martin."

"All right," said Pete; "smoke another Aragon cigar. I want to play a little more on that bully old fiddle before I go."

After a few more selections on the violin, Pete suddenly laid the instrument aside.

"See here, Mr. Stevens, I want to give you a little straight talk. You will find after you've been in business a while that it pays to concentrate your trade. You can always get better terms if you buy the bulk of your goods at one place. Now, I've got the best part of your order—the fancy goods—and so I can afford to do better by you on the staples than any one else can. I'm going to offer you a deal that you can't afford to pass up. You are well posted on the prices of staples, and I want you to sit down here and figure with me a few minutes, and I want to give you some inside points on quality."

"It won't do you any good, Crowther."

"Yes, it will. It always makes me feel better when I offer to do a man a good turn."

During the next half-hour they went carefully over the matter.

"Now, you'll have to admit," said Pete, "that this is the best proposition you've had yet, and you know that you are dead safe on quality. It's like picking up a hundred dollars off that table. I couldn't make you this offer if I didn't have the rest of your order."

"Martin will be badly disappointed," mused Stevens, hesitantly.

"So will I if I don't get the whole order. You might as well let the tail go with the hide, and this is purely a business matter. You've got to consult your own interests, and nobody else will make you such an offer as this on the staples alone."

Before the hour of 11:30 arrived Pete had booked Stevens's order for his entire stock, amounting to over $8,000. When the train, which was an hour late, pulled into the station and Martin stepped off and came face to face with Pete, he dropped his sample-case upon the platform and gazed at his competitor in astonishment.

"How did you get here?" he cried.

"I drove from Dover last night."

"In that storm?"

"There was a storm, come to think," grinned Pete.

"After Stevens's order, eh?"

"That's what. And I landed it."

"No!"

"Yes."

"Did you get it all?"

"IT'S GREAT SPORT TO BRING HOME THE BACON," HE WROTE IN CONCLUSION

"Sure, I made a clean-up. You see, old man, I had to even up that Cameron deal."

"Looks like horse and horse," admitted Martin, dubiously. "Where are you going this afternoon?"

"I'm going in to the house. Stevens is coming in to-morrow to change the order some and pick out some of the stuff."

"Well, enjoy yourself, Pete. I know how you feel."

Late that afternoon, when Pete reached the office and presented the situation to Mr. Dodd, that gentleman sat back in his chair and regarded him with a look of mingled satisfaction and envy.

"Great work, Pete, great work!" said he. "It reminds me of the old days. You make me feel like taking a sample-case and striking out again myself. But, say, you haven't had any sleep since night before last. I want you to go up to the best hotel and stop at our expense. Get a good rest. We will try and make a good impression upon Mr. Stevens to-morrow."

On the evening of the following day Pete was sitting in his room at the hotel writing a letter to his wife. He told her about the stirring events of the past two days, describing in detail the incidents of the long night ride, the big order, and the satisfactory day that Mr. Stevens had passed with the company. "It's great sport to bring home the bacon," he wrote in conclusion, "and have everybody at the house give you the glad hand, but, all the same, I'm ready to start out again. A little taffy tastes pretty good, but too much of it is as bad as castor oil. This is a crackajack hotel, and it has got all the dudads that go along with $6 per (the Company pays it), but I've always noticed that when a hotel gets about so high-toned it goes in for a lot of monkey-work that isn't any earthly use, and the people in it swell around too much and don't act natural. I prefer to be where things are more genuine, even if they aren't quite so rashashay. I'll be glad to-morrow when I get out and hit the pike again. A man has the most fun while he is playing the game. PETE."

CHRISTMAS WHEN WE WERE KIDS

BY CARL WERNER

ORDINARILY I give little heed to him who begins his story with "Now, when you and I were boys," or, "Yes, indeed; those were the good old days!" Strikes me that all days are good days if they are boy-and-girl days. It is the age of the individual rather than of the day that makes the difference.

My grandfather—he of the Saxon side of the family—once told me a story in this connection that comes to my mind whenever I'm tempted to speak comparatively of departed youth. He was a small boy when he came to this country, and for many years afterward he carried a kind recollection of the cherries that grew on the old homestead that he had left behind. Through all the years, until middle life, he sought in vain for cherries as good as those he had plucked in his childhood on the old farm. He tried red cherries and black cherries, cherries from all parts of the State and from all parts of the United States, but none were as sweet or as satisfying as the fruit of his boyhood days. He resolved that if he ever revisited Europe a feast of those cherries would be the chief event of his tour. Eventually the opportunity came. He was careful to time the voyage so as to reach his destination when cherries were ripe. Arriving in Europe, he lost no time in journeying to the town of his birth, and soon he stood in the old orchard beneath the trees. It was a supreme moment. The craving of half a lifetime was to be gratified. With eager hand he plucked a luscious cluster and conveyed the fruit to his mouth. The next moment he had spat it upon the ground. The cherries were unpalatable and impossible, and he took his departure with face awry and lips a-pucker.

"You see," he used to tell me, "the fruit was as good as ever; it was I who had changed, not the cherries."

So, when I am moved to prate of the superior qualities of the old swimming-hole and the games we used to play and the pies our mothers used to make, I think of Grandfather's cherries and hold my peace.

Nevertheless, and in spite of the cher-

ries, I doubt very much if our boys and girls get as much fun out of Christmas as you and I did. Not that their capacity for enjoyment is less, but that our opportunities were greater. Location has much to do with it, and the boy in the country and in the small town—and such most of us were—has the best of it in a hundred ways.

Diminishing frugality, which marks the passing generations, has to do with it also; for it is unquestionable that affluence acts as a check to the pleasures of giving and receiving.

I try to make my boy's Christmases as joyous as mine were; but it is hard to overcome the disadvantage of his misfortune in being a child of the city. I cannot give him the broad expanse of starlit sky to gaze at on Christmas Eve from his bedroom window. I cannot give him the snow-topped roofs of the neighboring houses, with the smoke going straight up from the chimneys in silent columns, or the jingling of sleigh-bells, or the fairy frostings on the window-pane, or the soft footfalls of travelers along the village road, all of which added so much to the delicious mystery of the night before. I cannot give him the brilliant Christmas mornings, the broad, snow-covered meadow sparkling like a blanket of white diamonds, the hills to coast on, the ponds for skating, the drifts to tunnel through, or the sleigh-ride out to Grandfather's farm.

Ah, those *were* the Christmas mornings, in spite of the cherry story—speaking of Grandfather reminds me of it—and those *were* the good old times!

And really, when you come to think of it, doesn't it strike you that children of our time were more imaginative and less mercenary than children of to-day? Weren't they more prone to accept things as they found them, and less given to digging into intrinsic values?

I know a little chap who came down to his Christmas tree last year and surveyed the display with a smile of mild interest, until his eye fell upon a certain little gray horse on wheels. Then he sniffed contemptuously.

"Huh!" he said, as he turned his back to it; "that came from the five-and-ten!"

He was right, in point of fact, but—

Well, it wasn't like that when we were kids, *was* it? Of course I don't hold the children responsible for the transition. I think the child's attitude toward Christmas is just about as the parents make it. Now, when I've spent two hours of an evening hanging candies and glass folderols on the Christmas tree, I feel that I have done all that could be expected of me, except footing the bills. But have I? Why, trimming the tree was only an incident, a mere finishing touch to the Christmases our fathers and mothers used to make for us. The best things we found in our stockings were the toys made by Santa Claus—a real flesh-and-blood Santa Claus in shirt-sleeves and overalls, out in the woodshed, after we had gone to our dreams. And that same Santa Claus used to cut the tree himself, and haul it in from the woods on Christmas Eve.

I recall one winter when a terrific blizzard set in just before the holidays, and the little up-State town in which we lived was snow-bound. It was utterly impossible for any one to get out of the village or into it. The Christmas tree problem seemed insoluble, and, although I did not know it then, my father and mother were sorely perplexed. I am sure there was much anxious discussion in the late evening as the great day drew near. Christmas Eve arrived, and the fury of the storm was unabated. Sundry preparatory hints were thrown out, so that our disappointment would be less keen. But our supreme confidence in the mythical saint was not shaken.

I remember that the awful possibil-

ity of his failure did occur to us, momentarily, on Christmas morning as we tumbled out of bed, and that we went more fearfully down the stairs in consequence; but, oh, joy! there in its usual corner stood the expected blaze of green and goodies and glory!

We never knew until a week later, when the ceremony of stripping the tree was over—and it *was* a ceremony in those days—that Santa Claus had failed us, after all. Of course by that time the fun was over, and we didn't care.

How do you think they accomplished the impossible? I can imagine them standing over our cot that evening, when we were asleep, looking at our rosy, expectant faces, and how their hearts may have ached in contemplating the disappointment of the morrow. And I can imagine how my father may have suddenly slapped his thigh and cried, "By George!" under his breath, as he was wont to do when an idea came to him. And I can imagine with what feverish pleasure they set about putting the inspiration into effect.

It happened that among our house plants we had two, an oleander and an orange tree, that had grown to very large proportions. Taken out of their jars and put together in a single tub they made a very respectable showing. Of course the two trunks had to be wound together with brown cloth to make them look like one, and several extra pans of corn had to be popped and strung to fill the gaps in the foliage, and unusual ingenuity had to be exercised in making the candles stick on the slender branches. But all of this extra work was a labor of love; and, as a result of it, that tree, without a doubt, was the most radiantly beautiful one we had ever seen.

I can't help believing that the Christmases at which the parental love is paramount to the parental pocketbook are the happiest for the children as well as for the parents. Not attempting to fathom the psychology of it, I believe that in the giving which entails sacrifice there is an added joy which is transmitted to those who receive.

I never doubted that my new rocking-horse, dappled and rampant, came direct from Santa Claus. I did not know that my father, with crude tools and an amateur hand, had spent his winter evenings in fashioning the thing—when his pipe and book were calling him to an easy chair by the fireside. Nor did I know that every stitch in the woolen scarf that went twice around my neck, crossed over my chest, and doubled around my waist was worked by my mother's patient hands.

But I do know that through some mysterious means I felt the love and devotion that were breathed into these things with the making, to the end that my sense of appreciation was keener. I believe that the spirit of this kind of Christmas preparation diffuses itself throughout the household and reaches the heart of every member, from the oldest down to the babe in arms.

Not that every father and mother ought to sit up nights making rocking-horses and things for the kiddies. No, no; I'm just throwing in the suggestion that the lack of this sort of thing may partly account for the difference between the Christmases of then and now. For my part, I could no more make a rocking-horse than I could make a piano—and I can't even play one (I mean a piano). Once I essayed to fashion an elephant out of a small block of wood, and I left it on the boy's pillow as a surprise for him. Next morning I found him sailing it in the bath-tub. He thought it was a battleship!

Speaking of toys, why, even the store kind seem to have changed in general character since our day. Don't you think so? Of course there are certain old staples that will go on forever, but

there are thingumajigs that there never used to be. Now my recollection of Christmas morning shows me an array of rather substantial things, such as tool-chests and fishing-rods and drums and jackknives (one every year), and a wooden velocipede, and an all-over cap that covered even my chin and had eye-holes in it to see through, and skates with heel-plates (do you remember the heel-plates ?), and always a few books. We didn't have so many of these mechanical contrivances that let you wind them up a few times and then stop and refuse to be wound up or to run down or to do anything but submit to being dissected by the young gentleman, who is secretly delighted at an excuse for ripping the insides out of 'em. We had a few baubles, to be sure, such as trumpets and jacks-in-the-box and monkey-on-the-sticks—what *is* the plural for those things, anyhow ?—but even that sort of toy was more durable than it is nowadays, it seems to me.

I recall a pair of stilts—and who sees any stilts around these parts ?—and mittens, and mufflers, and sleds, smelling very painty, and a pair of copper-toed boots.

Oh, those copper-toed boots ! Not boots *à la* English, meaning anything other than bath slippers, but real American boots, reaching nearly to the knee, with straps on the sides, and red tops, and a strip of bright copper in either toe. Oh, that first pair of boots, just like a man's, only handsomer ! I couldn't have been more than four years old, but I recall the occasion distinctly—how proud I was, and how they laughed when they came to my bed the next morning and saw the copper toes sticking out at the foot-board ! I had slept all night with my boots on !

And oh, those sleds ! those sturdy, steep-hill-going, red-painted sleds ! We used to gather on the hill by the old school-house on Christmas mornings to try out the new ones. There was sex in sleds, too, those days. The boy-sleds were built low and long and sturdy, with handles on the sides and solid wooden runners. Grown-up people called them coasters, I believe, but they were known in boyland by the frankly intimate name of " belly-whackers." In general outline they resembled somewhat the flexible flyers of to-day, but with considerably less of the flexible and infinitely mor of the "whack." The girl-sleds were higher, lighter, and built on more graceful lines. They were more decorative, too, and usually bore the picture of a supercilious swan floating on a small patch of pea-green water, or else a cluster of vivid flowers. Sometimes added to this was the name of the good little girl who owned it.

I remember one such particularly. I encountered it, and—horrors !—almost stumbled over it, trailing behind its possessor, just as I was starting up the hill after my first slide of the morning. It was a spick-span new one, only an hour from the Christmas tree. Its top was decorated with a magnificent painting representing a wreath of pink roses, and within the wreath was the name " Blanche." Guess I'd never observed Blanche at close range until then, for when she turned a pair of brown eyes upon me at my offer to tote her sled up the hill I felt something flutter under my jacket. She seemed all daintiness and beauty, and I all mittens and boots. But she was exceedingly gracious, I remember, and when we reached the top of the hill she urged me to try the new sled myself, which I did. And then we tried it together, to see if it couldn't go faster with two on—which *it* did. And then she proposed that we slide down one more together—which *we* did. And this we continued to do, going down like the wind, with her curls

brushing my cheek as they streamed out behind, and walking up very slowly, with our hands together on the rope, until the distant whistle of the 12:02 train told us it was noon and dinner-time. I remember how those long lashes drooped when I said "Good-by," and how deliciously happy and disgracefully red I was when she answered, shyly, "I'll be here again to-morrow."

I went home whistling, my battle-scarred belly-whacker scraping along in the rear, forlorn and forgotten. The happiness of conquest was in my heart.

Oh, those first romances! those first little heart-affairs of the ante-teens! Looking back through the dim vista, what do you find in later years that is half so simple or half so sweet?

And yet, do you know, I'm jiggered if I have the faintest recollection of ever seeing that little girl again. Funny, isn't it? I remember clearly that we had turkey for dinner, and that I "spoke first" for the wishbone, and that I almost quarreled with my sister over it—although why it mattered which "choosed it" first is inexplicable, as it required both of us to wish with it. I remember that my sister took an exasperatingly long time to decide what she would wish for, and that just as we were ready to pull she said, "Wait a minute," and started to think of a new wish, having disposed of the first one by exercising the prerogative universally conceded to members of her sex; and how we kept hitching up our fingers toward the top, each having a secret notion of getting a little more leverage than the other, until one would cry, "No fair!" after which we would start down at the ends again, only to repeat the process. And I remember how, finally, my father was summoned to act as umpire, and how, after a few more false starts, we pulled, only to have the hub fly off independently and impartially, all by itself, which was taken to signify that neither wish could be realized.

Oh, yes! And I remember that the next morning, while we were playing "shinny" on the mill-pond, a boy made a face and chanted the name of the brown-eyed girl at me in a voice of extraordinary carrying power and a tone of unmistakable derision, and that I was filled with wrath and humiliation and there was a fight on skates in which considerable execution was done on both sides.

Blanche, you sweet little girl with the brown eyes, I wonder what you are like this Christmas morning!

Fair, fat, and forty, like the rest of them, possibly. Still, it is hard to fancy you different from what you were at ten. Stoutish you may be, for you were plumpish then; nearing forty surely, for so am I; but still fair, radiantly fair, and gracious without the shadow of a doubt, for eyes like those and the grace with which you extended me the hospitality of your beflowered namesake will defy the ebb and flow of fortune and the flight of time.

There's no use talking, these snowless Christmases of the big cities are not the simon-pure article. Why, whenever it snows around our place my youngsters awaken in the morning, begging me to promise that I'll not clear the sidewalk until they've had a chance to play on it. Generally I promise, in defiance of repeated warnings from the officer on the beat, whose attitude on the question is decidedly belligerent. On these occasions I think of my own boy time, when from Thanksgiving till near Easter time there wasn't a spot of bare ground as big as your hand; I think of the quarter-mile hill, of the little river on which we could skate four miles straight away; I think of the tunnels we used to dig through huge drifts, and of the fine forts we used to build, breast-high and roomy enough for a small army. I think of these things on

snowless Christmas mornings, and I feel that somehow I'm not giving the youngsters a square deal.

However, as far as the snow is concerned, there's plenty of it outside of the larger cities, and the joys of the old-fashioned winter are not becoming extinct by any means. No doubt there are quite as many rivers to skate on and hills to coast down and tunnels being bored and forts being raised as there were in my time; and I'm mighty glad if there are, even if my own kids, paying the price of the Call of the Town, are not among the fortunates.

But there is, in the last analysis, one great common and deplorable shortage in the measure of to-day's Christmas, when we match it with the Yuletide that you and I knew as boys. It is the decadency of that element of surprise—of the unexpected. There is too much taking of children through the stores, too much parading them before the shop windows and showing them what they are going to get, and, incidentally, what they are not going to get. There is too much counseling with them and having it all understood beforehand. There is more realism than there was in our time and less of mystery; more of the matter-of-fact and less of the fanciful.

Another aspect of the overdone modern Christmas was once described by a writer of great common sense in these words: "The great majority of Christmas givers expect to receive as much as they give. In many cases the Christmas gift actually breeds selfishness instead of good will and gratitude. A proportion, if not a large proportion, of the Christmas morning action on the part of children and adults consists of criticism of the people who have made them presents; and much of this criticism is cruel and contemptible." This writer adds: "I would try to make our distorted Christmas a real Christian Christmas, to carry out the spirit of gratitude to God and of good will to men. I would not do away with the Christmas gift, but I would try to teach both the adult and the child that swapping and trading are not giving, and that the only gift that is a gift is that which comes from the heart of the giver who expects no material return."

If our children are to get as much out of Christmas as we got out of it, we must give them the mystic atmosphere of the unknown, the pleasure of undirected anticipation. It is the uncertainty of the evening and the unexpectedness of the morning that makes the home a fairyland at Christmas time.

CHILDREN IN BOOKLAND

BY

ELIZABETH McCRACKEN

THE SECOND OF A NEW SERIES ON AMERICAN CHILDREN

ONE day, not long ago, a neighbor of Colonel Thomas Wentworth Higginson, of honored memory, was talking to me about him. Among the score of charming anecdotes of the dear Colonel that she told me, there was one, the most delightful of all, that related to the time-worn subject of the child in the library. "As a family we were readers," she said. "The importance of reading had been impressed upon our minds from our earliest youth. All of us liked to read, excepting one sister, younger than I. She cared little for it; and she seldom did it. I was a mere child, but so earnestly had I always been told that children who did not read would grow up ignorant that I worried greatly over my sister who would not read. At last I unburdened my troubled mind to Colonel Higginson. 'She doesn't like to read; she doesn't read,' I confided. 'I am afraid she will grow up ignorant; and then she will be ashamed! And think how we shall feel!' The Colonel considered my words in silence for a time. Then he said: 'There is a large and finely selected library in your house; don't be disturbed regarding your sister, my dear. She will not grow up ignorant. You see, she is exposed to books! She is certain to get something of what is in them!'"

Colonel Higginson's neighbor went on to say that from that day she was no longer haunted by the fear that her sister, because she did not read, would grow up ignorant. Are many of us in that same condition of feeling with respect to the children of our acquaintance, even after we have provided them with as excellent a library as had that other child, in which they may be "exposed to books"? On the contrary, so solicitous are we that, having furnished to the best of our knowledge the best books, we do not rest until we are reasonably sure that the children are, not simply getting something from them, but getting it at the right times and in the right ways. And everything and every one conspires to help us. Publishers issue volumes by the dozen with such titles as "The Children's Reading" and "A Guide to Good Reading" and "Golden Books for Children." The librarian of the "children's room" in many a library sets apart a certain hour of each week or each month for the purpose of telling the children stories from the books that we are all agreed the children should read, hoping by this means to inspire the boys and girls to read the particular books for themselves. No effort is regarded as too great if, through it, the children seem likely to acquire the habit of using books; using them for work, and using them for recreation.

Certainly our labors in this direction on behalf of the children are amply rewarded.

Not only are American children of the present time fond of reading—most children of other times have been that; they have a quite remarkable skill and ease in the use of books.

A short while ago, spending a spring week-end with a friend who lives in the country, I chanced to see a brilliant scarlet bird which neither my hostess nor I could identify. "It was a redbird, I suppose," I said, in mentioning it later to a city acquaintance.

"What *is* a redbird?" she asked. "Is it a cardinal, or a tanager, or something still different?"

"I don't know," I replied. "Perhaps," I added, turning to her little girl of ten who was in the room, "*you* know; children learn so much about birds in their 'nature study.'"

"No," the child answered; "but," she supplemented, confidently, "I can find out."

Several days afterward she came to call. "Do you remember *exactly* the way that red bird you saw in the country looked?" she inquired, almost as soon as she saw me.

"Just red, I think," I said.

"Not with black wings?" she suggested.

"I hardly think so," I answered.

"P'aps it had a few *white* feathers in its wings?" she hinted.

"I believe not," I said.

"Then," she observed with an air of finality, "it was a cardinal grosbeak; and the other name for that *is* redbird; so you saw a redbird. The scarlet tanager is red, too, but it has black wings, and it isn't called a redbird; and the crossbill is red, with a few *white* feathers, and *it* isn't called a redbird either. Only the cardinal grosbeak is. That was what you saw," she repeated.

"And who told you all this?" I queried.

"Nobody," the little girl made reply. "I looked it up in the library."

She was only ten. "How did you look it up?" I found myself asking.

"First," she explained, "I picked out the birds on the bird charts that were red. The charts told their names. Then I got out a bird book, and looked till I found where it told about those birds."

"Do you look up many things in the library?" I questioned.

"Oh, yes," the child replied.

"And do you always find them?" I continued.

"Not always by myself," she confessed. "Everything isn't as easy to look up as birds. But when I can't, there is always the librarian, and she helps; and when she is helping, 'most *anything* gets found!"

The public library of my small friend's city, not being the library I habitually used, was only slightly familiar to me. Not long after I had been so earnestly assured that the scarlet bird I had seen was a redbird, I made occasion to go to the library in which the information had been gathered. It was such a public library as may be seen in very nearly every small city in the United States. Built of stone; lighted and heated according to the most approved modern methods; divided into "stack-rooms" and "reading-rooms" and "receiving-rooms"—it was that "typical American library" of which we are, as we should be, so proud. I did not ask to be directed to the "children's room;" I simply followed a group of children who had come into the building with me.

The "children's room," too, was "typical." It was a large, sunny place, furnished with low bookcases, small tables, and chairs. Around two walls, above the shelves, were pictures of famous authors and celebrated scenes likely to be known to children. At one end of the room the bird charts of which I had so interestingly heard were posted, together with flower charts and animal charts, of which I had not been told. At the other end was the desk of the librarian, who so helped young investigators that, when she helped, *anything* got found.

I seated myself at the little table nearest her desk. She smiled, but she said nothing. Neither did I say anything. The time of day was just after school; the librarian was too much occupied to talk to a stray visitor. I remained for fully an hour; and during that hour a steady stream of children passed in and out of the room. Some of them selected books, and, having obtained them, departed; others stayed to read, and others walked softly about, examining the pictures and charts. All of them, whatever their various reasons for coming to the library, began or ended their visits in conference with the librarian. They spoke just above a whisper, as befitted the place, but I was near enough to hear all that was said.

"We want to give a play at school the last day before Christmas vacation," said one small girl; "is there a good one here?"

The librarian promptly recommended and put into the child's hands a little volume entitled "Fairy Tales a Child Can Read and Act."

A boy, entering rather hurriedly, asked,

"Could I have a book that tells how to make a wireless set—and have it quick, so I can begin to-day before dark?"

It was not a moment before the librarian found for him a book called "Wireless Telegraphy for Amateurs and Students."

Another boy, less on pleasure bent, petitioned for "a book about Abraham Lincoln that will tell things to put in a composition on him." And a girl, at whose school no Christmas play was apparently to be given, asked for "a piece of poetry to say at school just before Christmas." For these two, as for all who preceded or followed them, the librarian had help.

"How wonderful, how unique!" exclaimed an Italian friend to whom I related the experiences of that afternoon hour in the "children's room" in the library of that small city.

But it seems to me that the wonderful thing about it is that it is not unique; that in almost any "children's room" in almost any public library in America practically the same condition prevails. Not only are "children's rooms" of a very fine order to be found in great numbers; children's librarians, as sympathetic and as capable as the librarian of my small friend's library, in as great numbers, are in charge of those rooms. So recognized a profession has theirs come to be that, connected with one of the most prominent libraries in the country, there is a "School for Children's Librarians."

The "children's librarians" do not stop at assisting them in choosing books. The story hour has come to be as important in the "children's rooms" as it is now in the school, as it has always been in the home. Telling stories to children has grown to be an art; there is more than one text-book laying down its "principles and laws." Many a librarian is also an accomplished story-teller, and in an increasing number of libraries there is a story hour in the "children's rooms." Beyond question, we in America have taken every care that our public libraries shall mean something more to the boys and girls than places in which they are merely "exposed to books."

American children read; it is doubtful whether any other children in the world read so much or so intelligently. In our public libraries we plan with such completeness for their reading that they can scarcely escape becoming readers! At home we keep constantly in mind the great importance of inculcating in them a love of books and a wontedness in their use. To so many of their questionings we reply by advising, "Get a book about it from the library." So many of the fundamental lessons of life we first bring to their attention by putting into their hands books treating of those lessons written by experts—written, moreover, expressly for parents to give to their boys and girls to read.

A few days ago I received a letter from a mother saying: "Do you know of a book on hygiene that I can give to my children to read—a book on that subject *for* children?"

Within reach of my hand I had such a book, entitled "The Child's Day," a simply but scientifically written little volume, telling children what to do from the hour of rising until the hour of retiring, in order to keep well and strong, able to do good work at school, and to enjoy as good play after school. It was a book that a child not only could read with profit, but would read with pleasure.

At about the same time a father said to me: "Is there any book written for children about good citizenship—a sort of primer of civics, I mean? I require something of that kind for my boy."

A book to meet that particular need, too, was on my book-shelves. "Lessons for Junior Citizens," it is called. In the clearest and also the most charming form it tells the boys and girls about the government, national and local, of their country, and teaches them their relation to that government.

It is safe to say that there is practically no subject so mature that it is not now the theme of a book, or a score of books, written especially for children. Every one of the numerous publishing houses in the United States issues yearly as many good volumes of this particular type as are submitted. A century ago a new writer was most likely to win the interest of a publisher by sending him a manuscript subtitled, "A Novel." At the present time a beginner can more quickly awaken the interest of a publisher by submitting a manuscript the title of which contains the words "For Children."

"Authors' editions" of books we have long had offered us by publishers; "*éditions de luxe*," too; and "limited editions of fifty copies, each copy numbered." These are all old in the world of books. What is new, indeed, is the "children's edition." We have it in many shapes, from "Dickens for Chil-

dren" to "The Children's Longfellow." These volumes find their way into the "children's rooms" of all our public libraries; and, quite as surely, they help to fill the "children's bookcases" in the private libraries to be found in a large proportion of American homes. For no public library can take the place in the lives of the children of a private library made up of their "very own" books. The public library may, however, often have a predominant share in determining the selection of those "very own" books. The children wish to possess such books as they have read in the "children's room."

Sometimes a child has still another similar reason for wishing to own a certain book. Only the other day I had a letter from a boy to whom I had sent a copy of "The Story of a Bad Boy." "I am glad to have it," he said. "The library has it, and father has it. I like to have what the library and father have."

So parents buy books for their children in very much the proportions that parents bought them before the land was dotted with public libraries. Indeed, they buy books in larger proportions, for the reason that there are so many more books to be bought! The problem of the modern father or mother is not, as it once was, to discover a volume likely to interest the children; but, from among the countless volumes offered for sale, all certain to interest the children, to choose one, two, or three that seem most excellent where all are so good. A mother of a few generations ago whose small boy was eager to read tales of chivalry simply gave him "Le Morte d'Arthur;" there was no "children's edition" of it, no "Boy's King Arthur," no "Tales of the Round Table." The father whose little girl desired to read for herself the stories of Greece he had told her put into her hands Bulfinch's "Age of Fable;" he could not, as can fathers to-day, give her Kingsley's rendering, or Hawthorne's, or Miss Josephine Preston Peabody's. Like the father of Aurora Leigh,

> "He wrapt his little daughter in his large
> Man's doublet, careless did it fit or no."

At the present time we do not often see a child wrapped in a large man's doublet of a book; even more seldom do we see a father careless if it fit or no. What we plainly behold is that doublet cut down, and most painstakingly fitted to the child's little mind.

Unquestionably the children lose something by this. The great books of the world do not lend themselves well to making over. "Tales from Shakespeare" are apt to leave out Shakespeare's genius, and "Stories from Homer" are not Homer. In cutting the doublet to fit, the most precious part of the fabric is in danger of being sacrificed.

But whatever the children lose when they are small, they find again when they come to a larger growth. Most significant of all, when they find it, they recognize it. A little girl who is a friend of mine had read Lamb's "Tales." The book had been given to her when she was eight years old. She is nine now. One day, not long ago, she was lingering before my bookcases, taking out and glancing through various volumes. Suddenly she came running to me, a copy of "As You Like It" in her hand. "This story is in one of my books!" she cried.

"Yes," I said; "your book was written from this book, and some of those other little red books there with it in the bookcase."

The child went back to the bookcase. She took down all the other volumes of Shakespeare, and, sitting on the rug with them, she spent an utterly absorbed hour in turning over their leaves. Finally she scrambled to her feet and set the books back in their places. "I've found which stories in these books are in my book too," she remarked. "Mine are easier to read," she added; "but yours have lovely talk in them!"

Had she not read Lamb's "Tales" at eight I am not certain she would have ventured into the wide realms of Shakespeare at nine, and tarried there long enough to discover that in those realms there is "lovely talk."

Occasionally, to be sure, the children insist upon books being easy to read, and refuse to find "lovely talk" in them if they are not. It was only a short time ago that I read to a little boy Browning's "Pied Piper of Hamelin." When I had finished there was a silence. "Do you like it?" I inquired.

"Ye-es," replied my small friend; "it's a nice story, but it's nicer in my book than in yours. I'll bring it next time I come, so you can read it."

He did. The story was told in prose. It began, "There was once a town named Hamelin, and there were so many rats in it that the people did not know what to do." Certainly this is "easier to read" than the forty-two lines which the poem uses to make an identical statement regarding the town

named Hamelin. My little friend is only six. I hope that by the time he is twelve he will think the poem is as "nice" as, if not "nicer" than, the story in his book. At least he may be impelled by the memory of his pleasure in his book to turn to my book and compare the two versions of the tale.

The children of to-day, like the children of former days, read because they find in books such stuff as dreams are made of; and, in common with the children of all times, they must needs make dreams. Like the boys and girls of most eras, they desire to make also other, more temporal, things. To aid them in this there are books in quantities and of qualities not even imagined by the children of a few generations ago. The book the title of which begins with the words "How to Make" is perhaps the most distinctive product of the present-day publishing house. No other type of book can so effectively win to a love for reading a child who seems indifferent to books; who, as a boy friend of mine used to say, "would rather hammer in nails than read." The "How to Make" books tell such a boy how to hammer in nails to some purpose. I happened to see recently a volume called "Boys' Make-at-Home Things." With much curiosity I turned its pages—pages illustrated with pictures of the make-at-home things of the title—glancing at directions for constructing a weather-vane, a tent, a sled, and a multitude of smaller articles. I thought of my boy friend. "Do you think he would care to have the book?" I inquired of his mother over the telephone.

"Well, I *wish* he would care to have *any* book!" she replied. "If you want to *try* this one—" She left the sentence unfinished, unless a sigh may be regarded as a conclusion.

I did try the book. "This will tell you how to have fun with your tools," I wrote, when I sent it to the boy.

Except for a laconic note of thanks, I heard nothing from my young friend about the book. One day last week I chanced to see his mother. "What do you think I am doing this afternoon?" she said. "I am getting a *book* for my son, at his own request! He is engrossed in that book you sent him. He is making some of the things described in it. But he wants to make something *not* mentioned in it, and he actually asked me to see if I could find a book that told how!"

"So he likes books better now?" I commented.

"Well—I asked him if he did," said the boy's mother; "and he said he didn't like '*booky*' books any better, but he liked this kind, and always would have, if he'd known about them."

Whether my boy friend will learn early to love "booky" books is a bit doubtful, perhaps; certainly, however, he has found a companion in one kind of book. He has made the discovery quickly, too; for he has had "Boys' Make-at-Home Things" less than a month.

It was an easy matter for that boy's mother to get for her son the particular book he desired. She lives in a city; at least three large public libraries are open to her. As for book-shops, there are more within her reach than she could possibly visit in the course of a week, much less in an afternoon.

The mothers who live in the country cannot so conveniently secure the books their boys and girls may wish or need. I know one woman, the mother of two boys, living in the country, who has to exercise considerable ingenuity to provide her sons with books of the "How to Make" kind. There is no public library within available distance of the farm-house which is her home, and she and her husband cannot afford to buy many books for their children. The boys, moreover, like so great a variety of books that, in order to please them, it is not necessary to select a book that is not "booky." Their parents are lovers of great literature. "I cannot bring myself to buy a book about how to make an aeroplane, for instance," their mother said to me one day, "when there are so many wonderful books they have not read, and would enjoy reading. Since I must limit my purchase of books, I really think I ought to choose only the *real* books for the boys; and yet they want to make things with their hands, like other boys, and there is no way to teach them how except through books. My husband has no time for it, and there is no one else to show them."

The next summer I went to spend a few days with my friend in the country. The morning after my arrival her boys proposed to take me "over the place." At the lower edge of the garden, to which we presently came, there was a little brook. Across it was a bridge. It was plainly to be seen that this bridge was the work of the boys. "How very nice it is!" I remarked.

"We made it," the older of the boys instantly replied.

"Who showed you how?" I queried, wondering, as I spoke, if my friend had, after all, changed her mind with respect to the selection of books for her children, and chosen one "How to Make" volume.

"It told how in a book," the younger boy said. "A Latin book father studied out of when he was a boy. There was a picture of the bridge; and on the pages in the back of the book the way to make it was all written out in English—father had done it when he was in school. It was a long time before we could *quite* see how to do it; but mother helped, and the picture showed how, and father thought we could do it if we kept at it. And it is really a good bridge—you can walk across on it."

When the boys and I returned to the house my friend greeted me with a merry smile. As soon as we were alone she exclaimed, "I have *so* wanted to write to you about our bridge, patterned on Cæsar's! But the boys are so proud of it, they like to 'surprise' people with it—not because it is like a bridge Cæsar made, but because it is a bridge they have made themselves!"

Another friend of mine, the mother of a little girl, has had a different problem, centering around the necessity of books for children, to solve. She, too, lives in the country, and her little girl is a pupil at the neighboring district school. During a visit in the city home of a cousin the small girl had been a spectator at the city child's "school play," which happened to consist of scenes from "A Midsummer-Night's Dream." When she returned home, she wished to have such an entertainment in her school. "Dearest," her mother said, "we have no books of plays children could act."

"Couldn't we do the one they did at Cousin Rose's school?" was the next query. "Papa says we have *that*."

"I am afraid not," her mother demurred. "Ask your teacher."

The child approached her teacher on the subject. "No," the teacher said, decisively. "'A Midsummer-Night's Dream' is too long and too hard. Read it, and you'll see. But," she sagely added, "if you can find anything that is suitable, and can persuade the other children to act in it, I will help you all I can."

That evening, at home, the little girl read "A Midsummer-Night's Dream." "Mamma," she suddenly cried, as she neared the end, "my teacher says this is too long and too hard for us children to do. But we *could* do the play that the people *in it* do—don't you think? It is *very* short, and all the children will like it because it is about poor Pyramus and Thisbe, that we have all read about in school. It isn't *just* the same as the way it was in the story we read; but it is about them—and the wall, and the lion, and everything! Don't you think we could do it? They did the fairy part when I saw it at Cousin Rose's school, and not this at all. But couldn't *we?*"

"I did not like to discourage her," my friend said when she related the tale to me. "*All* the other children were willing and eager to do it, so her teacher couldn't refuse, after what she had said, to help them. I helped with the rehearsals, too, and I doubt if the teacher or I ever laughed so much in all our lives as we did at that time—when there were no children about! The children were so sweet and serious over their play! They acted it as they would have acted a play on the subject of Pyramus and Thisbe written especially for them. *They* weren't funny. No; they were perfectly lovely. What was so irresistibly comic, of course, was the difference between their performance and one's remembrance of regular performances of it—to say nothing of one's thoughts as to what Shakespeare would have said about it. How those children will laugh when they are grown up! They will have something to laugh at that will last them a lifetime. But *poor* Shakespeare!"

I did not echo these final words of my friend. For does not Shakespeare rather particularly like to bless us with the laugh that lasts a lifetime, even if—perhaps especially if—it be at our own expense?

Books are such integral parts of the lives of present-day children, especially in America. Their elders appreciate, as possibly the grown-ups of former times did not quite so fully appreciate, the importance of books in the education of the boys and girls. It may even be that we over-emphasize it a bit. We send the children to the book-shelves for help in work and for assistance in play. In effect, we say to them, "Read, that you may be able to mark, learn, and inwardly digest." It is only natural that the boys and girls should read for a hundred reasons, instead of for the one reason of an older day—the pursuit of happiness in the mere reading itself. "How can you sit idly reading a book when there are so many useful things you might

be doing?" was the question often put to the children of yesterday by their elders. To-day we feel that the children can hardly do anything likely to prove more useful than reading a book. Is not this because we have taught them, not only to read, but to read for a diversity of reasons?

American children are so familiarly at home in the world of books. It should not surprise us to find them occasionally taking rather a practical, every-day view of some of the things read. A little girl friend of mine chanced to begin her reading of Shakespeare during a winter when her grown-up relatives were spending a large portion of their leisure going to see stage representations of Shakespeare's plays. She therefore heard considerable conversation about the plays, and about the persons acting the chief rôles in them. It happened that "As You Like it" was one of the comedies being acted. The little girl was invited to go to see it. "Who is going to be Orlando?" she inquired; she had listened to so much talk about who "was," or was "going to be," the various persons in the several dramas!

"But," she objected, when she was informed, "I think I've heard you say he is not very tall. Orlando was *such* a tall man!"

"Was he?" I ventured, coming in at that moment. "I don't remember that about him. Who told you he was tall?"

"Why, it is in the book!" she exclaimed.

Every one present besought her to mention where.

"Don't you remember?" she said, incredulously. "He says Rosalind is just as high as his heart; that wouldn't be *quite* up to his shoulder. And she says she is *more than common* tall! So he must have been *'specially* tall. Don't you remember?" she asked again, looking perplexedly at our blank faces.

There are so many bonds of understanding between American children of the present time and their grown-up relatives and friends. Is not one of the best of these that which has come out of our National impulse toward giving the boys and girls the books we love, "cut small;" and showing them how to read those books as we read the larger books from which they are made? "What kinds of books do American children read?" foreigners inquire. We are able to reply, "The same kinds that grown-up Americans read." "And why do they read them?" may be the next question. Again we can answer, "For much the same reasons that the grown-ups read them." "How do they use the libraries?" might be the next query. Still we could say, "As grown people use them." And if yet another query, "Why?" be put, we might reply, "Because, unlike any other children in the world, American children are almost as completely 'exposed to books' as are their elders."

I WOULD NOT BE A CHILD AGAIN

BY HAROLD TROWBRIDGE PULSIFER

I would not be a child again
For all the rainbow's hidden gold;
Though I saw wondrous visions then,
My hands were never strong to hold.

Forgetful of the open sky,
Bravely I dreamed as hour by hour
I lingered like some butterfly
The prisoner of a single flower.

With strength to love, but none to save,
I marked each fragrant petal fall.
Flower and dream found a wind-bourne grave
With molten sunlight for a pall.

Then I was left with empty hands
And loneliness too blank for tears.
God pity him who understands
Glad dreams too holy for his years!

THE NEW BOOKS

Why Women Are So. By Mary Roberts Coolidge, Ph.D. Henry Holt & Co., New York. $1.50.

No one can fail to understand this title, for it is cleverly noticeable. The author claims to be impartial, and to have made a first-hand study of the ordinary, orthodox, middle-class women, who have constituted the domestic type for more than a century. She defends with skill the thesis that sex traditions rather than sex character have produced what is called "feminine" as distinguished from womanly behavior. In order to prove her point, she assembles a great number of undisputed facts, all supporting her view. While her statements are true, she makes the mistake of generalizing too recklessly. As some one said concerning her premises, it depends upon *whose* mother and grandmother she is talking about. Probably in some circles these ladies were the stunted product of their narrow lives. But in so many circles as to be of importance in considering the question in hand our mothers and grandmothers had better-trained minds and were of far wider outlook than have the specialized products of the latest modern ideals. The author's good-natured irony is directed against the training that too often used to be regarded as necessary for girls. It may be that some readers will recoil from her uncompromising plain speech. We are rapidly becoming emancipated from prudish traditions. A boy she says might be by nature a coward, and a girl a fighter, but he would be admired for winning in a fisticuff encounter, while she would be called a "vixen" under similar provocation. Very justly, credit is given to liberal-minded men who have tried to dispel the apathy of women toward their advancement in social and educational lines. The "learned lady" was as much of a bugaboo to most women as she was to men. And as to the laws, "Most men are better than the law," said Alice Stone Blackwell. It is amazing to know that even now only thirteen States give to women the joint guardianship of their children. Such facts as these help us to comprehend the bitterness with which the women's rights movement began. The arguments, supported by statistics and other facts, made in favor of equal suffrage are stated with more restraint, though no less strongly, than by other recent writers. A chapter on Literary Amateurs is interesting from its point of view. An acute observation is to the effect that, while the number of qualities called "feminine" in recent thinking has diminished, masculinity has remained a fixed congeries of characteristics. Yet listen to Professor Gayley, of the University of California, describe the male college student: "Busy to no purpose, imitative, aimless; boastful, but unreliant; inquisitive, but quickly losing interest; fitful, inconsequential, platitudinous, forgetful; noisy, sudden, ineffectual." Would one be far astray if all these terms (except perhaps boastful) had been applied to women, and assumed to be merely "feminine"? The alarm about the "feminization" of the schools by women teachers does not seem to extend to the undoubted feminization of the family, through the inattention of men to their family duties. In the words of the author, when woman "shall have caught up with the game and when she has acquired the same confidence in herself that the ordinary man has and an equal opportunity to exercise her abilities, she will be—herself! Not a masculine female, nor a defeminized anomaly, but just a competent, sensible woman, for whose service the world already has unlimited use."

Arrival of Antony (The). By Dorothea Conyers. E. P. Dutton & Co., New York. $1.35.

Any one who loves the Irishman in his own land (and who can wholly resist his charm?) must enjoy this story. Antony, for sufficient though mysterious reasons, was brought up on the Continent in good society. When of age, he took his place in Ireland between two uncles who were somewhat scandalously engaged in horse-dealing. A greater contrast to his former life could hardly be imagined, yet innate nobility kept Antony true to his accepted position, and, a loyal youth, he lived with and loved his old Uncle Tim. The brighter future that opened to him reconciles us to his discipline. The perfect Irish humor and point of view, with dashing accounts of horse-racing and fox-hunting, carry the reader on with an enjoyable sense of having found something fresh in the way of good tales.

Johnny Blossom. By Dikken Zwilgmeyer. Translated by Emilie Poulsson. The Pilgrim Press, Boston. $1.

Johnny Blossom's gay little figure, with mouth pursed up in a shrill whistle, wins our hearts at first sight. No little Lord Fauntleroy is Johnny—and even less is he the irresponsible mischief of modern boy stories. He is simply the dearest, most natural boy we have met in all recent fiction. Translated from the Norwegian, the atmosphere and wholesome feeling of the sweet little narrative is really a bit of sincere and noble art. Johnny Blossom truly is not local, but universal. Would that his wise parents were as universal! Note the way they meet Johnny's schemes and receive his childish confidences, and be enlightened. Everybody should know dear little Johnny Blossom.

Helen Ormsby. By Belle Moses. D. Appleton & Co., New York. $1.50.

A fanciful, merry, often foolish, and quite improbable story of seven gay, rich college girls who, when the father of one of them was threat-

ened with financial difficulties, came in a body to his elegant home and paid to be trained in housekeeping under his six servants. Lovers and fun came into the scheme, of course, but equally of course it never could have happened.

Russian Wonder Tales. By Post Wheeler, Litt.D. The Century Company, New York. $2.50.

A beautiful book, charmingly illustrated with colored plates by a Russian artist, Bilibin, contains translations of Russian myths as told to the little children of Russia. The Foreword, by the translator, is a valuable paper upon folk-tales, their origin and meaning. This is for the older reader and student. Children will be fascinated by the mysteries and marvels of the tales, and in the quaint, brightly tinted pictures they will find unending pleasure.

Journal of a Sporting Nomad (The). By J. T. Studley. The John Lane Company, New York. $3.50.

The present year has apparently seen a larger addition to the number of books on sport than has any previous year. Mr. Studley's book tells us about Alaska and North Canada, but also about Newfoundland, Iceland, Spitzbergen, and Africa. His book is thus one of very varied interest. His manner of writing is simple and straightforward, and his descriptions are graphic.

Sir Walter Raleigh. By John Buchan. Henry Holt & Co., New York. $2.

A boy's book which is at the same time a distinct contribution to history is certainly desirable for any family library, and that description fits Mr. Buchan's "Raleigh." The present volume might well charm all ages. Surely the delightfully quaint and exquisitely colored pictures would please the veriest child, and the text is simple enough to be understood by any lad of the grammar school age. The account of Raleigh is unlike other accounts, and therefore it will interest those of an older age who may welcome another point of view with regard to one of the greatest names in the Elizabethan age.

Spiritual Culture and Social Service. By Charles S. Macfarland. The Fleming H. Revell Company, New York. $1.

This is a distinctly inspirational book. Its author, already esteemed for his devotional, theological, and exegetical writings, stands in the group of such prophets as Phillips Brooks and James Martineau. His brief but well-rounded sermonettes all speak to conscience. His message is given in thoughtful and ringing speech from his chair as Secretary of the Federal Council of the Churches of Christ in America, intent on using the key to our pressing social problems which Jesus has given in the as yet unapplied principles of his gospel of a divine humanity. The splendid manhood of Jesus, rousing men to moral enthusiasm by its inspiring revelation of what they must become to be true men, is strongly emphasized. New points put to old texts demonstrate the statement that "we need some new commentators." This book has two things that the whole Church needs to have—spiritual authority and human sympathy. It is a book to be read, and read again; by none more needed than by those religionists who decline to try to better the present social order on the plea that we must leave that in the hand of God.

Childhood Verses. By Burges Johnson. Thomas Y. Crowell & Co., New York. $3.

It is difficult to construct the right sort of book on children or for children. Mr. Burgess Johnson, the author of "Rhymes of Home," "Rhymes of Little Boys," etc., has essayed to do this sort of thing, and has succeeded. His elaborate quarto volume is notable both because of its twenty very remarkable illustrations and because of his poems, which reflect not a little of the Eugene Field atmosphere. The book is one which concerns itself with very little children. It will doubtless be a foremost contribution to the Christmas gift season.

Historical Setting of the Early Gospel. By Thomas Cuming Hall. Eaton & Mains, New York. 75 cents.

This is a small but meaty volume, lighting up the historical background of the New Testament. Not only are many passages therein better understood, but also, what is equally important, the hitherto but partially comprehended character of primitive Christianity and the early Church—"it was a new brotherhood with a new economic life," in a period of social reconstruction. It was the religion of a working class, as it again was in the mediæval free cities; the religion of thrifty freedmen, doing for their class "much what the evangelical revival did for the rising working class of England, and what Socialism is doing for that class in Germany." It was persecuted, says Dr. Hall, because of the "jealousy of the economic and social power that the new organization evolved," threatening the solidarity of the Empire. The solidarity of the Church, thus threatened, became correspondingly important. So it was for a social and political rather than a purely theological interest that heresies (literally, factions) were banned, and orthodox formulæ insisted on as the test of membership in good standing. Dr. Hall points to the internal conflicts in labor unions to-day as "an admirable commentary on the early Christian history." Thus viewed in its historical setting, the New Testament is, as he says, "an intensely modern book." Thirty years ago a distinguished Churchman, Dr. Hatch, of Oxford, called attention to the social and economic character of early Christianity. This has never till now been so fully exhibited. While we must cease, as Dr. Hall concludes, "to idealize the early Church after the fashion of an unhistorical High Churchism," we cannot

"underrate the elements of great primitive moral strength in a Church which, in spite of all the weaknesses brought into it by . . . the Empire's underworld, transformed the ideals of the community."

Economic Beginnings of the Far West. By Katharine Coman. Two vols. The Macmillan Company, New York. $4 per set.

While this work throws little new light on the history of the expansion movement from the Mississippi to the Pacific, it is valuable as bringing together a great variety of useful information relating to the several steps in the American advance hitherto accessible only in scattered publications, many of them books now seldom read by any but professional historians. Certainly it makes very plain the influence of colonizing ability in determining the ultimate ownership of the vast trans-Mississippi region; for, as Miss Coman truly observes, the international controversies of which this region was the subject were undeniably "adjudicated in advance of diplomatic award by thronging settlers whose political and economic vision no less than their superior industrial efficiency made them masters of the coveted country." In her first volume she graphically depicts the failure of the Spaniards and the French to follow up the discoveries of their explorers—whose adventures she relates in perhaps superfluous detail—and in the second volume she describes the successful exploitation by the American pioneer of the resources of the different States now comprised in our Far West. Each of the successive processes in the Americanization of Louisiana Territory, Texas, California, and Oregon—the distinct but mutually helpful activities of the hunter, trapper, trader, missionary, and home-seeker—are informingly described, not merely in a general way, but with emphasis on the specific contributions of well-known and little-known leaders; and the net result is an excellent presentation of both the obstacles overcome and the opportunities utilized by the "economic founders" of Western America. The inclusion of a number of admirably chosen illustrations, mostly from old books of travel, undoubtedly reinforces the statements of the text by affording interesting and convincing glimpses of the land and the people in those bygone times.

Land and Peoples of the Kasai. By M. W. Hilton-Simpson. A. C. McClurg & Co., Chicago. $3.50.

In these days when interest in the Congo and other regions of equatorial Africa is particularly keen, Mr. Hilton-Simpson's book is well in place. A few years ago he visited the Kasai basin of the Congo Free State. The Kasai is the largest of the tributaries of the Congo River; it falls into the Congo about a hundred and forty miles above Stanley Pool. The region described by the author is little known to most of us, and his account differs so much from one's preconceived notions that it will occasion surprise in more than one particular. For instance, he tells us that he came across no examples of brutality on the part of white men towards the natives, and yet he lived for practically two years in close contact with the natives. He adds, however: "What goes on in parts of the Congo which I have never visited I am not in a position to state." Another thing which may surprise some is the author's tribute to the blacks. Let no one imagine that "any sort of man" will do to administer the black man's country. "No one can more quickly distinguish a gentleman from a scapegrace or a strong man from a weak than the primitive inhabitants of Central Africa. Let the Belgians, bearing this in mind, do their utmost to induce men of the *best class* to enter the Congo service, and the success of their colonial enterprise should be assured."

Religion in China. By J. J. M. De Groot, Ph.D., LL.D. G. P. Putnam's Sons, New York. $1.50.

The eminent sinologue to whom we owe this new volume of American Lectures on the History of Religions develops a profounder view of his subject than is commonly taken. It is the fruit of independent research during and after the six years which he spent in the Far East in study of the Chinese and their languages. The groundwork of the religion and ethics of China as presented by Confucianism is found in Taoism, of which Confucianism is the more conservative and classic form. Taoism is a doctrine of the universe, "universism," Tao meaning "the way," or natural order, in the constitution of the world and of man. Taoism sets forth the way of human conduct where conformity to the order of nature leads to happiness. Here Chinese wisdom in immemorial antiquity anticipated the doctrine of Grecian Stoics many centuries later, "Live according to nature." Like the Greek philosophy, Chinese wisdom had its four cardinal virtues, of which benevolence was the chief, all given from Heaven, and it enjoined their culture as the Tao to all blessings. Like the Socratic ethics, Confucianism conditioned virtue on knowledge, but made knowledge dependent on the study of orthodox classics. Consequently, despite its sublime theory of universism, Chinese religion has been unable to rise above "demonocracy," worshiping and dreading the spirits—divine and devilish—swarming throughout the universe. The details given in this deeply interesting volume will impress its readers with a conviction of the prodigious revolution involved in the modernizing of the Chinese mind. Yet it has already been effected in a multitude who have proved their faith by their lives and by many martyr deaths.

BY THE WAY

"O for an hour of Suleiman the Magnificent!" the beaten Turks might well exclaim in this day of their extinction as a great military power. On thirteen different occasions Suleiman's armies marched forth from Constantinople through its Adrianople Gate, and as many times returned in triumph through that portal of victory. The equally famous Golden Gate was walled up by Mohammed II after his capture of the city in 1453, as a superstition arose that by it the Christians would re-enter Constantinople, victorious.

That peculiar combination of age, worldly wisdom, and affability which insures the application of the sobriquet "uncle" to a public man does not always save him from being relegated to private life when the political tide runs out. "Uncle" Joe Cannon and "Uncle" Cy Sulloway are recent illustrations of this truth. A host of Congressional nephews must now find new subjects for avuncular honors.

The p'ai-lous, or memorial arches of China, says Frederick McCormick in the "National Geographic Magazine," rival the pagodas in grace, beauty, and numbers. Many of them are erected to commemorate the devotion of virtuous widows who have refused to remarry. The fabled phœnix, which never changes its mate, is prominent in the decorations of these arches.

The dead are evicted from their holdings in great cities with much more difficulty than the living. A cemetery in New York City which had been unused since 1851 has just been sold. Three times the opposition of descendants of persons buried there has held up the sale. The bodies, with the tombstones, were several years ago transferred to another burial-place.

A curious foot-note to history is found in Mr. G. L. de St. M. Watson's recently published book "A Polish Exile with Napoleon," to the effect that the Emperor's evenings at St. Helena were solaced with music from a piano which was imported from England at a cost to Napoleon himself of £122 ($610). The musician was perhaps Mme. Bertrand; at any rate, the piano was bequeathed to her and was removed by her from the island after Napoleon's death.

An illiterate, in the eyes of the United States Census Bureau, is a person of ten years or over who cannot write, regardless of his or her ability to read. Judged by this standard, illiteracy in this country has decreased in the last decade from 10.7 to 7.5 per cent. Among children from ten to fourteen years old only a fraction above four to the hundred are now illiterate.

Andrew D. White's eightieth birthday, celebrated November 7, was marked by messages of congratulation from all parts of the world. Among them was one from the German Emperor, who formed a strong attachment for Dr. White when he was the American Ambassador at Berlin.

Nine years ago Mme. Alice Blache, according to an interview in the "Dramatic Mirror," came to this country from France, speaking no English, having little money, and with few friends. Now her friends are legion, she speaks excellent English, and she is a dominant figure in the motion-picture world, being the president of a film-producing company which she has built up and from which she is said to draw an income of $50,000 a year. She seems to combine a Frenchwoman's talent for business with the American ability to grasp an opportunity such as the motion-picture furor has afforded.

New York City must get its Christmas trees this year from some other than its usual source of supply. The Department of Agriculture has barred the sending of such trees from New England, because of the prevalence there of the gypsy moth and the brown-tail moth. It hopes thus to prevent the spread of these pests.

If buyers of Christmas presents will bear in mind the following injunctions of an auxiliary Consumers' League, they will help effectively to spread the Christmas spirit of good will: Don't leave Christmas shopping till the week before Christmas. Don't shop after five o'clock or on Saturday afternoons. Don't give your address carelessly to the saleswomen. Don't forget that "the welfare of the worker is part of the buyer's responsibility."

An incident seen on a city street the other day indicates that the antagonism between drivers of horse-drawn vehicles and chauffeurs of motor trucks is giving way to an *entente cordiale*. A heavily loaded wagon was stuck between two car tracks, and the horses were vainly endeavoring to pull out their load. A huge ten-ton motor truck passed, then turned, backed up, and with a mighty push dislodged the wagon. The driver beamed his thanks, and an atmosphere of general good feeling took the place of one of gloom and hard words.

Among anniversary celebrations this year is that of Liechtenstein, a tiny Principality on the Rhine, established in 1712. Its population of 10,000 are in many respects ideally situated, for they have a beautiful, productive country, they pay no taxes, have no public debt, and are free from liability to military service.

Large corporations, comprised mainly of Englishmen, are now making Oriental rugs in a wholesale way, according to a writer in one of the magazines. These corporations, located mainly in Turkey, gather the rug-makers from different places, set up looms for them, and give them regular pay. The workers copy handsome antiques, and in this way the price of fine rugs has, it is asserted, been much reduced.

Chauffeurs in Berlin, Germany, are forbidden to smoke cigars or cigarettes while on duty. This order by the municipal authorities has been issued with a view to lessening accidents.

Items like this make encouraging reading for the traveling public: The largest single order ever placed for steel passenger coaches was given recently by the New York Central Railroad. It was for 207 cars, representing an investment of $5,000,000. These cars thus cost about $25,000 each—and they are worth it, in assurance of safety to passengers and immunity from damage suits to the railways.

Signor Scotti, the singer, appeared in the papers on his recent arrival in America as a "how to get thin" expert. The Scotti system is simple: no potatoes, no fresh bread, no butter, spaghetti but once a week, and nothing at all to drink at meals. But is a temporarily diminished waist line worth so many gustatory sacrifices?

The Outlook

Contributing Editor

The Balkan War: The Turks

The Turkish Government's request for an armistice interrupting the Balkan war was answered last week. After consulting the allied Governments of Servia, Montenegro, and Greece, the Bulgarian Government, according to report, imposed two conditions to an armistice, added to those already indicated in The Outlook as probable. These were the demolition of the Tchataldja forts, which form the outer line of the defense of Constantinople, and the unconditional surrender of Adrianople and the other strongholds, instead of the expected permission to the Turkish troops to march out with "the honors of war." These honors have been amply earned, claim the Turks and the European military officials in sympathy with them. As to Tchataldja, the Turks were no less resentful. Naturally, they were not willing to leave Constantinople open to Bulgarian attack at any time, though they must have seen that the Bulgarians would not be willing to leave the Turks free to amass an army on a possible new Bulgarian frontier under the protection of those forts. Hence, whatever might be said as to the other terms, these particular conditions appeared unjust and harsh to the Turks. Apparently they formed the rock on which the peace proposals finally split. At all events, the Turkish Government replied as follows:

> The Bulgarian Premier has addressed to the Ottoman Government a document containing conditions for an armistice, which were communicated to-day to the Council of Ministers and were considered to be unacceptable. Consequently . . . the Commissioner-in-Chief has been instructed to continue military operations, with the help of the Almighty, until reasonable and moderate conditions are proposed to us.

The phrase "with the help of the Almighty" has doubtless a special reference to the Sheik-ul-Islam's recent proclamation. The Sheik, as the chief Mohammedan prelate, ordered a hundred eloquent and influential Ulemas—the Mohammedan theologians and preachers—to go to the front with a view of elevating the morale and exciting the warlike ardor of the Turkish army at Tchataldja. This attempt to stir up religious fanaticism in the army was interpreted by some as a counsel of despair. A part of the appeal reads thus:

> With a view to exciting and encouraging the soldiers of the enemies who surround us, their priests, cross in hand, are working in the ranks of the army. It is not fitting that our Ulemas should neglect the accomplishment of a similar duty.
>
> In order that the victory and glory promised by the Almighty may be granted without delay to the Ottoman army, it is necessary that the venerable Ulemas organize a Jehad [a holy war]. Such a holy war has, moreover, become an obligation, if the condition of the Ottoman soldiers, who are all heroes, is to be strengthened.

The Turkish Government apparently regarded the conditions as an ultimatum. They were therefore summarily rejected. But they need not have been regarded as an ultimatum. Turkey could have made counter-proposals. Instead, to order an immediate resumption of the war is, to say the least, extraordinary on the part of a defeated Power. In their turn, the allied troops may now decline to treat further with Turkey until they can dictate sterner terms in Constantinople itself. Or they may arrange a treaty which will give to them all that they have conquered but will omit that which has not been conquered.

The Balkan War: The Allies

Another and chief reason why the Turks rejected the armistice proposals was doubtless because last week, for the first time since the war began, the Bulgarian advance received a real setback. The attack on the Black Sea end of the twenty-six Tchataldja forts seemed at first successful; indeed, as reported, a small detachment of

Bulgarians even got beyond the forts and began its march towards Constantinople. But on the second day's battle it became clear that the Bulgarians were not prepared to make the further sacrifice of life which would have followed any attempt to storm the rest of the forts before their resistance had been destroyed by bombardment. And in the matter of bombardment the Bulgarians were at a disadvantage. They had to fire from a lower ground against the Turkish defense, and were further handicapped by being compelled to employ field artillery instead of siege guns. Thus they were held at bay by the heavier projectiles of the Turkish howitzers Finally, something went wrong with the Bulgarian transport. On the other hand, the Turkish supply and commissariat department had been relieved, and the numbers of Turkish troops had also been reinforced by the arrival of soldiers from Syria. The battle continued for most of the week, resulting in the retirement of the Bulgarians for a slight distance. This acted as a tonic to the spirit of the Turkish troops, and doubtless accounted for the summary nature of the Turkish Government's reply to the Bulgarian Government's conditions. As to the Servian advance, the news of the week chiefly concerns the victory at Monastir, the principal town and fortress in the interior of Macedonia. It seems that the brunt of the attack was borne by the Servian infantry, the men wading breast-deep in the water and the surrounding marshes. The Turkish troops were in great strength, their numbers being estimated at eighty thousand, reinforced by about a hundred field guns. The despatches say that the fight lasted four days and cost the Turks and Servians no less than twenty thousand each in killed and wounded. The Servians took a great number of Turkish prisoners. The Greeks have now occupied the town of Florina, to the south, and have cut off the Turkish rear-guard, numbering about thirty thousand men, retreating from Monastir after its capture by the Servians. Large quantities of ammunition and stores fell into the hands of the Greeks when they cut off the rear-guard. The gallant little Greek navy has, moreover, been busy, having occupied during the week the islands of Nikaria and Mitylene, or, as it is often called, Lesbos. Nikaria lies close to Samos, and received its name from Icarus, that famous mythological personage who was drowned between this island and Samos by flying so near the sun that his wings of wax melted. Mitylene lies off the west coast of Asia Minor, separated from it by only a few miles. As the population of these islands is nearly all Greek, their capture by the Greeks was welcomed. At the northern end of the lengthening war-line, of which Nikaria forms the southern point, the Montenegrins have been advancing by the capture of the Albanian ports, Alessio and San Giovanni di Medua.

The Balkan War: The Cholera

A more dreadful enemy has broken out in the Balkan Peninsula than is the Turk to the Bulgar or the Bulgar to the Turk—that common enemy to both, the cholera. While the Constantinople authorities have been able to keep this enemy out of the foreign quarters of the city, it has made ravages in the native quarters. In the army encamped at Tchataldja and at Hademkeui and San Stefano, half-way to the capital, however, the cholera camps have become terrible sights. Incredible as it may seem, in the endeavor to destroy the Bulgarian boast of a triumphal entry into Constantinople and the celebration of mass in Santa Sophia, the Turks have transformed that mosque into a pest-house. No less than two thousand cholera-stricken patients, it is reported, have been crowded within the walls of this former Christian temple. Outside the city in the great cholera camps, the Red Crescent Society is apparently unable to supply either bread or water, much less a blanket to cover the sick or a rest for their heads. It is supposed that several thousand died in these camps last week. Of that at Hademkeui a despatch reads: "The dead lie in heaps, . . . the faces drawn with the combined agony of thirst and the torturing pain in the vitals." There is thus greater necessity than ever to heed the appeal for funds made by the American Red Cross. It has already telegraphed tens of thousands of dollars to Constantinople, where the money is being spent in connection with the funds contributed by the various Red Cross Societies of Europe. But more money is needed at once. It should be sent to the Red Cross treasurer, Mr. Jacob A. Schiff, Red Cross Office, United Charities Building, New York City. In addition, sums sent to the American Red Cross for distribution by the Bulgarian Red Cross, the Servian Red Cross, or the Greek

Red Cross will be immediately sent to the societies in those countries. With regard to the work of these societies, it should be remembered that the suffering is being greatly increased now that the Balkan winter has set in, with its heavy snows and bitter winds in the mountain regions. Americans in the Turkish Empire may expect the arrival before long of our own armored cruisers Montana and Tennessee, which have been coaling at Gibraltar. At present, in the Bosphorus, at Constantinople, the only American vessel is the little Scorpion. Meanwhile the American Embassy in the Turkish capital is being guarded by British marines! This is as it should be if we cannot guard our own embassies. In this case we should have had men at hand, both at Constantinople and on the Syrian coast. Trustworthy news from Turkey gave to the authorities at Washington plenty of warning.

The Chinese Republic: The Delay in Recognition

The fourth annual Conference held by Clark University on questions of foreign relations and the dependencies was wholly devoted this year —November 13 to 15—to China. The Conference included a considerable number of native Chinese: Mr. Wang, one of the officials of the railway from Peking to Mukden; Mr. Tsao and Mr. Kuo, advanced students; Mr. Yui and Mr. Chin Tao-chen, who spoke from intimate knowledge. Several missionaries stated their point of view, especially Dr. Edmunds, of Canton, and the Rev. Paul L. Corbin; Mr. Edward B. Drew, for many years a member of the Chinese custom service, gave a graphic sketch of Sir Robert Hart from personal experience; while half a dozen recent travelers, headed by President Eliot, stated the results of their personal observation. Among the variety of interesting discussions of trade, industry, education, religion, and personal characteristics of the Chinese, the two subjects which stirred up most interest and seemed to go deepest into the heart of the matter were the failure of the United States to recognize the Chinese Republic and the recent loan to China under the influence of the six allied Powers, both regarded by many of the members of the Conference as evidences of the Dollar Diplomacy which is new for the United States and has still to gain popular favor. We state as follows, in this and the following paragraph, the views expressed at the Conference in favor of immediate recognition. The question of recognition is tangled up with that of the assertion by European Powers of a sort of benevolent protectorate over China. Upon the face of it, any government in any country which has come into power by a national revolution, and has maintained itself for a full year, has a prima facie right to recognition, and the withholding of such recognition is not only an inconvenience, but a serious hindrance to the complete acceptance of the new government by its own people. The policy of the United States on this point has always been liberal, and well may be, inasmuch as this country was recognized in 1778 by France, while the Continental Congress, then the only National Government, was driven out of its capital, Philadelphia. Without the recognition and military aid of France the Revolution must have failed. In the discouraging period of the Confederation, when the United States had neither money nor credit, Holland, Sweden, Prussia, and Spain recognized and treated with the Republic of the United States. Toward the Latin-American Powers the United States reciprocated this cordiality to struggling young nations. We were the first to recognize them in 1822, an example speedily followed by other countries; in 1849 an agent was sent by President Polk with authority to recognize the Republic of Hungary, if he thought it likely to continue. Such weak Powers as Liberia, Hayti, Santo Domingo, the Central American States, were recognized, and re-recognized after revolution; and even infant Panama was recognized, it was said, before it was old enough to cry for help. Upon a basis of international law of precedence and of republican sympathy, the United States ought forthwith to recognize the Republic of China. There is here no question of two rival powers contending for government; there is no other claimant to sovereign authority in China except the present republican Government. It would be as easy, it was pointed out, to put a Japanese or an Arabian prince on the throne of China as to restore the Manchu dynasty. People say that the present Government is not really republican. But a nation which recognized the French Empire under Louis Napoleon, and is at present in diplomatic relations with non-republican states, has no right to insist that the new government of a country shall be republican; but simply that it is actually

a government and is governing, as is the case in China.

The Chinese Republic: Financial Influences

The Chinese believe, and some of their representatives at Worcester did not hesitate to say so, that the delay of the United States in recognizing China is due to the connection of American bankers with the effort to control the finances of China. That point of view was undoubtedly strengthened by the straightforward and candid address of Mr. Willard Straight, formerly Consul-General at Mukden, and now the representative of the American bankers concerned. The facts as he states them were already substantially known to the public; the Chinese Government is in desperate need of funds for current expenses, to pay off the army, and to clear up arrears. At the same time it desires to build essential railway lines, and to carry out the much-needed reform of the currency. Mr. Straight says that the Chinese Government asked for a loan of three hundred millions, and was referred to the so-called "four groups" of associated British, German, French, and American bankers, by whom three conditions were laid down: (1) Loans must be made only through this combined syndicate, to which Russian and Japanese groups were speedily added. (2) Each of the groups was to participate in the profits to be had through the expenditure of part of this money by the Chinese Government in purchases from abroad. (3) The bookkeeping and the expenditures on public works were to be subject to the supervision of a representative of the banking syndicate. These conditions are hard and humiliating and cannot be avoided by simply refusing to borrow; because China must have immediate funds. When China recently attempted to make an independent loan, the six-Power group threw all its energy into preventing subscriptions; and the Russian Government aided by a pretense of demanding the payment of overdue installments on the Chinese indemnity for the Boxer war. Mr. Straight's address substantially claims that the bankers had a right to make the only loans to the Chinese Government; and every one of the six Powers (including the United States) appears to have used diplomatic pressure on China in behalf of its group of bankers. In this process there is an element of the comic, because neither the Japanese nor the Russians are prepared to put up their shares of the capital; and it is expected that each of them will turn over the greater part of its fifty million dollars to be subscribed by the four moneyed groups. Nobody can deny the right of the bankers to refuse to lend on what they think unsafe security, although it was understood that they were to place the bonds at a discount which would give them a handsome bonus—probably not less than twenty-five millions. What they are actually doing, it was claimed, is to enlist the six Governments in a combination which refuses to recognize China until the Chinese agree to finance their Government on onerous terms dictated by the banking groups, not for the advantage of the Chinese, but for the foreigners' profit. Some believe that the real reasons why our State Department now holds back from recognizing the Chinese Government have not been given to the public; but the American banking group certainly believes that their Government is aiding them in their financial deal with China. It is a dangerous thing for the United States to permit the Chinese to have even a reasonable suspicion that they are considered still, as they have been for seventy years, a source of profit and exploitation to other nations; and the United States cannot afford to pool its policy in China with other nations, every one of which is in possession of territory claimed by China. Nearly a month ago The Outlook expressed its hope that the Government of the United States would promptly recognize the Chinese Republic. It is only fair to add, however, that the State Department has announced that this Government is simply withholding its official recognition until the present provisional republican Government of China is ratified by popular suffrage.

The Industrial Development of China

The extraordinary and apparently rapid political changes in China during the last two or three years have created such a sensation throughout the Western world that the average observer has failed to note the fact that the industrial evolution of China has been equally extraordinary and significant. For thirty centuries China has been one of the great agricultural countries of the globe. An immense population has been maintained by the products of the soil, raised by the most careful and intensive processes of cultivation. An article in the October number of that very

interesting periodical the "National Geographic Magazine" gives in a striking and pictorial form an account of the scientific way in which the Chinese employ irrigation and soil-enrichment to preserve the fertility of their densely populated area. The author of the article in question, the late Professor F. H. King, an agricultural scientist not given to making unsubstantiated estimates or statements, says that forty canals across the United States from east to west and sixty from north to south would probably not equal in number of miles the canals employed in China to-day both for transportation and irrigation. We often hear of the deforestation of China. It is unquestionably true that during three or four thousand years of populous life the Chinese have destroyed many of their forests. This was due perhaps to two causes: first, the pressing necessity for obtaining fuel and lumber; and, second, the fact that the Chinese had not discovered that trees may be cultivated, like crops. But in one respect the Chinese afford us an example of agricultural economy which is in striking contrast to our extravagant and almost criminal wastefulness. This example is in their work of fertilizing agricultural soils. Every farmer in the United States knows the value of stable manure. The writer of these lines is to-day, for example, within fifty miles of New York City, paying $2 a wagon-load for well-rotted stable manure, used in the development of a long-neglected field which he is seeding down in grass for hay. But the American people apparently have almost no conception of the value as fertilizers of the chemical elements in human waste or manure. In China these chemical elements are preserved and utilized with the utmost care. In China "the 400,000,000 of adult population send back to their fields *annually* 150,000 tons of phosphorus, 376,000 tons of potassium, and 1,158,000 tons of nitrogen, obtained from human waste," says Dr. King. He adds that "the people of the United States and of Europe are pouring into the sea, lakes, or rivers, and into the underground waters, from 5,794,300 to 12,000,000 pounds of nitrogen, 1,881,900 to 4,151,000 pounds of potassium, and 777,200 to 3,057,600 pounds of phosphorus per million of adult population *annually*—and this waste we esteem one of the great achievements of our civilization." What a lesson in extravagance! When the Chinese begin to devote to manufacturing the same care and precision which have characterized their agriculture for thirty centuries, there is no reason to suppose that they will not achieve an equal success. That there is a marked development of modern manufacturing in China is indicated by the following list made by the Shanghai "Times" of recent enterprises in China:

A new cotton factory with 20,592 spindles opened at Shanghai.

Electric lighting installations at Changsha, Hangchow, and Foochow.

A brick factory at Canton with up-to-date British machinery, capable of turning out 40,000 bricks per day.

A cement plant at Tongshan equipped with motor plant and new machinery, having a capacity of 500,000 barrels per year.

Two new flour mills at Chungking and Yunanfu.

A leather factory and tannery at Canton.

A match factory at Hangchow.

A large private printing establishment with foreign machinery started at Changsha.

A new paper mill at Hankow.

A rice-hulling mill at Changsha.

This list, of course, is not a catalogue of Chinese manufactures, nor even a complete list of all the new factories established in recent months, but it is here presented because it is an important and concrete indication of what is going on in China. We hope the directors of the Panama Exposition will lay emphasis in their Chinese exhibits on modern Chinese industry and agriculture rather than on Chinese ceramics and antiquities.

The New Minister to Belgium

The appointment of the Hon. Theodore Marburg, of Baltimore, as Minister to Belgium, to succeed the newly appointed Ambassador to Japan, the Hon. Larz Anderson, has a special element of appropriateness, inasmuch as Mr. Marburg was one of the three members of the American Committee on the Celebration of the Hundredth Anniversary of the Signing of the Treaty of Ghent in Belgium, who took part in the initial conference in London on the terrace of the House of Commons, which resulted in the creation of the British Committee and the choice of Earl Grey as its head. Mr. Marburg is the Secretary of the American Society for Judicial Settlement of International Disputes, and is connected with many other organizations devoted to the extension of the arbitration idea. He is a man of extensive business interests, and has devoted a large amount of time, effort, and money to the public service in his own city, as well as in wider circles.

Private or Public Pensions for Ex-Presidents?

The announcement has been made by the Carnegie Corporation (the board of trustees formed two years ago to manage Mr. Andrew Carnegie's educational and other organized beneficent work) that it is proposed to establish a fund the income of which should be used to provide "a pension for each future ex-President and his widow, unmarried, of $25,000 per year as long as these remain unprovided for by the Nation." This last phrase suggests the comment which we venture to say will be made by the vast majority of those who read this announcement—namely, that if such provision is necessary and desirable it should be made by the Nation. The American people are not niggardly or unappreciative of services rendered. The very reasons adduced for the establishing of a private pension apply with double force as reasons why the Nation should assume its own obligations. These reasons, as stated by the trustees, are that ex-Presidents "may be able to spend the latter part of their lives devoting their unique knowledge gained of public affairs to the public good free from pecuniary cares." A provision intended to be delicate and thoughtful is that no application need be made by the proposed recipients, but that the provision established should be offered to them by the representatives of the donor. With full appreciation of Mr. Carnegie's generous desire to contribute to a much-needed reform, we think that the method which he proposes for the accomplishment of this reform has very serious objections. We doubt if the people of the United States can accept with comfort a proposal to make their Presidents the beneficiaries of private philanthropy. A not improbable and very desirable result of this generous proposal ought to be that Congress at the first opportunity should take up the need and usefulness of such pensions as a National question, and act promptly, as National dignity requires.

The Extra Session of Congress

It was not in the least a matter for surprise that the President-elect should announce his intention to call Congress together for a special session not later than April 15. What is surprising is that there should be any question in any man's mind as to the prime necessity of this action. Governor Wilson states two reasons for his decision: one, that the pledges of the party should be redeemed promptly; the other, that business should be relieved quickly of uncertainty as to just what tariff revision will be made. He might well have added another: that it should never be possible for a space of more than a year to intervene between the time of a Congressional election and the time when the new Congress meets to take up the problems intrusted to it by the people at that election. The absurdity of the present system is always brought most emphatically to view when, as in the present case, there is a change of party predominance. The Democrats were by the election which has just taken place put in power as regards the Executive and both branches of the National Legislature. Yet, if it were not for the plan of an extra session, there would be from early in November, 1912, to early in December, 1913, no way for the party to carry out its policies or to reply to the mandate of the people which puts responsibility upon the party. That Congress and the people should remedy this state of affairs needs no demonstration. Whether the plan, often proposed, that the Constitution should be so amended as to allow a newly elected President to be inaugurated on the first of January following his election is adopted, or whether some other shifting of dates be deemed preferable, does not matter. The essential thing is that a recognized absurdity should not be left untouched because of political inertia—that is, in common parlance, political laziness.

The Three Presidential Candidates

Mr. Woodrow Wilson has wisely escaped to Bermuda from the throng of office-seekers and the scarcely less insistent and irritating throng of voluntary advisers. There he can take counsel with himself and send for such counselors as he may wish to consult with. His task is an exceedingly difficult one. He owed his nomination to the aggressive action of Progressive Democrats, although the reactionaries and the bosses reluctantly joined in it, and his election would have been impossible but for his reputation as a Progressive. And yet to keep his party together and achieve political success he must have in his Administration from the forces which control the Democratic party in such States as New York, Indiana, Illinois, and Colorado the support which those forces gave to him in the nominating

Convention. We do not take the gossip of the newspapers respecting Cabinet appointments very seriously, but, if there is any truth in that gossip, Mr. Wilson proposes to make a Cabinet of Progressive Democrats. We hope this is true, for we wish to see in America the issue clearly drawn between those Progressives who believe in a return to the individualism of the past and those Progressives who believe in going forward to a self-governing Republic, co-operating alike in city, State, and National administration for the general welfare. Mr. Taft, at the Lotus Club dinner last week, made a speech which, to use his own figure, may be regarded as his "swan song." In this speech he indicated two reforms which he regarded as desirable: the first involving a change in the written Constitution, the second in the National habit. The first was an indorsement of a plank in the Democratic platform. He would have the Constitution extend the Presidential term to six years, and, as the Democratic platform proposes, forbid a re-election. If he had made this suggestion six months ago, and accompanied it by the refusal to accept a second term himself, his suggestion would have carried a weight in the country which it now inevitably lacks. The Outlook does not think the recommendation a reform. Six years is too long for the term of a President whose Administration the people do not approve. It is too short a term for a President whose services the people wish to continue. The principal argument against a second or third term is the supposed power of the President to continue in office despite the popular will. This argument seems to The Outlook to have been finally overthrown by the recent Presidential election. The second reform which Mr. Taft proposes has for its object to bring more closely together the operation of the executive and the legislative branches. "The studied effort to maintain those branches rigidly separate is, I think, a mistake." We agree with him. The connection between the executive and the legislative branches, which is now carried on in non-public conferences, would be more efficient, and would be free from some of the present evils, if it were carried on in the open. This result Mr. Taft would accomplish by giving seats in the House to the members of the Cabinet. Whether this attempt to engraft on the American Constitution the English method would succeed is, we think, very doubtful, but Mr. Taft's proposition may at least have the effect of bringing before the American people for their discussion the question how to accomplish a result much to be desired. Mr. Roosevelt in two utterances has given emphatic expression to his faith that the Progressive party is to go on with its work by transforming the political campaign into a campaign of education. He expressed this conviction in a very brief address to the State Progressive Committee in convention in New York City, and also in a written letter to the Committee appointed by the mass-meeting of Progressives held in Boston, to which we referred last week. The following sentence from that letter expresses admirably the purpose and the spirit of the Progressive movement:

> We work with a feeling of the kindliest charity toward all our opponents, but with a firm resolution not to rest until this has been made both a genuine political and a genuine economic democracy, until justice has been secured to the weak no less than to the strong, until equality of opportunity is secured, and at least some rough approximation to equality between reward and service, until the burdens have been lifted from the helpless, from women and children and from overworked men, and until the souls of our people have got the upward lift that comes only with the vision of genuine brotherhood and the spirit of insistence by each of us, not only upon the rights of each, but upon the duties of each and the rights of all others.

The Bathtub Decision

The decision of the United States Supreme Court in the Bathtub Trust case and its order to dissolve the combination entered into in order to fix prices paid by the consumer and the jobber are of importance and value because they show that the plain provisions of the Sherman Law are not to be nullified by the specious pretext set up in this case. This pretext would make the rights of the owner of a patent override the duties of manufacturers as laid down by the Anti-Trust Law. Whatever doubt was felt as to the outcome of this case came from the decision of the Supreme Court last spring in the Mimeograph case, in which, contrary to the opinion of the Chief Justice and the minority of the Court, it was held that the owner of a patent on a mimeograph may compel a purchaser of the machine to buy from the patentee the paper and ink to be used on the machine. Far-reaching and extraordinary as this decision was, the Supreme Court has now definitely refused to

carry it further by saying (as it was asked to do by the Bathtub Trust) that the power of the owner of a patent should include control by him over trade in the unpatented product of a patented machine or process. The scheme of these manufacturers who were trying to set up a monopoly was ingenious: they wanted to control the sale of enameled iron ware, and among them they owned the processes by which the enamel is applied to the cast iron of bathtubs and kitchen ware; they transferred the rights in all these patents to a young man without capital who was merely their dummy and agent; he issued licenses precisely alike in terms to the manufacturers to make the bathtubs; the manufacturers in turn made, or tried to make, these licenses a part of their contract with jobbers and to insist, not only upon a uniform price, but upon a price which should rise or fall as the manufacturers ordered. Thus the bathtub, which was not itself a patented article, could be, they imagined, controlled as to its sale with impunity. The case differs from the dissolution of the Standard Oil Trust because the trade normally would follow lines of very severe and lively competition. This has been shown by the fact that since the methods above described stopped, while the case was awaiting decision, the prices of the product have fallen from twenty-five to forty per cent, while, so one of the Government's attorneys states, nearly all the manufacturers in this line are running their factories overtime and making money at the reduced prices. The central point involved is thus stated by Mr. Justice McKenna, who read the Court's opinion: "Rights conferred by patent are indeed very definite and extensive, but they do not give, any more than other rights do, a universal license against positive prohibitions. The Sherman Law is a limitation of rights—rights which may be of civil consequence, and therefore restrained."

Railway Accidents: Passengers

Some dreadful railway accidents have just happened. And what is singular, they have all happened on one railway system, the New York, New Haven, and Hartford. And what is still more singular, several of them have happened upon a very short stretch of track which runs through a thickly populated region, namely, the track between South Norwalk and Bridgeport, Connecticut. On the whole road during the past seventeen months the following wrecks have occurred:

June 8, 1911, Fairfield, Connecticut, freight, 4 killed; disregard of signals.

July 12, 1911, Bridgeport, Connecticut, Federal express, 12 killed, 100 injured; careless engineer.

August 28, 1911, Middletown, Connecticut, passenger, 60 injured; spreading rails.

June 11, 1912, Clinton, Massachusetts, passenger, 8 injured; open switch.

July 15, 1912, Stonington Junction, Connecticut, passenger, 3 killed, 4 injured; collision.

October 3, 1912, Westport, Connecticut, Springfield express, 9 killed, 50 injured; crossover.

November 16, 1912, Greens Farms, Connecticut, Merchants' Limited, 19 injured; cause in doubt.

November 16, 1912, Milford, Connecticut, Portland express, 4 cars derailed; frog split.

November 17, 1912, Putnam, Connecticut, freight train, 1 dead, 1 hurt, 1 missing; rear-end collision.

November 18, 1912, Derby, Connecticut, freight train, 4 cars derailed; train jumped a frog in crossing through a labyrinth of switches.

In these accidents twenty-nine persons were killed and two hundred and fifty-eight injured. What have been the causes of these disasters? Nearly all have apparently been due to disregard of signals or poor equipment. Careless disregard of signals and poor equipment on one of the supposedly best roads in the world? This seems incredible. Perhaps the most notable of the above disasters was that which occurred at Bridgeport. After investigating it, the Inter-State Commerce Commission recommended certain reforms to the company. Had these reforms been put in operation they would, it is held, have prevented further casualties. Under the present law the Inter-State Commerce Commission unfortunately does not possess power to compel carriers to adopt hard and fast rules in connection with actual train operation. In the cases of both the Bridgeport and Westport wrecks the trains were operated, it was shown, without automatic control and went from one track to another over a short crossover at a speed of more than sixty miles an hour. Under these circumstances we are not surprised to read the announcement of the State Attorney at Bridgeport that he will prosecute the railway officials on the findings of the coroner, who charges criminal negligence in connection with the Westport wreck. In the Bridgeport and Westport disasters the coroner's jury, it is announced, found the railway either criminally negligent or jointly responsible

with the engineer. Jail penalties for such a showing may not be amiss; but better still would be the enlargement of administrative power to enforce such reforms as will make such a condition impossible. Pending this, a road so well equipped in other respects as is the New Haven can at least replace its present crossovers by longer ones, and we are glad to hear that it is doing so.

Railway Accidents: Employees

The "Baltimore and Ohio Employees' Magazine" is an attractive publication. The subject-matter covered is varied and interesting, but nothing is of greater point just now than the discussion of safety. Mr. Willard, President of the Baltimore and Ohio Railway system, was recently asked this question: "Where do you place safety in relative importance among the ends to be sought in the operation of a road?" He promptly replied, "Above everything else." That this is a first consideration is indicated by the "safety page" of the "Baltimore and Ohio Employees' Magazine." Each month it indicates the divisions of the road which make the most creditable showing as to immunity from injuries to employees. Most accidents to them, it finds, are due to failure of the human element—that is, to thoughtlessness or carelessness. For instance, during a period of nine months fourteen employees were killed in stepping off one track to another as a train was passing. Again, nine employees were killed while adjusting angle cock or air hose while the train was in motion, despite the rule prohibiting that practice. Moreover, nineteen employees were killed in train accidents: three of these accidents were due to defects, the remaining sixteen were chargeable to the fact that the rules were not rigidly obeyed. Furthermore, twenty-six employees were killed by not keeping a proper lookout while working on the track or while walking from the yards. "Think of these twenty-six experienced men losing their lives!" says the "Magazine." Mr. W. R. Moore, the Baltimore and Ohio agent at Chillicothe, Ohio, declares that "a man would be a fool to put his hand or foot in the mouth of a lion, thinking he could withdraw it before the jaws came together. . . . The man who will try to adjust a draw-bar when cars are approaching each other closely might as well take a chance with a lion;" and again: "If a physician should offer you five thousand dollars for your arm or leg for medical purposes, you would not sell; you would think him a crank for making such an offer; well, some of you take a chance every day by selling to the railway for a great deal less. The company wants to buy your arms and legs and is willing to pay a fair price for them, but it wants them fastened to your body." The company may also remember, however, that in a great number of accidents the carelessness of the brakeman is really and ultimately the carelessness or negligence of the organization.

A New Day in Prison Reform

Delegates from all sections of the United States to the American Prison Association's annual meeting at Baltimore, November 9–14, must have felt that a new day is dawning in American prison reform. At the meeting at Baltimore a special committee, appointed a year ago by the American Prison Association and composed of representative members of the Association, rendered a strong adverse report on contract labor, condemning particularly the Maryland penitentiary. It was pointed out that the so-called earnings of the prisoners, amounting to some $30,000 per year, were achieved at the expense of necessities which are allowed free of charge to the inmates of prisons in States with more modern systems of prison administration. Labor from sun to sun, absence of educational and recreation features, were condemned. The committee's report favored the application of a combination of the State use and State account systems of prison labor, whereby the State shall manufacture for its own consumption and that of its political subdivisions such products as are most readily produced in the prisons; and wherever the needs of the State are not sufficient to absorb the products they should be supplemented by products that can be used within the State where they are manufactured. The opinion predominated among the delegates who spoke that the principle of the contract system is bad. A number of delegates stated that they preferred even the contract system to prison idleness. Closely allied was the subject of relief of prisoners' families. The Association felt keenly the injustice of the enforced destitution of those dependent upon prisoners, but has marked out as yet no constructive suggestions.

Defective Delinquents in Prison

The topic of feeble-mindedness and other mental abnormalities of prisoners had perhaps the largest share of space upon the Baltimore programme. Dr. Goddard, Dr. Fernald, and Dr. Healey, all of whom have made careful studies of defective delinquents, urged greater classification along psychological and psychiatric lines. Many wardens and superintendents still showed reluctance to accept the findings of the scientists as to the extent or nature of feeble-mindedness in criminals. There is probably no question receiving closer attention by the heads of correctional institutions than the problem of the defective delinquent. An interesting development in this connection is the recent appointment of Professor von Kleinsmidt, formerly of the Department of Psychology of De Pauw University of Indiana, to the position of Associate Superintendent of the Indiana Reformatory, the Board of Managers planning thereby to unite the sciences of sociology and penology in better methods for the reformation of the offender. Prison farms, farms for inebriates, tramp farms, and reformatory farms came in for extended discussion and for general approval. Here the problem is picturesque and often astounding. From all over the country came verbal reports from the platform that vicious and hopeless criminals were being trusted at a distance from the institution, were working hard, were often without guards, were docile and normal, and were doing a man's work. Warden Gilmour told of the transformation of the sullen, discouraged man at the Central Prison of Toronto into the busy, trusted farm laborer of the prison farm at Guelph. Warden Homer, of the latest New York State prison at Comstock, reported that several hundred men were trusted daily outside the prison, which is still without walls, and that as a reward of good conduct a Saturday afternoon ball game has recently become a regular feature. Similarly the District of Columbia and Kansas, Washington, Colorado, Arizona, and many other States are working prisoners at some distance from the prisons. Skeptics as to the new order foresee possible general jail deliveries and find it difficult to understand why the men have failed to run away. The Association passed unanimously a resolution condemning those recent accounts in the daily press that attributed the causes of the recent prison riots at Jackson, Michigan, and Rawlins, Wyoming, to the failure of humanitarian methods introduced as a substitute for the older and more rigorous discipline. The delegates to the Association felt keenly the injustice of blaming modern methods of humanity for conditions resulting from politics, inefficiency, ignorance, and inability to employ modern methods reasonably. The Association pointed to the remarkable success of modern methods in many of the leading prisons of the country to refute the news and editorial allegations which have been specially prominent in recent months. A feature of special interest was the local Maryland situation. On the opening evening Governor Goldsborough announced that he had recently appointed a commission to investigate the Maryland State Penitentiary and to present a plan for the modernizing of Maryland prison methods. The Governor stated his absolute opposition to the contract labor system. Commissions were present from New Hampshire, New Jersey, Wisconsin, and several other States. Noteworthy were the bearing and caliber of the majority of the prison wardens and reformatory superintendents, a stalwart group of good carriage, of large heart, and of businesslike methods and principles.

The Nobel Prize for Literature

The 1912 Nobel prize for literature has been awarded to Herr Gerhart Hauptmann, the German poet, dramatist, and novelist. This prize is part of a bequest left by Alfred Bernhard Nobel, the Swedish scientist, who died in 1896. By his will a large portion of his fortune was devoted to five annual prizes, each valued at about $40,000, to be awarded without distinction of nationality. They were to be awarded for the most important discoveries in physics, in chemistry, in physiology or medicine, for the most distinguished work of an idealistic tendency in the field of literature, and for the best effort by a person or society toward the fraternity of nations and the promotion of peace. The last named is awarded at Christiania by a committee of the Norwegian Storthing or Parliament. The others are awarded at Stockholm by the Swedish Academies. The prize for literature has been conferred on the following persons:

1901, Sully Prudhomme.
1902, Theodor Mommsen.
1903, Björnstjerne Björnson.

1904 (one-half to each), Frédéric Mistral and José Echegaray.
1905, Henryk Sienkiewicz.
1906, Giosuè Carducci.
1907, Rudyard Kipling.
1908, Rudolf Eucken.
1909, Selma Lagerlöf.
1910, Paul Heyse.
1911, Maurice Maeterlinck.

Herr Hauptmann may well feel a sense of pride at being included in such a list. He was born in Silesia, on November 15, 1862, and the honor of receiving the Nobel prize fell on his fiftieth birthday. Working on a farm as a boy and young man, Hauptmann employed his spare time in study. At length he was able to desert the plow for a university course at Jena. By the time he was thirty he had won an acknowledged place as a dramatist. His first dramas, such as "Vor Sonnenaufgang" (Before Sunrise) and "Die Weber" (The Weavers), set forth the condition of the lower order of day-laborers much as Zola or Gorky might have outlined. These depressing plays, however, were not merely examples of crude, stark, brutal realism; something like their shock was necessary to stir the slow-moving Germans to a realization of the condition of the working classes. When they did so realize it, they paid due praise to Hauptmann, and from that moment his career was assured. The later period of his career, beginning with his imaginative fairy drama "Die Versunkene Glocke" (The Sunken Bell), has been marked by mysticism as well as a high degree of dramatic and poetic idealism. Much of his work combines the repulsive with that which is beautiful and compelling.

The "Baptist Bible"

Under striking headlines several newspapers gave out as a bit of sensational news last week that the Baptists had banished Jonah's whale from the Bible and put in its place "a great fish." The impression of audacity on the part of the Baptists was deepened by the report that they had modified the Lord's Prayer. Evidently the reporters and headline producers had not even yet learned that the modified form of the Lord's Prayer which they ascribe to the Baptists is the form to be found in the Revised Version (New Testament) of 1881, which is used in numberless churches every Sunday of the year, and that the whale could not be eliminated from the Book of Jonah for the simple reason that no standard version of the Book of Jonah—neither the Douay Version, nor the King James Version, nor the Revised Version (Old Testament) of 1885—contains any reference to a whale. The "great fish" of Jonah has come to be called a "whale" simply because in the passage in Matthew which contains a reference to the Jonah story the common English versions use the word "whale." Even there the Revised Version puts "sea monster" in the margin. The basis for this sudden journalistic interest in the Bible—an interest which is all the more welcome because it bears with it evidence that it has been aroused where it is needed—is the recent publication of an "Improved Edition" of the Bible, based in part on a former version known as the Bible Union Version, and published by the American Baptist Publication Society. This version is the final result of labors that have extended over nearly thirty years. There are many variations from both the King James Version and the Revised Version, as well as from the Douay. For example, the first two verses of the first chapter of Genesis are as follows:

The King James Version:

In the beginning God created the heaven and the earth. And the earth was without form, and void; and darkness *was* upon the face of the deep. And the Spirit of God moved upon the face of the waters.

Douay Version:

In the beginning God created heaven, and earth. And the earth was void and empty, and darkness was upon the face of the deep; and the spirit of God moved over the waters.

Revised Version:

In the beginning God created the heaven and the earth. And the earth was waste and void; and darkness was upon the face of the deep: and the spirit of God moved upon the face of the waters.

Improved Edition:

In the beginning God created the heavens and the earth. Now the earth was waste and empty; and darkness was over the face of the abyss; and the spirit of God was brooding over the face of the waters.

As for Jonah's whale, the Improved Edition simply substitutes in the passage of Matthew the "great fish" of the Book of Jonah, instead of the "sea monster" suggested in the margin of the Revised Version. It is true that the Improved Edition puts "immerse" in parenthesis after "baptize." This is not new. The Bible Union version was published

in two forms, one using "baptize," the other "immerse." This edition simply puts them together as alternatives.

PROSPECTS IN THE BALKANS

In spite of obstacles raised by mutual distrust, both Turks and Bulgarians are, we believe, probably really desirous of ending the war in the Balkans. Under these circumstances it is reasonable to hope that terms of peace will soon be arranged—possibly before this issue of The Outlook reaches our readers.

On another page those readers will find an interesting article by a writer who has made a long, careful, and intimate study of the Eastern question. In this article he forecasts certain ultimate results, some of them of a very radical nature, which he thinks may eventually follow what, if he is right, will prove to be much more than a local revolution. Without either indorsing or criticising his prophecy, we here attempt the task of telling our readers what we think there is reasonable ground to hope may immediately result from that revolution. We do not write here either history or prophecy. We do not undertake to tell our readers either what has been or what will be. We simply tell them what we think there is reasonable hope may be the present issue of the military campaigning now, we trust, about to end, and the diplomatic negotiating now begun.

Bulgaria may follow the example set by Germany, which insisted at the end of the Franco-German War on entering Paris. Or she may follow the example of Russia at the end of the Russo-Turkish War, which did not insist on entering Constantinople. We hope that she will follow the example of Russia.

We hope that if Constantinople remains a Turkish city, it will be under some sort of protection and control from the European Powers—control adequate for the protection of all foreigners residing within the city.

We hope that Montenegro, Servia, Greece, and Bulgaria will be able to maintain in some form in time of peace that co-operation which has given them success in time of war. The difficulties in the way of federation are enormous, perhaps insuperable; but before this war the European Powers thought the difficulties in the way of co-operation would be insuperable. The statesmanship of King Ferdinand of Bulgaria, and of Prime Minister Venizelos of Greece, found a way to overcome those obstacles. We hope that the same enlightened statesmanship will find a way to overcome the apparently insuperable obstacles to political union. We do not hope for immediate federation, but we do hope for the establishment of such a relation between these independent kingdoms as will eventually lead to a united Balkan Empire. We do not think it is unreasonable to hope that, as the skill of a Cavour made out of separated kingdoms a united Italy, and the skill of a Bismarck made out of separated kingdoms a united Germany, so the skill of a King Ferdinand and of a Prime Minister Venizelos may make out of separated kingdoms a united Balkan nation.

We hope that Servia will secure a commercial port on either the Adriatic or the Ægean Sea, or on both. She needs such a port for her self-development, and she is entitled to it as a reward for her courage.

We hope that Albania will be a free and independent state until she chooses of her own accord to affiliate herself with the other states in the Balkan Peninsula.

We hope that the European Powers will at least not hinder, if they do not co-operate to promote, this development of the Balkan peoples into a united nation.

And we hope that Russia will get a free passage to the Mediterranean. Commerce is a great enlightener, and there is no one influence which would do more to bring Russia into fellowship with free and enlightened Europe than an ice-free port and a developing commerce.

We may add, as a reassurance to readers who have friends in Constantinople, that private advices give us good ground to believe that American and English residents in that city are not under such great apprehension, for their safety as the American press has aroused in the minds of their friends here. As a concrete illustration of how little life in Constantinople has been affected, it is worthy of note that not only the college work at Robert College has gone on without serious interruption, but some erection of college buildings which had been begun before the war has not been halted. The most serious danger to foreign residents in Constantinople is from epidemic, and with proper precautions suggested by modern sanitary knowledge it is believed that it is possible successfully to guard against this danger.

NO CAUSE TO WORRY

Two weeks ago, in the course of an editorial on the meaning of the Democratic victory, The Outlook undertook to indicate the pledges to which the American people have a right to hold the Democratic party bound. No one will deny that a party which commits itself to certain definite policies is under obligation, if put into power, to see that those policies are carried out. There may be, however, a legitimate difference of opinion concerning the extent to which such a party is under bonds. It is only the implacable partisan who will be captious in interpreting a party's promises. One who wishes to be fair will interpret such promises liberally. This is what The Outlook attempted to do, all the more because it does not believe that the methods which the Democratic party proposes will secure the ends of freedom and justice at which the Democratic party aims. The Outlook took pains to interpret the Democratic pledges fairly and to resolve every doubt in favor of the party that now must bear the responsibility for the government of the Nation.

With this especially in mind, The Outlook emphasized those particulars in which the Democratic party could not be held to be bound. One of these particulars it mentioned as follows:

> The people have no right to expect of the party any action tending to lessen the power of the bosses or to increase the power of the people—except in so far as the election of United States Senators by the people and preferential Presidential primaries may have some such effect. The Democratic platform is absolutely silent on this subject.

Stimulated by an editorial in the New York "Sun"—that assiduous universal censor—three or four correspondents have called our attention to the following declaration of the Democratic platform:

> We call attention to the fact that the Democratic party's demand for a return to the rule of the people, expressed in the National platform four years ago, has now become the accepted doctrine of a large majority of the electors. We again remind the country that only by a larger exercise of the reserved power of the people can they protect themselves from the misuse of delegated power and the usurpation of governmental instrumentalities by special interests. For this reason the National Convention insisted on the overthrow of Cannonism and the inauguration of a system by which United States Senators could be elected by direct vote. The Democratic party offers itself to the country as an agency through which the complete overthrow and extirpation of corruption, fraud, and machine rule in American politics can be effected.

Neither the "Sun" nor our good friends who have written us need worry. The moral obligations resting upon the Democratic party as a result of its victory are sufficiently extensive and heavy as they are, so that no anxious friends have any occasion to feel concerned because The Outlook has deprived the Democratic party of any burden that rightly belongs to it. If The Outlook committed an error, it was obviously through a desire to be scrupulously fair, and to include in the list of the burdens which rested upon that party none which that party had not clearly and willingly assumed.

In the light, however, of the remonstrance of these anxious friends, we have re-examined our statement, and still feel that it is justified by the facts, and that it relieved the Democratic party of no burden it can be fairly required to bear. The Democratic party has assumed no responsibility to end boss rule, or even seriously to attack it. Those who demand that it should do so are demanding that which it is not fair to ask of the party. The passage quoted from the platform does not refer to boss rule at all. The closing sentence of that passage can be fairly interpreted only in the light of the context. What it refers to there is made clear by the examples it cites—"the overthrow of Cannonism and the inauguration of a system by which United States Senators could be elected by direct vote." Oligarchical methods employed in the management of both houses of Congress are evils which call for correction, but they have only distant relationship to that very distinctive evil of American politics, the rule of the boss. The Democratic platform promises no relief from that form of boss domination which, for example, was described in The Outlook two weeks ago by Richard Spillane in his article "Driven from the City." The Democratic party might overthrow Cannonism and its successor, the rule of the caucus, it might, in addition, secure the direct election of Senators, and might even do more to secure the "exercise of the reserved power of the people," and yet leave the rule of the boss untouched. Those who regard this passage from the platform as referring to boss rule do not know, apparently, what boss rule is. Mr. Murphy, of New York, Mr. Taggart, of Indiana, and Mr. Roger Sullivan, of Illinois, know very well what it is, and for that reason the forces

which they controlled were perfectly willing to vote for the platform that contained that passage.

Mr. Wilson also knows what boss rule is. He has had to deal with it in New Jersey. As we said in discussing this subject two weeks ago, actions speak louder than words, and, while the people have no right to demand that the Democratic party attack the bosses, they have the right to expect that Mr. Wilson as President will carry on his battle against the bosses as far as it can be carried without threatening his party with disruption.

LETTERS TO UNKNOWN FRIENDS

Your definition of Christian is the only thing that ever grated on me. I am something of a purist, and believe the meaning of a word should not be changed. A Christian can be nothing more or less than one who believes that Christ is the Son of God and who follows in his footsteps. A Unitarian may be as godly, as holy and righteous a man, but he is not a Christian. C. F. F.

I do not find, in either the Century Dictionary or Webster's Dictionary, your definition of the word Christian. I do not think that the best usage of modern English justifies that definition. I am not, however, greatly interested in the question of how the *word* should be used. I am greatly interested in the question, What are the conditions upon which Jesus Christ accepted men as his followers and received them into his fellowship? A study of the four Gospels justifies, I think, the statement that he never made either an emotional experience or an intellectual belief a condition of such fellowship.

On one occasion his disciples were discussing who should be greatest in the kingdom of heaven. He took a little child and put him in the midst of the group and said to them: "Except ye be converted and become as little children, ye shall not enter into the kingdom of heaven." It is not to be imagined that this little child knew anything about the doctrine of the Trinity, or the divinity of Jesus Christ, or of vicarious atonement. The characteristic of a little child is not knowledge, but open-mindedness and eagerness to learn. The condition of entering Christ's fellowship is not knowing the truth, but eagerness to learn the truth. When a child of proper age applies for admission to the public school, we ask how much he knows, for the purpose of determining, not whether we will let him into the school, but where in the school he shall be placed. The Church has made the mistake of supposing that one cannot become a pupil in Christ's school until he has learned what Christ teaches. But it is not necessary that he should have learned what Christ teaches in order to enter Christ's school; it is necessary that he should desire to learn and should be willing to accept Christ as his teacher.

Very early in his ministry Jesus was teaching by the shore of the Sea of Galilee. The people crowded upon him, and he asked one of the fishermen to favor him by allowing him to use his boat as a pulpit. The fisherman consented, pushed the boat out a little from the land, and Jesus, sitting in the prow of the boat, talked to the people on the shore. Then he turned to the fisherman and counseled him to push out into the deeper water and cast his net for fish. The fisherman replied: "We have been fishing all night and got nothing; still, if you say so, we will try again." He did, with instant success that amazed the fishermen. When they had come to land, Jesus turned to the fishermen and said, "Follow me, and I will make you fishers of men;" and it is said that "when they had brought their ships to land, they forsook all and followed him."

There is no reason to suppose that in this case these fishermen knew anything about the doctrine of the Trinity, or the divinity of Jesus Christ, or the vicarious atonement, or about any of the so-called essential doctrines of the Christian religion. But they had an open mind and were willing to learn; they had an accommodating spirit and were willing to put their boats at the service of a religious teacher; and, when the issue was presented to them, they were willing to leave their business and follow the spiritual aspiration which he had enkindled in them by his teaching.

In another case Jesus was passing through the city of Jericho. A tax-gatherer, small of stature, drawn by curiosity, climbed a tree to see the celebrated Rabbi. That he was jeered at by the crowd is highly probable, if crowds in that day were at all like crowds in our day. Jesus called him down from the tree and went with him to his home, inviting himself to be the tax-gatherer's guest. What he said to the tax-gatherer we do not know; but we do know that he could not have been a tax-gatherer under the Roman tax system with-

out having been guilty of constant oppression of the people, and we know that before Jesus departed from his home Zaccheus promised to restore to those whom he had oppressed by false taxation fourfold, and to give half of what remained of his fortune to the poor; and Jesus upon this statement accepted him. There is not the least reason to imagine that Zaccheus knew anything about the Trinity, or the divinity of Jesus Christ, or the like.

On several occasions Jesus rejected those who came to him desiring to enter his fellowship. Once a rich young man came running, kneeled down in the road before him, addressed him in the language of reverence as "Good Master," and asked what he should do to inherit eternal life. Jesus put no questions to him respecting his belief or his emotions. He first put before him the ethical laws: Do not commit adultery, nor kill, nor steal, nor bear false witness, and honor thy father and mother; and when the rich young ruler replied that he had always complied with these laws from his youth up, Jesus prescribed for him the same condition which he had prescribed in the case of the fishermen, and which he had accepted when voluntarily offered in the case of Zaccheus: "Sell all that thou hast and distribute unto the poor, and follow me."

It is sometimes asked whether, in order to be a follower of Christ, one must in our time sell all that he has and give to the poor. No! But he must, in our time, if he will be a follower of Christ, hold all that he has in loyalty to Christ, and use all that he has in such way as he believes will best serve Christ's purpose in the world. The question, how much of his income he will use for promoting the kingdom of God in his own family and making the lives of his own children rich and full and noble, and how much he will spend outside of his own family in promoting rich, full, and noble lives in others, each man must determine for himself, but he must determine it in the spirit of loyalty to Christ.

On another occasion three men applied to Jesus to become his followers. The first was jauntily ready to follow him everywhere, until Jesus said to him: "Foxes have holes, and birds of the air have nests; but the Son of man hath not where to lay his head." The second was ready to follow Jesus, but would first go back and bury his father. Jesus would have no promise of loyalty to be fulfilled in the future. The applicant must accept Jesus as his Master unconditionally, and afterward ask permission to go to his father's funeral. The other would follow, provided he might first go back and bid his family farewell. To him Jesus gave the same reply, for he would have no divided allegiance. In these cases the conditions of discipleship were absolute, unquestioning, and immediate loyalty to Jesus as a Supreme Master, but in none of them was there a request for an opinion respecting the character or the mission of Jesus.

On one occasion Jesus did ask his disciples, after they had been with him for more than a year, what they thought of him, and Simon replied, "Thou art the Christ, the Son of the living God;" and Jesus accepted this definition of his character in very explicit terms. But he not only did not make acceptance of this definition a condition of his fellowship, he did not even regard it as sufficient to admit to his fellowship; for almost immediately after, when Peter inveighed against the idea that Jesus' mission would involve his crucifixion, Jesus rebuked him in very vigorous terms, saying, "Get thee behind me, Satan; thou art an offense unto me." Later, when he was washing the disciples' feet and Peter said to him, "Thou shalt never wash my feet," Jesus replied, "If I wash thee not, thou hast no part with me." Couple these instances together and their meaning is clear. Believing that Jesus Christ is the Son of God does not make one a Christian, unless he is willing to follow Jesus even to the death and to obey Jesus even in apparently insignificant details. That acknowledging Jesus to be the Messiah and the Son of God does not of itself constitute one a Christian is evident from the fact that in more than one instance it is recorded that the devils, when cast out of the possessed, acknowledged his Messiahship and his divinity.

There are five words by which in the New Testament Christians are designated. To understand what these five words mean is to understand what is a Christian in the New Testament sense of that term. These five words are:

Disciples, or scholars.
Believers, or the faithful.
Followers, or soldiers.
Brethren, or members of the household.
Saints, or the holy.

A Christian is a scholar seeking to learn from Christ how to live. He is a believer, or faithful one, trusting in Jesus as Master and as friend. He is a follower or soldier,

who has enlisted in Christ's service and given himself to carrying on Christ's work in the world. He is a brother, or member of the household, ready to work in co-operation with all other loyal followers of the Master. And he is a saint or holy one; that is, one who has given himself up entirely to Christ's service and is entirely possessed by the ambition to be Christlike.

LYMAN ABBOTT.

THREE CAPITAL BOOKS OF THE WILDERNESS

EDITORIAL BY THEODORE ROOSEVELT

MAJOR Stevenson-Hamilton, the warden of the Transvaal Government Game Reserves, has written an entirely new type of book.[1] It is the first time that full advantage has been taken of his opportunities by any competent observer and writer whose good fortune has put him in charge of one of the great sanctuaries for the wilder forms of life that have been created in both the Eastern and the Western hemispheres of recent years. There have been plenty of good books about African game, some by professional naturalists, some by men whose interests were primarily those of the hunter; and it is a mistake to suppose that there is not room for other good books of this type. But Major Stevenson-Hamilton's book is far more than any ordinary hunting book can be. He deals with African travel; he deals with hunting; but the great value of his book consists in the notes on the life histories of the big game, as well as of the crocodiles, poisonous snakes, and some of the birds and insects, which give its peculiar character to the South African fauna. I know of no other book which contains as much and as valuable information on outdoor African natural history of an interesting kind. There are of course books by great hunters in which more information will be found upon some particular species of big game—lion, or elephant, or buffalo, or rhinoceros. But taking game in the aggregate, and other interesting animals as well, there is no other book I know which equals this. Take the account of the ratel or honey-badger, for instance, the most valiant and I am inclined to think the most interesting beast in Africa. Major Stevenson-Hamilton's work has been such as to enable him to make observations and investigations in a way that the big-game hunter pure and simple cannot possibly do, and in consequence he has added some really extraordinary bits of information to our knowledge of the ratel. Its partnership with the honey-bird is one of the noteworthy facts of natural history. Both the bird and the mammal have a peculiar and marked individuality in their make-up and habits; the whole life history of each is well worth studying, but their partnership in marauding against the bees is the most extraordinary of all. Normally the ratel feeds on vegetable matter, insects, and the like, yet Major Stevenson-Hamilton gives what seem to be unquestionable incidents of its attacking and killing adult males of the largest and most formidable antelopes. If attacked, it will fight to the death against any odds, and it is no easy work for even a lion or leopard to kill it.

Major Stevenson-Hamilton's position enabled him to note closely all kinds of incidents in the life of the great carnivores, the big cats, the hyenas, and those bush pirates the hunting-dogs. His running notes on natural history are enlivened by accounts of very interesting adventures—one or two of them in connection with lions were of a really extraordinary nature. Like every other competent observer—including the authors of both the other volumes here considered—he dwells on the extreme variability of character among the higher mammals. This is a factor always to be considered in speaking of dangerous game. There is a certain average difference in the danger of hunting lion, buffalo, elephant, and rhinoceros, but this average difference is less than the very wide differences among individuals of the same species. On the whole, lions charge more readily than any other species; yet some can hardly be bullied into making any kind of a fight.

The account of the tame eland makes one regret more than ever that some government does not somewhere undertake the task of taming this splendid animal. The eland is probably by nature much fitter for domestic uses than are cattle. Unfortunately, as with the American bison, it lived in regions where

[1] Animal Life in Africa. By Major J. Stevenson-Hamilton. William Heinemann, London.

the natives never reached the stage of themselves taming species of wild animals. Accordingly in Africa, as in America, the tame animals that now flourish were taken over from races who had domesticated them through long ages, so that they had become entirely fitted for their work. At least two, and probably three, wild species of oxen proper were thus tamed, not to speak of the buffalo, the gaur or gayal, and the yak, in Asia, from which region doubtless the cattle-owners spread into Europe and Africa many thousands of years ago, just as within the last few hundred years they have spread into the Americas and Australia. The bison could unquestionably have been domesticated at least as easily as the other species of cattle were domesticated in the long-buried past, and the eland probably much more easily, and certainly very much more easily than the reindeer. In the case of the eland it is not too late now, although the work would probably have to be done by a government rather than by a private individual.

Major Stevenson-Hamilton is not only a keen observer and good writer as well as a good hunter, but he is also admirably fitted to give advice on the whole subject of game reserves and of preserving the wonderful fauna of the wilderness without interfering with the legitimate demands of the settlers in wild places. His book should be in the library of every hunter, of every naturalist, of every man who cares for the life of the wilderness. Moreover, it should be in the hands of every man who is awake to the need of preserving at least a fragment of that extraordinary wild life which vanishes before civilization.

There are all kinds of problems connected with preserving wild creatures, by the way, and one of the most important of them, of a totally unexpected kind, has come to the front during the last decade in connection with the wapiti, the elk, of the Yellowstone Park. The Yellowstone Park was always a favorite summer range of the elk. Under protection they have increased enormously in numbers. They summer within the park; although some of them winter within it, especially near its northern border, the majority tend to go out, especially to the south. All wild birds and animals of course possess a fecundity such that where natural checks are removed they increase in geometrical ratio. This is true of them just as it is true of tame animals; let any kind-hearted lover of animals remove all checks on the increase of, say, the cats or rabbits on his place, and inside of a year he will find this truth illustrated by practical experiment. Almost any species, if freed from natural enemies, increases so fast as speedily to encroach on the possible limits of its food supply, and then either disease or starvation must come in to offset the fecundity. In European game reserves the shooting tends to keep down any abnormal increase—although even in these game reserves over-preservation often results in stunting the development of the animal or exposing it to disease. In America hitherto the success of the effort to preserve the different kinds of wild creatures has not been great enough to cause us any alarm as to their over-increase, with the single exception of the elk in the Yellowstone Park. But this is a very serious exception. Elk are hardy animals and prolific. It is probable that a herd under favorable conditions in its own habitat will double in numbers about every four years. There are now in the Yellowstone Park probably thirty thousand elk. A very few moments' thought ought to show any one that under these circumstances, if nothing interfered to check the increase, elk would be as plentiful as cattle throughout the whole United States inside of half a century. But their possible range is of course strictly limited, and as there are no foes to kill them down, the necessary death rate is kept up by nature in a far more cruel way—that is, by starvation in winter. The suffering and misery that this means is quite heartrending. Every winter the wapiti herds that go south of the Yellowstone Park lose thousands upon thousands of their numbers by the long-drawn agony of slow starvation. The loss falls especially, of course, on the calves of the year, and the cows in calf—the very animals that under any proper system of hunting suffer least. From time to time well-meaning people propose that the difficulty shall be met by feeding the elk hay in winter or by increasing the size of the winter grounds. Of course there are circumstances under which feeding hay is not only proper but necessary, and it may be that there can properly be made a slight enlargement of the summer range of the elk. But as a permanent way of meeting the difficulty neither enlarging the range nor feeding with hay would be of the slightest use. All that either method could accomplish would be to remove the difficulty for two or three years until the elk had time to

multiply once more to the danger-point. What is needed is recognition of the simple fact that the elk will always multiply beyond their means of subsistence, and that if their numbers are not reduced in some other way they will be reduced by starvation and disease. It would be infinitely better for the elk, infinitely less cruel, if some method could be devised by which hunting them should be permitted right up to the point of killing each year on an average what would amount to the whole annual increase. The herd must be kept stationary, and it should be kept stationary in some way that will work the least possible cruelty to the animals and will be of most use to the people of the country, especially of the States in which the park is situated. Of course the regulation should be so strict and intelligent as to enable all killing to be stopped the moment it was found to be in any way excessive or detrimental. There should be no profit hunting—that is, no sale of the meat or trophies.

Mr. Sheldon is an outdoor naturalist, a faunal naturalist, as well as a great hunter. His present volume [1] is one of a series he is writing dealing with the animals of Alaska and the Northwest, a series which when finished will give us more information on the natural history of the most interesting animals of the Northwest than any or indeed all other volumes contain. Mr. Sheldon and Mr. White—whose book I shall next consider—are big-game hunters of the best type. They are not professionals, but in point of hardihood, of skill in their craft, of ability to fend for themselves, and of readiness to meet every emergency and every risk, it is not too much to say that they are fairly entitled to come in the line of descent straight down from the Boones and Crocketts, the Kit Carsons and Bridgers, of the old days. Each of them by preference hunts entirely alone. Each is as competent to care for himself as any Indian. The book is admirably written by a man who loves the mountains, the great woods, and the stormy seacoasts, and who describes with power and charm what he has seen. He is the direct reverse of a game butcher; he cares nothing for a "big bag." He kills only what must be killed. His book is of practical value to naturalists.

Mr. Sheldon's book is most interesting, as well. Its greatest value consists in the account of his hunting trip after the huge bear of Montague Island, a bear which Hart Merriam has made into a new species—"species" nowadays having no such significance as in former times, it being a mere term of convenience. His observations of the habits of the big bear have a particular value. It is evident that nowadays these bears are not dangerous game in the sense that various African animals are to be considered dangerous game. The book is illustrated by exceedingly good and well-chosen photographs, and also by certain pictures of Carl Rungius's, which make us realize vividly that even the best photograph in no shape or way replaces or comes anywhere near replacing a really good picture by an artist who is himself a first-class out-of-doors man.

Stewart Edward White's book [1] deals with hunting-grounds as unlike those of northwestern America as can well be imagined. He too has written a notable book, and has given a fresh proof, if one were necessary, that the fact that many first-class books about hunting in a given region already exist in no way means that there is not ample room for another first-class book. It is totally unlike Sheldon's, except in the sense that both men have a great love for wild natural scenery and good power of describing it, that each is an observer as well as a hunter, that both are thoroughly hardy men whose deeds in no way resemble those of the mere holiday hunter. I am not running down the holiday hunter at all, for he may do the best that his opportunities allow: I am only pointing out that he must not compare himself with the man who can push boldly into the unknown and do all his work for himself.

Mr. White was for part of the time while in Africa a companion of Mr. Cuninghame, a professional elephant hunter, who managed my safari during most of my own trip in Africa, and Cuninghame wrote me that White was the very best game-shot with a rifle he had ever seen in his life. The account of some of his adventures with lion and buffalo is thrilling, and, moreover, it is so written as to give a real and satisfactory idea of just what it was that happened, and, without either understatement or exaggeration, of what might have happened if the powder had not been straight. Moreover, his account of his gun-bearers, of the natives they met, of the vast, strange, barren country through which he traveled, and of the great

[1] The Wilderness of the North Pacific Coast Islands. By Charles Sheldon. Charles Scribner's Sons, New York.

[1] The Land of Footprints. By Stewart Edward White. Doubleday, Page & Co., New York.

beasts by which he was continually surrounded, is all most interesting. The chapter on the lion dance of the wild savages who were his porters is as vivid as anything of the kind in any book. And the following chapter, describing the precarious rise from the ranks of a porter with aspirations to become a gun-bearer, is not only very humorously told, but affords a practical illustration of some of the things which Mr. White does that make him a good hunter. Not the least interesting chapters are the two which describe the visit to Mr. McMillan's Juja Farm, where the fortunate visitor can relish, as probably nowhere else on earth, the experience of living in a house with every comfort and luxury, right in the middle of the teeming life of the African wilderness.

In the appendix Mr. White treats of rifles and equipment. In his protest against the needless luxury, in fact the cumbrous luxury, of present-day African hunting he is quite right. At the same time, in the outdoor sense of the word, Mr. White is a very "hard" man, and it would not be well for the average holiday sportsman to try to follow his example in cutting down the paraphernalia of African camping life, any more than in cutting down cartridges. Moreover, he is mistaken in thinking that all the men who use shorts and leggings, leaving their knees bare, do so for the sake of looks. Much the best hunter of my own party speedily adopted them, purely because he liked them; and he has used them since then, hunting sheep in the Mexican desert, and moose and caribou in the great northern forest. Personally, I cannot stand them; but that does not alter the fact that other people genuinely like them better than any other rig. It is rather gratifying to find that White used three rifles of the same kinds that I used—a Springfield, a 405 Winchester, and a double cordite Holland & Holland—and that he found that each of them did just what I found they did, that is, the Springfield was his ordinary weapon—his walking-cane, so to speak; the Winchester was his lion gun and the gun for the big antelope; while the Holland was for the few species of very heavy game. But I emphatically dissent from Mr. White's advice to take out only three cartridges for every head of game which it is expected to shoot. His own record was extraordinary, for he got about one animal for every two cartridges fired. I believe that the great majority of animals he killed cost him but one cartridge apiece. Moreover, the antelope of the plains were killed at an average of 245 yards, with a maximum of 638 yards. Now I am an ordinary shot, neither better nor worse than the average big-game hunter who has had some experience. But I could not begin to approach these figures. I did not ordinarily shoot at such long ranges, and yet I averaged about three times as many cartridges to a kill as did Mr. White. As a matter of fact, Mr. White at a hundred yards shoots about as well with a pistol as I do with a rifle. Unless the hunter going to Africa is a very unusually good man, I advise him to triple the number of cartridges which Mr. White thinks it necessary for him to take.

Mr. White hunts his lions in the most sportsmanlike style. I agree with him that rounding them up on horseback and following them on foot are the two most sportsmanlike ways. But when he speaks as he does about hunting them with dogs he should remember that it is an exceedingly difficult feat to train a lion pack with real efficiency, and that a pack not so trained is only a doubtful and occasional help. For a century hunters have employed dogs occasionally in chasing lions, and never with any marked success. It was not until Mr. Paul Rainey, an experienced bear hunter, introduced his pack of Mississippi bear hounds into East Africa that this method of hunting became a really startling success. Until Rainey brought his hounds to East Africa few people believed that anything could be done with hounds against lions. Then when Rainey had made his striking success most people jumped to the opposite extreme, and said that it was not a really sporting way in which to hunt lions. As a matter of fact Rainey's was a great feat—not quite as great as the feats of Buffalo Jones and his associates in roping lions, rhinos, and giraffes, but still a great feat. Wherever settlers are found lions must be destroyed, and the very few hunters able to train a pack as Rainey trained his can do more for their destruction than any other man. Of course, where it is desired to preserve lions it is wise not to let such a man as Rainey with such a pack as Rainey's go after them!

These are three capital books, written by three men of the best outdoors type, three men who are hunters, who are naturalists, who are keen observers and excellent writers.

THE BALKAN WAR

A POLL OF THE PRESS

THE TURKS

THE New York "American" prints in part an address delivered in 1905 by Mr. Bryce, British Ambassador at Washington, from which we take this excerpt:

There is encamped in eastern Europe and western Asia a band of raiders, miscalled a Government, who have done nothing since they came out of Central Asia but rob and murder the unhappy peoples they have conquered, and who have unfortunately been treated by the European states as if they were a civilized Power.

The worst Governments in other parts of Europe at least profess to secure order and administer justice, and consult the interests of the governed. Those who rule Turkey do none of these things. The Sultanate would long ago have disappeared, being either overthrown by internal insurrection or seeing its territories partitioned among neighbor states, had it not been for the mutual jealousy of other Powers.

The "American" says:

While the views of the author of "The American Commonwealth" on the Eastern question could be expressed with perfect propriety, it would not be fitting that the distinguished diplomat should do so at this critical time; still it is fair to suppose that his views freely expressed in 1905 have not materially changed.

In the same strain the New York "Mail" says:

Strange that Europe should ever have deemed it desirable to save the Turk from expulsion! Strange that the destroyers of the Greek civilization; the ravagers of temples and churches and libraries; the authors and centuries-long perpetrators of the tribute of children; . . . the injectors of nameless shames, diseases, and corrupting vices into the blood of Europe; the perpetrators of the awful massacres of Chios, of Smyrna, of Cyprus, of Armenia, of Bulgaria; the pillagers of thousands of European villages and the outragers of myriads of European women—strange, indeed, that these monsters should fancy that they have the right to appeal to Europe for protection! The blood of countless thousands of murdered Christians cries out against such a doctrine.

No. . . . The Bulgarian at the door of Constantinople is Nemesis. He represents the overdue justice of centuries.

THE BALKAN FEDERATION

According to the Paris "Temps," the terms of a compact were signed last March, a compact which not only provided for concerted action against Turkey and the time for that action, but also outlined the division of the spoils of war. The Burlington, Vermont, "Free Press" says:

The Balkan powers plainly selected the time for their onslaught upon Turkey with the greatest care and the most skillful strategy. Choosing a period when Turkey had not had time to recover from the disastrous effects of a prolonged struggle with Italy, the . . . allies suddenly began a campaign which was evidently carefully thought out and well planned as the result of long deliberation.

A marked feature of the war was the excellent fighting of the Bulgarians, says the Buffalo "Express."

Their infantry has shown great steadiness, their artillery is credited with splendid work, and their generalship is of a kind not to be despised. It is known that Bulgaria made long preparation for this war, and evidently that preparation was thorough and wise.

The New York "World" points out the main reason why the war has succeeded:

The Bulgarians were operating in Turkey, but mainly among Bulgars and friends. The Greeks fought in Turkey, but among Greeks. The Servians invaded Turkey, but the welcoming villages were Servian. . . . Each nation marched to relieve its own race, with short lines of communication and a friendly folk about it. For this reason the advance information of the allies was perfect. . . . Wherever they went men of their own blood, beliefs, and national aspirations came to them from the side of the enemy.

Thus the Knoxville, Tennessee, "Sentinel" concludes:

Military critics missed the mark in predicting that Turkey would construct another impregnable Plevna and hold up the Bulgarian armies, as it held back the Russian, and that the Asiatic reserves would then overpower the Balkan allies.

On the other hand, the allies' success has been so instant and continuous as to lead the Springfield, Massachusetts, "Republican" to query: "When have events of such momentous import come with such stupefying speed?"

THE TURKISH DEFEAT

The Turkish press is pessimistic but defiant. The Constantinople "Tanin" thinks that, even if Tchataldja should fall, a new line of defense, beginning at San Stefano, could be organized. It adds:

All the population of Constantinople should work at the erection of these lines of defense.

We ought to have a Corps of National Defense. Every one must fight, for it is probably the last time that we shall fight in Europe.

The Constantinople "Ikdam," however, which is supposed to have Government connections, urges the necessity of making peace. The result of another defeat, it says, would be not only the expulsion of the Turks from Europe, but the partition of the whole Turkish Empire.

According to the London "Times" Constantinople correspondent, cabling Wednesday, giving a statement from Kiamil Pasha, the Turkish Premier thus complains of the Powers:

A fortnight ago . . . we demanded mediation from the great Powers, with the object of concluding an armistice as a preliminary to peace. Several days passed before they decided to undertake the task of mediation in common. . . .

Had the great Powers without loss of time communicated our demand for an armistice to the allies, they would have taken serious steps to insure a cessation of hostilities, and saved the lives of thousands of soldiers who fell in the battles which have since occurred. . . .

Had the fortune of war been propitious to us, and had the Imperial army entered Bulgaria, would the great Powers have shown that indifference which marks their attitude to-day, or would they have forced us to quit Bulgaria, as once they prevented us from marching victoriously into Athens, and from retaining the territories we had conquered from the Greeks?

As to final peace terms, the London "Times" expresses the hope that Turkey will accept those offered, adding:

The Turks will do well not to be misled by the resistance they are able to offer at the Tchataldja lines. All the valor they can summon to their aid can never now repair in the slightest degree the territorial losses they have sustained.

Turkey's instinctive appeal to the Powers "was not unnatural, in view of the practice of the past," says the New York "Tribune," and it adds:

But now the past is indeed past. As a French wit has put it, "Old Mr. Status Quo is deceased."

Even if the Powers had listened to Turkey's appeal for help, says the New York "Evening Post," "it is doubtful whether the result would be largely different from what it will be if Constantinople and the Balkan States are left to settle matters between themselves." The "Post" then proceeds to point out another result:

This same reason makes the possibility of a European conflict much less probable than it would have been in case Turkey had been victorious. With the Balkan States as pawns in the game, the appetites and passions of the Powers might easily be aroused. With the Balkan States largely the masters of their own fate, there is obviously so much less matter for the Powers to quarrel over.

There must be, says the New York "Sun," three phases to the negotiations for peace:

First, Turkey and the allies must agree on the extent of territory the former is to cede to the latter, the conditions under which it is to be transferred, and the amount of indemnity, if any, one side is to pay to the other.

Next, the Balkan States must satisfy the mortgage of the European Powers upon the estate thus acquired. Austrian purposes for Albania and her interest in an internationalized Salonika must be met and satisfied. The Rumanian demand for "compensation" from Bulgaria for her passivity during the present war must be honored or rejected. Russian concern for the future of Constantinople, and perhaps for the opening of the straits to her Black Sea, must be considered.

Finally, the rival claims of Servia, Greece, and Bulgaria in Macedonia . . . must be reconciled before the new order is established in the Balkans.

THE FINAL DISPOSITION

Among the terms of peace offered to the Turks by the Balkan allies were, as reported, the following:

The surrender of the Turkish army.

The demolition of the Tchataldja forts.

The evacuation of Adrianople and the other strongholds now besieged by the allies.

The surrender of conquered territory and the payment of a war indemnity.

The Dardanelles to be opened to the commerce of all nations without restriction.

Constantinople to be put under international control, and Salonika to be made a free port.

"With regard to the visible facts of the situation," comments the Chicago "Inter Ocean," "these terms strike disinterested observers as both moderate and shrewd." It explains:

They are shrewd because they offer inducements against intervention by the great Powers of Europe in behalf of the beaten Turks. They avoid arousing national jealousies. They consider all the interests involved.

With regard to Albania, the New York "Times" thus counsels:

The erection of Albania into an autonomous state, under the suzerainty of Turkey with a Christian Governor, after the plan that has worked admirably in Lebanon, would be one means of utilizing Turkish influence, and preventing the confusion that would otherwise arise.

THE POWERS

Among the Powers of Europe, thinks the Missoula, Montana, "Missoulian," "there

appears to be the honest purpose to let the Balkan belligerents have the fruits of their hard-earned victory."

As to the attitude of particular Powers, Austrian feeling towards Russia is reflected by the Vienna "Neue Freie Presse," which has always enjoyed a certain official authority:

The Austro-Hungarian monarchy has been appealed to for intervention between the two parties in the struggle on the Balkan Peninsula. This is a flattering offer, but it is impossible to comply with it until Russia changes her present policy. . . . While we do not covet an inch of ground which belongs to Russia, and we think that Russia has the same feeling towards us, . . . Russia is jealous of the power which we exercise over the south and east of Europe, . . . though in comparison with Russia's vast possessions . . . Austria's territory is no more than that little vineyard which the rapacious Jezebel wanted to add to her royal garden.

Russia's position is outlined by the St. Petersburg "Rossya," supposed to be a Government organ:

We cannot conceal from ourselves, nor indeed from others, the fact that the sympathy and friendship of Russia are on the side of those who are our Slav brothers both by race and by faith.

The St. Petersburg "Novoye Vremya" says:

Of course every thinking Russian sincerely wishes for the growth of Slavism, and would gladly support a policy leading to the ultimate victory of the Slav idea in the Near East. But . . . it would be naïve to think that the war will be with the Turks only. Of course, with regard to the Turks, the Serb-Bulgaro-Greek army might prove sufficient. . . . Even if the Bulgarian guns are never directed north or west, the war will really be with Austria just the same.

THE CHOLERA

Meanwhile a common enemy, the cholera, has attacked both the army of the Sultan and the army of the allies. Says Mr. Ashmead Bartlett, correspondent of the London "Daily Telegraph:"

No words can convey an adequate impression of the terrible ravages of the Asiatic cholera, carrying off hundreds of men in a day, and casting dread into the heart of a resolute foeman. A man may be perfectly well in the morning; a few hours later he is writhing on the ground in agony, and is a corpse by nightfall. Every road over which the troops move to the front is marked by a trail of corpses, or of men dying by the roadside. There are no medical arrangements of any sort. Once a soldier is seized with the cholera he is regarded by his comrades as a pest to be avoided. Those who fall are left to die where they drop. . . .

The scenes in the villages in the rear of the army pale into insignificance compared to the horrors of Hademkeui, the headquarters of the Turkish army, where the remnants defeated at Lule-Burgas were rallied. It is the men who went through the awful hardships and sufferings of the retreat after that battle, and who lived ten days on green corn or scraps of offal picked up as they marched, that yielded the greatest number of victims on the altar of Asiatic cholera.

The London "Daily News" Constantinople correspondent also gives a vivid story of the cholera horrors. He says the daily mortality is placed by some of the authorities at six thousand, but by none at less than two thousand. A well-known war correspondent said to him:

Of all the hundreds and thousands of men dragged here from Asia, scarcely one per thousand will return to their families, and their friends will never learn their fate.

"Turkish officers declare," says the Boston "Journal," "that the spread of the disease has made any real resistance to the invaders impossible, but also that it will effectually prevent the Bulgarians from crossing the line and occupying the district around Constantinople."

The cholera is a peril not alone to the two armies. Says the New York "Times:"

The cholera and typhus, which have attacked impartially the contending forces in the marshes about the Tchataldja hills, are as dangerous to the world as to the immediate victims, for their infection will spread unless checked on the spot. At best the resources of the Turkish administration to deal with the peril are inadequate, and those of the Bulgarians no less so. The former are demoralized by defeat; the latter are hampered by conditions of actual warfare, in which scant attention can be given to any but the men fit to fight.

With the cessation of fighting on the adoption of the armistice there will be opportunity for the splendid organization of the Red Cross to get in its effective work. The demand for all sorts of supplies and for trained men and women to apply them will be very great and very pressing. We in America are too far from the field of operations to send nurses or physicians. But we can send money, and we should send it without stint.

To this the Sioux Falls, South Dakota, "Press" adds:

The Red Cross organization of the world is human sympathy materialized. It ministers alike to the fallen friend and the fallen foe. When it asks for aid, the appeal of the Red Cross goes straight to the heart of the philanthropist, for real philanthropy is dedicated to the cause of humanity in the broadest sense.

WHERE THE GUNMEN COME FROM

BY JAMES FORBES

The conviction last week of the gunmen who actually killed the gambler Herman Rosenthal, following the conviction of Becker, the former lieutenant of police, who planned the crime, makes this article of peculiarly timely interest. Mr. Forbes is the Director of the National Association for the Prevention of Mendicancy, and readers will remember his articles in The Outlook on the Yeggman, the Tramp, and the Ex-Convict.—THE EDITORS.

WE used to look to Arizona and Nevada for gunmen. But these sections having become civilized, we are compelled to fall back upon our own East Side for the supply of hired assassins. Years ago the old English and Irish thug of the "Red Leary" type obtained. These men usually inflamed themselves with liquor, and fought with their fists, brass knuckles, and the like. Later came the "guerrilla," the immediate predecessor of the modern gunman. His justification in the eyes of the politicians who "took care of him" lay in his ability to vote early and often, and to do such "rough-house" work as primary day in a close district might demand. Although he came into prominence only in the late '90s, the "guerrilla" is already a thing of the past. Though his memory be not sacred, even he was a less unsavory character than the more pretentiously styled "gunman" who has succeeded him. Although essentially a "rough-house" man, he fought with his fists, though his ethical sense rarely restrained him from kicking his victim. Nor was he unacquainted with the sandbag and blackjack.

The gunman is a new species in New York even among gangsters. He seems to be a product of the last decade. He has neither the burly physique of the old thug nor his aggressive courage. So he resorts to more refined methods—the revolver. The Western gunman, though a desperado, was never, or rarely, a hireling. But the fellows we have on the East Side to-day, whose profession is the six-shooter, are just the transplanted, slinking type of hired bravo of familiar Italian style. They have their regular prices for killing, maiming, or beating up. And the jobs are turned off very cheaply here.

Instead of the former thug, the Neapolitan bravo, the burly Apache in cap and blouse, or the sodden Hooligan of London, who lurks in dark corners and waylays his victim, we have in New York a dapper, black-haired, brown-eyed, sallow, sleek, well-dressed, carefully manicured person. In some variations of our old-time thug and in the picturesque assassins of other lands there was occasionally something that might appeal to the romantic side of us. But the East Side gunman lacks even the doubtfully redeeming quality of picturesqueness. He is essentially a coward; he is almost childishly profane, this accomplishment being necessary to overawe the broken-spirited people who are his usual prey. With the ferocity of the rabbit, he sports such appellations as are evidenced in the list of Rosenthal gunmen. He is the rat, the weasel type of man, undersized, wormy, not even approaching the wolf man in style. The quality of his courage is most accurately shown in his congenial business of beating up girl pickets in a shirt-waist makers' strike. On such occasions your "Spanish Louies," "Kid Twists," "Cyclone Lewises," and other doughty warriors of their kind, with gangs of rabbit-like retainers, all packing guns of large caliber, are most effective.

The New York gunman has no fight in him. He is a parasite upon the outlaw industries, and those whom he bleeds are wretches so degraded by liquor, drugs, and similar excesses as to be able to oppose no resistance even to his feeble will. It is the gunman and not the gun that talks. That he actually ever pulls a trigger, except to shoot a man in the back, is a matter for interesting psychological deduction. In fact, he presently becomes the victim of his own long-continued bluster. As a result of excesses, his inhibitory powers fail as the force of impulse increases, and presently the instrument of death in his hands comes into use—whether half-subconsciously or not. Swinging his gun with finger through the trigger guard, swaggering, bragging of "croaking this one" and "cooking that," he comes to believe himself a desperado. All sense of perspective is lost, and, steamed up all the time by drugs or liquor, stimulated by the glare of the lights, the jangling music, in the back rooms he infests, he is seized by an obsession to do the very thing that he has

boasted of—to make good in the eyes of the gang.

Such artificial stimulation is necessary in our East Side silken, perfumed gunman, who is invariably a pander, and whose luxuries—for he demands luxuries, and would scorn the Spartan corn beef and cabbage and mixed ale of the "guerrilla"—are his tribute as the parasite of "Pretty Marian," "Cross-Eyed Lizzie," or the "Kansas Kid." Under these conditions, he is supposed to recognize the *quid pro quo* idea. He must play the cavalier—protect his dame. If she be arrested, he must bail her out. If the "Johnnie" she has in tow will not part from his "roll" amiably, the gunman must appear on the scene and supply the necessary impetus. Under pain of distressing scenes, he must at least pretend to live up to his oaths of fidelity to the fair one whom he has selected as his meal-ticket. But, being a rat at heart, he is never faithful very long. Inter-underworld feuds, with the beatings up and cowardly shootings typical of them, are continually occurring under the lash of some injured beauty's tongue.

Quite in keeping with his other drug-exhaled ideas is the gunman's absurd confidence in the power of the underworld to protect him through the police and the politicians. But the underworld is pathetically weak. It knows no such thing as coherence or concerted action. Each of its members is an extreme individualist, who, when his or her interests compel, will not hesitate to violate what is supposed to be a fundamental code, "Thou shalt not squeal." However, there is a fragment of reason in the almost childlike faith of criminal peoples in their ability to secure protection. Political exigencies have developed types of leadership in politicians who have stood, and still stand, the traditional sponsors for social outlawry, and whose ability as "fixers" is unquestionably great. The blind faith in the "Big Fellow" in New York, in the "Big Four" of Pittsburgh, and in kindred institutions throughout the country is justified in large measure, and reflects the modern tendency to commercialize even vice. But the slum politician, although he must protect his henchmen for the political strength their votes and those of their gangs afford, shies at including murder in the list of negotiable crime.

As a parallel to the New York gunman, even closer home than the Italian bravo, is the "highbinder." The On Leongs, Hip Sings, or Four Brothers tongs have difficulties to adjust in Boston, New York, Philadelphia, San Francisco, Seattle, or New Orleans. Highbinders, paid by the job, are imported from some other city than that in which the tong execution is to occur. Armed with long blue-barreled .45 automatics, the sandal-shod Celestials come shuffling into the local Chinatown. The lobbygows (messengers) of their employers point out the victims. At a convenient time and place the fusillade occurs, and then the furtive, inconspicuous highbinder slinks back into the byways inhabited by his tong, and the white man's justice seldom strikes effectively. "A war of monkeys," in police parlance.

But even this type of the bravo has something about him superior to the East Side gunman. A slave, he carries out the mandates of his tong masters; for hire, it is true, but only incidentally for hire. He simply executes the justice of his tong, and no doubt is justified in his own eyes. There is no such code of ethics in operation with our gunman. He is but a cunning, dangerous beast, with certain menacing qualities for sale to any bidder, for any purpose. Having no stomach for fighting, he will, whenever possible, "double-cross" his employer, as in the very usual instance where gang leaders hire their retainers out to employers and labor unions impartially, as thugs in the same strike. Or again, having contracted with a chain of gambling-houses to supply gunmen for protection against raiders, they will, in collusion with the raiders, permit their gambling patron to be held up, and, after having pocketed his fees for protection, proceed to the division of the new spoils.

Most of the gunmen in New York are Jews or Italians. When we consider that both races are home-loving, and that the Jew in particular has withstood the disintegrative acid tests of civilization more successfully than any other race, it is surprising that from homes often patriarchal in type, the parents deeply religious and self-sacrificing for their children, the sons of such mothers and fathers should in a few short years deteriorate into the unmoral creatures of whom this article treats. What we have said of the Jewish home may be said in large measure of the Italian home, for, be it remembered, the Italian criminal is not the father of the Italian children of New York.

Is there, then, some evil influence peculiar to the city or country or climate, operating

to bring about so sinister a transformation of type? Or is it a case of new wine in old bottles? Has the wine of liberty that has been fermenting so long in the races in the Old World suddenly found a destructive expression in the New? Is it something in the air that makes these children resent the rigid discipline so long imposed upon them in Europe? Is it the reaction from the Russian ghettos? Certainly this theory does not apply to the Italian children.

In the matter of the Jews it is a question how far the patriarchal family discipline that obtained in the Old World is possible in the New. There is a pervading resentment against restraint on the part of the young people growing up in this city that would have been regarded as unheard-of rebellion in the homes in Russia, or, again, in Italy.

Certainly this change is not due to congestion of population. The ghettos of Warsaw and Krakow are quite as over-populated as New York's East Side, and the outlet there for healthful ambition infinitesimal in comparison. In those two cities conditions of poverty are at least as bad as the worst prevailing in New York; yet gun-play is unknown. Perhaps the nearest approach to Jewish criminality (so viewed at least by the Government bureaucracy) in Warsaw and other Russian cities is the developing of the type of the Jewish intellectual who allies himself with the physical force movement against the Russian bureaucracy. But this does not imply moral deterioration necessarily.

What is it, then, that produces gunmen from these two excellent races? Is it the intensely stimulating atmosphere of the cities of Western civilization that brings out all the repressed forces of their nature? Is it the fact that commercialized vice carried on in tenement neighborhoods cheek by jowl with respectable home-loving families makes sin less hideous and at the same time suggests an escape from drudgery? Surely these influences are disintegrative, subversive of good morals; undoubtedly they account for the continual sloughing off, as it were, from homes of piety and happiness and forcing into the mire children of excellent promise.

Many are the gradations through which the sloughed-off product of the home passes. He does not become a gunman at a stroke. There is a period of apprenticeship preceding his final definite reception into vice and his naturalization among the outlaw citizenry of the underworld.

School environment, so far as school authorities can impose it upon the boy, is good, but how far this is offset by street environment is the question. Many experts consider street environment the vital factor in shaping the boy's character.

The street atmosphere of vice soaks into the boy or girl more or less rapidly according to temperament and the relatively close-knitted or loose-knitted moral fiber which resists or surrenders in greater or less time: The pleasures of the young on the East Side constitute one potent factor in breeding gunmen. The dance-halls down there have from their inception been largely in the hands of men connected either directly with commercialized vice or of so low moral standards that they have permitted what might have been innocent, healthful amusement to degenerate into license and immorality.

The boy or young man of the district, having passed through the public school, and now at work in a broker's office or as a messenger boy, is still unable to escape the atmosphere which stimulates and sophisticates before its time. From a day's exciting work he goes almost directly to the dance-hall or pool-room. Then the day comes when "Louis" or "Lefty" or "Whitey" is laid off from his job. If he still lives at home, he is afraid to go there and tell the old folks that he has lost his place. So he goes to a furnished room—one of the most fatal steps in the beginning of a boy's downfall, since here he almost certainly finds criminals who induct him into the ways of "easy money." He is either taught to pick pockets or given employment in some outlaw and degenerate profession in connection with gambling or other vice. As his nature feels the reaction and he seeks stimulants, as do all about him, he acquires the "hop" habit, probably, and then his descent is rapid, sure, and final.

Another thing to be considered is that underworld peoples are almost always deficient mentally, and defective in some physical respect. They are one-sided to a degree. The moral obliquity of gunmen and their kind is justified from the scientific and humanitarian standpoint. In another generation we shall very likely have, instead of widely advertised criminal trials, scientific tests by alienists, which will show in all instances, probably, that arrested mental development is symptomatic of the underworld.

It must be remembered that children who are at all defective are peculiarly subject to

the criminal tendencies of environment. Childish vanity plays an important part. The only acts of children that are particularly exploited are their misdeeds. Now and then one gets into the papers on account of stealing, maybe, and is taken to the Children's Court and reprimanded. This makes a hero of him. Anything that is picturesque catches the child's eye, and gun-play, above all, is the most picturesque of crimes. When a man wields a six-shooter, and has his picture in the papers, that act may sow the seed in innumerable infantile minds of future gun-play.

There is no doubt that the great exploitation of the present disgusting Rosenthal tragedy has moved defective boys to emulate the exploits of the four unfortunates who are now close to the shadow of the chair. And it is important to note that, whether induced by such exploitation of the Rosenthal murder and its settings or not, a lively agitation is on foot to discover the defective children in the schools and secure for them such constructive training as will insure the fullest mental development possible in each case. As usual, the experts are divided, one opinion leaning strongly to the segregation of all alleged defectives in a central training school, and the other, and perhaps the more humane, standing out for no further segregation than special classes for such children in their own neighborhood schools.

We should note, too, in this general connection, great advances made in recent years in the physical care of school-children, such as free dental clinics, oculists' examinations, the furnishing of spectacles where necessary, and the strong movement on foot to furnish sufficiently nourishing lunches to underfed pupils. Granted a wholesome home atmosphere, the best development of the modern school plant on its social side, small parks and playgrounds provided, a cleaner municipal government which will remove from the child's vision and perception vice and ruffianism in their more obvious aspects, it must follow that, unless there be some latent moral lesion, the child can be steered successfully through the formative period of his life free from taint.

Comparatively recent additions to municipal activities possess in a high degree the preventive quality which successfully offsets evils inseparable from congestion. The authorities are alive to the danger of the gang tendency, and are trying to the best of their ability to work out some remedy. They are face to face with the adolescent period of the youth, after he has left school. But it is beyond the province of this article to attempt to adjudge the precise value of, or take sides in the great battle between the advocates of, environment *versus* heredity and temperament as the prime factors in determining disposition and conduct.

THE SAINT OF LITTLE BIRDS

BY ARVIA MACKAYE

We are sure that our readers will like to know that the author of this poem is the daughter of Mr. Percy MacKaye, the well-known writer of dramas, and is only ten years old.—THE EDITORS.

On the fresh first day of spring
  Will come Saint Valentine;
Every sort of bird he'll bring,
  That will nest in every vine.

Every bird a rose-red heart
  Shall bear unto his love,
So that they may never part—
  Robin, swallow, thrush, or dove.

Valentine, that blue-winged saint,
  Will bring the sunny Breeze,
That scatters buds and flowers quaint,
And wakes the drowsy humming bees.

He shall drive the snowflakes back,
  Trumpeting to them all:
"Spring shall follow in your track;
  Wait till winter, ere you fall."

AFTER TURKEY BREAKS UP—WHAT?

BY WILLIAM T. ELLIS

ALL the world is wondering concerning the consequences of the present war in the Near East. To many persons the despatches are largely a muddle of strange names, confused battles, and involved diplomacy. May a plain man find a clear trail out of this tangle? Readers not a few are asking to be told in broad, general, untechnical terms what really has happened, and what are the likeliest consequences. Clearly, great issues are involved. The public to-day, with its growing world mind, wants to be informed. With some diffidence, and having as my only warrant the fact that I have studied the situation on the ground through patient months, trying to see it from many angles, do I venture to restate the whole subject, endeavoring so far as possible to deal with the basic human factors.

It may clarify the geography of the story to speak, not of the Balkans, but of that bit of Europe at the extreme southeastern corner of the continent which juts down toward the Mediterranean, with the Adriatic Sea on the west and the Ægean Sea on the east. This peninsula is the little strip of Europe which the Apostle Paul best knew It was to this region that he adventured when he heard in a dream the same cry that has caused the present war—"Come over into Macedonia and help us." It was to dwellers in the Balkans that he wrote his letters to the Philippians and the Thessalonians—Thessalonica being, of course, the city of Salonika which the Greeks recently captured. On this peninsula also the events of classical literature were chiefly enacted. Here Homer sang, and his Achilles fought, his Hercules labored, Socrates taught, Phidias wrought, and Paul preached. Some readers may study the scene of the war more intelligently from the map of Paul's journeys in the back of their Bibles, or from the maps in the classical histories which we knew during school days. This peninsula is the door through which armies and travelers have passed from Europe to Asia or from Asia to Europe during long ages, and consequently it is one of the oldest battlefields in the world.

In his heyday the Turk conquered it all, even to the city founded on the Bosphorus by the first Christian emperor. Little Montenegro, a mere spot on the map, with but a quarter of a million inhabitants, has been longest free from Ottoman dominion; for freedom is the birthright of mountain folk. Greece, down at the tip of the peninsula, won her independence nearly a century ago, and has ever since nursed the thought of vengeance against her ancient oppressor. Servia and Bulgaria more recently escaped from under the Turkish yoke. None of these four Powers has ever ceased to regard the Turk as their national, racial, and religious foe. If fuel were needed to keep alive the ancient animosity, it has been furnished in abundance by the Moslem oppression of the Christians in Macedonia. Lust and loot and bloodthirstiness have been always present factors in these atrocities. The Greek Church has seen to it that the souls of her members in the Christian states in the Balkans, and in bigger Russia beyond, should be harrowed by these tidings of persecution and massacre. One of the shrewdest of the American residents in the Near East said to me upon one occasion, "We shall never have peace so long as Moslems rule Christians." Unarticulated, that thought has been in the minds of millions of the subjects and neighbors of Turkey. Hence the war. Back of the fighting Christian states which took advantage of Turkey's internal chaos to precipitate the war, Russia has stood as mentor and guardian. Pan-Slavism and the devotion to the Cross which the Greek priests everywhere have preached, have been moving factors in Russia's conduct. The importance of her part in the present situation will steadily be discovered as the days progress. Russia means that in the conclusion of matters she shall have a free passage through the Dardanelles, and exert a dominant influence at Constantinople.

So much for the present war, with its dramatic victories by the Christian allies. Every interested person has expected grave consequences when the oft-prophesied and inevitable war in the Balkans should become an actuality. Now that the event has happened, even the man on the street sees the unlikelihood of a return to old conditions. Victorious armies cannot be dictated to by gentlemen in frock coats in foreign capitals. The Balkans have passed out of the posses-

sion of Turkey. The primitive passions of a multitude of men have been unleashed. The deepest instincts of a long-suffering people, bound into oneness by common ties that are fundamental, have got beyond all barriers imposed by diplomacy. The victorious armies of the allies are as confident as the Crusaders of the Middle Ages that they are doing the will of God. A glimpse into the minds of the people is afforded by this letter from a Bulgarian woman to her husband:

> My dear Husband—Thou art right. Rejoin at once. Thou wouldst lose a day coming to embrace us. Go and do thy duty. I will pray for thee. God will not wish thee to leave nine orphans. Their innocent voices unite with mine for thy good and quick return. But do not worry about their future. He who watches over thee will watch over them also.
>
> If thou dost return, thou wilt find a loving, proud woman. If thou dost not return, know that the memory of thee will accompany me to the tomb. But I will find force to live and bring up thy sons and daughters, who will be the children of a national hero and Christian martyr.

Now, at last, the ancient prayer, "How long, O Lord, how long?" seems to be answered, and the power of Turkey shattered. The break-up of the Ottoman Empire at this writing seems inevitable and imminent. What will become of the pieces? Doubtless the Turk himself will go back to Anatolia, or Asia Minor proper, the land that was his home after he had spilled over from the uplands of Central Asia. In Anatolia, a fertile land of great possibilities, he will have a chance to work out his ultimate destiny, always in the salutary consciousness that the war-ships of the foreign Powers, insisting upon civilized behavior, are cruising in the Mediterranean. Instead of the involved problems of far-flung dominion, to which he has never been equal, the Turk, shorn of his distant territories, will have to learn efficiency, industry, and tolerance within his own Anatolia.

When we come to the question of the disposition of the major portions of the ancient Ottoman Empire, scarcely any two authorities agree. Nor is it necessary to tarry to discuss the exact limitation of the boundaries of the newly conquered Balkan territory. It will be apportioned among the allies, and the likelihood is that the Albanians, the oldest people in the peninsula, the descendants of the ancient Illyrians, may be given an independent existence.

First of all the problems is that of the fate of the city which was the first Christian capital and which Constantine called "New Rome," as he planted it on the Bosphorus, looking over toward Asia, which is less than a mile distant. Everybody who has felt the pulse of the Christians of the Levant is confident that, come what may, the cross will be restored to the dome of the Mosque of St. Sophia, and Christians will have full liberty in this city which is peculiarly theirs. Only an Oriental can understand the depth of the affront and ignominy contained in the fact that the Caliph of Islam has had his throne in the city of the first Christian emperor.

The jealousies for the possession of Constantinople are too powerful and too acute to permit of any one nation securing this prize. Germany has worked hardest for it (and it is perhaps fortunate that the mighty von Bieberstein has not lived to see the overthrow of all his great labors at Constantinople), and Russia most assiduously. Each is an effective block to the other, not to mention the interests which Great Britain, France, and Austria have in the situation. Probably Constantinople will be neutralized under the joint protection of the Powers. Russia's pet ambition to come through the Dardanelles into the Mediterranean, an ambition in which Great Britain has hitherto thwarted her, will doubtless be realized at this time. Such a great Power can no longer be bottled up. In this day of popular rights, nations as well as men must be accorded a square deal. It does not comport with the universal sense of fairness that Russia should be denied this outlet, any more than that Servia and Germany should be isolated. The rivalries of the Powers have a new factor to contend with in the intelligent, determined, and vocal spirit of a common world consciousness.

Having already lost Egypt and Tripoli, Turkey will be obliged to give up all her other outlying territory, which she has proved herself unfit to govern. At no time during the reign of the Turk have law and order and justice prevailed within her confines. In the distribution of the fragments, Russia will presumably get that section of Asia Minor lying north of the Taurus Mountains, north of the Mediterranean, north of Syria, and north of the Tigris River. Her frontier will be realigned to march with that section of Persia over which she now wields sovereignty. The ambitions of the Armenians for an independent kingdom in this region, which was once old Armenia, are doomed to disappointment,

at least for the present; for this pathetic people, despite their mercantile efficiency, are without solidarity and without experience in self-government. Russia will be well content with this prize, which gives her all she can ask in the way of territory and rectification of her boundaries. Perhaps she will ask a port at the head of the Mediterranean, and no man knows what answer the Powers will make.

The present seems the hour of opportunity for British diplomacy to settle some of its most delicate problems. England's old contention for the control of the Mediterranean is no longer valid. She has really lost it at the present time. The immediate concern of Great Britain is to keep control of the Persian Gulf, of the Suez Canal, and of the Red Sea, and to thwart the German Bagdad Railway, which is pointed straight at the heart of India. The simple way out, and the likeliest, is for Great Britain to take Arabia, the most lawless part of the earth, and agree to subjugate it in the interests of humanity. Britain is the most efficient and experienced policeman in the world, and in the present instance has more at stake in Arabia than any other nation. There are manifest compensations for the difficulty of the task.

The high strategy of such a move becomes clear when it is pointed out that already Great Britain is the greatest Moslem power in the world. To insure the tranquillity of these subjects who have been sorely disturbed by the waving of the green flag at Constantinople, Britain needs but to take possession of Arabia, which includes Mecca, Medina, Kerbela, and Meshed Ali, the four great shrine cities of the Moslem world. Once these pass from beneath the sway of the Sultan, his power for mischief will be almost wholly destroyed. With a modern police system and modern sanitation introduced into Mecca, the physical welfare of the world will be mightily served, for this city is the greatest plague spot on earth. Great Britain would not only protect the caravan routes and guard the safety of the pilgrims, but she would also introduce a measure of religious tolerance that would doubtless result in the eventual opening of these sealed cities to travel and trade by Christians. This consummation would not be so undesirable to the Moslems of the world as might at first sight appear. As pilgrims from all corners of Asia have gathered in inns and about caravan fires, they have talked of the safety and liberty which exist under British rule; and a Moslem's religion is not strong enough to make him enjoy being pillaged and persecuted by fellow-Moslems, as is the experience of many visitors to Mecca.

Still another vast concern would be affected by British control of Arabia—a concern of such magnitude that to dismiss it in a paragraph does scant justice to the reader's interest. Mesopotamia, once the home of world rule, the fountain of civilization, and the granary of the known earth, is being reclaimed from the desolations which Islam brought upon it, by the engineering work of Sir William Willcocks. There should be a home and affluence for twelve million people within the area of the present irrigation scheme which is now definitely under way. Sir William himself told me in Bagdad that the two twin problems of the Mesopotamian irrigation scheme are security and labor. Under British rule the security would be sure, and from her Indian and Egyptian territories the same sovereign power could furnish an abundance of field labor accustomed to the problems of irrigation.

As if these reasons were not enough for the taking over of Arabia by Great Britain, and as the ships of the future are to burn oil, and as a fuel station in the East is a problem of first gravity, there may be pointed out the simple fact that the Tigris Valley holds the first known and still unmeasured oil-fields. It was from the bubbling wells of bitumen that Noah got the pitch for his ark, and Nebuchadnezzar the cement for his brick palaces. To this day the overflow of oil in this region covers the Tigris River for miles. Great Britain already has secured absolute right to the oil-fields of Persia. The Anglo-Persian Oil Company sends its roots very close to the British throne. Several other corporations have sought from Turkey concessions for these Mesopotamian oil-fields. Should Britain get them, she would have on both sides of the Persian Gulf an absolutely unlimited store of fuel for her ships of war and commerce. The region of the Garden of Eden would once again teem with cities if Christian sovereignty and enterprise were given to Mesopotamia.

Of all the territory in the Turkish Empire, the most precious in the eyes of the greatest number of human beings is that little strip of land lying along the northeastern end of the Mediterranean which we call the "Holy

Land." Christendom and Judaism both have a peculiar and eager interest in Palestine. Here are the shrines of these two faiths. The soil of Syria was hallowed by the footsteps of the Man of Galilee, whom the world is to an increasing degree acclaiming as Master. Hungry-hearted Jews throughout the wide dispersion are also turning longingly toward this, their only fatherland.

Now Zionism is more potent than many persons know. It does not employ a press agent for all its operations. It plays a part in the world's diplomacy, through its control of financial channels, that is as potent as it is romantic. A single illustration suffices: Despite all edicts and restrictions and laws of expulsion, the Jews have remained in considerable number in Palestine. They and their friends will clearly be a factor in the settlement of the fate of this part of the Turkish Empire. The common mind of the world wills it so. The Jews themselves are not ready for a Jewish state. This strip of land must be controlled jointly by the Powers, and made open, under equitable conditions, to Jew, Gentile, and Moslem. Religious liberty must be realized in the land where it had its birth. It should not be necessary for the traveler to take a guard to protect his life from Moslem fanaticism as he enters the Temple area. Palestine is bigger than any nation, and all flags should become one in safeguarding the precious interests of this territory, which wields such sovereignty over the hearts of men.

Mention of Palestine calls up Germany's plight. German enterprise, especially as represented by the Emperor's visit in '97, has covered Syria with her trade-mark as a much-traveled suit-case is covered with labels. Observant travelers have said that Germany would surely get Syria. But this is no longer sure. Germany has overreached herself. She, more than any other nation, saw the value of Turkish territory. At high cost she made friends with the Turk. For his sake she turned her back upon Christendom, which had always made common cause against him. In high elation, Turkey accepted the friendship of Germany, which she thought to be all-potent. She favored Germany in concessions, as witness the Bagdad Railway; she bought German war-ships and German weapons, adopted the German drill and installed German drill-masters. Now, with a measure of justice, Germany has fallen together with the Turk. She has proved totally unable to serve her ally in the expected fashion. Her weapons and her strategy were unequal to those of the Balkan allies. Her diplomatic influence was not able to avert the war. She could not venture to prevent the humiliation of Turkey by her ally, Italy—and there is grim humor in this, because two years ago the Germans were talking seriously of substituting Turkey for Italy in the Triple Alliance! What remains to Germany territorially is hard to say. Her pre-eminent rights in the Bagdad Railway will in all likelihood be sacrificed. She will, however, have opportunity for free trade all over the Empire, under conditions more advantageous than existed with Turkey itself. In Anatolia, as well as in Syria. there will be opportunities for colonization. Possibly in Africa territorial compensation will be accorded by the Powers.

France and Italy already have their share, in Morocco and Tripoli, with free opportunity for commercial exploitation all over the regions that once were Turkey. Austria does not want territory, but she unquestionably will get to the sea and share in trade privileges.

The Triple Alliance has really become a Dual Alliance of Germany and Austria, and its potency has shrunken mightily. Italy is reported to be not over eager to renew the Triple Alliance, preferring a possible understanding with the confederated Balkan States and with Russia.

Great Britain, France, and Russia are standing together and dominating the situation. The outcome of present conditions, however territory may go and wherever sovereignty may run, will doubtless be liberty of travel and speech and research throughout these lands where graft and repression have been rampant for centuries. The peace of the Near East will be secure, and the riches of the Orient will be newly developed for the whole world. The archæologist may take his spade to the richest storehouses of antiquities, without fear of Turkish ignorance or vandalism. Best of all, in the thought of modern civilization, is the immeasurable emancipation that will come to millions of people within the boundaries of old Turkey, who have been suffering poverty and persecution incredible to the Western world. The largest task of social service before the human race at the present hour is the amelioration of conditions throughout the whole of that vast empire which for centuries has borne the name of the sons of Othman.

THE SKIPPER OF THE MATRIMONY

BY WILLIAM J. HOPKINS

THREE long blasts on the fog-horn, and the Matrimony came wallowing out of the fog, bound in. Her skipper stroked his grizzled beard thoughtfully and looked over the slowly diminishing strip of water that lay between the Matrimony and the wharf. The Matrimony was not fast.

"Charlie," he said, in a deep and gentle voice, "I guess you may as well be shortenin' sail. We don't want to carry away any o' them yachts this time—not if we can help it. No, not if we can help it," he added, as if to himself. "But what is to be will be."

Accordingly Charlie, who was half the crew, stirred up the other half, who was dozing by the foremast. The skipper had the helm.

"Hi, Benny! Shorten sail."

And Benny bestirred him, and together they took in the jib and left it in a heap on the bowsprit. Then they lowered the mainsail, but did not stow that either; and it swung, a great mass of dirty canvas, utterly cutting off the view to starboard. The skipper was a tall man, and many a time he had made shift to see by standing on tiptoe. Perhaps Charlie counted on that. With the foresail alone they made steerageway, but not much more. She was not what you would call an easily manageable vessel, and the tide ran swiftly.

However it happened—whether it was the tide, or the preference of the Matrimony for progressing sidewise, or the jib's blowing out again, or the fact that this time the skipper was unable to see even when he stood on tiptoe—however it happened, they managed to carry away two of the yachts, moorings and all.

The skipper sighed. "Stop runnin' around, Charlie," he said, in the same gentle voice. "You ain't gettin' nothin' done. Better drop anchor right here, while we unsnarl 'em. I don't know's I care about tyin' up at the wharf." He sighed again. "I knowed it," he murmured. "What is to be will be."

A cat rubbed against his great boots, and he looked down. "Not now, Tommy. I'm busy."

It was well along towards sunset when he had the moorings set once more in their places. The fog, which had cleared away reluctantly about noon, was rolling in again over the hills and up the shore. The Matrimony lay at anchor, safely out of reach of the yachts, and the skipper sat on a coil of rope, leaning against the mast, his cats about him.

There were many cats: four or five full grown, though still young; as many more half grown, but just beyond the kitten age; and, strolling along by the rail with four kittens that were just able to run, came another. She paid no attention to the cats already present, and they seemed satisfied to let her alone. The skipper whistled shrilly, and, with a great scrambling, still another cat came rapidly down the mast and landed on the skipper's shoulder. He began trying his claws in the skipper's clothes.

"There you are, Tommy," said the skipper. "I knowed you'd be up there. There, I guess that'll do. Your claws get through, though I know you don't mean nothin' by it. And there's Mammy, too. She ain't what you'd call an affectionate cat, now, is she? Only comes out when it's feedin' time."

Tommy seemed to understand. At any rate, he rubbed against the skipper's curling whiskers, as if to make amends for Mammy's deficiencies.

"Charlie'll be back pretty soon," the skipper went on, "and I expect he'll bring something for you. I expect he will. This old vessel's the onliest home we've got, Tommy, and we must try to make it seem homelike. And if Charlie don't hurry a little mite it'll be thicker'n cheese here, and then he might get on some o' them yachts by mistake. That'd be onfort'nit, Tommy, onfort'nit—them yachtin' fellers havin' your dinner. Like as not they'd have it all ate up 'fore ever I c'ld stop 'em. Now I shouldn't wonder if that's Charlie I hear. I shouldn't wonder a mite."

Tommy jumped down and walked to the rail; and Charlie appeared, bearing a bundle, which he held high out of reach of the horde of cats. He handed the bundle to the skipper.

"Thank you, Charlie," said the skipper. "We're much obliged. And now you might see how Benny's gettin' along with our supper. Seems to me I smell somethin' burnin'. Like as not he's fell asleep. He's liable to, any minute. And, Charlie, we'll

haul out at high water to-morrow mornin'. Four o'clock it is."

"What you goin' to do, Ike?" asked Charlie. "Paint her?"

"No," returned the skipper. His name was Isaac Thompson; but his devoted crew always called him Ike. "No. I don't cal'late she needs paintin' much. I'm goin' to calk her. She leaks a little forrard."

"Well," said Charlie, "all right." And he went his way.

As to the question of paint, whether the Matrimony needed any was a matter of taste. She showed no traces of it for three or four feet above the water, but her oak planking was sound. Most people might have wasted good money in paint, but not Skipper Ike. He kept her well calked; and what more could any skipper want? It was a question that evidently was not worrying him. He untied the bundle while the cats arranged themselves in a half-circle about him and gazed eagerly at it. Then he spread it open on the deck before him, and proceeded to give each cat a proper share; which they had no sooner received than each ran off with his own, growling, to find a spot where he could eat it without fear of molestation.

The next morning, at exactly high water, the Matrimony pushed her keel gently into the sand of a little beach on the far side of the harbor. The fog was still thick—so thick that one wondered how the skipper could find the beach at all. But he had even picked his place. And he ran an anchor out ahead and set up a few shores, the men wading in the water up to their waists. Not that there was really any need of shores, for the bottom of the Matrimony was as flat as a scow's; but merely as matter of form the skipper set a few. Then they went aboard for their breakfast and to wait for the tide to fall, and, incidentally, to dry their clothes.

The calking was done to the skipper's satisfaction in time for the afternoon tide, and Benny took the anchor out astern. Charlie was paying out warp, and the skipper strolled forward to see how he was getting on. Charlie seemed thoughtful.

"Ike," he said, "he's a pretty old vessel, ain't he?" It was a peculiarity of Charlie's that he always spoke of any vessel as "he."

"Yes," the skipper answered. He was not offended, as many men would have been. "Yes, I cal'late she is. She was counted old—leastways, she wa'n't by no means new—when I got her. I've had her twenty-five year—twenty-five year come September. But she's sound, Charlie. And tight now. Twenty-five year 's a long time to look ahead to, Charlie, but it's short enough to look back on—short enough." The skipper's voice dropped to little more than a murmur. He was talking to himself now. "I guess I'll go find Tommy. You'll get along. Just a bit of a strain on that warp, and she'll float."

The skipper went in search of Tommy, but Tommy was not to be found, high, low, nor aloft. The old Matrimony was afloat and swinging easily at anchor when the search ended. The skipper looked worried.

"Charlie," he said, "I s'pose you ain't seen Tommy? No, I thought not. He must 've slipped ashore while we were busy. I'm goin' ashore to find him. You c'n rest easy here for a bit."

He landed on the sand and pulled the boat up. Then he stood, for a moment, undecided.

"I'll go up wind," he said then. "That's the likeliest way. And I hope I find him. But what is to be will be—what is to be will be."

The fog had blown in thicker than ever. The skipper sniffed it eagerly; it dripped from his beard and his clothes were wet with it.

"I love the smell of it," he said to himself, "and I believe Tommy does, too."

He could not see fifty feet, but he strode rapidly up the beach, keeping near to the water and whistling softly. He seemed shut in by an immense silence, as if he were alone in the world. The soft noise of the water was but a part of it, and when he whistled more shrilly, noises echoed all about him and the fog gave back strange sounds. At last he saw the cat, standing and waiting for him, tail in air and blinking lazily.

"There you are!" cried the skipper. "Come, Tommy."

But, though he patted his shoulder, Tommy did not come and jump upon it, as he expected. Instead, he turned about and walked away, looking back occasionally to make sure that the skipper was following, going just fast enough not to be caught.

"Well," said Ike, after trying a fruitless run for a short distance, "I guess you know what you're up to, which is more'n I do. So go ahead, and I'll come along."

There was not far to go. The cat had stopped by something that lay on the beach,

a huddled shape. But the skipper had seen it already.

"A man, by the Lord!" he cried, under his breath. "And has he life in him? We'll see."

That shape did not appear to have life in it. It lay, just as it had fallen or the waves had cast it, on its face, the feet still in the water. If it had been left there by the tide, there was small hope.

Ike took hold of it tenderly to turn it, and his face showed swift wonder, for the body was warm and yielding. He bent to listen at the heart, and drew back quickly.

"Drunk!" he said, in disgust. "Dead drunk—and it's just luck that he ain't dead. A night here would 'a' finished him, he's that far gone. Well, Tommy, we'll just take him aboard. You ought to have a medal, that's what you ought, for life-savin'. It ain't your fault if he dies now."

So saying, he rolled the unconscious man over into his arms, and with the same motion he rose to his feet. Skipper Ike was a strong man, and he strode along now as fast as he had come. The body hung limp and helpless in his arms, head and feet dangling. He stopped for an instant to lift the dangling head upon his arm, and saw the face. He had not looked before.

"By the living God!" he cried, and dropped the body. It fell upon the sand, one arm crumpled under it. "Me carrying him! I'll not do it! I'll not! Let him die, as God meant he should. And I'll help him to it."

And he ran off a little way and came back carrying a stone in his hand—a huge stone, such as few men could lift. He raised it above his head, held it poised a moment, then let it fall into the sand.

"I can't do it. I ain't a murderer." He stood for some minutes gazing down at the helpless body that lay with one arm crumpled under it. "But I c'n leave him here," he muttered, "and let the night do its work—the night and the water. And I will. It was never meant that I should have to carry him."

He spoke earnestly, as if he were pleading. And, having finished, he turned resolutely and strode down the beach. But before he had gone fifty paces he faltered and looked back. The cat was sitting beside the body, blinking lazily.

"Come, Tommy," the skipper called; but the cat did not move.

"Come here, Tommy," the skipper called again, somewhat angrily.

The cat rose, took a few steps, stopped, stretched—and went back; and he began to dig in the sand close to the head, as if he would bury it.

Skipper Ike sat down and buried his face in his hands. "Oh, Tommy, Tommy," he moaned, "it's little you know what you done—findin' him—and stickin' to him. And I can't leave him so. I can't. If he could only have died so, an' me not knowin' to it till it was done! But I can't leave him now; 'twould be clear murder. Ah, well, what is to be will be."

So saying, he rose and again went to the body, his feet seeming to drag him there reluctantly. And once more he took up his burden, apathetically, without looking at the face; and doggedly he strode off down the beach. The cat ran along beside him.

Charlie leaned over the rail, looking into the fog. He heard the sound of oars, then the boat took shape. He watched it silently for a while.

"Hello, Ike!" he called. "Got him?"

"I got him," answered the skipper.

The boat was well under Charlie by this. "And what's that you've got besides? A man, is it, Ike? And is he dead or alive?"

"Alive, but near dead, too. I'll need some help, Charlie, getting him aboard."

Charlie gave him the help he needed, and they got the man aboard.

"It's dead drunk he is, ain't he, Ike?" said Charlie. "Give him a souse overboard, I say. And who is he, d'you know, Ike?"

Ike ignored the last question. "A souse overboard would finish him, Charlie," he answered. "He's that far gone. It's heat he needs, and to lay by for a while. I'll put him in my bunk."

And so he did, covering him deep in blankets, and left him. More he could not do. Then he went on deck to meet, but not to answer, many a question from Charlie.

"It's feedin' time for the cats, Charlie," was all the reply he would make. "Don't you see Mammy stalkin' along by the rail there?"

The next day the skipper was strangely silent. He was not usually silent, though he was never a garrulous man. The crew made preparations for going out again; and incidentally they discussed the man who lay, unconscious still, in the skipper's bunk.

"Who is he, anyway?" growled Benny. "Why, I ain't even seen him."

"Nor you won't, neither," said Charlie. "I ain't askin' no questions. Ike ain't told

me nothin', and that's a sign that he don't mean to. But Ike knows him well enough. Well, it's queer, that's what it is. And now we're goin' out this afternoon, like as not."

"In this fog—thick enough to cut out chunks of it an' put 'em in your pocket?" growled Benny again. "Why can't he wait till it lifts?"

"It ain't a-goin' to lift till the moon changes in the west," answered Charlie, triumphantly; "and that won't be for a good two weeks yet. Ike told me so to-day. And what's fog to him? He c'n pick his way anywhere—in the thickest fog that ever blew in, Ike can."

Benny was silent for some while. "Well," he said at last, "I don't like fog, an' I just wish Ike didn't. An' I don't like his pickin' up that corp', neither, an' bringin' it aboard. It's bad luck, that's what it is. You'll see."

"He ain't no corp'," said Charlie. But he had his misgivings.

And Skipper Ike tended the "corp'" all day, until it began to show some signs of returning consciousness. Then he went out and closed the door softly.

"Not yet," he said, "not yet. I couldn't stand it yet. Maybe to-morrow, or soon, but not yet. I'm afraid I might do him hurt. I guess he'll get along."

And with that he went on deck. "We'll be goin', Charlie. Better get the anchor hove short and some sail on her."

And so they did; and presently, with frequent short blasts on the fog-horn, the Matrimony was under way, bound out. She was an engine of destruction, slow, but not less sure for that. Her skipper knew that well. He laid his course well away from the yachts, and she cleared the breakwater safely, but with none too much margin. They could hear the sound of the seas breaking heavily upon it, for the breeze was fresh, as it is apt to be in such thick weather. It made Benny nervous to hear breakers so near and not to be able to see them.

"That's pretty close, Charlie," he said. "It's too close for me. Ike makes me nervous sometimes."

"Huh!" answered Charlie. "You'd rather go aground to the west'ard, I s'pose. I ain't worryin' any. Ike ain't a-goin' to pile her up—not on any breakwater, he ain't."

"Well," muttered Benny, as he turned to the rail again and looked off into fog, "all the same, he makes me nervous sometimes. It's that corp' in the cabin, that's what it is."

"He ain't no corp'," Charlie said for the second time. But he did not speak with conviction, for again he had his misgivings.

And the skipper stood at the wheel all night, and he thought hard. He did not speak, except occasionally to Charlie, telling him to heave the lead; and, that done and the sample of the bottom brought up by the lead carefully inspected, he returned again to his silent thinking. Toward morning they began to hear the whistle of an occasional steamer feeling her way into port or out. The Matrimony always answered these by a long blast, and the skipper gave them no thought.

"Charlie," he called softly, in his deep voice, just as day was breaking, "have you seen Tommy? He ain't aloft, is he? I want to come about, and he's liable to get throwed off if he's up there. It's blowin' pretty fresh."

Charlie looked up at the shadowy masts. Tommy's favorite station was on the spreaders.

"I don't see him, Ike," he answered. "It ain't hardly light enough to make out much, but he came rubbin' against me a half-hour ago. That's the last I seen of him."

"Better stand by your jib, Charlie. I'm comin' about."

And the crew stood by the jib, and, with a thunder of shaking canvas, the Matrimony slowly came about. As she heeled to the wind a small body dropped from the gaff of the mainsail into the water, and it gave a cry as it fell. Charlie had not thought to look out on the gaff by the peak block.

That cry frightened Benny nearly out of his few remaining wits. "D'you hear that, Charlie? It's the soul of the corp', that's what it was! An' now bad luck 'll be comin' to us—comin' fast."

"Shut up!" cried Charlie. "It's Tommy, that's what it was, gone overboard. An' now Ike'll be goin' after him 's soon 's this bloomin' old vessel—'s soon 's he stops goin' to leeward. An' it'll be for us to take in the jib. You'll see. Better stand by your sheet."

And so it was. "I'm goin' after him, Charlie," said the skipper. "I couldn't leave him to drown, and me doin' nothin'. I shouldn't know no peace. You c'n lay to, here. Blow your horn once in a while, and I'll find you."

He was lowering their only boat as he

spoke—the wheel was lashed—and soon he disappeared into the fog, astern. The sound of his oars rapidly died away.

"I hope I find you, Tommy," he was murmuring. "I hope I find you. You're a terrible worry, but she wouldn't seem like home without you. She went a long ways before I c'ld bring her up, but I did it as soon as I could. And I hope I find you, but what is to be will be. I shall ha' done what I could, and that's always a comfort. Yes, that's always a comfort."

He followed their wake as long as he could, but that was not long. The sea wiped it out, although the Matrimony left a wake that in ordinary weather was visible for nearly a mile. And the rowing was hard work, too, but he did not mind that. It was the fog that he objected to, for the first time in his life; the fog that narrowed his vision to a small circle in which the waves rose and fell with monotonous and provoking regularity. Search as he would, he could not see that small head for which he was looking. He listened until his ears ached—and heard nothing but the wash of the waves as they broke. A half-dozen times he cheated himself into thinking that he heard Tommy crying, and pursued the cry in vain.

The skipper sighed. "Well, Tommy," he said at last, "I guess I'll have to give it up. It's hard to do it, and hard on you, but you couldn't keep up a great while in this sea. I'll just try one more time."

That time he found Tommy. He pulled him into the boat, talking to him all the while, when he suddenly became conscious of the hoarse whistle of a steamer. He had heard it at intervals for some time, but had not heeded, so occupied was he with the search. But now it became an almost continuous bellowing; and in one of the brief intervals he heard the faint, scared toot of a fog-horn.

"That's Charlie," he said aloud, "gettin' in trouble. And I can't help him none. I couldn't get there in time. And what is to be will be."

As he made an end of speaking there drifted down the wind faintly a sound as of splintering wood. That was all. He heard no more the frantic bellowing of the steamer, only the measured blast of her whistle every minute or two. He listened for a few minutes to make sure.

"I guess that was the Matrimony, Tommy," the skipper said, "and we better get there soon 's we can. That won't be none too soon, against this sea. I hope she ain't hurt much, Tommy. Bowsprit gone, maybe, or such like; that's easy fixed—but not worse. I can't bear to think of worse."

The cat crawled, shivering, under his seat, and he began to row with powerful strokes in the direction of the schooner. There was nothing to guide him except his sense of direction and the wind, for the steamer seemed to have proceeded on her course. He heard her whistle now off on his right. He rowed on doggedly. Suddenly the boat was lifted high on a great sea, dropped into the hollow, and the next wave broke over the bow, wetting the skipper's legs and drenching the cat afresh. The cat cried out, and the skipper stopped rowing.

"Come up on the th'art, Tommy," he said, "out of the wet. That was, likely, the wave of the steamer. We're close on to her course now, and I'll follow her wake."

He began rowing again, and was soon in the broad wake, which he followed, knowing well that it would lead him straight to the schooner, if she were afloat. If she were not—but he could not bear to think of that, and put his fear from him. And while he hoped and feared his search came to an end.

There was no mistaking the signs. Here were broad stretches of yeasty seas on which the foam lingered. And here, close at hand, was a piece of the steamer's rail, but no sign of the Matrimony. Skipper Ike knew better than to hope.

"Cut her right in two, 'tis likely," he said. "Cut her right in two, she did. And Charlie and Benny—but they must 'a' had time to climb aboard. Well—" he sighed a long, shivering sigh—"well, what is to be will—no, it has been. That's the last of her, Tommy."

He put his hand on the cat and stroked him. Then he wiped his eyes. Suddenly he remembered the man who had been lying helpless in his bunk.

"I'm glad of it—glad of it," he said. "It's nothin' that I'm responsible for—his drownin'—and I'm glad."

A faint cry came to him, and he turned his head, then began rowing again. Soon he stopped rowing, and presently pulled aboard another cat.

"Now ain't that lucky, Tommy? It's Mammy, that's who it is. And I s'pose I'd better be goin' over the water to leeward, just as a matter o' form. For I ain't noways

anxious to find him. But I see a splinter or two."

He rowed easily back and forth a few times. Then a something took shape out of the fog to leeward, and the skipper's heart sank. He rowed slowly toward it, but he did not talk to Tommy. In another minute he was trying to get a nearly helpless man over the stern.

"Here!" he cried, angrily. "Keep still, can't you? Don't swamp the boat."

The man was in at last and seated in the stern. He looked up as the skipper resumed his seat, and spoke weakly.

"Well, Ike—"

"Don't you call me by name."

The man smiled feebly. He seemed amused. "Well, then, as I was about to remark, here we are again, cats and all."

"It ain't by any wish o' mine," said the skipper, shortly. "Where's Charlie and Benny?"

"How should I know?" answered the stranger. "I have not the honor of knowing those estimable gentlemen. But if they are—or were—your crew, it seems very probable that they are now on their way to, let us say, Nova Scotia. Yarmouth or Halifax, I believe it was. I have no doubt that they had opportunity to take passage, although it must have been hasty."

He waited for a reply, but the skipper made none.

"No doubt you feel some regret that I was not drowned," continued the stranger.

The skipper nodded. "I do," he said.

The man seemed amused again. "Quite natural, quite natural that you should," he returned, amiably. "But I have followed your illustrious career, Ike— Ah, pardon me. A slip, I assure you. As I was saying, I have followed your career, at intervals of course, for a number of years, and I do not believe that you are capable of standing by and seeing a creature drown—a cat, for instance. I am. Now I should have seized the chance to see you drown, supposing you to be drownable, with some pleasure, not to say eagerness. It is somewhat of a mystery to me that you are—what you are."

The skipper glowered at him, saying nothing. And the man looked at the skipper for some minutes, with a sort of wonder in his eyes.

At last he sighed shortly. "But many things are mysterious, Ike—"

The skipper half rose from his seat. "By the living God," he said, thickly, "if you name me again—"

The man interrupted him. "You will do nothing. It is hard—impossible—to break up old customs instantly. Don't I know? You will pardon me if the name slips out now and then. As I was saying, Ike, many things are mysterious. Now, it is a mystery to me that your Charlie and your Benny should have allowed that steamer to cut us in two. You would not have allowed it. I would not. Sheer incompetence, Ike. For I am as good a man in a fog as you are. Confess it. Give the devil his due."

The skipper only growled in reply.

"I suppose I must take that as assent," said the man, "and I thank you for your hearty indorsement." He was silent for a moment, half smiling to himself. "The first thing I knew—the first thing for some days, I should judge—the nose of that steamer cut in alongside my bunk. Wasn't it fortunate, Ike, that it did not come a foot farther aft? It would have sliced me very neatly. Sharp things, those steel steamers. And I made up my mind right away that that was where I got off. I waited a long time, it seemed to me, for the steamer to withdraw from my room—very rude, to enter a gentleman's room that way, unannounced. But it did so at last, and I got off at once, taking the bunk with me. There was plenty of room to get out, plenty of room."

There was again silence between them, broken only by the hard breathing of the skipper, who glared fiercely at the stranger. The skipper was an elemental man.

"Your old hooker gave her a hard tussle," continued the stranger, chuckling. "Scraped some of the paint off her bows. Why, nearly the whole of the 'N. S.' dropped in on my bunk. That was how I guessed where she was bound. Lucky there were no ladies aboard, Ike."

The skipper rose at that, dropping the oars into the boat. The smoldering fire in his eyes blazed up fiercely. "By the living God!" he cried. "I'm a-goin' to kill you, Jim Doane," he went on, quietly.

There was no shadow of fear in the eyes that met the skipper's. Only a mild curiosity showed in the voice. "Now I wonder if you are," he said. "I have been wondering. In your place I should have done it long ago, when you found me—somewhere. I suppose that you found me. Now is an excellent opportunity—excellent. Nobody

need ever know that there was a murder. Nothing about but the fog and the sea. But you missed your best chance, Ike. You should have known better than to take me in. You ought to have batted me over the head with an oar, or have rowed around me and then off. And a jeer or two, Ike. That's what I'd have done. Why," he said, chuckling again, "I almost swamped your old boat, but I hadn't the strength. I regret that I had not."

"I'm a-goin' to kill you, Jim Doane," said the skipper again, less quietly than before. "You robbed me of my wife—all I had in the world. Twenty-five years ago you stole my wife. I ought to 'a' killed you years ago. But I'll do it now." His deep voice, usually so gentle, rolled out the sentence. He looked about him for some means of carrying it out.

Doane was smiling. "Oh, don't look around, Ike," he said. "Use your hands. I promise to stay quiet. I wondered if I could poke you up to it."

The skipper had taken up an oar and held it poised.

"Don't use that, Ike," said Doane. "I wouldn't use that. Blood on it, you know. There'll be a question or two to answer. Use your hands."

A change came over the skipper's face. He put the oar down softly. "I can't do murder," he muttered. "I can't do murder." And he sat down on the thwart and buried his face in his hands. His lips were moving, but no sound came from them.

Doane watched him, the same amused smile on his face. "Can't do it, eh? Haven't the spirit of a—a—" He looked about and his gaze fell on the cats. "Haven't the spirit of a cat, eh, Ike? I knew you couldn't."

The skipper still sat with his face hidden; his lips moved on. A softness came over the face of the other as he watched.

"Ike," said Doane at last, gently, "you are a God-fearing man, which I'm not, and a good man, which I'm not, either. I wish to God that I was! And I ask your pardon for rousing you, and for—for—"

The skipper raised his face and again his eyes were fierce.

"Jim Doane," he said, "were you good to her?"

And Jim Doane met those fierce eyes evenly. "I was as good to her as I knew how to be," he said, "while she lived."

The skipper turned away for a moment; then he took up the oars again.

"It's a weary long way to shore," he said, without looking up. "I c'n do it with no trouble, but I'll thank you not to bother me with your talk. And, once ashore, our ways part for good and all. I hope I'll never set eyes on you again."

And the skipper began rowing. The cats shivered in the wind and snuggled closer to him.

THE TUG OF WAR

BY PRISCILLA LEONARD

Said the Bottle that was old to the Wine that was new:
"I was made long ago, ere the grapes of you grew;
So adapt yourself to me, and learn how to be content.—
It's unsafe and *demagogic* and OUTRAGEOUS to ferment!"

Said the Wine that was new to the Bottle that was old:
"The power that stirs in me is beyond your strength to hold;
Though I rend you into pieces, that power I shall fulfill,
For it's ferment that I must—and it's ferment that I will!"

There is something, it is true, in the Bottle's point of view,
But—the victory always rests with the Wine that is new.

THE NEW BOOKS

Everybody's St. Francis. By Maurice Francis Egan. The Century Company, New York. $2.
Japanese Gardens. By Mrs. Basil Taylor (Harriet Osgood). Dodd, Mead & Co., New York. $6.
Bells and Other Poems (The). By Edgar Allan Poe. Hodder & Stoughton, New York. $5.
Shakespeare's Tragedy of Romeo and Juliet. Hodder & Stoughton, New York. $5.
She Stoops to Conquer. By Oliver Goldsmith. Hodder & Stoughton, New York. $5.
Colonial Homes of Philadelphia and Its Neighborhood (The). By Harold Donaldson Eberlein and Horace Mather Lippincott. The J. B. Lippincott Company, Philadelphia. $5.
Art Treasures of Washington (The). By Helen W. Henderson. L. C. Page & Co., Boston. $3.
Old Time Belles and Cavaliers. By Edith Tunis Sale. The J. B. Lippincott Company, Philadelphia. $5.
Castles of England and Wales. By Herbert A. Evans. The George H. Doran Company, New York. $4.
Tapestries. By George L. Hunter. The John Lane Company, New York. $5.
Broad Highway (The). By Jeffery Farnol. Doubleday, Page & Co., New York. $3.
Holiday Cards and Calendars. E. P. Dutton & Co., New York.

A few of the more notable gift books of the season may here be noted. Any such survey should by all means include the just-published life of St. Francis of Assisi. In text and illustration it challenges the interest of old and young alike. Every year brings some new book about St. Francis. The present volume is by Mr. Maurice Francis Egan, our Minister to Denmark. M. Boutet de Monvel's delightful pictures and Mr. Egan's equally delightful text are worthy of the handsome setting given by the publishers to the book. Let no one expect to find this a formal and complete biography. But, whatever it lacks in this direction, readers may expect to find it a genuine and just appreciation. The text quickly transports us to the mediæval life of Umbria, that country "of sweet and austere hills and valleys." There Mr. Egan is a lively guide, and there he shows us the lively lad who lived in Assisi. The boy owed to his Provençal mother that care-free vivacity which found expression in the jongleur ditties; perhaps he also owed to her some of that more divinely joyous later period which, despite its austere outward forms, found expression in sermons to the birds. Mr. Egan's is a volume for every boy and girl to read, for it is full of youth. And it is full of a real religion, the kind easy to those who are ever young. But those who have thumbed their Sabatier over and over again in the desire to know more about St. Francis should also read the book. Though it is a very "popular" volume—as its title shows—it has additional value in emphasizing the simplicity and economy of the means used by the Saint in attaining his purpose both as a religious and as a social reformer.

It seems a far cry from Umbria to Japan, but the charm of nature, people, and hills is found both in the Monvel pictures just noted and in those by Mr. Walter Tyndale in the volume on "Japanese Gardens." Certainly, among the year's holiday books this will assuredly find a very prominent place. For some time Americans have had a fad for Italian sunken gardens; they may now perhaps have another fad for Japanese gardens. Our returning travelers from Japan are enthusiastic about that fad, and the present volume reflects that enthusiasm. Mrs. Taylor's vivacious text and Mr. Tyndale's exquisitely colored pictures will make many a reader long to see Japan for himself.

In the usual holiday editions—often unnecessarily heavy to the hand—of the works of great men the year 1912 finds three which demand special mention. The first is an edition of Edgar Allan Poe's poems, the illustrations being by Mr. Edmund Dulac. The book is chiefly valuable because of these pictures, which, in most instances, will probably satisfy Poe lovers. The second volume is a large edition of Shakespeare's "Romeo and Juliet." The illustrations are by Mr. Hatherell, and are remarkable alike for originality and harmony. The third volume is a large edition of Goldsmith's "She Stoops to Conquer," with illustrations by the always delightful and sympathetic Hugh Thomson. Those who have seen Miss Annie Russell in the present rendition of the famous play in New York City will have a special appreciation for these illustrations.

A volume on Philadelphia's Colonial homes represents the collaboration of Mr. Eberlein and Mr. Lippincott. We are all interested in Colonial architecture because that is the sort which seems to recall our American history the best, and we are all interested in the various existing types of Colonial architecture. Many of them are in the neighborhood of Philadelphia, and the present volume is restricted to those in that vicinity. While the book will have a very special interest to Philadelphians, it will also have much interest for all students of architecture.

Another art volume, by Helen W. Henderson, has to do with Washington. There is an increasing feeling that, as Washington is our political capital, so it should be our art capital. At present it is excelled in the number and value of paintings, for instance, by New York, Philadelphia, Chicago, and other cities, and in the number of engravings and etchings by Boston. But, so far as sculpture is concerned, there are already some notable examples in Washington. Their number and quality are quite sufficient to call for description in such a volume as that just published by Helen W. Henderson. As to paintings, too, the additions to the Corcoran Gallery

of Art and the actual birth of a real National gallery make plenty of text for such a book. Aside from sculpture and painting, the other art collections in Washington are interesting—especially that of pottery in the National Museum. The present volume, therefore, is a valuable guide for intending visitors to Washington, and contains much varied information of interest to everybody.

A capital book of very high class gossip is Edith Tunis Sale's account of "Old-Time Belles and Cavaliers." The belles range from Pocahontas to Betsy Patterson, and the cavaliers from King Carter to Count Rumford.

If the intending traveler to England and Wales would like to post himself on the architectural, domestic, and military biographies of the castles there, let him consult Mr. Evans's just-published volume. Despite its not over lively text it is an excellent compendium.

Mr. Hunter's book on tapestries will be indispensable for those who take a close interest in the history and technique of the ancient art and in the modern revival of the art. In such a volume naturally the illustrations play a most important part, and here the four color plates and the very numerous photo-engravings are admirable and in many cases unique. There is a fascination in finding in these pictured tapestries the stories of antiquity, the deeds of mediæval knighthood, and scenes from legend and myth. One of the best examples of the last class in this art is Burne-Jones's "Holy Grail," while among the old pieces one's attention is strongly caught by the Renaissance tapestry representing Ahab and Jehoshaphat. The book will be of the greatest use and interest to all collectors and connoisseurs.

We have received a sumptuous holiday edition of Mr. Farnol's delightful romance "The Broad Highway." The color pictures are tasteful and restrained, the format is suitable, and all in all the volume is exceptionally suited for presentation purposes.

Messrs. E. P. Dutton & Co. send us a large assortment of Christmas cards, art calendars, holiday oddities and novelties, small gift books, and other pretty and jolly things for holiday greeting. It would be impossible to consider them individually, but the variety and choice are large, and no doubt the publishers would be pleased to send special catalogues to those who are interested.

Problems of Men, Mind, and Morals. By Ernest Belfort Bax. Small, Maynard & Co., Boston. $1.50.

The fifteen essays included in this new volume by a prominent British Socialist are introduced by an exposition of his theory of ethical evolution. This differs from the oxthodox Marxian theory in acknowledging a psychological besides an economic factor in the sphere of intellectual and moral relations. Nevertheless, he holds that "the ethic of Socialism has not only no need of a personal Deity, but may well find a personal Deity in the way." We are further informed that in "the new social ethics" society has "no right . . . to interfere with the sexual liberty of the individual *per se*," but only on "the question of children" who may result from it, and then only on the ground of social utility. Mr. Bax's remarks on "continence," deprecating it as not good for the average man, do not accord with the best medical authority any better than with sound ethics. "'Continence,'" he tells us, "may be conducive to a 'virtuously' ascetic life, but it certainly does not conduce to a socially ethical life (at least for the vast majority of men)." There are Socialists and Socialists. Socialism does not stand or fall with the party of Mr. Bax, as religion does not stand or fall with the Church of the Latter-Day Saints of Utah.

Preacher (The): His Life and Work. Yale Lectures. By the Rev. J. H. Jowett, D.D. The George H. Doran Company, New York. $1.25.

This latest of the long series of Yale lectures on the Lyman Beecher Foundation is a sort of Sermon on the Mount—a discourse from a mount of vision reached by an intensive and costly soul-culture. Thence speaks a prophet to a school of prophets on the grandeur and responsibility of their calling. He leaves no point in the life and work of the preacher untouched, but links the streets with the heights in the light of a sublime purpose irradiating drudgery and commonplace. Conspicuous are the danger-signs found set along the way to the heights at every possible divergence. Among the many volumes in this series none outranks this in inspirational value.

Tangles. By Margaret Cameron. Harper & Brothers, New York. $1.30.

A book full of amusing tales told so skillfully as to excite attention and prevent the reader from skipping to find out the end. The people who figure in the droll predicaments are bright-witted and full of clever expedients. While there are both romance and mystery, the author holds to her sure and graceful course between undue sentiment on one side and an excess of complex detective plots on the other. She is a diverting, talented *raconteur*.

Origin and Antiquity of Man. By G. Frederick Wright, D.D., LL.D. The Bibliotheca Sacra Company, Oberlin, Ohio. $2.

The problem discussed in this volume is for geology to solve with whatever assistance other sciences can contribute. Dr. Wright discusses it with the ample knowledge gathered during his forty years' study of geology, supplemented by such evidence as history, philology, physiology, and psychology can give. The central point of interest is the evidence derivable from the story which geology tells of the glacial epoch, during which all the present northern centers of civilization were buried deep in ice.

This period culminated, as Dr. Wright concludes, not more than twenty-five thousand years ago, perhaps less. He argues that "while the antiquity of man cannot be less than ten thousand, it need not be more than fifteen thousand years." This is a far lower estimate than most other authorities have reached. It is generally admitted that man existed *during* the glacial epoch, and this seems to be admitted also in Dr. Wright's reference to palæolithic men who "became extinct" under the rigors of that period. These, he says, and not the American Indian, were our "real aborigines." One must agree with him that it is unnecessary to allow immense time for the growth of Egyptian and Babylonian civilization. The being who can discover how to produce fire is not far separate from him who can build pyramids; when great geniuses are born evolution speeds. Of the hypothetical "missing link" between man and a lower creature Dr. Wright can find no evidence. All the continents are included in his survey, but most prominence is given to ours, and especially to our own land. The store of varied information he has brought together imparts a well-sustained interest in his elaborate discussion. It is apparently a supplement to his great work on "The Ice Age in North America," the fifth edition of which appeared in 1911.

Life of Mirabeau (The). By S. G. Tallentyre. G. P. Putnam's Sons, New York. $3.50.

The author (whose real name, we are told, is Miss E. V. Hall) in her "Life of Voltaire" made a notable contribution to the literature of biography; in fact, there are few biographies which surpass it in acuteness and readableness. Frankly, we do not find the companion work on "Mirabeau" equal in those qualities. The opportunity for a fine study of the subject was unique, but the difficulty of that subject was also unusual. The result is not so well proportioned nor always so clear as one could wish.

Call of the Brotherhood, and Other Poems (The). By Corinne Roosevelt Robinson. Charles Scribner's Sons, New York. $1.25.

There is a note in these poems not often struck in books of contemporary verse—the note of deep personal feeling. This feeling is so strong and so sincere that one is tempted to forget the form and to be aware only of the thought, so direct and transparently clear is the force of personality behind the lines. The poems carry the sense of profoundly felt experience or of passionately held convictions, and they are full of quick sympathy with human conditions. The poem which gives its title to the volume conveys the feeling which penetrates it in six lines:

> "If a frail sister slip, we must hold her;
> If a brother be lost in the strain
> Of the infinite pitfalls of pain,
> We must love and lift him again."

If perfect felicity of phrase does not always wait on deep feeling, neither skill nor energy of expression is lacking in this volume; a warm, generous, high-spirited facing of the facts of life; frank, courageous, not without pain, but entirely without cynicism or fear. Two poems selected almost at random will convey better than any description the vitality of thought and feeling which gives this book of verse a vibrant quality:

THE GREAT QUESTION

> My heart is weary with the world's distress,
> The cry of those who struggle in the night.
> Oh, Lord, who sent thy Son for our redress,
> We pray thee as of old, "Let there be light!"
> I would not ask thee "Why," nor pierce the veil;
> All that I long for is to know, behind
> The torture, and the terror, and the wail
> Of human woe, there is no cruel, blind,
> Unreasoning Chance, that hurls us here and there,
> Victims of an insensate Tyranny;
> I would not ask the Cause, but this my prayer—
> To know there is a Cause for Misery:
> Could I but see the working of Thy Hand
> I should be willing not to understand!

TOGETHER

> I cannot leave you, ask me not to go,
> Love of my youth and all my older years—
> We, who have met together smiles or tears,
> Feeling that each did but make closer grow
> The union of our hearts—Ah! say not so
> That Death shall find us separate. All my fears
> Are but to lose you. Life itself appears
> A trifling thing—But one great truth I know:
> When heart to heart has been so closely knit
> That Flesh has been one Flesh and Soul one Soul,
> Life is not life if they are rent apart,
> And death unsevered is more exquisite
> As we, who have known much, shall read the whole
> Of Life's great secret on each other's heart.

Diaries of William Charles Macready. Edited by William Toynbee. In 2 vols. G. P. Putnam's Sons, New York. $7.50.

When one takes up these two heavy volumes with their more than a thousand rather closely printed pages, one wonders whether most readers would not prefer a judicious condensation. The famous tragedian wrote voluminously, often feverishly. His personal likes and dislikes were never shaded, and the dislikes predominated. He was a colossal egotist, and an ingenuous one moreover; one can hardly open the book at a venture without finding the actor's confidential report to his diary that he had *never* acted this or that part so well as the night before. He knew many famous people on and off the stage, and talks of them freely and often amusingly. American interest will naturally center largely around Mr. Macready's accounts of his journeys in this country, of his feud with Forrest, and of the Astor Place riots—the latter a graphic bit of scene-painting. In reading such passages, whatever one's views of that disgraceful episode in American theatrical history, one forgets the superabundance of entries like "Went to Thomas and Gimler's to give orders," or "Met Mr. Penn, or Pell, and Mr. Griffiths." The forty-nine portraits are a valuable addition

to the work. Despite its excess of matter, the Diary affords an excellent field for browsing here and there by the student of the drama and of English and American social life from 1830 to 1850.

Secret of the Clan (The). By Alice Brown. The Macmillan Company, New York. $7.50.

One of the best stories for girls we have seen for years. It has both plot and incident; it is not priggish or preachy; the girls of this clan act and talk naturally; and, finally, the fun is contagious.

Rise of Roscoe Paine (The). By Joseph C. Lincoln. D. Appleton & Co., New York. $1.25.

More ambitious and perhaps a little less amusing than most of this author's Cape Cod stories. We like all of Mr. Lincoln's books, including this one, but there are others among his books that we like better.

George Palmer Putnam: A Memoir. By George Haven Putnam, Litt.D. G. P. Putnam's Sons, New York. $5.

The late George Palmer Putnam was a representative American publisher and a real citizen. In this double capacity he naturally took an interest in international copyright, and began his activity in that direction as far back as 1837. The present volume by George Haven Putnam should be in the hands of every one interested in this subject. It is a real contribution to the history of international literary relations. But the volume is far more than this. Its reminiscential value is very evident, especially to the men of letters and noteworthy characters of another era than ours. The value of the book in this direction may be gathered when we mention the fact that Mr. Putnam had personal relations with Louis Napoleon, Washington Irving, Fenimore Cooper, Hawthorne, Sumner, Bayard Taylor, Talfourd, Élisée Reclus, Fredrika Bremer, Susan Warner, Longfellow, Dana, Emerson, Lincoln, Bryant, Curtis, and many another. The biography discloses a man of sturdy character, of high ideals, and of far-reaching sympathies.

German Memories. By Sidney Whitman. Charles Scribner's Sons, New York. $2.25.

Mr. Sidney Whitman has already instructed us authoritatively concerning Germany and Austria. In his just-published volume he tells us about German society in particular, and of himself as connected with that society—about school days in Dresden and about the famous men whom he knew later—the old Emperor, Bismarck, Moltke, Mommsen, Lenbach, Bülow. This is a book of genuine German atmosphere.

Kings and Gods of Egypt. By Alexandre Moret. Translated by Madame Moret. G. P. Putnam's Sons, New York. $2.

The Outlook has already had occasion to commend "In the Time of the Pharaohs," by Alexandre Moret, and the just-published book by that author also deserves commendation. It is a popular account of certain representative figures in Egyptian history and worship. A particularly interesting chapter has to do with the Egyptian ideas of resurrection as symbolized in Osiris. Other chapters treat of the mysteries of Isis, but perhaps most interesting of all is a chapter on the indebtedness of Homer to Egyptian literature and art for certain passages in the Iliad and Odyssey.

Cardinal de Richelieu. By Eleanor C Price. With Twelve Illustrations. McBride, Nast & Co., New York. $3.25.

An interesting and scholarly account of the great Cardinal who did so much to break up the feudal system of France, convert the government into an absolute monarchy, and so unconsciously prepare the way for the French Revolution. The author, however, unfortunately assumes too much knowledge of European history in her readers, and has made a book which for this reason will not be as valuable to the general reader as it might have been.

Fifty Years of Prison Service. An Autobiography. By Zebulon Reed Brockway. Charities Publication Committee, New York. $2.50.

Mr. Brockway is recognized by all who know anything of the prison reform movement as one of the most practical and influential leaders in the attempt to make punishment reformatory rather than vindictive. The book may be cordially recommended both for interest and instruction to those who wish to know what in a Christianly civilized state a prison ought to be.

History of the Modern World, 1815–1910 (A). By Oscar Browning. In 2 vols. Cassell & Co., New York. $7.50 per set.

It is a pleasure to take up such large volumes as Mr. Oscar Browning's and find them so light to the hand. These books are thus admirable for popular reading in a double sense, for the text is clear, compact, and comprehensive, though not as vivacious as one might wish. The author's sense of perspective, however, is excellent, as might be imagined from the thirty years which he has spent in teaching history at Cambridge.

Gallant Little Wales: Sketches of Its People, Places, and Customs. By Jeannette Marks. Houghton Mifflin Company, Boston. $1.25.

There are not too many books on Wales. The latest is by Jeannette Marks. She seems to have breathed the atmosphere of Wales as if she had always lived there, and not as if she were breathing it from "outside." Hers is thus a delightful book in subject and style. The descriptions are of well-known picturesque regions in North Wales and of some of the most interesting aspects of present-day Welsh life. We hope that the author will soon follow her volume with a companion book about South Wales.

BY THE WAY

Not long ago the Maxim "silencer" for guns was welcomed by military experts as an aid in warfare; now another silencer is announced, this one coming in the interests of peace—a device that is to silence the motor boat engine. The inventor, not content with this public benefaction, is, it is stated, at work on a silencer for noisy street cars; may his work be uninterrupted!

A Bureau of Labor was established in Porto Rico in September. This Bureau, says the "American Federation of Labor Weekly News Letter," will be of special value to the working people of the island. Labor conditions, the "News Letter" goes on, are steadily improving in Porto Rico; and as evidence it cites the fact that a daily labor paper has been successfully started.

A recent Pension Office report states that there were at the close of the last fiscal year 860,294 pensioners on the rolls, of whom 238 were widows of soldiers of the War of 1812. The last actual survivor of that war died in 1905, at the age of 105; the last surviving soldier of the Revolution died in 1869, aged 109 years.

Not since a baby fell out of a New York City elevated car window and landed uninjured in an astonished citizen's arms has a more curious accident happened than one that occurred last week on a Ninth Avenue elevated train. A violent lurch at a curve pitched a trainman from the car to the street below; but he alighted on an upholstered couch that happened to be on the sidewalk! The man's life was saved by the remarkable coincidence.

A periodical of peculiar interest to those who like to study physiognomy is "The Detective," of Chicago. It contains dozens of photographs of offenders against the law who are "wanted." Some of the faces are hard, many show simply stupidity, some are bland and agreeable in expression, and one, as the description declares, "has an innocent look" and the owner possesses "a soft voice, is a fine penman, and believes himself a poet"!

Our American dust is certainly brought nigh to European grandeur when the highest bidder at a New York City auction sale can become the owner of a real letter of Catherine de' Medici, written entirely by her own fair hand. Such links to royalty come high, however; $1,350 was the price paid for the letter at the recent Hoe sale.

Dean Stone, of the Columbia University Law School, criticises the methods of conducting examinations for admission to the bar in New York. They favor the man of photographic memory, he says, but keep out the more capable man who has reasoning ability. This obsolete system of examination, the Dean asserts, exists in no other State in the Union.

The crossing of the Delaware River by Washington just before the battle of Trenton, which was one of the turning-points of the Revolution, is to be commemorated by the purchase of the property on which the landing was made, and its use as a public park.

Captain W. I. Chambers's invention of a catapult device to launch hydro-aeroplanes from war-ships is characterized by Mr. Glenn H. Curtiss as "the most important achievement since wheels were put on land machines." The device, only thirty feet long, enables the aeroplane to fly immediately after leaving the ship's deck.

Rough-and-ready surgery, says Mrs. Arthur Colville in her book of African travel called "A Thousand Miles in a Machilla," is quickly learned by a traveler who accompanies a large caravan, with which slight casualties are frequent. Mrs. Colville's panacea was strong permanganate of potash in hot water, which she declares effected wonderful cures in treating sprains, bruises, and sores. Some other traveler in places where a physician cannot be reached may find this worth trying. It is, however, caustic, and, taken internally, a mortal poison.

Actresses are commonly reputed to wear "paste" jewelry on the stage. That some of them wear genuine diamonds, however, is attested by the new York City Custom-House, which recently assessed the gems of an incoming French actress at $327,000.

The problems of "Edwin Drood," Dickens's unfinished novel, have a perpetual fascination for the inquirer, like those of Junius and the Man in the Iron Mask, says the London "Athenæum" One problem, according to the "Athenæum," is settled by Sir Robertson Nicoll's recent book on the Methods of Dickens: it is that Drood was murdered. "If he rose again to confute Jasper, well-established human testimony means nothing," the reviewer concludes.

"The trouble about dramatizing novels," says William A. Brady, the theatrical manager, "has always been that the people who wrote the plays, and the managers who put them on, have been bothered about trying to reproduce the book exactly. I don't read the book at all. Then I don't have any trouble in telling whether I have a play." This apropos of the successful dramatization of "Little Women," as presented by Mr. Brady. The public, however, unlike Mr. Brady, no doubt looks for a degree of resemblance between the characters of a play and those that have made a book popular.

"Joe" Wood, the Boston baseball pitcher, during the past season attained an efficiency percentage of .872, which is said to be a higher average than any other pitcher has attained since 1875.

Times have changed since Captain Burton, sixty years ago, made a pilgrimage to Mecca at the peril of his life. A recent account of such a pilgrimage, by Mr. A. J. B. Wavell, says that with a passable knowledge of Arabic and of Moslem ceremonial, and with due precautions as to avoiding pilgrims from the country to which one pretends to belong, "the pilgrimage to Mecca may be made in disguise without running any risk worth mentioning."

One of the oldest dry-goods houses in New York City, that of Lord & Taylor, is to move to the new shopping district on Fifth Avenue. This is the fourth removal of the firm since its founding in 1826, and its successive removals register the shifting business centers of the city. It was first on Catharine Street, then on Grand Street, then on lower Broadway, and since 1872 at Broadway and Twentieth Street. The new store will have several novel features—among others, the attractive one that no goods will be sold below the street floor.

The Salem Trial of the Lawrence Case

When an American court, an American jury, and American legal methods can stand such a test as that to which they were subjected in the trial of Ettor, Giovannitti, and Caruso, they must be established on a fairly firm basis. Our courts are far from perfect, our juries are human like the rest of us, and our legal methods sometimes seem designed to thwart as well as to promote justice and fair play; but they are, we believe, essentially sound. It is an occasion for thankfulness on the part of every decent, law-abiding American when our court methods for obtaining justice do withstand any severe shock. In the case of Ettor, Giovannitti, and Caruso it was not merely the defendants who were on trial. The question was not merely whether these three men were guilty of murder, but also whether an American court could discriminate between charges against men as murderers and opposition to men as agitators of an undesirable propaganda. The acquittal of these three men proves that that court could see and enforce the distinction. The events of the Lawrence strike, which began in January of this year and lasted for several weeks, are still fresh in the minds of the people. During that strike a woman was killed. It was charged that the killing was the consequence of a riot, and that those who were engaged in the riot had been wrought up to their pitch of excitement by the speeches of two leaders in this strike, Joseph J. Ettor and Arturo Giovannitti. Passions were inflamed on both sides. How deep the feeling ran and still runs regarding this strike The Outlook has evidence in the form of numerous letters from its readers. The struggle was one of those in which each side is convinced that those who are not actively for them are against them. On the one hand, the opponents of the strikers regard Ettor and Giovannitti as intruders, who came bringing disorder, anarchy, and hatred; they consider that the inevitable consequences of their activity must be revolution and death; and that they must be held responsible for such inevitable consequences. When, therefore, a homicide occurred, those who felt this animosity toward the leaders of the strike declared that these leaders should be held directly accountable as murderers in the eyes of the law. On the other hand, the sympathizers with the strikers, who were for the most part poor people unaccustomed to the English tongue or to American institutions, regarded their fight as a struggle on behalf of justice and human rights, and looked upon the opponents as the selfish and heartless apologists of a selfish and heartless capitalistic system. With such feelings on both sides, Ettor and Giovannitti were arrested as murderers on the ground that their words had brought the murder about, and Joseph Caruso as one of the actual perpetrators of the deed. For months these men lay in jail. The case came to trial in October. The case for the prosecution may be fairly said to rest upon the assumption that the sort of economic doctrine which Ettor and Giovannitti held and preached was of itself an incitement to murder. After the testimony and arguments of counsel were all in, the judge charged the jury that neither Ettor nor Giovannitti could be adjudged guilty of murder in the first degree, though it would not be contrary to the law to convict them of murder in the second degree. Each of these two prisoners, instead of counsel as usual, made his own final plea to the jury. The jury was not long in deliberation, and promptly brought in a verdict of acquittal. To regard this acquittal as in any wise an approval of the doctrines that these men preached would be as irrational and unintelligent as would have been a conviction of these men on the ground simply that they held such doctrines. If the American people believe that the economic theories propounded by the Industrial Workers of the World and

their leaders such as Ettor and Giovannitti are contrary to public policy and welfare, the way to combat such theories is not to put the preachers of the theories into jail, but to show that other theories more in harmony with American institutions will in practice result in real justice in industrial and social conditions.

Arbitration and the Panama Canal

At a recent dinner of the New York Chamber of Commerce Senator Root made a very strong plea for submitting to arbitration the differences between the Governments of Great Britain and the United States regarding the administration of the Panama Canal. To be exact, Senator Root takes the ground that there are not differences to be adjusted, but that there is only one difference. Under the Hay-Pauncefote Treaty the United States agreed, according to Senator Root, to treat the vessels of all nations, including her own vessels, on equal terms in the matter of Canal tolls. It is apparently his view that the terms of the treaty in this respect are not debatable, although, in our judgment, there is some reasonable ground for asking whether, in framing the Hay-Pauncefote Treaty, the United States deliberately intended to waive in this wholesale fashion her authority to administer the Canal for her own necessary self-protection with due regard to the just rights of the rest of the world. But, assuming for the moment that Senator Root is correct in his assumption that the general terms of the treaty are not debatable, there remains the question which he recommends for arbitration, namely, whether the exemption of American coastwise vessels from the payment of tolls is a violation of the general terms of the treaty as Great Britain and Senator Root interpret it. Of this particular question Senator Root said in his speech:

> I say to you, if we refuse to arbitrate it, we shall be in the position of the merchant who is known to all the world to be false to his promises.

As our readers know, The Outlook does not believe that the exemption of American coastwise vessels—that is to say, vessels engaged solely in the transportation of American merchandise from one recognized United States port to another United States port—is, in any sense of the word, a discrimination against foreign nations. If there is anything in the Panama Act of the nature of a loophole or evasion which permits, by hook or by crook, American *foreign* commerce to take advantage of this provision for its *domestic* commerce, the Panama Act should be at once amended to correct a secret abuse of this kind. We have more than once said in these pages that we should like to see submitted to arbitration the question whether our coastwise navigation laws are incompatible with the Hay-Pauncefote Treaty. But we cannot go as far as Senator Root in believing that hesitation regarding such arbitration springs from the same motive that makes a dishonest merchant "false to his promises." There are some practical difficulties in the way of a just and impartial arbitration of this question which, so far as we know, have never come up before in the history of international disputes. This is not a question which involves the interest of the United States and Great Britain alone. The interest of all the great maritime powers of the world are involved. Can arbitral judges be selected who are not really parties at interest? It has been suggested that the court might be constituted of South American jurists. But what states have a greater stake in the issue than those which lie along the Atlantic and Pacific coasts of South America? Switzerland is perhaps the only country capable of furnishing international jurists of high standing who would probably be free from all pressure of selfish public opinion when acting as judges of the case. We wish that Senator Root, for whose authority as an international jurist this country has the greatest respect, would indicate how the arbitration court which he recommends could be constituted with justice to all the interests concerned.

The Coal Question

An investigation has been made by the Merchants' Association of New York City into the advances in price for anthracite and into the statements as to the alleged shortage of the coal supply and the danger of still further increased prices. The results of this inquiry seem to sustain certain statements of those in control of the output of coal, who may be for purposes of convenience here termed the Coal Trust, but these statements of the Coal Trust do not by any means cover the basic questions relating to production, carrying, and distribution of anthracite. The Merchants' Association, through its committee, finds that the immediate recent advances in the retail price have been due to the independent coal dealers rather than to those retail dealers who

are under control of the Trust. When it is remembered that the great bulk of the trade is controlled by the Trust, and that the independent producers and dealers control only about fifteen per cent of the total trade, the reason for the fact stated by the committee of the Merchants' Association is at once evident. There are two kinds of advanced prices now paid by consumers: one (which is paid by all consumers) is the advance made by the Coal Trust over the prices of last year; the retailers under the control of the Trust have adhered, it appears, closely to these advanced prices as fixed by the Trust; the second advance has been made by the independent dealers because the retailers under the control of the Coal Trust have not been able to supply coal as fast as it was needed, and buyers who must have coal immediately have been obliged to get it wherever they could, and in many cases from independent dealers at advanced prices. The first advance of which we speak was made by the Coal Trust on the ground of the additional cost to it caused by the breaking off of work while the new contract between the coal companies and the unions was being considered; to the same cause is attributed the temporary shortage of coal. But this matter also will bear a little further examination. It is alleged, and apparently on official statistics, that in point of fact the loss to the Coal Trust from these causes was about six and a half million dollars; while it is pointed out, on the other hand, that the increase in price of twenty-five cents per ton must have given the Trust some fifteen million dollars of profit—an excess of eight and one-half millions over its loss. It is furthermore asserted that improved methods of production and the use of small sizes of coal formerly discarded have made the profits of the Coal Trust larger and not smaller in recent years, and that the consumer of coal has not only reaped no benefit from these things, but has had to bear the burden of increased prices.

The Coal Monopoly

The whole coal problem, thus brought into prominence by the recent events, is a deep-seated question of monopoly, combination, and price-control—a question of precisely the sort that calls for full investigation and action by the Inter-State Commerce Commission, and one that in some of its aspects should certainly be looked into by such a Commerce Board dealing with other than railway interests, as was urged and promised by the National platform of the Progressive party. It has long been known that the anthracite mining companies and the railways which carry this coal are under the same control and practically under the same ownership, so that it has been possible for these owners to fight off claims for fair pay by the miners on the ground that the coal-producing companies are not paying large dividends; to get their own large profits from the coal-carrying business; and at the same time to assert that the coal-carrying railways are not making excessive profits because those profits are needed in order to pay the established dividend on an enormous capitalization which does not represent investment. Now it is further alleged that the Coal Trust controls not only the production of coal and its carriage, but also its distribution. In a hearing which has been going on before the Pennsylvania State Railway Commission the admission was wrung reluctantly from numerous Philadelphia retail coal dealers that they held the leases for their coal-yards from the coal-carrying railways, and that in some cases the railways even owned the machinery in the yards for handling the coal. It seems to have been established that the majority of the coal-yards in Philadelphia were thus ultimately owned by the Coal Trust. This is a branch of investigation which ought to be pushed to a conclusion in New York City and in other large places. If it appears that every branch of the coal industry is under the control of the Trust, while the consumers (which means everybody who uses anthracite) are paying exorbitant prices, the need for drastic action is instant.

The Balkan War: The Allies

Last week saw little fighting in the Bulgarian advance on Constantinople. For this there were two reasons. The first was the resumption of discussions between envoys from Turkey and Bulgaria concerning an armistice and peace terms. The second was the cholera, which, despite the Red Cross camps, is making dreadful ravages among the troops. At Adrianople the lines of investment drawn by the Bulgarian troops are being tightened day by day, the attackers' trenches being now only about a thousand yards from the city itself; the foreign consuls have hoisted flags over their offices so as to prevent the Bulgarians from firing shells in their direction.

It is reported that the Turkish garrison has been reduced by losses through the desperate sorties and by deaths from diseases to less than half of its strength at the beginning of the siege. Part of the Greek army has now gone eastward from Salonika to the region where last week the Bulgarians captured a great number of Turkish reserves. Meanwhile the Greek navy has taken another of the islands in the Ægean Sea—Chios this time, one of the richest of them. The capture may mean justice at last, for it may be remembered that when, in 1822, some of its inhabitants rose in revolt, sympathizing with the general Greek revolt, the Turks massacred or sold into slavery nearly all the population of over a hundred thousand persons. But the week's principal event occurred in the advance of the Servian troops through rough, mountainous Albania, and their arrival at the Albanian port of Durazzo, the ancient Dyrrachium where Cæsar besieged Pompey in B.C. 48. A place of importance under the Romans, the city has shrunk to a dilapidated town, and its formerly fine harbor is now full of silt. Its seizure by Servia is proof of her need of a seaport, but it is resented by Albanians and by Austrians. The Albanians resent it because it takes no account either of the fact that they are, as they claim, as much a nation as are any of the allies, or of their historic and national rights, or of their recently proclaimed independence. Hence, if there is elementary justice in the principle of "the Balkans for the Balkan peoples," it must be, they assert, also to the advantage of the Albanians. Austrians object to a Servian port on the Adriatic because Servia would thus cross from east to west Austria's north-to-south commercial, if not territorial, path to the Ægean. Two solutions of the difficulty have been suggested. The first is that Servia should obtain an Ægean port by making Salonika—by far the finest harbor on the Ægean, and no farther from Servia than is Durazzo—a free port. It is reported that Turkey has already consented to this. In the event, however, that Servia would not be satisfied, a port to the east of Salonika could be secured to her, Greater Servia thus extending southward to the Ægean. The second solution is that Servia should obtain an Adriatic port, subject to the same conditions as those long prevailing at the harbor of Antivari in Montenegro—that is to say, no fortifications to be built, and no war-ships, either Servian or foreign, to be admitted to the port. Thus Servia's real desire could be reached, not by military possessions, but by a guaranteed access to the Adriatic for commercial purposes only. This might be reconciled with an independent Albania.

The Balkan War: Europe

Despite the occupation of Durazzo, the danger last week of a European conflagration resulting therefrom grew less. In general, throughout Europe the disproportion between the question of a port for Servia and the untold calamities that would result from a European war were more clearly seen. Certain movements and events in particular countries were also helpful towards the trend for peace. The principal movement was in Austria. Nine of the Austrian provinces are inhabited by Slavs, and they are naturally more or less in racial sympathy with the Slavs in the Balkans. But six out of these nine Austrian provinces are not only Slavic in general, but are Serbo-Slavic in particular. The reported applause given in Bohemian Prague to the news of Servian successes, and the reported slipping across the frontier of a considerable number out of Austria's six million Serb subjects, warned the Austrian Government, lest it have trouble at home, to move cautiously in any threat to Servia. As somewhat offsetting this, in Austria's interest, Rumania began concentrating troops along the Russian frontier, and, it is said, has issued a general mobilization order. This is interpreted as forecasting the Rumanians' determination to help Austria in case of trouble with Russia and the Balkan allies. It may seem strange that Rumania should be less friendly to the allies than to Austria. The present position of the Rumanians, however, is presumably not so much one of regard for Austria as one of fear that the rise of a Big Bulgaria would make their own kingdom look small in comparison. In case of actual war Austria would count on the support of the other members of the Triple Alliance, Germany and Italy. If Russia, as the greatest Slav power, supported the Servian claim, she would be, it has been supposed, backed by the other members of the Triple Entente, France and England. But the governments of Germany, Italy, France, and England are making no secret of their strenuous counsels of moderation to Austria and Russia. In the Triple Entente, so far as the relations between

Russia and England are concerned, a statement was made last week that England had no intention of supporting Servia's claims by force of arms or aiding any other Power to do so. This is in harmony with Premier Asquith's recent speech, in which he declared that no "isolated question" (that is, a question concerning some specific claim) should be permitted to provoke interference in the Balkan war by inducing hostilities between interested Powers in advance of the general settlement of peace. The Premier's speech has now been followed by a proposal from Sir Edward Grey, the British Foreign Minister, that an international conference should take place as early as possible and that its programme, while avoiding the injection of any question that might wound national susceptibilities, like the issues directly at stake between Turkey and the Balkan States, should discuss such questions as the independence of Albania, the free passage of the Bosphorus and the Dardanelles, and the disposition of the Ægean Islands. The Six Powers are therefore now engaged in preparing the way for an international conference to include as well Turkey, Bulgaria, Servia, Montenegro, and Greece.

⁂

Football Pro and Con

Each year the American game of football is the subject of criticism and the object of attack, and each year it continues if it does not grow in popularity. A football attendance of thirty or forty thousand has become a commonplace. The crowd at a football game is not the sort of crowd that assembles at an automobile race, rather excitedly anticipating the thrill of a serious accident, and more eager when one occurs. It is the sort of crowd that enjoys the thrill of the game but dreads the casualties. When, a few years ago, a fatal accident occurred at West Point, the crowd who witnessed it dispersed with the grief of it written on their faces. Those who say that the American football crowd is like the throng at a Roman gladiatorial show or a Spanish bull-fight are slanderers. As football has been freed from serious accidents it has grown in popularity. It can never be other than a rough sport, and it is none the less wholesome for that; but it is growing more sensible, and it is all the more wholesome for that. To the undergraduate the important phase of a football game appears to be the victory or defeat at its close. Few undergraduates at Yale, for example, minimize the importance of the field goal which at the last moment tied the score with Princeton and saved the Yale team from what seemed certain defeat; few undergraduates at Harvard can forget that the Harvard team has been one of the strongest American college teams in recent years and has scored emphatic victories over both Princeton and Yale. And so along the line. Cornell men think of the strong game their team played against Pennsylvania, and the "break" by which it was defeated. Pennsylvania men think of the dramatic scores their team has made in more than one game, turning apparent disaster into triumph. Wisconsin men take satisfaction in the winning of the "conference" championship. What is lasting, however, about this season is not the victories or defeats, but the effect of gain or loss in the progress of football as a rational, manly sport. This year has afforded another test for the rules which opened up the game, as well as for the modifications of those rules made for the purpose of meeting certain practical difficulties. There seems to be little doubt that during the past two or three years there has been a reduction in the number of serious football accidents. It is certain that there has been a reduction in unfair and needlessly rough play. Several incidents can be cited to illustrate the improvement in spirit that has come over the game. In the game with Harvard the Dartmouth team was subjected to criticism for the roughness of its play. A supporter of Dartmouth, in a printed statement, in commenting upon this criticism, suggested that what appeared needlessly rough play was simply the effect upon Dartmouth players of the criticism by Dartmouth undergraduates of the earlier symptoms of lethargy in the team. It was furthermore said—we paraphrase the statement from memory—that if on investigation Dartmouth found any of its players really guilty of what was unfair, the offense would be dealt with by the College itself. A Harvard player was sent from the field for rough play, and that fact was recognized by Harvard men as a blot on the Harvard record even if the penalty was not just. A Princeton player was likewise sent from the field, and the Princeton captain came to the player's defense and declared that he was as clean a player as any on the team. There are graduates who still call themselves young men who can remember very well that, when charges of rough-

ness were made, the normal answer was a counter-charge, or some cynical remark to the effect that football "wasn't marbles or squat tag." The progress in this respect has been indubitable, and the present sensitiveness to criticism shows, first, that such charges are not so recklessly made as they used to be and are therefore taken more seriously, and, secondly, that they are regarded not as a criticism upon the game itself but as a demand for adherence to the high standards of sportsmanship. One can recognize this progress and can recognize the great value of athletics and the specific advantage of a vigorous game like football while recognizing at the same time the continuance of certain evils in American college athletics. The excessive excitement over athletic contests, the extravagance in expenditure of time and money, the lack of due proportion maintained between the athletic and intellectual pursuits, all need attention. There is not a college or university in which the authorities are not immediately responsible for the conduct of its athletics. We believe that those college authorities can do very much more than they are doing now in rendering athletics more wholesome and more rational. At present this task seems to be the concern of a comparatively small proportion among the faculties of our colleges and universities. It ought to be the concern of every man in a position of responsibility as college teacher.

The Profit on Crime

The report on the State Convict Board of Alabama shows that the total gross earnings of convicts in that State for the year ending September 10 was $1,073,286.16. These figures, without taking into account the earnings of one hundred convicts who were employed on the State farm, from whom the State would have received $30,000 more if they had been leased on the same terms as the others, shows a gain for 1912 over the previous year of $16,456.93. The figures for other States where the convict lease system is in force are not at hand, but there is every reason to believe that the above is a fair sample of the profits made elsewhere. No doubt this statement of the Convict Board, coming at the time of the year when the papers are filled with the reports of bountiful harvests and bumper crops, will read to a good many people like another evidence of the prosperity of the State. Other persons, considering the dubious source of this income, will perhaps comfort themselves with the reflection that the profits of the State upon its convicts go very largely to support the public schools, and so return good for evil. How many know or have considered the actual facts in regard to the matter, namely, that under the fee system, as it still exists in Alabama and other parts of the South, the sheriff is put in the position of a recruiting agent for the employers of convict labor; that about eighty-seven per cent of all convicts of the State are Negroes, many of whom, arrested for trifling offenses, have drifted into crime because of ignorance and the neglect of the State properly to educate them; that in spite of the regulations to protect these unfortunate slaves of the State, life in the convict camps to-day is more degrading and cruel than it ever was under the worst form of slavery; that when these men are finally released they go back into the walks of daily life broken in body and embittered in mind, to become not only a burden but a menace to the remainder of the community? Considered in the light of its ultimate results to the community, this large profit from convicts' labor is not a gain —not even in the material sense—but a loss. A few private individuals may profit by this system, but the State loses. The State loses because these men from the convict camps and the mines return, at the end of their period of servitude, worse in body and in soul than they were before. No State can afford to make a business profit out of the moral degradation of any of its citizens.

A New Editor for the "Churchman"

The Rev. Herbert Britton Gwyn, of Chicago, has been elected editor of the "Churchman," which, since Mr. McBee's regrettable retirement last spring, has been without an editor-in-chief. Mr. Gwyn is a Canadian and a graduate of Trinity College, Toronto. He served as assistant in a Toronto parish, and for the past ten years has been rector of St. Simeon's Church, Chicago. Last spring the "Churchman" was purchased from Mr. Marshall H. Mallory by a syndicate, represented by the following directors: The Rev. Dr. Douglas, Canon of the New York City Cathedral; the Rev. Dr. Slattery, Rector of Grace Church; the Rev. Howard Robbins, Rector of the Church of the Incarnation; the Rev. George Alexander Strong, Rector of Christ Church; and the Rev. John Mockbridge, Vicar of Trinity

Chapel—all in New York City ; together with an equal number of laymen. Mr. Gywn will enter upon his new duties with the beginning of the new year. Mr. W. B. Parker, formerly associated with the "Atlantic" and later with the "Century Magazine," will continue to act as business manager of the "Churchman." Under Mr. McBee the "Churchman's" influence has been much wider and broader than that of a merely denominational paper. The Outlook sees every reason to hope that this valuable and vital influence for Christianity will be fully maintained under the new editorship.

HEALTH AND THE FEDERAL GOVERNMENT

If a father comes home from business to find one of his children seriously ill, he does not treat the matter as he would a business question. That child's illness is a bigger and more important matter to him than any mere question of dollars and cents. There is only one thing that he regards as of more consequence than the health of the members of his family, and that is their character and reputation. When illness enters his household, he needs no further argument to persuade him that human life is more valuable than property.

And yet if Americans were judged by the Government they have made for themselves, they would appear to place a higher value upon property than upon human life. The Federal Government is very well equipped, on the whole, to help farmers protect the health and lives of cattle ; but it is very badly equipped to enable the American people to defend their own health and their own lives.

In this issue Mr. Earl Mayo, whose articles on the various aspects of public duty toward questions of health have evidently made a marked impression upon the readers of The Outlook, presents the facts upon which the demand for a Department of Health in the Federal Government is based. We advise our readers to read carefully Mr. Mayo's article and then decide what they wish Congress to do about this matter.

There is no question of the right of the Federal Government to conduct such a department. It has as much right, for example, to put up barriers against disease as it has to put up barriers against goods of foreign manufacture. Moreover, it is exercising its right already through various disconnected agencies, such as the Public Health Service and the officials who are engaged in the enforcement of the Pure Food Law. The question is not whether the Federal Government shall exercise the right or not, but whether it shall exercise that right intelligently and effectively by means of a single, unified, administrative body devoted solely to matters of health.

Suppose such a department were established, what would its functions be ?

In the first place, there should be no misapprehension as to what those functions would not be. The Federal Department of Health would not be concerned with the treatment of individual cases of illness. It would not have anything to do with the "healing art." The officers of such a department would not be engaged in making sick people well.

Unfortunately, some of the advocates of such a department or service have done much to create a wrong impression on this point. For example, the National platform of the Progressive party, in its plank favoring the "union of all the existing agencies of the Federal Government dealing with the public health into a single National Health Service," adds the phrase : "Without discrimination against or for any one set of therapeutic methods, school of medicine, or school of healing." The platform might as well have opposed discrimination against or for any school of theology. With the work of such a Department of Health, so-called therapeutic methods, schools of medicine, or schools of healing, have nothing whatever to do. One might as well say that in establishing the Bureau of Chemistry there should be no discrimination against or for the practice of alchemy ; or in the work of the Geodetic Survey there should be no discrimination for or against astrology. The Bureau of Chemistry is concerned only in ascertaining and acting upon the facts of the science of chemistry. The Geodetic Survey has only to take into account the scientific work of geographers, mathematicians, and astronomers. And so the sole basis of such a Department of Health as is proposed should be, and must necessarily be, the facts of science as ascertained by the scientific methods of the laboratory. As a matter of fact, there is no confusion regarding this. It must be remembered that there is nothing essentially new so far as the nature of the work itself is concerned. It should not be forgotten that it was the United States

Government which carried on the investigations that resulted in the expulsion of yellow fever from the Canal Zone. The Federal Government did not engage in curing people, except in so far as it employed physicians to care for those for whom it was directly responsible, as it employs physicians and surgeons in the army and navy. So far as the public is concerned, its work had nothing whatever to do with methods of therapeutics or schools of healing. It was a scientific work as firmly based upon the facts of science as the engineering work in the construction of the Canal and its locks. It was an error to introduce the question of schools of healing into the proposal for a unified public health service or department, and it should not be repeated. The one form of discrimination which such a department should practice should be against the unscientific, and for the methods of the ascertained facts of science.

The primary function of such a Department of Health is that of acquiring and distributing information. In other words, it should do for the health of the people what the Department of Agriculture is doing for the agriculture of the people. The officials in the Department of Agriculture have at no time attempted to tell farmers how they must plow their land or sow their seed. The Department of Agriculture is continually studying the question of soil, of seed, of animal life, and of agricultural methods, and is storing up and tabulating this information. And then it makes this information accessible to those to whom it will be useful; it answers the queries of farmers; it sends out its instructors. This is just what such a Department of Health would chiefly do with regard to the health of the people. At present there are no uniform vital statistics for the United States. There is no means, for example, of accurately ascertaining what the death rate in America is. Some States and some cities have vital statistics that are, in part at least, valuable, but there is no uniformity with regard to these statistics. There is no means of comparing the death rate of one city with that of the other cities of the United States. In New York City, for example, stillbirths are not counted among the births at all. In other places they are included both in the statistics of births and in the statistics of deaths. New York City can compare the death rate of children in one year with that of the previous year, and thus can measure its own progress in the immeasurably valuable work of saving infant lives. There is no way, however, by which New York can discover whether its methods are more effective than the methods of the other cities of the country, for the basis underlying its own records is different from the basis underlying the records of other cities. A National Department of Health would establish a uniform system of statistics, and would be enabled to let any city know how its work on behalf of the health of its inhabitants compared with the work done by other communities. The fight against disease cannot be carried on in ignorance. It must be based on knowledge. A National Department or Bureau of Health is the only instrument through which knowledge of health and disease on a National scale can be obtained, and it is the only agency which can distribute such knowledge Nationally.

Secondarily, its function would be regulative. Now the United States Government does to some extent establish health regulations. But only to some extent. To-day the Nation at large must depend for protection against the invasion of cholera through the port of New York, not upon its National servants, but upon officials of the State of New York. It so happens that in the past the State of New York has done some exceedingly competent work in this respect; but the people of Ohio and of Pennsylvania and of Minnesota, and of other States where immigrants go, should not have to be dependent upon the efficiency of the State Government in New York to be adequately protected against the disease which may at any time become a menace to the whole Nation by appearing at the port of New York. It is as much the function of the Federal Government to fortify the Nation against foreign disease as it is to fortify the Nation against foreign armies. It cannot do so adequately until a single, united body for that purpose is established as its instrument.

The question whether such a body should be a Department with a Cabinet officer at its head, or a bureau erected in one of the departments, or an independent commission having no relation to any department, like the Inter-State Commerce Commission, is not an unimportant question, but it is a secondary one. Mr. Mayo puts cogently the arguments for making such a body a Department in charge of a Cabinet officer. It would be better, however, to have a bureau or an inde-

pendent commission rather than not to have a unified body at all. The prime duty of Congress in the protection of the health of the American people is to unite the various disconnected, and sometimes conflicting, agencies of the Government into a single body and to give it power: first, to acquire the necessary information; second, to make that information accessible to the public; and, third, to enforce generally and effectively such regulations as are now enforced by the Federal Government sporadically.

MR. WHITMAN'S CALL TO THE CITY

A dinner was given in New York City on Friday evening, November 22, to Mr. Whitman, the District Attorney, in appreciation of his successful prosecution of Police Lieutenant Becker and the four gangster gunmen. In his speech at the close of the dinner Mr. Whitman put admirably the issue before the people of the city—before the people of all cities—in saying that the question is, not whether New York City is better or worse than London, Paris, Vienna, or St. Petersburg, but whether it is the best city we can make it.

To that question there is but one possible answer: It is not the best city we can make it.

The difficulty is not that the majority of the citizens are corrupt or inefficient. They are neither corrupt nor inefficient. The American people are an honest people. They are an efficient people. There are no people more energetic and efficient in private enterprise. But in public affairs they have been spasmodic or inert.

Mr. Whitman's sentence gives the rallying cry: To make our city the best city we can make it.

How can we get together?

One party can prescribe a platform and nominate candidates and invite all citizens to join it. This method never has succeeded. Party affiliations and party prejudices are too strong. It may be desired, but it is not to be expected, that Democrats will support Republican nominees, or that Republicans will support Democratic nominees, or that either will support Progressive nominees. There are thousands of voters in New York City who would be glad to vote for a party pledged to make the city the best city that can be made, but are not prepared to commit themselves to the referendum, initiative, and recall as a means of doing it.

The different parties, through their party organizations—Democratic, Republican, Progressive, Prohibition, Socialistic, Labor—can form a coalition and apportion the offices according to the size of the various constituencies represented. This method has sometimes succeeded. It succeeded two years ago. Except the Mayor, the coalition candidates were elected, and in all those departments which the coalition candidates control New York City has had the best administration she has had for many a year—perhaps the best she has ever had.

But coalitions are generally short-lived. And behind the coalition is no united constituency to give it courage and support. A coalition is at best a temporary expedient—better than nothing, but very far from the ideal.

The ideal would be a union of all citizens in a common endeavor to make New York City the best city they could make it; a union which would no more be a coalition of different parties than the Red Cross Society is a coalition of different churches.

Such a union might be called into existence by the City Club, but its object should not be the upbuilding of the City Club, and the City Club should not control it; or by the Citizens' Union, but not to upbuild the Citizens' Union, and the Citizens' Union should not control it; or by a group of Republicans, Progressives, or Independents, but not to promote the political fortunes of either the Republican, the Progressive, or the Independent organization, and neither organization, in its National capacity, should control it. The platform should be a pledge to make New York a clean, wholesome, well-ordered city in which to live, and the candidates should be the best available men to carry that pledge into effect.

Is this impracticable?

We never can tell what we can do till we try. It was thought impracticable in 1860 to unite the men of the North in a resolute determination that slavery should not become National. But the Union proved practical. It was thought in 1840 that it would be impracticable to unite the jealous and hostile kingdoms of Italy in a united Italy. But the genius of Cavour accomplished it. It was thought impracticable six months ago to unite Montenegro, Servia, Bulgaria, and Greece in

a common effort for the emancipation of the Balkan Peninsula. But, thanks to two great statesmen, it has been done temporarily, and it is reasonable to hope that the temporary fusion may grow into a permanent union.

To-day the different commercial organizations of New York are uniting in a common effort to preserve the commercial prosperity of the city from being impaired if not destroyed by its inertia. Why should it be thought impracticable to unite the citizens of that city in a common effort to make it the best city they can make it?

The municipal campaign ought not to wait for next fall. It ought to begin now. It ought to be more than an anti-Tammany campaign; more than an anti-vice campaign; more than an anti-graft campaign. It ought to be a campaign to make the biggest city in the land also its greatest city—or at least as great as any other. It should aim not merely to elect candidates; it should also aim to study the municipal problems and to formulate some municipal principles. It should seek to find answers to such questions as these:

How to make a dock system that shall keep pace with the world's steamship systems?

How to preserve sanitary conditions in a population of four millions crowded together in so compact a space?

How to keep our streets from becoming cañons into which the sun never penetrates?

How to add new and needed thoroughfares to relieve the present overcrowded streets?

How to meet the just criticisms on our present cumbersome school organization, and make it at once simpler and more efficient?

How to reorganize our police as an army, under quasi-military control and military discipline?

How to weed out from it the few but influential members who both demoralize and dishonor it, and make it from top to bottom an organization devoted to protecting the citizens from criminals, never employed to protecting the criminals from the law?

How to unify our too complicated city government, and make all its departments co-operative because all parts of a coherent whole?

We do not here formulate any principles. We do not even attempt to state all problems. We only indicate the direction in which the citizens of New York should move if they would make that city the best it can be made.

The city has been stirred as never before by the revelations of organized crime in partnership with the guardians of law and order. Now is the time for the citizens to awake; now is the opportunity to move forward to a common end, animated by a common purpose to make the city of New York worthy of the geographical place it occupies, and the social and civic place it ought to occupy in the life of the Nation.

AUSTRIA AND THE BALKANS

Austria, of all the European Powers, has been one of the most consistent, and therefore one of the most successful, obstructionists of the principle of political independence or self-government. Her emperors and statesmen have been among the most powerful advocates of the system of aristocratic despotism—often benevolent despotism, it is true, but nevertheless despotism. France has become a republic; Stein and Bismarck made a constitutional empire of Germany; the warring Italian principalities were welded by the great Cavour into a unified democracy, with a monarch who may be called a hereditary President at its head; reactionary Spain has had little influence on European politics since the days of those two great English Imperialists, Admiral Nelson and Lord Palmerston; even Russia set free her serfs under Alexander II, and the whole world knows of the slow but sure progress towards constitutionalism within her borders during the past fifty years. It may be said that Russia, not Austria, is the greatest European opponent of free government. It is true that Russia has treated the peasants and the Jewish population within her own borders, and the inhabitants of Finland and Russian Poland who claim the right to be considered as living outside of her own borders, with a despotism and cruelty much more barbaric than any exercised by Austria in modern times. It is true that Austria, at least since 1866, has pursued a liberal and enlightened policy with regard to her own subjects incomparably better than anything the Russian populace has ever enjoyed. It is true that Austrian rule in Herzegovina and Bosnia has been far superior, politically, economically, and socially, to the misrule of Turkey. It would be unjust not to recognize the efficiency and material prosperity of Austria's administration of her own empire

during the last fifty years. But it is the prosperity and efficiency of a benevolent autocracy imposed from above, not the progress of a freely developing and self-governing people. Moreover, Austria has persistently sought to promote the autocratic or despotic theory of government among her neighbors.

The foremost name in the history of Austrian statecraft is that of Prince Metternich, who during the first fifty years of the nineteenth century was the most influential reactionary in Europe. He believed in the divine right of kings and in the divinely appointed association of Church and State. He sincerely feared democracy, and saw no safety for Europe except to parcel it out among four or five great Powers. The stability of Europe and the suppression of all democratic or "revolutionary" movements was to be insured by these great monarchical powers working together in harmony for their mutual advantage. This is the idea of the "European Concert." It is nothing more nor less than the principle which has been applied to industry in America by some of the great promoters of the "trusts" or "combines." Metternich was the apostle of the monarchical "combine," and his philosophy of government prevails to a very large extent in the administration of the Austro-Hungarian Empire to-day. Metternich was not a "robber baron," an individualistic "land-grabber," like Napoleon or Abdul Hamud II of Turkey. He believed in the "gentlemen's agreement." He wanted the monarchs of Europe to sit about a round table and divide the political profits of Europe with proper consideration for one another, but with the same regard for popular rights that finds expression in the saying popularly attributed to Commodore Vanderbilt, "The public be damned!"

A story is told of Dr. Jowett, the great liberal Anglican clergyman who was Master of Balliol College at Oxford, which illustrates the futility of an absolutist policy like that of Austria. A group of Oxford men were discussing after dinner the question as to which held the position of greatest authority, the bishop or the judge. The lawyers present claimed the honor for the judge, because he can say "you be hanged." The clergy in the party retorted that the bishop is greater, because he can say "you be damned." "Yes," commented Dr. Jowett, who had not spoken until then, "very true; but when the judge says 'you be hanged,' you are hanged!"

The trouble with Metternich's philosophy of government is that popular rights will not stay damned. Austria tried to condemn them to destruction when she urged the European Powers to forbid Cavour to federate the Italian states into one united nation and she was driven out of the Italian Peninsula for her pains.

There is every indication that she would to-day like to say to Bulgaria and Servia, You shall not make a united and constitutional nation out of the Balkan States. If this is the Austrian intention, if it is her desire to-day, as it was in 1850, to obstruct constitutionalism and protect absolutism, the liberal statesmen of Europe ought not to sit quietly by and let her accomplish so reactionary a design.

It is said that Austria is depending upon the Triple Alliance—that partnership between Germany, Austria, and Italy formed in 1883 for mutual protection against France and Russia—to aid her in the control, if not the actual subjugation, of the Balkan States. It may be so, for Austria is not sufficiently powerful to act alone in any partition of European territory. But we do not believe that Italian statesmen, familiar with the lives of Victor Emmanuel II, Cavour, Massimo d'Azeglio, Villamarina, and the other great opponents of Austria in the Italian struggle for independence, can bring themselves to support Austria in throttling the Balkan peoples in their similar struggle for independence and union.

If any reader thinks the foregoing brief interpretation of Austria's malign influence upon the development of free government in Europe is overdrawn or unjust, let him consult William Roscoe Thayer's "Life and Times of Cavour," a biographical work by an American writer which takes rank with the great biographies written in the English language. At the Congress of Paris—convened in 1856, at the conclusion of the Crimean War, primarily to settle the terms of peace with Russia, but also to determine the status of united Italy in Europe—England, under the leadership of Lord Palmerston, her Prime Minister, and Lord Clarendon, her representative to the Congress, espoused the Italian cause and gave Cavour the whole weight of their moral, if not their political, support. Austria, under the leadership of Count Buol, a faithful disciple of Metternich, bitterly opposed the creation of the new

European nation which Caviour was striving to make out of united Italy. What European diplomatists thought of Austria's arrogant absolutism in those days is indicated by two incidents of the Congress of Paris related by Mr. Thayer. At one of the sittings Count Orloff, the Russian envoy, said in a stage whisper to Cavour, "To listen to Buol you would suppose that the Austrians had taken Sebastopol." And Bismarck remarked: "If I could be as great for a single hour as Buol thinks he is all the time, I should establish my glory forever before God and man!"

The Balkan allies, not Austria, are in military possession of the Balkan Peninsula, and we cannot believe that Italy, France, and England will permit Austria to insist on distributing the fruits of the victory.

One of the most honorable and inspiring pages in the history of English diplomacy is that which records the story of England's support of Cavour and a united Italy. If England now supports the Balkan allies she will have the applause of every lover of political freedom throughout the civilized world.

RECREATIONS OF A PRODUCTIVE SCHOLAR

EDITORIAL BY THEODORE ROOSEVELT

ANYTHING that Professor Lounsbury writes is certain to be interesting. Any collection by him of the writings of others is also certain to be interesting. Probably when Mr. Lounsbury is doing what he himself is willing to accept as work, it is both so profound and so erudite that we laymen can do little but admire it from a distance. Fortunately, however, he is also willing to do what he regards as play, such as a Life of Fenimore Cooper, or a study of English adapted to the needs of those who are not scholars; and all of his writing of this lighter kind adds markedly to the sum of enjoyment of laymen who are fond of reading.

The two volumes before me illustrate the good that can be done by people of cultivation who at our different universities provide the means needed to foster productive scholarship—for, unfortunately, productive scholarship in this country is apt to be unremunerative. The slender volume on the early literary career of Robert Browning[1] is based on four lectures delivered at the University of Virginia under the terms of the Barbour-Page Foundation, a foundation due to the wisdom and generosity of Mrs. Thomas Nelson Page. The "Yale Book of American Verse"[2] is published by the Yale University Press under the auspices of the Elizabethan Club of Yale University, a club founded by Mr. Alexander Cochran. It is the kind of club the possession of which every real university in the country must envy Yale.

[1] The Early Literary Career of Robert Browning. By Thomas R. Lounsbury. Charles Scribner's Sons, New York.
[2] Yale Book of American Verse. Collected by Thomas R. Lounsbury. Yale University Press, New Haven.

This study of Browning particularly appeals to any man who, although devoted to Browning, yet does not care for the pieces that some of the Browning clubs especially delight in. Browning's great poems, those which will last as long as English literature lasts, are given their full meed of praise by Professor Lounsbury. The other poems, those which especially excite the interest of the average Browning Society, are treated very amusingly, and on the whole very justly. Professor Lounsbury insists that these "poems" will not permanently last, because they are essentially formless, and therefore not poetry at all, and indeed not literature. He holds that the attraction such poems exercise on certain people is the attraction of the unintelligible. Mr. Lounsbury's writings are always full of delicious touches, and he is sometimes at his best in this little volume, as, for instance, where he says, "In fact, commentaries on Browning generally bear a close resemblance to fog-horns. They proclaim the existence of fog, but they do not disperse it." One of his main contentions is that fundamentally the interest in those poems of Browning which are both very long and very obscure does not differ in kind from that displayed in guessing the answers to riddles, or, to use a more dignified comparison, from that employed in the solution of difficult mathematical problems.

I think, however, that for the admiration of these rather obscure philosophical poems of Browning there is a reason upon which Mr. Lounsbury has not touched. He says truly that the men who admire Browning are very apt to be men not especially drawn to

writers in whom lofty speculations have found their fitting counterpart in clearness and beauty of expression; and he instances Wordsworth and Tennyson as poets to be enjoyed only by men and women who have a certain degree of fondness for literature as literature. Now, I think it is true of Browning (as it is true of Walt Whitman) that many of the people who labor longest and hardest to master his meaning are entirely mistaken in thinking that they enjoy him as a poet. But I do not think that Mr. Lounsbury's explanation that they prize him only as a puzzle fully accounts for the enjoyment of many of these men, or the profit they derive from their study. The fact is that Browning does represent very deep thought, very real philosophy—mixed, of course, with much thought that is not deep at all but only obscure, and much would-be philosophy that has no meaning whatsoever. In an instance that came to my own knowledge, a class of college boys in a course of literature, after carefully studying Browning for a couple of months, and after then taking up Tennyson, unanimously abandoned Tennyson and insisted on returning to the study of Browning. These hard-working, intelligent boys were not all of them merely interested in puzzles. They were not all of them blind to poetry as such. They did care to a certain extent for form, but primarily they were interested in the great problems of life, they were interested in great and noble thoughts. Doubtless many of them rather enjoyed having to dig out the thought from involved language. But probably a greater number felt a larger enjoyment in finding lofty thought expressed in language which was even more lofty than obscure.

It is true that as a poet Browning is formless. But the poets who are great philosophers are few in number, and great philosophers who have any gift of expression whatever or any sense of form, or whose writings so much as approach the outer hem of literature, are even fewer in number. Browning the philosopher is not more deep than many other philosophers, and in form and expression he is inferior to many poets. But he is a philosopher, and he has form and expression. The philosophy he writes is literature, even though hardly in the highest sense poetic literature. Therefore he appeals to men who are primarily interested in his writings as philosophy, but who do derive a certain pleasure from form or expression; who, without being conscious of it, do like to have the writings they read resemble literature. These men are given by Browning something that no other poet and no other philosopher can give them; and I do not think that these men receive full justice at Mr. Lounsbury's hands. Moreover, as compared to Tennyson or Longfellow, or any other of the more conventional poets—and I am extremely fond of these conventional poets—there is far more in Browning, even in Browning's simpler and more understandable and formal poems, that gives expression to certain deep and complex emotions. There are many poets whom we habitually read far more often than Browning, and who minister better to our more primitive needs and emotions. There are very few whose lines come so naturally to us in certain great crises of the soul which are also crises of the intellect.

"The Yale Book of American Verse" is an excellent anthology, and the preface is one of the best things about it. In this preface Mr. Lounsbury quite unconsciously shows why he appeals to so many men to whom a college professor who is nothing more than a college professor does not readily appeal. He mentions that on the march to Gettysburg he picked up a torn piece of newspaper containing certain verses which have always remained in his mind, and which he includes in this collection of verse. This is the only hint in Professor Lounsbury's writings that he fought in the Civil War. A Professor of English Literature in a great university who in his youth fought at Gettysburg must necessarily have something in him that speaks not only to scholars but to men.

This anthology includes hymns as well as secular poems. The collection is good in itself, as I have already said, and, moreover, to all real lovers of anthologies it will also seem good because each of them will take much satisfaction in wondering why certain of his or her favorite poems have been left out, and why certain other poems have been put in. I suppose every man who cares for poetry at all at times wishes that he could compile an anthology for his own purposes. I certainly so feel. I would like to compile two anthologies, one of hymns and one of those poems which our ancestors designated quite ruthlessly as "profane," in opposition to sacred. I should not expect any one else to read either of my collections. I should not wish the edition to consist of more than

one copy. But I would like, purely for my own use, to own that copy! In the anthology of hymns, for instance, besides all the great hymns, from Bernard of Morlais to Cowper and Wesley and Bishop Heber, I would like to put in some hymns as to which I know nothing except that I like them. Every Christmas Eve in our own church at Oyster Bay, for instance, the children sing a hymn beginning "It's Christmas Eve on the River, it's Christmas Eve on the Bay." Of course the hymn has come to us from somewhere else, but I do not know from where; and the average native of our village firmly believes that it is indigenous to our own soil—which it cannot be, unless it deals in hyperbole, for the nearest approach to a river in our neighborhood is the village pond.

As for the "profane" anthology, I think I should like to make one consisting of several volumes. Even Mr. Lounsbury's volume of American verse, though it contains some specimens of verse I would not have included, omits others which I certainly should put in. And then, think of the many, many volumes that would be needed to include the English poems, and the French poems, and the German poems from the Bard of the Dimbovitza, and all the other poems which no human being could make up his mind to see any anthology leave out! I fear that a perfect anthology of the kind that fills my dreams would be as large as the various rather dismal series of volumes which contain, as we are told, "the world's best literature"—and doubtless would be as unsatisfactory.

Meanwhile, as all this represents an unattainable dream, we have reason to be glad that Mr. Lounsbury's particular anthology has been published.

THE RAILWAY ARBITRATION: A REVIEW

I—THE FACTS OF THE CASE

THE settlement by a Board of Arbitrators last week of the long-standing dispute between the locomotive engineers and the railways in the eastern part of the country is of almost unprecedented importance, because of the wide extent of this labor struggle, because serious interests pertaining to the public at large are involved, and most of all because of its bearing on the fundamental questions in future dealing with industrial railway wars. Both sides to this particular controversy have accepted the award, and that in itself, although it was fully expected, is a happy augury for authorized arbitration under similar conditions.

THE HISTORY OF THE CASE

Six months ago, when it seemed almost inevitable that a railway strike of colossal proportions would take place that might paralyze the business of this country even as for a short time the commerce of England was paralyzed a year ago, there was set in motion a means and agency of conciliation provided under the laws of the United States. The locomotive engineers on fifty-two railways in the so-called Eastern District of the United States demanded that their wages should be, as they called it, "standardized," and also relatively equalized with the wages of the engineers on the roads westward. Their complaint was not so much of low wages as that there were great inequalities among the different roads involved, and that the same service on the different roads ought to meet the same reward. There were also other demands, but all of them had as their moving cause the desire to establish equal conditions and equal pay among railway engineers the country over. Their union, the Brotherhood of Locomotive Engineers, is not only one of the strongest labor organizations in the country, but one which in the past has been reasonable and conservative. These demands were flatly and apparently finally rejected by the railway companies, on the ground that to yield would involve a cost of seven million dollars a year, and that conditions of business made this impossible. The threatened disastrous conflict was first postponed and is now finally averted through the prompt action of Judge Knapp, of the United States Commerce Court, and Mr. Neill, of the United States Labor Bureau. The Erdman Law gave the opportunity for arbitration, although it did not compel arbitration. Under its provisions the President may appoint any member of the Inter-State Commerce Commission or any member of the United States Commerce Court to act as a mediator with the United States Commissioner of Labor, and these two are instructed to offer

arbitration when either one of the parties to a railway labor dispute asks for such action. It did not appear probable that either would so ask; but, without sitting supinely while a labor war broke out and commercial interests were imperiled, the two men we have named, relying on the implied permission of the law, sought out the official representatives of the railways and of the union, and by every means in their power urged them toward conciliation. Presumably neither side dared take the responsibility and opprobrium of refusing mediation and thereby closing the railways and blocking the transportation of half the Nation. Each appointed its representative on the board—for the engineers, Mr. P. H. Morrissey, formerly head of the Conductors' and Trainmen's Union, and a man of unquestioned ability and fairness; for the railways involved, President Daniel Willard, of the Baltimore and Ohio Railroad, a road which has an enviable reputation for its treatment of its employees. As it did not seem possible for the disputants to choose a single man to act as a third arbitrator, a larger board was selected, under the provisions of the law, by mutual consent. Its members, in addition to those already named, were Oscar S. Straus, former Secretary of Commerce and Labor, who was Chairman; Albert Shaw, editor of the "Review of Reviews;" Otto M. Eidlitz, former President of the Building Trades Association; Charles R. Van Hise, President of the University of Wisconsin; and Frederick N. Judson, of the St. Louis Bar. As these five men were named by the Chief Justice of the United States, the United States Commissioner of Labor, and the Presiding Judge of the United States Commerce Court, it is evident that the interests of the public at large were adequately and prominently brought before the Board of Arbitration, as assuredly the nature of the case and the large principles involved demanded.

THE TWO CONTENTIONS

Leaving aside exact figures and precise claims as to wages, it should be pointed out that each side in this controversy put forward a contention based upon a broad economic theory, and applicable to many other economic and financial problems now before the country. These two contentions have been thus stated in these columns: "The engineers declare that for public safety only men of high skill and experience should be employed; that living cost has so increased that former wages are insufficient; that if skill and care among those who constantly have our lives in charge is to be maintained, living wages must be paid, and that the time has come for a movement in this direction. On the other hand, the companies reply that if they increase the pay of engineers they must ultimately increase the pay of all employees; that this means a charge on the railways which can be met only in one of two ways—by raising rates (to which the Inter-State Commerce Commission objects) or by decreasing dividends. The railway managers seem to take it for granted that the first course is really the only available one, and argue that railway stock is so widely held in small amounts that to decrease dividends would be not only to lower the market value of stocks and thereby injure business, but to decrease also the incomes of such an enormous number of people that it would really be a blow at the consumer—that is, the user of railways." And The Outlook commented as follows: "This is a question which requires calm consideration, for it affects industrial conditions fundamentally; it may, however, be said that no large industrial concern dealing with public safety and public comfort should be allowed to make the payment of large dividends its first consideration; before dividends should come fair treatment and reasonable pay to its employees, safety and reasonable treatment for both employees and public, and finally the maintenance in proper condition of the industry itself. So long as the alleged necessity of maintaining the stock market value of securities and of keeping up whatever dividend rate has been established are considered paramount, the industrial question in its largest aspects will remain unsettled." Thus the engineers, well paid though they are, may naturally lay stress on the terrible strain of their service and the responsibility for human life upon them; and, on the other hand, the railways may with considerable reason urge that they must not be forced to pay higher wages and at the same time be debarred from raising their rates.

THE THIRD PARTY IN INTEREST

It is a long cry from the day when the public first heard the heartless saying, "The public be damned!" as applied to railways. Now it is admitted by all, except a few rock-bound and mediæval-minded economists, that the public is not only a third party in rail-

way management, but that it is *the* most important party; and that questions of wages and rates are subordinate to human safety, to reasonable comfort for passengers, and to justice and fairness in charges for both passenger and freight transportation. This is clearly stated in the award of the Board of Arbitration. It is pointed out that the population of the area served by these roads is forty per cent of the total population of the country, and that the section involved represents at least four-tenths of the wealth of the entire United States. A strike such as was contemplated would have cut off food supplies from the big cities in the East within a week, while their milk supply might not have lasted over a day. "It is evident," says the award, "that for a great section of the United States a railroad strike can no longer be considered as a matter which primarily affects the railroads, operators, and employees. It is therefore imperative that some other way be found to settle differences between railroads and their employees than by strikes."

WHAT IS THE REMEDY?

It might fairly be argued that this state of things would justify legislation for the appointment of a Board of Compulsory Arbitration. It is The Outlook's belief that the Erdman Law should be modified so that the machinery of arbitration might be set in motion, not only (as now) upon the application of one of the parties to the dispute, but on the official application of the Government, as representing the public, or of private individuals among the public whose interests are threatened. What the Board of Arbitration in this case suggests might, however, bring about the same results, without the form of compulsory arbitration. It recommends the establishment of Federal and State wage commissions which shall exercise the functions regarding labor engaged upon public utilities analogous to those exercised by the public service commissions with regard to capital. The Board says: "While the railway employees feel that they cannot surrender their rights to strike, if there were a wage commission which would secure them just wages the necessity would no longer exist for the exercise of their power. It is believed that in the last analysis the only solution—unless we are to rely solely upon the restraining power of public opinion—is to qualify the principle of free contract in the railroad service." And it adds: "It is well understood by the Board that the problem for which the above plan is a suggested solution is a complex and difficult one. The suggestion, however, grows out of a profound conviction that the food and clothing of our people, the industries, and the general welfare of the Nation, cannot be permitted to depend upon the policies and the dictates of any particular group of men, whether employers or employees."

If this plan were put in operation, the new Commission would exercise authority over labor disputes on railways just as the Inter-State Commerce Commission exercises authority on other railway matters. And as hearings from both disputants as to the questions involved would certainly be held, the decisions would have the effect, though not the form, of compulsory arbitration. A necessary adjunct to this plan would be some way of penalizing the unions or otherwise enforcing strictly and promptly the decrees of the Commission.

THE MINIMUM WAGE QUESTION

The award recognizes the minimum wage principle. It was impracticable for the Board to decide whether an increase of wages should be granted on all of the fifty-two roads, or upon some and not upon others, or how much the increase should be for each class of service on every road where it was granted. The complications as to the classes of service (whether day or night, or freight or passenger, for instance) were intricate and almost innumerable. It was necessary accordingly to fix on some principle under which the basis of a fair wage should be found. The Board held that it ought to take into account the relation of compensation of engineers to that of other classes of employees, both in the Eastern District and all over the country. A minimum wage for each class of work was the only way out. The award may be illustrated by taking one case alone: for engineers in passenger service the minimum wage is fixed at $4.25 per day. This increases pay for engineers in most of the roads involved in the arbitration, but not in all; in other classes of service many of the men on some roads will have to submit to a lower wage in order that, under the minimum wage plan, their fellow-workmen on other roads may receive an equal reward for their work.

DISSENTING VIEWS

Both Mr. Morrissey for the engineers and President Willard for the railways have

accepted the decision, and both the Brotherhood and the railways will loyally abide by the award, which will be enforced, however, only up to May 1, 1913. This short time is due, first, to the fact that the Erdman Law provides that such an award shall be enforced for one year, and, secondly, to the fact that the award is retroactive, dating back from May 1, 1912. Mr. Morrissey and Mr. Willard have expressed (the first formally in a minority report, the second informally) their dissent from some of the findings of the Board. While Mr. Morrissey acknowledges that there has been a gain in essentials and that a step forward has been taken in the standardization of engineers' rates and of conditions for the Eastern District, at the same time he expresses the belief that the award will have the effect of retarding the progress of arbitration in the settlement of industrial disputes on the railways. He contends that the award does not settle the important principles raised by the engineers, and claims not only that it is based upon statistics that are unreliable for the purposes for which the Board used them, but that the Board also erred in the application of these wage statistics. For this reason, he says, "while the engineers will faithfully abide by the award during the period that it is to continue, at the same time it can be only temporary because its fundamental basis is so insecure." He dissents from the majority of the Board in their recommendation that wage commissions be established with power of compulsory arbitration, although he suggests that there are some important activities to which such commissions might profitably give attention. A striking suggestion is made in his recommendation that hereafter arbitration boards should be so constituted that none of the parties composing them—not even representatives of the public—should have a majority of the members; that the majority should be constituted by the representatives of at least two of the parties agreeing.

Mr. Willard, on the other hand, says:

> My acceptance of the award as a whole does not signify my approval of all the findings in detail. It is intended, however, to indicate clearly that, although the award is not such as the railroads had hoped for, nor is it such as they felt would be justified by a full consideration of all the facts, yet, having decided to submit their case to arbitration and having been given ample opportunity to present the facts and arguments in support of their position, they now accept without question the conclusion which was reached by the Board appointed to pass upon the matters at issue.

Thus ends peacefully what threatened to be a gigantic and calamitous industrial war.

II—THE PRINCIPLES INVOLVED

The Board of Arbitration lays down three principles which appear to The Outlook of great importance and essentially just. Upon two of these the Board is apparently unanimous; upon the third there is a dissenting opinion. And this opinion is entitled to great weight, both from the character of Mr. Morrissey, the representative of the engineers on the Board, and from the fact that in it he personally reflects the general opinions of the railway employees. With regard to this controversy three principles seem to us clearly applicable:

1. Three parties are affected by a controversy between the owners and the employees of a railway: the owners, the employees, and the general public; the interests of the last are of paramount importance, but have too generally been disregarded. The railway system of the United States is to the community what the arterial system is to the individual. Its stoppage is fatal to well-being, and may easily prove literally fatal to many lives. For it inevitably and necessarily deprives the great centers of population of the supplies of food and fuel. The highways of the Nation must be kept open and unimpeded. We add that, if this cannot be done by private ownership, public ownership will be substituted. To public ownership there are serious objections. But they are not so serious as the food and fuel famines which follow from railway wars.

2. The employees must be paid a fair compensation. If the railways are not able to pay such compensation, they must obtain permission from the Inter-State Commerce Commission to raise their rates, or must act on Mr. Brandeis's suggestion of a year or two ago and by increased efficiency and economies in other directions secure the necessary funds.

The first duty of a railway corporation is not to pay dividends to its stockholders, important as that duty is. Its first duty is to operate the highways of the Nation efficiently and honestly. To do this it must keep the roadbed and rolling stock and stations in

good condition; but it is equally essential that it keep the men who operate the railway in good condition. These two things are necessary to enable the railway corporation to do the business for which it has been created; only thus can it render to the public the service for which the public has given to it its charter. Not until it has paid the necessary operating and maintenance expenses are there any profits, and dividends are profits. If in any one year it cannot keep the road and the men in good condition and divide profits, it must do its work without profits. If it cannot permanently keep the road and the men in good condition and divide profits, it will naturally go out of business, and the public will have to take it up or the railway will be abandoned. But dividends never ought to be paid out of the wages of the men or out of money temporarily saved by the deterioration of the road.

We believe that the public will with substantial unanimity sustain these two principles: the interests of the public are paramount, and the payment of a fair wage must precede the payment of a fair dividend.

And we also believe that the public will be willing to pay such price for transportation as will enable the railways to pay both a fair wage and a fair dividend. But they are not willing to leave the railway corporation the sole judge of what is fair.

3. The third principle is thus stated in the daily press account of the report of the Board:

> In many respects the railroads are subject to the Inter-State Commerce Commission and various State Commissions. The same is not true of the employees of the railroads, the Board says. This disparity of status suggests the creation of Federal and State wage commissions which shall exercise functions regarding labor engaged in work upon public utilities analogous to those exercised with regard to capital by the public service commissions already in existence.

From this suggestion Mr. Morrissey, former Grand Master of the Railroad Trainmen, who in the Board represents the engineers, dissents. He says:

> I wish to emphasize my dissent from that recommendation of the Board which, in its effect, virtually means compulsory arbitration for the railroads and their employees. Regardless of any probable Constitutional prohibitions which might operate against its being adopted, it is wholly impracticable. The progress toward the settlement of disputes between the railways and their employees without recourse to industrial warfare has been marked. There is nothing under present conditions to prevent its continuance. It will never be perfect, but, even so, it will be immeasurably better than it would be under conditions such as the Board proposes. The peace that would satisfy such an ideal condition as that had in mind by those making the recommendation would be too dearly bought even if it could be attained. To insure the permanent industrial peace so much desired will require a broader statesmanship than that which would shackle the rights of a large group of our citizens.

Compulsory arbitration would promote rather than prevent labor wars, unless it can be so framed as to secure the approval of the trainmen. But in it we can see nothing essentially inconsistent with either justice or liberty. The same objections were made a quarter of a century ago to the creation of commissions to regulate the owners of the railway that are now made to a commission to regulate the operators of the railway. The creation of such a commission rests in both cases on the same fundamental principle: The railway is a public highway; the owners and operators of the railway are servants of the public; and the public interests are paramount.

There would be nothing inherently unjust in enlisting trainmen as soldiers are enlisted, provided a speedy hearing for all complaints and a prompt and efficient securing of justice can be obtained for them. Such a system would not be unjust. It would not be inconsistent with liberty. It might be impracticable. The real question is, Would it work well?

The first Federal Railway Commission had only power of investigation and advice. Such a commission could hardly be objected to by Mr. Morrissey. And it would be a great advantage to the public and to the men themselves to have such a commission, clothed with authority to investigate all complaints and all labor difficulties affecting transportation, either at the request of the parties, of a third party, or on the initiative of the commission itself. It is quite possible that an informed public opinion is all the compulsion that is required in any labor war. It is certain that in many labor wars no other compulsion is needed. Under present conditions neither the public nor the stockholders, and in many cases not even the men themselves, have sufficiently accurate and authoritative information concerning the facts to form a just judgment respecting the merits of the controversy. Some method of securing a

just judgment comes first. How to enforce such judgment may be left for future consideration.

The Outlook heartily seconds all three of the recommendations of the Arbitration Board.

THE BECKER CASE

A POLL OF THE PRESS

DEATH sentences have been pronounced on Police-Lieutenant Becker and his four hirelings for the Rosenthal murder in New York City, and have called forth much interesting newspaper comment. As to the crime itself, the opinions of many journals are thus summarized by the Peoria, Illinois, "Herald-Transcript:"

The story of the killing of gambler Rosenthal reads like a tale of some morbidly imaginative fiction writer. The sharing of the spoils with the various gambling-houses by the police, the exercise of autocratic power by the lieutenant and his men to compel professional murderers to remove objectionable "squealers," and the perfect nonchalance with which these hired assassins performed their work are details which strain the normal man's imagination.

Two newspapers opposed to capital punishment thus comment. One of them is the Ogden, Utah, "Standard:"

No murder trials have given more general satisfaction than those in which Lieutenant Charles Becker, who instigated, and the four gunmen, who participated in, the murder of Herman Rosenthal in New York, have been found guilty of murder in the first degree. . . .

We are, on general principles, opposed to capital punishment; but in this instance we would not raise the slightest protest if Lieutenant Becker, "Lefty Louis," "Gyp the Blood," "Dago Frank," and "Whitey" Lewis were sent heavenward as were the leaders of the Sepoy mutiny in 1857. New York State has our permission to assemble the entire police force of New York City and, in the presence of officers and men, blow Becker and his gang of cutthroats to Jericho.

The other paper opposed to capital punishment is the La Crosse, Wisconsin, "Tribune." It remarks:

The men are about as depraved, as brutal, as the limits of human degradation permit. When we read of the doings of their kind, we forget, for the moment, that we are opposed to capital punishment. . . .

It is to be regretted that other contributors to the Rosenthal murder—men as low and dangerous as the five convicted—are to go free as a reward for furnishing information which led to the conviction of the five assassins. However, it is probably true that were informants refused immunity, it would become impossible to convict the ringleaders of criminal cliques anywhere.

As to the trial itself, the Sioux Falls, South Dakota, "Argus-Leader," speaks in common with very many newspapers throughout the country in declaring:

The unanimous verdict of guilty of murder in the first degree rendered by the jury in the gunmen's trial, after deliberations that lasted but seventy minutes, is the climax to one of the most sensational cases ever tried in the New York courts. . . .

It took fifteen days to try and convict Becker; the trial of the gunmen lasted about the same length of time, an unusual thing in the courts, especially in the New York courts. . . .

It was indeed a great trial; it might be called a model trial. . . .

It was a great trial, because it was conducted in the presence of the most formidable of all oppositions: that which is hidden, and is fostered by wealth and power.

"It is well to give credit to Justice Goff," adds the Peoria, Illinois, "Herald-Transcript," "who ruled without reference to quibbling in the trial of the cases, and to the jurymen, who placed their own lives in more or less jeopardy in fearlessly pronouncing judgment on members of the most cold-blooded fraternity in the world."

"Aside from the value of the service performed for the community by Justice Goff in the cases of the five murderers of Rosenthal," remarks the Philadelphia "Times," "that jurist has benefited the community in a large degree by setting a salutary example to his associates on the bench of the Supreme Court." The "Times" then explains:

Justice Goff has shown them that even the most conspicuous murder trial, in which experience and cunning are enlisted for the defense, does not have to be dragged out to a weary length as a theatrical spectacle; does not have to be conducted at the mercy of hair-splitting counsel; and can be brought to a rapid finish without a loss of dignity by the court and without a scandalous miscarriage of justice through mistrial or failure of the jurors to agree.

All the presiding judge needs to run his own court is hard common sense and a determination to get at the essentials. Lawyers will yield when they find he means business, and respect him for his firmness. By teaching this lesson to lawyers and judges Justice Goff has set a standard, at least for celebrated cases, so far above what was accepted in the Thaw trial, and even before that, as to cause the community to

gasp. He deserves a special word of thanks for setting a precedent from which judges hereafter will not depart without inviting censure.

Commenting upon the significance of the trial of the gunmen, the Milwaukee "Sentinel" says that "the death sentence in the case of the four gunmen should work a radical change in the mental processes of the bad element in New York's East Side." The "Sentinel" adds:

The general change to be wrought was illustrated in the expression that sprang to the faces of the four men when the evidently unexpected verdict of guilty was pronounced. It was one of dazed surprise and consternation. Why? A local observer says:

"They had seen many men—gangsters—murdered, and in nearly every case the murderer had got away and policemen had let it be known that it was a good thing the man was killed."

That puts in a nutshell one phase of the peculiar psychology of East Side thuggery. Murder as such was not regarded as a particularly serious thing, either legally or morally.

The point to consider was the chance of getting away scot free; and in the chances of cases typified by the Rosenthal murder—murder, that is, committed within the circle of the "underworld," with its police and political connections—the chance of escape was as ten to one against the chance of punishment.

The New York "Sun" points out the fact that the word "gang" includes "not merely the desperate and ignorant brutes who do murder for a wage and exist only by toleration of the police." The "Sun" adds:

It describes the gamblers who thrive through police corruption, the policemen who fatten on the earnings of crime, the landlords who rent their property for illegal establishments, the dishonest and the inefficient executives who, for profit or through incapacity, permit the gigantic conspiracy of criminals to exist. Collectively, these are to-day recognized as the gang. Each stands in the same dock with Becker and his crew.

The cause of New York City corruption is municipal politics, declares the Peoria "Herald-Transcript." "Trace the case of the Rosenthal murder back to its source," it says, "and you will find that the tragedy which has brought five men to the electric chair and made New York's Police Department a subject of National contempt goes back to the admixture of partisan politics and municipal business."

In fact, municipal politics in New York is a business in itself—a business at which hundreds of men make their living, and at which other hundreds have grown wealthy more easily and more quickly than they could have done in almost any other line of endeavor.

Elections in New York are not decided on the basis of what is good for New York, as a rule, but with consideration for the jobs involved. . . .

Police-Lieutenant Becker, reaping his harvest from the gamblers, doubtless felt that he was merely gathering in his legitimate share of the spoils due the job he held.

What is involved in this relationship between politics and systematized, commercialized crime is vividly explained by Magistrate Joseph E. Corrigan in his article "Magnates of Crime" in "McClure's Magazine" for November. Judge Corrigan concludes his article with definite proposals for the reform of police administration and court procedure.

The Los Angeles "Municipal News" was established by the citizens of Los Angeles through an initiative ordinance adopted in 1911. It is published weekly by the city of Los Angeles under the direction of the Municipal Newspaper Commission. It says:

New York's police scandals and the Becker trial have informed the world of the helpless condition of the people of New York City, so far as the government is concerned. The great city is managed under laws made at Albany, and much of this lawmaking is through trades with New York's Tammany-made membership in the Assembly. . . .

New York has reached the point that it obeys what laws it wishes to. Obedience is determined largely by the police and the magistrates, and they have been shown to be the sunshine of vice growth.

New York might restore efficient government and suppress official crime without home rule, but those who have studied the latest presentation of facts agree that home rule is the first step the great city must take before it can purge itself.

With home rule, with the right to make its own laws, institute its own government, and make and unmake its officials, New York will be in a position to gain a character for municipal honesty. Los Angeles knows the value of home rule by experience, and joins in the wish that New York may have it soon, if that be the means of attaining virtue.

Says the Springfield, Massachusetts, "Union:"

Mayor Gaynor's attacks on ministers and social workers for their methods in attempting to make New York a more moral community have been based on the assumption that because of the character of New York's population and its position as the center of activity of all kinds in the East, it cannot be of as high morality as smaller communities. The Mayor has been answered by the clergymen themselves, but the other day his position was attacked by a group of men who represent the ideals of the public, but are not necessarily professional reformers. Among them was District Attorney Whitman, who said it angers him to hear it said that other cities are worse than New York. "Our ideal should be to make it as good as it can be made," he says.

A NEW POWER IN EUROPE

BY STEPHEN VAN RENSSELAER TROWBRIDGE

THE outstanding fact revealed by the war thus far is the rise of a new power in Europe. The energy, ability, and patriotism displayed by the Bulgarian army have riveted the attention of the West. We can scarcely imagine what must be the feelings of the Russians, who have hitherto disdainfully treated Bulgaria as a dependent principality, but who must now fully recognize the intense feeling of nationality which has inspired "the young giant of the Balkans." Greece, Servia, and Montenegro have carried out their parts in the invasion of European Turkey, and they have been in almost every instance victorious. But the force and mass of the Bulgarian advance and the fact that Adrianople, once the proud capital of the Ottoman Empire, and Constantinople, the present capital, are upon the verge of capitulation, give to this intrepid little nation a new prestige and a dominating influence in eastern Europe. David has gone forth against the champion of the Philistines.

In a democratic country like Bulgaria the army is the product of the people. It is not the machine of a monarch. And back of the army are the thrift and self-sacrifice of a nation of peasants. The national traits are stolidity (in contrast with the hot-tempered and capricious peoples of southern Europe), thrift, especially in agriculture, indomitable courage, and a passion for education. In some respects the Bulgars betray their Oriental origin. Their complexions are rather dark, and the Tartar or Finnish elements in their physiognomy are often strongly marked. The peasant women carry the household burdens and walk deferentially behind their husbands. The younger women deck their hair, as in the East, with strings of coins, and they love garments of brilliant colors. The shepherds are clad in sheepskins, and the creaking wagons, drawn by oxen or buffaloes, are followed by rough-looking drivers carrying goads in their hands.

But the highland climate of the Balkans and the purity of the home life maintained through a thousand years of national existence have combined to make the Bulgars a singularly strong-built race. Both men and women are broad-shouldered, and they stand erect. Smoking is not common, and drunkenness in public is very rare. Street quarrels and riots are almost unknown, in marked contrast with the noisy demonstrations of Greek and Albanian towns. The mass of the people are peasants occupied with farming, pasturing flocks, lumbering, and the culture of roses. It is one of the ironies of history that the very battlefields near Tirnova and the Shipka Pass, where the Russians bore down upon the Turks with such relentless hand-to-hand fighting in the blizzards of the winter of 1877, are now planted with rose-bushes. Attar of roses is distilled from the petals, and forms one of the chief exports of the country.

The city life in Bulgaria is distinctly Western. Municipal improvements have been rapidly made since the Turkish yoke was thrown off in 1878. Schools and gymnasia have been established in all the large towns, and the homes are built in European style. A university was erected in Sofia in 1907, and Philippopolis (the ancient Philippi of the New Testament) has a *gymnasium* which cost $150,000; this corresponds, roughly speaking, to our high school. The *lycée* for girls in the same town is well administered and well attended. It is interesting to note that, while the Bulgars have an intense love for education, the theaters are very poorly attended and are opened only occasionally. The people are made of sterner stuff than their neighbors, the pleasure-loving Serbs. The practical nature and shrewd judgment of the Bulgars are shown in the fact that, instead of keeping their Turkish prisoners in useless confinement, they have put eight thousand of them to work building the emergency railway to communicate with the field of war.

The history of the Bulgars, which is certainly a dramatic one, falls naturally into six periods:

1. *Invasion* from the valley of the Volga westward and southward across the Danube during the seventh century. This was a period of crude barbarity, before the tribes had come into contact with the Christian faith. The Slavic inhabitants in the region of the Balkans were subjugated and absorbed into the Bulgarian stock, giving to the con-

querors much of Russian literature and usage, in very much the same way that the conquered Arabs have influenced the form and spirit of Turkish literature. The cities of that region were wrested from the Byzantine Empire. Krum, the battle-lord of the Bulgars, a ruthless barbarian, defeated the Greek Emperor, advanced to the walls of Constantinople in 813 A.D., and humiliated the Byzantines by exacting a tribute. He devastated the surrounding country and carried off a vast number of women and children captives. The prisoners, many of them priests and even bishops, did not hide their faith from their captors, and so successful was their preaching that many of the enemy were deeply influenced. The execution of four bishops and several hundred Christians only increased the devotion of the missionaries. Within a generation converts were found throughout the tribe, and in 864 A.D. King Boris himself accepted the Christian faith. Since then Bulgaria has remained a part of the Greek Orthodox Church, though with a national organization of its own.

2. *The Golden Age*, extending throughout the tenth century, is dear to the hearts of the Bulgars. For during this period the boundaries were extended by conquest so as to reach from the Black Sea to the Adriatic, and from the Danube to the Ægean. The title of Prince was superseded by that of Czar. National histories and poems were written in the Cyrillic character. The sermons of St. Chrysostom were translated into Bulgarian and the monasteries flourished. But an invasion by Byzantine armies rudely interrupted this prosperity and peace. The diadem of the Bulgarian Czars was captured and brought to Constantinople, where it was offered up as a trophy in the Church of Santa Sophia. For two centuries an intermittent warfare distressed the land, the sturdy Balkan mountaineers maintaining a certain degree of freedom.

3. *The Turkish Supremacy*, which began with the Mohammedan victory of Kosovo in 1389 and lasted until the last quarter of the nineteenth century, is the gloomiest epoch of Bulgarian annals. Certain tribes were persuaded to accept Islam, and their descendants to-day are known as Pomaks, or Moslem Bulgars. The Turkish practice of carrying off the flower of the Christian youth every five years to serve in the corps of Janissaries in Constantinople was a terrible grievance to the people. The Bulgarians were forbidden to build new churches, the noblest of the ancient churches were forcibly transformed into mosques, taxes became exorbitant, and forced labor was introduced, with torture and imprisonment as the alternative. Brigandage flourished, and the villagers were ground down under manifold hardships. Records for these five centuries are scarce, because the native language was prohibited by the Turks, libraries were burned or captured, and the clergy were required by the Mohammedans as a matter of policy to chant the liturgy in the Greek language. This long period of misgovernment and repression ended in a great tragedy: the massacre of over fifty thousand Bulgarian men, women, and children at the instigation of the Turkish authorities. The pretext for this fearful onslaught was a conspiracy and a local insurrection near Philippopolis in May, 1876. But the fiercest massacre was perpetrated in the town of Batak, a long distance from the troubled district. The Christian population of 7,000 men was entirely disarmed, Ahmed Agha, the Turkish lord, giving his oath that "not a hair of their head should be touched." Then the defenseless multitude was furiously set upon by the Turks under the command of Ahmed Agha. Great numbers took refuge in the church. The roof was torn off by the Turkish soldiers, who flung burning pieces of wood and rags dipped in petroleum down upon the helpless Christians. In other parts of Bulgaria similar outrages occurred by secret consent of the Turkish Government. The Turks had taken care to isolate Bulgaria from communication with Europe. The first authentic news of the massacre came to President Washburn, of Robert College, at Constantinople. "At the outset," says Dr. Washburn, "we alone had had these details, and what we did with them is no secret. It was no secret at the time that we gave them to Sir Henry Elliott, the British Ambassador. We did this in the hope that he could make the Turks see that they were making a terrible mistake. We also communicated the facts to powerful friends in England, to Mr. Pears, correspondent of the daily 'News,' and to the correspondent of the London 'Times.' Could we have done less?" The result was that Mr. Gladstone published his famous pamphlet, and by his impassioned eloquence helped to swell the torrent of indignation that swept through Christendom. Dr. Washburn's record gives such a graphic picture of the intricacies and disappointments

of the diplomacy in the Near East that I venture to quote somewhat at length:

It was under Abd-ul-Aziz that the massacres were planned and commenced. But we had to face a more serious difficulty. It was to be expected that the Turks would deny everything; but Mr. Disraeli, the English Prime Minister, declared in Parliament that the reports, for some of which we were responsible and which he must have known came from us, were "mere coffee-house babble" and without any foundation—that he had official information to this effect. We begged Sir Henry Elliott to send one of his own secretaries to Bulgaria to investigate and report to him. After excusing himself for some time, he sent for me one day and told me that he had at last received orders to do so, and that he would send Mr. Baring down to see me before he started, which he did. But before that I had learned from Sir Henry himself that he was not only sending his youngest secretary, who knew but little of the country and none of the languages, but that he was to get his information from the Turkish authorities and to be in the country only two or three days. I protested in vain, although Mr. Baring agreed with me. Sir Henry told me that he was acting under instructions from home. This made it clear that there was to be no real investigation, and what was wanted by Mr. Disraeli was an official report to confirm his statements that nothing serious had happened in Bulgaria. There was nothing left for us to do but to defend our honor and our veracity as best we could. I went at once to the American Minister, explained the situation to him, and begged him to send Mr. Schuyler, who had just arrived in Constantinople as Secretary of the Legation and Consul-General, to make an independent and impartial investigation of the situation in Bulgaria with proper interpreters for Turkish, Bulgarian, and Greek. He said that he had no authority to do this, but that, if I could persuade Mr. Schuyler to go, he would find a way to send him. I found it easy to persuade Mr. Schuyler, and he left Constantinople with his interpreters the day after Mr. Baring, overtaking him at Adrianople. Mr. Baring was an honest man, and I do not think that he was sorry to find himself checkmated at the beginning of the game. He saw at once that Mr. Schuyler's report would be accepted and believed by all the world. I do not know what report Mr. Disraeli got. He did not publish it; but the first result of Mr. Schuyler's preliminary report, made in ten days, was to convert Mr. Gladstone and make him the leader in the great agitation which finally overthrew the Disraeli Government, and which before that led to the Conference of Constantinople. Mr. Baring went with Mr. Schuyler to Batak and saw with his own eyes the unburied bodies of some five thousand men, women, and children who had been slaughtered in this one town, far from the seat of the insurrection. Our graduate, Mr. Peter Dimitroff, went with Mr. Schuyler as his Bulgarian interpreter. Could we have done less than this under the circumstances?

Having been through the very midst of the Adana massacre in 1909, I can imagine the heartbreaking scenes in the Bulgarian towns at the time of which Dr. Washburn writes. The Turks have certainly done their utmost to retard the civilization of Bulgaria. At last the tide has turned against them. A British correspondent, in speaking of the flight of the Turkish population before the onrush of the Bulgarian armies in the recent advance upon Constantinople, remarks:

One thought strikes an observer forcibly at seeing the Turks migrating back to their ancient home, namely, how little altered after five hundred years are the wanderers, returning practically in the same manner in which they came into Europe—the same rough wooden carts, dragged by bullocks or buffaloes, and covered with straw matting, which conceals the household lumber, and the female members of the family hunched into the smallest conceivable space peering with sad eyes at the unfamiliar sights, while the sheep and goats are prevented from straying by the youngsters of the family.

4. *Emancipation* from the Turks came with the Russian invasion of 1877 and the Treaty of San Stefano. But what was hailed at first as liberation proved to be an exchange of masters, for the policy of Russia in demanding "autonomy" for Bulgaria was to reduce that state to the sad condition of Finland and Poland. The young nation, to use a phrase of Prince Bismarck, had thus been "put in the saddle," but had not yet "learned to ride." A Russian prince was sent into the country to assume control pending the calling of a Parliament and the choice of a King. For the astute policy of Russia designed to give the Bulgars a self-contradictory Constitution, apparently very democratic, but with the possibility of leaving extraordinary power in the hands of the King should he prove to be the willing agent of Russia. The articles were so drawn up that a deadlock in politics was likely, thereby inviting Russian intervention. When the first National Assembly convened at Tirnova, it was composed of 213 Bulgarians, mostly peasants, who had had absolutely no experience in government. Military conscription and elementary education were made compulsory. All titles of nobility were prohibited. Freedom of the press was guaranteed. Prince Alexander of Battenberg, a nephew of the Russian Czar, was called to the throne. This young man, who was at that time serving as a Prussian officer at Potsdam, consulted Prince Bismarck, who advised him to accept, adding that a reign in Bulgaria would at least be "a pleasant reminiscence."

After due formalities Prince Alexander,

amid great enthusiasm, took the oath to the Constitution at Tirnova on the 9th of July, 1879. But the Prince had been placed in an impossible position. His career, far from becoming "a pleasant reminiscence," rapidly grew more and more tragic. He found himself surrounded by Cabinet officers who were delegated from St. Petersburg. The arrogant Russian generals absolutely controlled the newly organized army, and dictated their orders without any regard for Bulgarian feelings. The short boundary war with Servia, instigated by Russia, which ended with the complete defeat of the Serbs at Slivinitza, aroused profound admiration in the hearts of the Bulgarians for their new King. For he showed reckless courage upon the field of battle, and soon came to be known as "the hero of Slivinitza and the champion of Bulgarian freedom." Baffled by his growing power and popularity, the Russian agents conspired to seize him secretly and deport him to Russia. This shameful plot was carried out in the dead of night. The Prince was hurried away under threats of assassination, across the Russian border. The expectation was that in the resulting chaos Russia would step in and assume control. But the St. Petersburg diplomats had failed to reckon with the patriot-statesman Stambuloff, who was Speaker of the Bulgarian House and the embodiment of the new national spirit. He was "the Bulgarian Bismarck," and the entire nation rallied to his leadership. Prince Ferdinand, of Bourbon descent, was invited to the throne, and a policy of emancipation from Russian tyranny was openly followed. After the bitter experience of seven years under the Czar's autocracy the Bulgarian peasants declared that they hated the Russians even more than the Turks.

5. The period from 1885 to 1912 has been one of *free development*, not without diplomatic hindrances and annoyances, but affording this little nation of mountaineers the first fair chance for industrial and educational advance. The result has been scientific development of the natural resources of the country and practical experience in self-government, which has given to the common people courage and self-control. The army has been steadily increased, and has been equipped with the most modern arms, no doubt with a premonition of a struggle with the Turks or Austrians. But the failure of the historian rightly to interpret contemporary conditions is illustrated in the fact that one of the most observant English writers recently said that "the old feeling against the Turks has all but died away," and "the Bulgarian atrocities of 1876 have left no traces behind." What would he say of the battle of Lule-Burgas, when the Turks were hurled back in bloody defeat, or of the terrific bayonet assaults upon the Tchataldja forts? The period of free growth and general prosperity has been made the means for extensive and secret preparations.

6. The new period upon which the Bulgarian nation has just entered is that of *expansion*. National ambition is at the root of this, although the desire to free the Christians of Macedonia is very strong, and the instinct of revenge no doubt plays a large part in the motives of the war. Bulgaria can scarcely expect to weld into an empire the other Balkan kingdoms. But the annexation of the lion's share of Macedonia and the humiliation of Turkey will be sure to give this intrepid nation a dominant influence in the peninsula and a direct share in the future politics of Europe. Sir Frank Lascelles once expressed his judgment that the Bulgarians possessed more common sense than any other people he knew. This rare quality of common sense, which no doubt the Bulgars do possess in a much larger degree than any of their neighbors, will help them to work out a reasonable plan for economic expansion and national progress.

America has given to the Bulgarians two priceless gifts: the translation of the Bible into the vernacular and the educational inspiration of Robert College and the American College for Girls (now called Constantinople College). The excellent translation of the Bible, made by a joint committee of American missionaries and native associates, all of them scholarly and experienced linguists, has wrought a strong influence in the renascence of the Bulgarian language. My grandfather, Dr. Elias Riggs, served on this committee. The spiritual and moral force of the Word of God thus intimately brought to every Bulgarian fireside, and even into the school life of the children, is one of the hopeful signs for the future of the nation. The quiet, uplifting influence of the Protestant churches established in Samakov and Philippopolis, and the recent student mass-meetings in Sofia addressed by Dr. John Mott and Mr. Sherwood Eddy, are other instances of American contact and inspiration. The work of the American Board at

Monastir, in European Turkey, is also largely for Bulgarians.

But Robert College, situated on the Bosphorus, and presided over for thirty years by Dr. George Washburn, a lover of the Bulgarians, met the aspiration of the new nation in its hour of greatest need. And what Robert College has been to the young men, Constantinople College has been to the young women and to the homes which have produced the new generation.

From the year 1870 to 1890, when Bulgaria was coming to feel a new consciousness and a new ambition, the young men had no college of their own. Even the schools were very elementary, and there was a pathetic scarcity of teachers. The result was that the boys came crowding to Robert College, where they found a warm welcome and a vision of Western education. Such was the influence of this American college that when the first National Assembly met at Tirnova in 1879 for the adoption of a Constitution, one of the acts of the Assembly was to pass a resolution of gratitude to President Washburn and Professor Long for what they had done toward the elevation and independence of Bulgaria. The Assembly was a unique one, made up largely of peasants, some of them in their sheepskin clothes. Excepting for a group of Robert College graduates, no one knew anything about parliamentary law.

The direct political influence of the College has been very great. In the summer vacation of 1877 Dr. and Mrs. Washburn, to renew old friendships, visited the graduates who were residing in Eastern Rumelia or South Bulgaria. The trip proved to be like a royal progress. Everywhere bishops, military officers, and even the Governor of the province entertained and honored the American guests. A military escort was sent with them from town to town, and they were met at the railway station by the Mayor of Philippopolis. In 1895 the College was honored by a visit from King Ferdinand himself. While he was taking tea at the President's home the King remarked that Robert College had been a nursery for Bulgarian statesmen, and that he hoped it would continue to be so. An incidental note by Dr. Washburn is of dramatic interest: "He did not know it, but he drank his tea out of a cup that once belonged to his grandfather, then Louis Philippe, King of France." Relative to the statement by King Ferdinand, it may be said that for a certain period all the Bulgarian Cabinet Ministers except one were graduates of this College. Prince Alexander, when he commenced his reign in 1879, chose Mr. Stoiloff, of the class of '71, to be his private secretary and confidential adviser. Professor Panaretoff, of the College faculty, was sent to London by Prince Alexander on a special mission to the British Government. The class of 1881 may be taken as an illustration. There were twelve graduates, of whom nine were Bulgarians, two Armenians, and one Greek. Six of the Bulgarians became teachers and one an editor. Four were promoted to important official positions. One has been for many years in the diplomatic service. Mr. Slaveikoff, of the class of 1871, was Minister of Public Instruction until his death. Mr. Stoiloff held the highest positions in the Government and was the best-loved statesman and patriot of his day. The two representatives of Bulgaria at the Hague Conference in 1907, General Vinaroff and Judge Karandjuloff, were Robert College men. Students often overcame great obstacles in traveling to the College, which was situated in their enemies' country. In one instance a party of twelve young Bulgars from places only two or three days from Constantinople were four weeks making the journey. Having vainly tried two routes and having suffered a week in the wretchedness of a Turkish quarantine station, they started a third time and came over the mountains in carriages.

What was it that drew these young men to leave their fatherland and spend the best years of their young manhood in the Turkish capital? Perhaps the natural trend of their aspirations may be understood from the subjects of the orations delivered by the students on a certain Commencement day in the eighties. (And I remember from my own student days in Robert College that the Bulgarian boys were frequently victorious over others in athletic and oratorical contests.) When it is remembered that the spies of Abd-ul-Hamid prevented free speech in all other parts of the city and imprisoned persons suspected of modern ideas without any process of trial, such subjects as these are the more remarkable: Christianity and Patriotism, The Dark Ages, The Influence of the Fine Arts, Representative Government, Violation of Popular Rights, Man and Nature, The Destiny of States and Nations. No wonder that the Russian newspapers often attributed the anti-Russian feeling in Bulgaria

to the influence of Robert College! In a direct political sense the charge was false. But indirectly it was true.

Yet, with all this freedom of expression within the College campus, there have never been any serious disturbances among the students. It has been well said that the College is "a perpetual peace conference between all the nationalities and religions of the Near East." Once, during the perilous days of Russian invasion, the College was attacked by a Mohammedan mob; but the firmness and presence of mind shown by Dr. Washburn and Dr. Long halted and finally dispersed the mob.

It would be mere speculation to forecast the future of Bulgaria. But it seems clear that a nation which has so long held its Christian faith under an overwhelming Moslem domination, a nation which has made its home life the center of fidelity and affection, a nation that has dared to defy the proud Empire of Russia and has ventured to attack the old enemy of Christendom, has yet to reach its true Golden Age when the principles of an enlightened and benevolent Christianity are more thoroughly understood and more implicitly obeyed.

It seems almost certain that the rich and fertile province of Adrianople will be added by this war to the domain of King Ferdinand. This will give a free outlet through the Ægean Sea and will insure to Bulgaria a share in the commerce of the Mediterranean. If the port of Rodosto and the western shore of the Sea of Marmora are permanently occupied, the Turks will be well-nigh driven out of Europe. Salonika, the objective of the Greek campaign, has been taken. The fall of Monastir, with the surrender of five Pashas and fifty thousand troops, has brought decisive victory to the Servian arms. This will nerve the Bulgarians for a final effort. The desire of the troops is set upon celebrating mass in the ancient and majestic Church of Santa Sophia, the jewel of Christendom, condemned since 1453 to be used as a Mohammedan mosque. Meanwhile the scourge of cholera holds the striving nations in suspense. If Constantinople is forced to capitulate, the Bulgarian nation will have won one of the decisive victories of the world's history.

THE PROBLEM OF NATIONAL HEALTH

BY EARL MAYO

IT is estimated that the total physical wealth of the United States is $110,000,000,000. This is the computed value of all the land and all the buildings, all the mines and mills and factories, all the railways and other transportation facilities, all the domestic animals and farm products—in fact, everything in the country that possesses a monetary value except the people themselves. This is a tremendous sum, and the analysis of its components affords plenty of opportunity for indulging in the American fondness for big figures. We all share a little of the pride with which the Secretary of Agriculture makes his annual announcement of the $9,000,000,000 total which represents the yearly value of our agricultural products. We like to contemplate our $17,000,000,000 worth of railways, our $15,000,000,000 annual output of manufactures, and the serrated rows of figures which represent the many items in our National industrial economy. It is a proud record, and it shows that the people of the United States are the richest of the world's great nations, the foremost in material prosperity.

But what of the one item omitted from the above compilation of the country's assets? How about the value to the Nation of the 90,000,000 individuals who compose it? We are accustomed to think of the value of a thing as the price which it will bring, but that of course is based upon its expected productive power. The activities of human beings are the factor that gives value to all other material possessions; and while the daily papers give no quotations of the latest market values of human lives in New York or Chicago, it is possible to estimate the average worth of a life at any stage of its progress on this same basis of its anticipated earning power less the cost of its maintenance.

Experts in the complicated subject of social statistics, following this system, have

figured out for us with elaborate care the economic worth of human life at every period from infancy to advanced age. The dollar value of life increases steadily from birth to maturity, and then declines slowly as the expectation of life decreases. Different estimates vary somewhat for all ages on account of the impossibility of determining with exactness the average earnings of all classes of the population. Adopting for this average figure the sum of $700 a year—which probably is too low to be accurate for Americans—the monetary value of the average life in the United States is found to be a little less than $3,000, varying from $90 for the newborn infant to $4,100 for the matured adult of thirty. These are the figures employed by Professor Irving Fisher, of Yale, in his valuable report to the National Conservation Commission on the subject of National vitality, and they certainly are not excessive.

Adopting Professor Fisher's figure of $2,900 as the average value of the lives of Americans, we find that what may be termed the vital assets of this Nation of 90,000,000 inhabitants amount to upwards of $250,000,000,000, or nearly two and one-third times the entire amount of its other wealth. Although the material progress of the country has been remarkable and the expansion of its industries presents an astonishing record of growth, its most valuable crop is still the human crop; its most important business is the growing of sturdy men and women; and its greatest problem is the conservation of its *human* resources.

The vital stock of the Nation is receiving continual additions to capital in the form of births and is being constantly depleted by deaths, just as, with the merchantable forms of wealth, old capital is being steadily wiped out and new capital created. In the United States the excess of births over deaths has been augmented by a very heavy immigration, so that the supply of vital assets has increased very rapidly. This rate of increase is bound to lessen in the future, and a wise policy of foresight dictates the necessity of care and study in the elimination of the great wastes now caused by accident and disease, which involve not only an impairment of vital assets but also a loss of monetary capital through its investment in the expenses of unnecessary sickness or in lives cut off prematurely.

In the absence of exact registration of deaths in a large part of the country, it is impossible to tell the precise number of lives lost every year as a result of violence and disease. For those cities and States which do keep a record of this matter the rate is about 16.5 for each thousand of the population. There is no reason to suppose that it is less for the remainder of the country. It is safe to say, therefore, that 1,500,000 deaths occur in the United States every year.

The big fact in connection with this million and a half yearly deaths is not their tremendous total. It is the undeniable truth that a very large proportion of them are preventable—that is, postponable for longer or shorter periods. There is no good reason that anybody can adduce why 130,000 Americans should die every year from pulmonary tuberculosis, or upwards of 30,000 from typhoid fever. The degree of preventability varies greatly, of course, with different diseases. In the case of some it is possible by means already known to bring about their total extinction. Others baffle medical skill and thus far refuse to yield to medical research, so that they are not at all preventable under present conditions.

If we make up a table, however, and include in it the number of deaths from each cause and the degree of preventability that we may conservatively ascribe to each one with our present knowledge of preventive measures, we find that the average percentage of avoidable deaths from all causes is 40 per cent. In other words, 600,000 of the 1,500,000 deaths that occur in the United States every year represent absolute waste—unnecessary waste.

In this army of 600,000 victims, uselessly sacrificed at the rate of 50,000 a month, are children in whom are centered the hopes and pride of parents, young men and women just ready to enter on careers of usefulness, earners whose families are deprived of comfortable support, young mothers snatched away from little children who need their care. It is impossible to picture the woe and misery and needless suffering for which these avoidable deaths are responsible; but, to return to the economic phase of the subject, it is possible to compute with fair accuracy the tremendous loss resulting from them.

Most of the unnecessary deaths occur among children or among those who have scarcely reached maturity. The median age of death from pulmonary tuberculosis is 33, and from other forms of tuberculosis 23. For pneumonia it is 37, and for typhoid fever

26. For diphtheria, on the other hand, the median age is three, and for the gastro-intestinal diseases which yearly decimate the children in our large cities the middle age falls in the first year.

Since the diseases most largely preventable bear chiefly on the earlier periods of life, the value of any postponement is considerable. Using the figures previously employed for the monetary value of life at different periods, we find that the average worth of each of the 600,000 possible prolongations is $1,700, or a round total of $1,000,000,000 that could be added annually to the vital assets of the Nation by the adoption of preventive measures entirely feasible.

The methods required for the prevention of unnecessary deaths would at the same time do away with much preventable illness. The conclusion of the most widely recognized authority on the relative extent of sickness and mortality is that for each death there is a little more than two years of invalidity. Applying this rate to the United States, it follows that there are on the average 3,000,000 sick persons in the country at all times. Many of these cases of invalidity are among the very young or the very old, but at least one-third of them are among persons in the productive periods of life, the great majority of whom are engaged in productive occupations. Averaging the earning power of the million workers constantly incapacitated by sickness at only $1.50 a day, the loss of earnings from this cause amounts to $450,000,000 in the course of a year. The cost of medical care, medicines, and nursing averages at least a dollar a day additional, or a yearly total of over $1,000.000,000. Applying to the sum of these two amounts the 40 per cent which represents the preventable portion of this illness gives a figure of more than $500,000,000 as the possible yearly saving on this score, and makes the potential addition to National resources through the elimination of avoidable sickness and death more than $1,500,000,000 a year.

Consideration of a few of the factors that contribute to this vast total indicates that the amount named is probably below rather than above the true figure. It is estimated that the number of persons in the country suffering from tuberculosis is approximately half a million, and of this army perhaps one-half are incapacitated from work, while the productive power of the others is more or less seriously affected. Of the deaths that occur during the period of early maturity one in every three is caused by this disease, which reaps a harvest of more than 130,000 lives every year and costs upward of $200,000,000 in loss of earnings and expense of care, aside from the $250,000,000 that represents the value of the lives destroyed. If the members of the medical profession were given a free hand to deal with this disease, backed by adequate provision for the care of existing cases, tuberculosis could be practically stamped out within a single generation.

The widespread continuance of typhoid fever is absolutely without excuse. Its existence is an indictment of our civilization. Yet it kills something over 30,000 Americans every year—good, sturdy Americans, most of them, just at the prime of life and with their economic value to the Nation at its highest. An expert authority on this subject has placed the annual cost of typhoid to the American people at $212,000,000. Half of this waste could be prevented by the installation of pure water supplies in the typhoid-ridden communities of the country. Half of the remainder could be eliminated by other simple preventive measures. A reasonable estimate of the yearly saving that could be made in this disease alone is $150,000,000.

The mortality from diphtheria has been lowered greatly since the discovery and adoption of its antitoxin, but it still destroys as many lives as typhoid. A remarkable reduction has been accomplished in the deaths caused by the other diseases of childhood, but nearly one-fifth of all the children born still die within the first year, and more than one-quarter before they reach the age of five. Of this slaughter of the innocents fully one-half could be avoided. Out of the 400,000 children who die every year in the United States, 200,000 or more might be preserved to lives of future usefulness by the adoption of preventive measures well within present knowledge.

The cost of what are usually described as social diseases is quite impossible to estimate, but a distinguished authority makes the statement that they are responsible for half the cost of all our institutions for the care of defectives. It is well known that they are among the heaviest contributors to infant mortality, to insanity, and to certain other diseases which are of particularly serious import for the reason that their frequency is increasing instead of decreasing. Certainly the loss to National efficiency which they

impose is not less than that caused by tuberculosis.

This list could be amplified to include many other diseases that we know how to prevent but do not prevent. Within recent years, for example, medical research has conquered malaria; but still there are from 2,000,000 to 3,000,000 cases of malaria in the United States every year, representing a monetary loss that runs into the millions. Nobody who has given the matter any attention whatever can doubt for a moment the tremendous size of the stake set before us as a reward for the intelligent conservation of National human resources. The prize is the most gorgeous ever offered to a people. What are we doing to earn it?

The story bids fair to become a classic of the farmer who wrote to the Department of Agriculture about his sick hog and received prompt advice that saved the porcine life, while his neighbor who applied to Washington for information that might help his sick wife was informed that the Government could do nothing for her. The usual moral drawn from this tale, that it is better to be a sick hog to be looked after than a sick human being to be neglected, is one that we ought to revise. Suppose we make it read: It is better for a Government, after providing fully for the health of the $250,000,000 worth of American hogs, to pay a little attention to the health of $250,000,000,000 worth of American citizens. Still, we are not in a position to blame Uncle Sam too severely for his neglect in this matter. Too many of our own health habitations are of glass. The man of wealth gives instant attention to the slightest ailment of his favorite horse or his pet dog, but he neglects his own physical troubles until their accumulated total becomes hopeless. The workman declines to make use of the safety device installed for his own protection because it is "too much trouble." We all have too much the point of view of Uncle Samuel. We realize that there is money in hogs. We fail to realize that there is money—a lot more of it—in men. We need to be educated out of our National habit of carelessness in matters of health; and this is a work that the National Government can undertake better than any other agency, through a Department of Health, just as it is daily educating the farmers through the Department of Agriculture to make their acres more productive, to make their herds more valuable, and to protect their crops from the attack of pests that frequently assail them.

It will not do to assume, because the Federal Government gives slight heed to the physical welfare of the general body of citizens, that it pays no attention whatever to health conditions. In a small way it operates a number of agencies charged specifically with the task of looking after health conditions in certain restricted spheres. These health agencies are scattered among the different departments of the Government, including the State, War, Navy, Treasury, Agricultural, Commerce and Labor, and Interior, besides independent bureaus for the District of Columbia and in the Government Printing Office. Approximately $15,000,000 a year is appropriated by Congress for the work of these independent and unrelated agencies. Among them there is inevitably much duplication of equipment and of effort. Duplication means waste. More important than this waste, however, is the fact that there are great gaps left unfilled between the activities of these bureaus, and these gaps comprise the most important fields that governmental effort in behalf of public health should cover, because they are the fields occupied by the greatest number of persons.

Of the Congressional appropriations for health purposes, the larger part, about three-fifths, goes to the medical departments of the army and navy, and of this amount more than three-quarters goes to the army. An efficient medical corps is recognized as an essential feature of a modern fighting force. The United States has able men in these branches of its service, but the service itself is organized in such a way as to reduce their efforts in many cases to the minimum of efficiency. The youngest lieutenant of the line can upset the most careful arrangements of the best sanitarian in the service if he chooses to do so.

When the Japanese engaged in war with Russia, their health officers went ahead of the army, selected the camp sites and made provisions for their sanitation. The result was that they went through that conflict without the usual army scourge of typhoid fever and with an immunity from the diseases ordinarily attendant upon military operations that aroused the admiration of the world. In our own brief conflict with Spain the health officers were ignored. The location and arrangement of camps were dic-

tated by line officers, most of them entirely inexperienced in such matters. As a consequence twenty thousand American soldiers were attacked by typhoid, and more than fifteen hundred were killed by it. Nor were the greater number of cases of the disease confined to Cuba. The camps at Chickamauga and other points in the United States established a frightful record in this respect and were responsible for the major part of the sickness and deaths.

After the war, when the United States took charge of Cuba, it happened, by a circumstance almost accidental, that a man of medical training, General Leonard Wood, was placed in command of the island. Under his administration members of the medical service, with outside volunteers, under the direction of Dr. Walter Reed, were intrusted with the work of investigating yellow fever. They found how the disease was spread and how it could be prevented, with the result that the mortality from yellow fever, which had been 428 to every hundred thousand of population in Havana in 1897, was stopped absolutely by 1902. The city, and to a great extent the whole island, was cleared of its worst scourge. This work, which is a striking illustration of what can be accomplished under favorable conditions, has been worth millions of dollars to the United States by protecting our own Southern ports and by teaching us how to combat this dreaded scourge. The inquiry naturally arises, Why are not conditions made favorable for such work at all times and in all places? If we are justified in cleaning up Cuba, why are we not justified in cleaning up the plague spots within our own domain? If it is good business to drive malaria out of the Panama Canal Zone, why would it not be good business to drive it out of our Southern States, where 2,000,000 persons suffer from its attacks every year? Is there any good reason why we should hesitate to create a department of our Government with the ability, the power, and the prestige necessary to do systematically for the people of the continental United States what we have been able and willing to do in isolated cases for our neighbors and our dependencies?

One of our National health agencies to which the statesmen at Washington point with pride whenever their derelictions in the matter of provision for the public health are mentioned is the Public Health Service. Nobody has ever ventured to attack the personnel of the Public Health Service or the efficiency of its efforts whenever it has been able to work with a free hand. But the point is exactly here—that it is not likely to be allowed a free hand in any serious crisis.

The visitor from Mars inspecting our governmental scheme probably would have considerable difficulty in guessing the department of the National administration to which this important health agency is assigned. It is unlikely that he would seek for it under the Department of the Treasury, but that is where it has been placed. The head of this Department is selected for the position because of his knowledge of finance. Usually he is a banker. He is kept so busy looking after matters of revenue, trying to prevent customs frauds, dealing with an occasional panic, and attending to the multifarious duties connected with the financial side of his work that he would need to be superhuman to have any time left over to devote to the question of public health. By the very nature of his position, as well as by his training, the subject is unlikely to possess any strong interest for him, and the health service is one of the very minor divisions of his Department.

One striking instance may be cited to show what happens to a Public Health Service administered by the financial officer of the Government. More than ten years ago, in 1900, or possibly a year or two before that, bubonic plague appeared in San Francisco. Its presence was determined by the absolute identification of cases in that year. Bubonic plague is a terrible disease. It has been a scourge of the Orient for centuries. As many as a million persons have died in the course of a single epidemic. The discovery of plague in any city is sufficient cause for serious alarm—not for a panic, but for the sort of alarm that expresses itself in prompt and vigorous efforts to prevent the spread of the disease and to stamp it out.

Was San Francisco alarmed? Most assuredly it was; but its alarm took the form of an all-controlling fear that the presence of the plague might become generally known, that visitors might be kept away from the city, that "business" might suffer. After the first announcements all the power of the controlling business interests of San Francisco was devoted to suppressing knowledge of the existence of the disease in the city. The local newspapers were throttled, and printed bitter denials of the facts instead of the facts themselves. The press associations, by per-

suasion or intimidation, were prevented from carrying news of the situation to the outside world. It was so difficult to get at the truth of the situation that the New York newspaper with which I was then connected sent a prominent medical man to San Francisco to investigate. But the influence of San Francisco business interests extended clear across the continent and was exerted upon this newspaper even before its commissioner had completed his work. The newspaper was not thoroughly intimidated. The report of its medical investigator was published, and it showed the existence of plague in San Francisco, but it was so toned down as to minimize the apparent danger.

When the outbreak first came to the official knowledge of the San Francisco Board of Health, that body declared a quarantine against the Chinatown district of the city. Chinatown was one of the sights of the city, an attraction to visitors. An obliging circuit judge was found, a United States judge, to declare this quarantine illegal, and in doing so he rendered the extra-judicial opinion that "there is not now, and never has been, a case of plague in this city."

For the protection of the remainder of the country the officials of the Public Health Service declared a quarantine against the State of California. It was beyond the power of local judges to remove this barrier to the spread of the disease, but it was not beyond the power of the big business interests that had accomplished so much already in the direction of suppression. The report of the members of the Service who had proved the existence of plague was discredited and denied and the men themselves were sent to remote and foreign stations. It was not until the following year that a commission of prominent scientists was appointed to make an investigation which showed conclusively the existence of numerous cases of plague in the heart of San Francisco. Even then the report of this commission was not given out promptly, as required by law, but was held back until the substance of its findings had been published by medical journals and by the Sacramento "Bee"—not, it will be noted, by the San Francisco newspapers, although these might have been expected to find the keenest news interest in the findings of the commission. But for this independent publication it might have been very much longer before the report would have been allowed the sight of day.

The Federal Government has spent more than a million dollars in killing rats on the Pacific Coast, and these sums have been supplemented by local appropriations. Business interests do not object to rat-killing—unless too much noise is made about it—but it is much easier to stamp out a danger of this sort in the beginning than to overtake it after it has gained great headway.

In other parts of the country the same effort of business interests to suppress unpleasant facts has been witnessed, though usually not on so extensive a scale as in the struggle by California to hide the bubonic plague. I was in New Orleans at the time of the last serious outbreak of yellow fever. For ten days before any statement appeared publicly in reference to the disease its presence in the city was a matter of common knowledge. It was the subject of earnest but subdued discussion on the Board of Trade and in the hotel lobbies. It was talked over in the newspaper offices. During all this time the strongest kind of pressure was exerted by important business interests to secure the adoption of a policy of concealment. Publication of the truth would hurt business, they argued. The city would feel the effects for years. The effort failed, thanks largely to the determined stand of a fearless and independent health officer. New Orleans attacked the outbreak openly and vigorously; the co-operation of the Public Health Service was obtained, and the city was thoroughly cleaned and put into a condition which makes it unlikely that it will ever again suffer seriously from yellow fever. Had the business opposition not been conquered at home, it is difficult to say how far-reaching the mischief might have been.

In connection with this San Francisco incident it is not necessary to attribute consciously improper motives to the Secretary of the Treasury or to any one else connected with the Federal Government. No doubt there were—or were supplied—satisfactory reasons for transferring the men who refused to close their eyes to the existence of plague in San Francisco. Accustomed by virtue of his position to give chief consideration to the demands of business, a Secretary of the Treasury would be likely to be moved by the argument that a certain policy would involve serious financial loss. But if a matter of this sort were in charge of a Secretary of Health, appointed to give chief consideration to the public welfare and responsible for the effect

of his actions upon the public health, his decision in such a case would be likely to be altogether different.

The greater number of the National agencies dealing with the subject of health are under the direction of the Secretary of Agriculture and are adjuncts of his Department. Of these the one that bears most directly upon the health of the people is the Bureau of Chemistry, intrusted with the administration of the Pure Food Law. This law was passed for the protection of the public from impure and adulterated foods and drugs, but to the minds of many persons some of the rulings under it have been designed to interfere as little as possible with the business of those interests that fought its enactment tooth and nail. The persistent thwarting of Dr. Harvey W. Wiley's efforts to enforce the Pure Food Law formed a principal cause of his resignation as Chief of the Bureau of Chemistry, and was done with the sympathy of some of his influential associates in the Department of Agriculture. This was possible because the Department under which Dr. Wiley's bureau did its work was devoted primarily not to questions of health but to questions of industry and production. It is perhaps not remarkable that to the mind of a Secretary intent on the prosperity of our tremendous agricultural industry the interests of the men who handle a vast bulk of the products of the farm loom larger than those of the well-intentioned fanatics who desire to avoid eating products preserved with injurious chemicals. A Secretary of Public Health would view the subject from a different angle.

Potentially one of the important agencies for public health is the Division of Purification of Water Supplies. At present this is an appendage of the Bureau of Plant Industry in the Department of Agriculture, a location which is not likely to give it great influence or opportunity for effective action. There is a big job waiting for just this sort of a body in the prevention of the great amount of typhoid caused by the pollution of lakes and streams used as sources of water supply. In a department and with a position that would enable it to cope with this difficult task, it might easily become the means of saving millions of dollars to the Nation every year through the restriction of this one disease. Another subordinate branch of the Department of Agriculture that might be made of vastly greater scope and value if it were made part of a comprehensive department devoted to the subject of health is the Division of Nutrition, which is devoted to determining the effect of various substances upon the body and the relative value of different foodstuffs. There is a vast field for experiment in this direction that might shed important light upon the problem of preventing certain serious diseases.

In the Department of Commerce and Labor are two important agencies that could be made vastly more effective if they were included in a Department of Health. The Bureau of Labor has made occasional studies of the health of workers in various trades, of the relation between occupation and disease, of factory sanitation and industrial hygiene. So far as its resources allow, it has been nibbling at the tremendous problem of the health and efficiency of our industrial workers—a problem that requires long, detailed, and systematic study, such as probably would be given to it by a National Department of Health.

In the Census Bureau, a branch of the Department of Commerce and Labor, is the Division of Vital Statistics. The subject of American vital statistics is one that it is difficult to discuss without using intemperate language. For, roughly, half our population we have no vital statistics worth mentioning, and for the other half they are so incomplete and inaccurate that no European authority will accept them without serious qualification. It is in no wise the fault of the census officials that this condition exists; but there is at least reason to hope that if the subject of health were raised to its proper position of dignity and importance, this phase of it, so essential to the correct understanding of vital conditions, would receive due attention.

Scattered among these various bureaus and divisions are sixteen chemical laboratories, all doing more or less similar work, and four pharmacological laboratories, all engaged in research in the action and standards of drugs. Were these twenty separate laboratories combined into two—one chemical and one pharmacological—there would be not only a great economy through the avoidance of duplication in equipment and effort, but there would be also a fair chance of the creation of a great National chemical laboratory fully equipped for studying the important problems of National scope that are pressing for solution.

More important even than the need for

expansion in the work of those National health agencies now in existence is the necessity for attention to great problems now receiving no attention whatever. The study of the causes of disease, the conditions that lead to its spread, and the measures necessary for its prevention, is surely a task of National size. Yet this is a subject that our proud Nation is content to leave to the private philanthropy of a Rockefeller, a Phipps, or a Russell Sage. Not only is such effort of vast possibilities in adding to the comfort and happiness of the people of the country, but there is money in it, as we have seen—more money than there is in preventing hog cholera or exterminating the boll-weevil, important and praiseworthy as these movements unquestionably are.

The greatest single work that awaits a National Department of Health, however, is educational work—the spread among the people of the United States of a practical knowledge of the means by which diseases already shown to be preventable can be controlled and exterminated. This work might well follow along the lines employed so successfully by the Department of Agriculture in teaching the farmers of the country how to combat insect pests, plant blights, and animal diseases. The need for this work is the real reason for the creation of a *Department* of Health, rather than a Bureau—that it may command the attention of the people, that its messages may come to them with authority, and that the consideration of the whole subject may be placed upon the plane which its importance deserves. Here again we have an excellent analogy in the Department of Agriculture, which has increased tremendously in value and influence since it was raised from the position of a mere Bureau to that of a full-fledged Department. Such educational work as a National Department of Health could do and should do would be a most potent influence toward saving the billion and a half dollars of waste now annually incurred through preventable sickness and death.

Who shall say that the subject of health is not of sufficient importance to deserve such treatment? As has been shown, it vitally concerns our most valuable National assets, the one thing on which depends the value of all our material wealth, the safety and very life of the Nation itself. At the same time, it should be pointed out that it is the members of Congress who are quibbling about forms, about the rights of this and that branch of the Governmental machine, about the advisability or inadvisability of increasing the size of the Cabinet. The workers for more adequate National attention to this tremendous problem of human conservation are not sticking at forms. They see a great work and a great need, and are anxious that the work be begun and the need be satisfied as quickly as possible. Their position was fairly presented by Dr. Wiley when he said, in answer to a question put at one of the Congressional hearings on this subject:

> I do not care anything about the name of the department. I would like to see one department—I do not know what you would call it—charged with the public health, public education, and public welfare, without being mixed up with promoting trades or extending agriculture or anything else—one department absolutely altruistic, which could stand above every interest and every demand of greed and graft which comes so often to us all from all parts of the country. You want to do something for the public health, and somebody comes up and says, "You are interfering with my business if you do it." How many thousands of times do you not hear that "You must not do this; you are interfering with my business"!

There we have it, bluntly spoken in plain terms. Work for the public welfare interferes with business. It is the cry of San Francisco confronted by the plague. It is the cry of the purveyors of rotten foodstuffs threatened with the Pure Food Law. It is the cry of the concocters of harmful or worthless nostrums contemplating the enlightenment of the people. Behind those Senators and Representatives so fearful of unduly magnifying the importance of the Nation's health by giving it recognition along with agriculture and war and commerce and labor; behind those high officials so ready to strain existing law and to nullify its protection because it hurts trade; behind those figureheads who bring ridiculous charges against honest officials; behind those loud-mouthed trumpeters of imaginary dangers who try to befog the issue—behind all these skulk strange figures. We glimpse now and then sinister shadows. They are the shadows cast by business—the kind of business that will suffer from efforts for the public good. It will be worth while for the American people to try to identify the substance of these shadows, to push aside the puppets and manikins and to drag the skulkers behind them into the light of day. Then they may decide for themselves whether or not it is well to interfere with the business

that is so strenuous in its opposition but so chary of showing itself in the open, whether or not they are willing to accept it as a satisfactory offset to the lives of their 600,000 fellow-Americans who fill unnecessary graves every year.

A FRIEND ON DECK

BY EDWARD A. STEINER

TRAVELING in the steerage is a habit from which one is easily weaned, especially when the steamship company's agent suggests that there are certain things which can better be studied from the captain's table and the purser's office or the director's desk at the home port.

Inasmuch as the purpose of this journey was a study of the "Care of the Emigrant," and as I know his side of the story fairly well, I took the hint. I studied the problem from the commercial and official view-point as I traveled across the Atlantic and from one port of embarkation to another; but I accepted only such privileges as did not hamper my absolute freedom, and which seemed necessitated by the nature of the inquiry.

This sort of semi-official journey for the purpose of such important investigations had great advantages, for many channels which would have been absolutely closed to me as a steerage passenger were opened. Unfortunately, however, they often bore the evidences of having been dug for the occasion—at least the aforesaid channels were sometimes suspiciously clean and the time of my visitation timed rather too accurately. Having seen all these harbors and transfer stations, as well as the steerage, over and over again—without escort—of course I had no difficulty in detecting the difference between the staging set up for my benefit and that which the emigrant has to face when there are no "distinguished" visitors present. So I could afford to permit the preparations to be made and enjoy hearing the brass band play for me on foreign shores "The Star-Spangled Banner," dine with royal commissioners, and travel in Government yachts.

On the whole, it may be said that the strict enforcement of the laws at Ellis Island immediately manifests itself in Fiume, Triest, Hamburg, and Bremen. Never were emigrants so closely scrutinized as they are now, and never were so many refused permission to take passage to the United States. From three to five physicians examine every traveler from the time he leaves his home until he reaches his steerage quarters, and so searching a physical test was never applied to him even when he was being drafted into the army. Not even the most radical restrictionist could subject the emigrant to a severer scrutiny than that which is now exercised.

After seeing over one hundred thousand steerage passengers, one could not help believing that the despair of the Royal Commissioner of Emigration of Hungary was genuine when he threw up his hands and cried, "You are robbing us of the flower of our manhood and womanhood!" The fact that one ship whose loading we watched carried sixteen hundred people of whom only three per cent were above the ages of twenty-eight and only two per cent below fourteen proved the truth of his statement.

It is not the aim of this article to point out the many wrongs still practiced against the emigrant, nor to call attention to the admirable care taken of him at such ports as Hamburg and Triest; but to point out one unused opportunity to prepare him properly for his ordeal at Ellis Island, to instruct him as to the advantages awaiting him outside our cities, and to help disentangle his confusion of mind and soul as he faces the unknown country.

The privilege of making such a test was granted me through the courtesy of the Hamburg-American Line, which gave me permission to use its steerage as a laboratory, while its officers aided me in my task in every possible way. My face was familiar to nearly all the steerage passengers, for before embarkation they had seen me standing beside the examining physicians, and, later, on

the gangplank as they boarded the ship; and in each case I asked them many personal questions.

My official position was emphasized by the fact that I made the rounds of the ship with the captain each day, and that I was treated by officers and seamen with marked respect. This, instead of making my approach to the steerage passengers more difficult, as I feared it might, had the opposite effect. I discovered that whenever I stopped to talk to an individual I not only received courteous replies, but that he was glad, even proud, to be spoken to by a man with authority. Moreover, the men in his group were eager to be spoken to and came to me with many questions and complaints.

There were eleven hundred steerage passengers; of these six hundred were adult males, and I spoke to every one of them during the ten days of the trip. I learned much of each man's history and was enabled in many cases to tell him something of the new place and country to which he was going, of the immigration laws and their enforcement, the opportunities farther west, the institutions which would aid him, and those he should avoid.

It is characteristic of nearly all steerage passengers that they try to fortify themselves against the officials at Ellis Island by all sorts of lies which they think will enable them to enter the country. For instance, a Turkish Jew had the idea that he would be more likely to be admitted if he said that he was a Turk rather than a Jew. When I inquired about his religion, he replied, "I am a Turk." Then I asked him how many wives he had. He stopped as if to count, and said, "Seven." When I told him that seven wives were six too many and that no polygamists are admitted to the United States, he readily admitted, what I already knew, that he was a son of Abraham rather than of Ishmael.

A boy of sixteen, who was going to his uncle, a baker, had been warned not to come into conflict with the contract labor law, and insisted that he had no friends nor job awaiting him.

A young girl of twenty told me that, through correspondence, she had arranged with a young man whom she did not know to claim her as his cousin. She hoped to find such favor in his eyes that he would marry her.

A man of fifty who had nearly a thousand dollars told me he had but fifty, fearing that he would be taxed if it were known how much money he was bringing.

In all cases I insisted that the best way to placate Uncle Sam was to tell the truth, and that nothing was to be gained by lying.

I was also able to straighten out many curious and incomplete addresses which would have delayed the immigrants in reaching their friends, or made it wholly impossible. For instance, one youth was going to his brother at Pleece Kal, R. F. No. 3715 LoranO. I do not know that he would ever have reached his destination: *Please call*, Rural Free Delivery 3715, Lorain, Ohio. It is certain that he would have been long detained at Ellis Island before the mysterious address could have been deciphered.

One of the most serious problems of the steerage is that of the relation of the sexes, and I could warn young women, reprimand the men, and tell all of them something of the moral ideals in our social life.

There were many opportunities to explain the nature of our government, the laws of citizenship, and the chances for an education. But that which seemed the simplest and at the same time the most important service I rendered was to tell those who were going into the interior of our country the best route to take, how to prepare themselves for the journey, and what were the values of our money.

Never before had I established such vital contact with my fellow-passengers as on this trip, when I was related to them in an official capacity; or, to state it more correctly, when I was a self-appointed official friend.

Unfortunately, the cabin passengers were landed on Sunday morning and the steerage passengers had to wait until Monday afternoon. I promised all of them that I would meet them at Ellis Island, and they looked forward to the landing with at least a little less fear.

On Monday afternoon I found them packed in the barges which brought them to the island, and when they saw that I had kept my word they cheered me and greeted me as I wanted to be greeted—as a friend.

Through the courtesy of Mr. Williams, the Commissioner of Immigration, I was permitted to supervise the examination of my friends and bring to the attention of the inspectors those who needed to be looked after first, that they might catch their trains. I was also authorized to insist upon the exchange of such railway tickets as seemed

to take them over a circuitous route. I also attended the hearings of those who were detained, and gave important testimony. When the last passenger left Ellis Island, I felt that I had really been of service to over eleven hundred people, and that I should like best to travel again as a *friend* on the ship.

They had crossed the ocean, their rights protected, their problems explained, and their fears dispelled by a *friend*. They were examined and admitted to the United States under the auspices of a *friend;* and the question arises, Why should not every ship have a friend on board who could give his whole time to this most important task?

With every ship which carries passengers from its home ports the Italian Government insists upon sending a royal commissioner who looks after the rights of his fellow-countrymen; at least, he is supposed to guard their rights. With scarcely any exceptions, however, these men are bureaucrats of the worst sort, who play and smoke with the first-class passengers and let their countrymen shift for themselves. In nearly every dispute brought to my attention they have taken the side of the steamship company.

In other ports it is one of the customs of the steamship company to serve its finest wines and best cigars to those officials who come to examine the conditions under which their people travel. In one case the royal commissioner was under the influence of liquor, or, rather, plain drunk, while the ship on which his charges were being driven was filthy, overrun by vermin, and short of many of its crew on account of desertion. Our United States consuls at the ports I have investigated, with very rare exceptions, are either ignorant of existing conditions, seemingly without authority, or, as in one case, stupidly careless, for when I reported to this man the condition in which I found the steerage he replied: "Oh, well, they are not traveling *de luxe*." Now, why should not the United States provide an official *friend* who would do what I tried to do? A law to this effect could easily be passed; the problem, of course, would be to find the men.

The following qualifications are not so rare but that the men ought to be found: A speaking knowledge of three languages, an acquaintance with the environment under which the immigrant has to live, unimpeachable character, and, above everything else, a knowledge of men, the ability to distinguish quickly between the truth and a lie, and a keen sympathy—which last is something more than merely having a good heart. There are many criticisms of this plan which rise in my own mind even as I suggest it. First, whether our United States commissioner, or whatever he was called, would not be corrupted by the good cigars and wines of the steamship company and the alluring society in the first cabin. To a degree this could be guarded against by giving him a decent room on the steerage side of the ship, with the privilege of taking his meals in the second cabin. He would have many more interested and important people watching his work and behavior than the Italian commissioner has, from the very fact that the passengers in the cabins are largely Americans.

The one thing which cannot well be guarded against is that he, too, might become bureaucratic, and so defeat the very object of his office. He needs to be the friend of a rather unattractive group of people, and for that reason it would be better if the office could be filled by some of those young idealists in whom religion has awakened the love of humanity regardless of the class in which it travels through life.

That such a friend is needed by the steerage passengers is self-evident, and I have tried to prove by my experiment that the immigrant will make use of such an officer.

I wish I might be able to impress Congress with the fact that such an officer would serve his country as well as the immigrant, and impress upon it the necessity of creating such an office. Then I should like to prove to the self-sacrificing, idealistic youths of this country that they ought to apply for the job, because it is a job worth while. I confess that I am confident that Congress would have less difficulty in getting the officers than in creating the office.

THE SPECTATOR

THE 9th of November is an important day in the civic life of London, and a delight to all "ye lovers" of pageantry. The Spectator is one of those simple people who, childishly perhaps, still thrills at the sight of marching soldiers and follows the column just for the enjoyment of keeping step to the military music. But when to these delights are added a real gilded coach, six gayly caparisoned horses, and a live postilion with a cracking whip, the Spectator feels his heart beat like any boy's, and he claps his hands in excitement. In fact, he is forgetting all about sequence and co-ordination and all such literary truths in his eagerness to take the reader into the very midst of the fun. For the 9th of November is Lord Mayor's Day in London, and is gladdened by the one old pageant still preserved in the life of the city. On that morning, with trumpet and drum and "youthful jollity," the change of Lord Mayors is celebrated. Dick Whittington, heralded by clanging Bow bells, thrice held this honored post, but since his rule London has had a new Lord Mayor every year with the regularity of Greenwich clock-work. The Spectator was fortunate enough to have a ticket for the balcony of the Mansion House, where the municipal head of the capital has his official and private residence.

The procession starts from the Guildhall, where the flock of pigeons cooingly echo Venice and its Piazza di San Marco. Down Princess Street it passes and makes a sweeping turn just below the balcony of the Mansion House. The setting for the pageant is unique. Opposite looms the Bank of England, a very rock of gold and mountain of bank-notes on which largely rests the prosperity of Great Britain. On one side is the Royal Exchange with its Corinthian portico, while across the way is the Mansion House, whence issue the laws that govern the city of London. In the triangular space between these symbols of England's greatness converges the traffic of the capital. A stream as unending as life itself meets and passes here, while the affairs of the world are influenced by the decisions reached within those three buildings. As the time approaches for the passing of the procession the streets are cleared of vehicles. The subdued roar of a crowd succeeds the noise of the suspended traffic as swaying ranks of people cover the pavements. Children are everywhere, clinging to their mothers' skirts and perched on the shoulders of their fathers. Here was a show free to all, and the thrifty British souls made the most of such an opportunity. The Duke of Wellington on horseback, in marble immobility, dominated the throng, which seemed to be patient, happy, and good-humored, like every typical English crowd.

A mist clouded the scene, uncertain whether to melt into the crisp air or remain, veiling everything in a white shroud. The effect was Rembrandtesque, but dampening to ardor. Yet the time of waiting soon passed, for the Spectator became absorbed anew in the skill and efficiency of the London "bobbies." They managed the mass of conflicting wills as absolutely as though the crowd had formed one body. They were so genial and jolly, too, that the dislike of the proletariat to those in authority could not exist in the kindly atmosphere of protection which the English policemen diffuse.

Such deductions were cut short, for on a sudden around the corner swung a gilded coach. It was a hundred and fifty years old, yet still gorgeous, and a very fat and pompous coachman in wig and three-cornered hat drove the six horses, while a jaunty postilion rode one of the leaders and cracked his whip to the gaping crowd. It was a regular Cinderella equipage, straight from the realm of fairyland. But, alas! no fair Cinderella alighted from the coach as it came to a swaying standstill in front of the Mansion House. It was quite empty. There it stood and waited for the Lord Mayor, who, preceded by lackeys, soon appeared, descended the stairs to the ringing cheers of the throng, and entered the picturesque coach. Away they went to the Guildhall, there to join the procession, while the City Marshal in scarlet rode bravely ahead to clear the road.

An hour ticked itself away, enlivened by galloping buglers, wearing peaked velvet caps and gilded coats, or trotting troops of cavalry, all hastening to the Guildhall. The increased activity of the police and the squad of ambulance assistants finally assured the Spectator and his *confrères* that the procession itself was on the way. At last it came into sight, and the effect was superb. Soldiers and civilians, sailors and aldermen, followed in such quick succession that the order is rather vague in the mind of the Spectator, confused by the flash of colors and the stirring music of the brass bands. He remembers a huge lifeboat manned by "jolly Jack tars" and an ancient press with its grinning "printer's devil." There were gay banners and fluttering flags carried by various guilds and military or naval schools; there was the usual number of red coats and

bear-skin helmets, and some uniforms of Nattier blue. Solemn mace-bearers and gilded coaches with lackeys clinging on behind and grim sheriffs inside all passed by under the light of the sun, which had finally consented to smile on the pageant. But best of all was the group of literary and historical personages mounted on fractious steeds which their riders managed gingerly or recklessly, to the amusement of the crowd. William Shakespeare won the most applause. He was dressed in black velvet, and was followed by personifications of his plays, also mounted and very debonair. Many jeering sallies greeted "Bottom" with his ass's head. Little Comus, riding in the train of Milton, was very popular. Monarchs and princes figured in the procession, too; Julius Cæsar, laurel-crowned, sitting in his chariot, and little Prince Arthur on his pony, both excited exclamations. The first caused murmurs of wonder, the second of pity. Tragic death coming to a man rarely arouses the universal sympathy which the same fate causes when a child is the victim.

And on streamed the gala procession with its picturesque pageantry and military bands until it had vanished in the distance. So thrilled was the Spectator in these pages from the past that he forgot all about the present until a cup of steaming coffee was offered him in the Egyptian Hall of the Mansion House. Then he realized how cold it had become.

Curiously enough, on the ninth day of November, London has three Lord Mayors: the outgoing, the incoming, and the acting Lord Mayor. The latter on this occasion proved a pleasant and genial gentleman who offered to show the Spectator over the Mansion House. Into the court where cases are tried, down to the strong room lined with glittering gold and silver plate, through the bustling kitchens where joints were roasting on spits in lavish and old-fashioned style, and up again to the gaudy reception-rooms and quiet council chambers, the Spectator followed his guide. The hospitable Lord Mayor suggested luncheon, which was followed by an invitation to hear him judge some cases in the court-room below. A pickpocket was first tried. He was pale and gaunt, and protested "Not guilty." The judging Lord Mayor, after hearing the evidence, replied: "Three months' hard labor for your innocence, my poor fellow." Oh, that look of hate from the starved eyes of the thief as he turned away from the judge, prosperous, honest, sitting in fur-lined robe and golden chain and pronouncing sentence on the wretch—the one, born to misery and hunger, dragging out a mere existence in the mire of the down-trodden; the other, gifted at birth with opportunities as golden as his chain, all the chances, all the luck leading him onward, till he sits in judgment above the unfortunate. Yet justice is just, though mistakes are made, and this man must go to prison in the name of law, for he was known to the police as a professional pickpocket; a few months in jail, a deeper impress of the prison stamp, release for a while, the wretch grown more hardened and brazen, and then a repetition of just such a scene in the Mansion House court-room; and thus is writ, in letters of shame, the life of a man.

Such meditations depressed the Spectator as he listened abstractedly to a few more cases, and the judge, by that curious telepathy of the mind, read his thoughts. So that later, walking back through the maze of apartments, he told a tale, and it was this. Riding one day in the tube, this gentleman asked a man sitting beside him what his paper said of a recent disaster at sea. Instead of replying, the man looked keenly at his interlocutor and asked a counter-question. Had he not sat on the bench three years before? Answering in the affirmative, the gentleman waited for further explanation. The stranger's face lighted up wonderfully as he replied: "I owe you an endless debt of gratitude, sir; you sent me to prison then, and it made me an honest man. I remember your face well, and can never forget that kindness you did me. Your act made me realize the meaning of justice and of right. You brought me up with a good round turn, and shame did the rest." Saying which a trifle brokenly, the unknown man jumped from the train and disappeared in the crowd. "But the glow in my heart, Mr. Spectator, remains to this day whenever I think of the gratitude of that stranger. And when the sight of so much crime and misfortune makes me wonder what the justice of it can be, I think of that unknown man."

"'Never dreamed though right were worsted, wrong would triumph,'" murmured the Spectator as he shook hands with his host.

"'Held, we fall to rise, are baffled to fight better,'" finished the kindly Lord Mayor, cordially returning the pressure.

And as the Spectator walked away he thought doubtingly of the story of the alderman who asked with scorn, "Palladio, who was he—was he a freeman of the city?" and thereupon rejected the great architect's design for the Mansion House because forsooth he was only an Italian. That official's ignorance was difficult to believe after such an interview with the gentleman who quoted Browning with the same ease that he formulated a philosophy of his own, and who, in spite of it all, was an alderman himself a year before. Education truly has done wonders even with the men in high office.

THE NEW BOOKS

Your United States. By Arnold Bennett. Harper & Brothers, New York. $2.

If one may judge by comments heard and extracts printed, no magazine articles of the year have been more widely read than those in which Mr. Arnold Bennett presented his impressions of a first visit to this country. Americans are thought to be somewhat sensitive to comments of foreign visitors, and the reason is found in the fact that too many books of this kind have generalized so sweepingly, often after very superficial observation. Mr. Bennett disarms criticism of this kind because he shows so plainly that what he has to record is exactly what he calls it—impressions. Here, as always, he visualizes for the reader most distinctly and sharply those things which did, in fact, interest him in a limited but active survey of certain things in American life. He will be the first to admit that things not seen by him might be seen by others which would modify the notes and comments he makes. It is his great merit that he does not pretend to be exhaustive or exact or to throw into full perspective the separate things talked about. The book certainly makes agreeable and often suggestive reading.

Wanderer in Florence (A). By E. V. Lucas. The Macmillan Company, New York. $1.75.

Most people know that Mr. Lucas is not only humorist, essayist, and novelist, but also art critic and art lover. When his wanderings took him to Florence, he naturally found in that greatest of art centers abundant material in architecture, sculpture, and painting for description, comparison, and criticism of an informal but discriminating kind. He has covered the ground thoroughly and in a way all his own. We cordially and unhesitatingly commend the volume both to those who know Florence already and to those who mean to visit it and who want something different from the ordinary handbook. The publishers have illustrated the work fully and with discretion.

Spirit of French Literature (The). By Mabell S. C. Smith.. The Macmillan Company, New York. $1.50.

Mrs. Smith's little book on Dickens may have prepared her readers somewhat for the larger study contained in the present volume—a survey of French literature with special attention to the political and economical conditions of the particular period which produced that literature. For instance, let us consider the realism of the nineteenth century. Renan was one of its exponents. Mrs. Smith says of him in part:

> Moralist, philosopher, philologist, historian, scientist, Renan brought a powerful mind to bear on a multiplicity of themes which he developed individually and then interwove in support of his great work on religion. . . .
>
> Renan's own nature was gentle and sincere; he was not a vulgarian who wrote for the pleasure of shocking; he was an earnest supporter of freedom of belief and of the application of scientific laws to the facts that lie behind theology. His work, nevertheless, forwarded a skeptical reaction against the religious impulse set in motion by Chateaubriand.
>
> It is in Renan's literary output that we are concerned, however, for he stands forth as a prince of realists. The photographic instinct was strong in him, yet he knew how to subordinate the unimportant, to select the vital and to develop everything with the accuracy of the scientist and the taste of the artist. His main work is that of the thinker and the scholar, but he delights also in sketches and "memories" which are delicately executed drawings. . . .

And then follows the well-known sketch of Nazareth in Renan's "Life of Jesus." In like manner Mrs. Smith supplements her own comment—compact and keen—by extracts from each author's work, these extracts reflecting, of course, not only the times in which the author lived, but also his own individual spirit and workmanship. The book is helpful and very suggestive. A corresponding volume on German literature would be equally interesting.

Lighter Side of Irish Life (The). By George A. Birmingham. The F. A. Stokes Company, New York. $1.75.

The author had already shown in his "Spanish Gold" and other stories of Irish life that one may write with humor about Ireland without following the stale, conventional lines of the comic Irishman of drama and fiction. Mr. Bernard Shaw has pointed out in his prologue to the Irish play called "John Bull's Other Island" that some of these conventional ideas are not only erroneous but topsy-turvy, and Mr. Birmingham enforces this theory without following Shaw in his extreme and paradoxical assertions. What is best of all is that the author has given us here a thoroughly readable book in which the anecdotes are novel and come in naturally to illustrate the meaning. There are sixteen color illustrations of rather widely varying merit by Mr. Henry W. Kerr.

Cease Firing. By Mary Johnston. Houghton Mifflin Company, Boston. $1.40.

Miss Johnston's new story is in effect a continuation of her earlier and moving tale of the war between the States, "The Long Roll." It takes up the narrative after Chancellorsville, describes the campaign in the Mississippi Valley, the fights in Tennessee and West Virginia, the final struggles in the Wilderness, and Sherman's march to the sea. A tender and pathetic love story runs through the book and issues victoriously, for victorious love sometimes ends not in marriage but in death. This book, like its predecessor, shows an enormous amount of patient work, of familiarity with detail which must have been won at great expense of time and toil. It is not, strictly speaking, a novel; it is rather a dramatization of a great struggle. Like Tolstoy's "War and Peace," it is the history of a great movement in human affairs. There are

times when the action seems to be impeded by its range, but there is no time when the interest and vital imagination of the novelist falters or grows faint. "Cease Firing" is the work of a very able woman who feels deeply but who is never a partisan; who, in two striking stories, has told the story of the war from the Southern point of view with ardor, passionate loyalty, and devotion, but without rancor or injustice to the opposing forces. It might be added in passing that the peace societies have no literature in their possession comparable with this book as an indictment of war.

Strong Hand (The). By Warwick Deeping. The Cassell Company, New York. $1.35.

A story of English country-town life, with a strong character in the person of the young doctor who fights dirt, ignorance, and selfishness in a place the evil conditions of which invite the epidemic of disease that comes to give the book its critical situation. Readers of Charles Kingsley's "Two Years Ago" will be interested in seeing how differently what is practically the same story-idea can be treated by two authors. In certain ways this seems to us the best novel Mr. Deeping has written recently.

Best of a Bad Job (The). By Norman Duncan. The Fleming H. Revell Company, New York. $1.

Norman Duncan has not written too much of the Labrador region, as is amply proved by the power of his latest story. Old Tom Tulk had to *learn* to make the best of a bad job, and he learned so well that he left a moral to every man on the coast. A tale of sheer courage touched by such tender pathos is not often found. "As for me," says Tom Tulk, "my friend is Laughter from Get-Along-Somehow, an' my best bedfellow is called Grit." With this he won back his courage and left his legacy to the men of the north seas.

Ordeal (The). By Charles Egbert Craddock. The J. B. Lippincott Company, New York. $1.60.

The Tennessee Mountains once more are the background of a romance by Charles Egbert Craddock. No beautiful mountain girl is involved, but moonshiners and a revenue officer furnish occasion for a murder and abduction, both falling upon innocent victims. The romance is strained and quite unconvincing, while the plot is far from strong. "The Ordeal" is not equal either in its form or originality to the early novels from the same pen.

World We Live In (The). By George Stuart Fullerton. The Macmillan Company, New York. $1.50.

In this vigorously written volume Dr. Fullerton, Professor of Philosophy in Columbia University, assails the idealist philosophy, and particularly its Berkeleian type, as false to the reality of things. Its world is not "everybody's world," the world of practical common sense. Obviously it is quite different. But this hardly justifies denial of an identity of the two at bottom, or accusation of the idealist, who practically treats everybody's world as real, of indulging himself, while alternating between the study and the street, in a sort of "Jekyll-Hyde experience." But Professor Fullerton insists that "the Absolute is no better than a word," and regards all soaring of thought above the physical world as illegitimate transcendentalism. Professor Royce's "new idealism" fares no better at his hands than Berkeley's; "the world as idea" is to him "a phantom world," unreal. Professor Fullerton fails to note that, while all that exists—even a dream—is, in a sense, real while it exists, only that which never ceases to exist can be real in the highest and ultimate meaning of the word. Everybody's world, though real while it lasts, is phenomenal and transitory. The everlasting Power behind it all, its very ground of being—this surely is the eternal reality. We cannot, then, with Professor Fullerton, abjure all "talk of a far-off divine event," etc., or confine philosophy to existing things—things which do not ultimately persist in being.

Belgium: The Land of Art. By William Elliot Griffis. Houghton Mifflin Company, Boston. $1.25.

To his long list of helpful books Dr. Griffis now adds "Belgium." The book has a sub-title, "The Land of Art." It is true that Belgium is one of the lands of art, although the title is more emphatically in mind as applied to some other lands. But, being true to a great extent with regard to Belgium, one looks in a book with over three hundred pages with such a sub-title for more than a comparatively few lines on Rubens and van Dyck. If the text is not to be enlarged in future editions of the book, the sub-title might well be omitted; as it is, it is misleading. Nor let the intending reader expect to be instructed about Belgian literature any more than he is instructed concerning Belgian art. Concerning present commercial and political conditions, however, despite one or two statements on which all are not agreed, the volume is very informative. As a history of Belgium it is clear, vivid, and well written. It should be in the hands of every visitor to one of the most interesting small countries in Europe.

Outline of the History of Christian Thought since Kant (An). By Edward Caldwell Moore, Professor of Theology in Harvard University. Charles Scribner's Sons, New York. 75c.

One can scarcely speak too highly of this illuminating review of a period coeval with that of our National independence, and characterized by a ferment and change in the world of thought as that has been in the world of action. During this period the new spirit that awoke in the Protestant Reformation has entered regions which, in lack of the necessary regulatives, it then failed to penetrate. These have been developed in the intellectual advance that began

with Kant: namely, the conduct of historical and literary criticism in scientific method; the scientific conception of nature and man's relation to nature; the idealist construction of the universe on the foundation laid by Kant. These have led to a reformation of thought concerning Christianity, the history of which Professor Moore has sketched in clear and striking outlines. He introduces it by a historico-critical survey of the entire movement, its factors and stages, with its changeful background of deism, rationalism, pietism, and æsthetic idealism. Its distinct lines are then traced in their details—idealistic philosophy, theological reconstruction, the critical historical movement, the contribution of the sciences, the English-speaking peoples—action and reaction. In each of these lines the contributory work of the great leaders is critically reviewed. The entire presentation is characterized by a masterly grasp and appraisal both of the whole movement and of its several particulars—a momentous movement still in progress on "the great and sure foundation" that has been laid. It is conceivable, says Professor Moore, that this century may witness changes as noteworthy as those of the last.

Through the Heart of Africa. By Frank H. Melland and Edward H. Cholmeley. Houghton Mifflin Company, Boston. $4.

Cycling through Africa has a venturesome sound, and the description of it by Mr. Melland and Mr. Cholmeley, while apparently making light of some of the hardships and dangers, only brings out more clearly and vividly the features of African life which certainly differentiate it from that of more civilized continents. The present volume is well worth reading throughout; it is the "latest word" regarding a large part of Africa.

Mornings with Masters of Art. By H. H. Powers, Ph.D. The Macmillan Company, New York. $2.

To the number of books on art, and especially on painting, must be added Dr. Powers's. His is a comprehensive volume, for he ranges from such subjects as "The Afterglow of Greece," "How Art Became Christian," to discussions of Ghiberti and Donatello, Leonardo and Michelangelo. The book, however, is not as comprehensive as its title would indicate. It deals chiefly with Florentine art. It is a suggestive and helpful volume.

Fanny Burney at the Court of Queen Charlotte. By Constance Hill. The John Lane Company, New York. $5.

Before opening this book one is inclined to ask why there is need of any better or other Fanny Burney story than her own diary and letters and the Macaulay essay, but one finds the answer in reading this volume, which, like two predecessors relating also to Madame d'Arblay, put the lively story of this most interesting figure of Court and literary life in the eighteenth century in modern form and with judicious selection and omission. Miss Hill has an enviably happy knack at this kind of thing, and it has never been better shown than in this book.

How to Get Your Pay Raised. By Nathaniel C. Fowler, Jr. A. C. McClurg Company, Chicago. $1.

This is one of the series of practical books in which Mr. Fowler collects the suggestions of many successful men to young people about to begin business life. Here there are such suggestions from over fifty business men, bankers, teachers, and others, and these are supplemented by the author's own tersely written chapters. The shortest recommendations we have noted are those of a civil engineer who says: "Remember, Always to do something, Keep doing something, And always do that something well."

International Bible Dictionary. By Rev. F. N. Peloubet, D.D. The John C. Winston Company, Philadelphia. $2.40.

There are many good points in this comparatively low-priced and well-illustrated volume. The announcement of its publishers that it conforms to "the latest discoveries and conclusions of modern scholarship" is but partly sustained by its contents. *E.g.*, its editor regards both the book of Daniel and the book of Jonah as historical, and the Fourth Gospel and the Revelation as both written by the Apostle John. No intimation is given that the Genesis story of Adam is not historical: "Adam was created (not born) a perfect man in body and spirit, but as innocent and completely inexperienced as a babe." Of miracle this notion is held: "It is simply a personal God putting his will into the laws of nature"—as if it were not in them continuously. Discussion of the miraculous and supernatural—terms usually confounded in popular thought—has advanced beyond this notion of divine interferences and interpositions.

Latin Works and the Correspondence of Huldreich Zwingli. Translated by Henry Preble, Walter Lichtenstein, and Lawrence A. McLouth. Vol. I. G. P. Putnam's Sons, New York. $2.

The edition of Zwingli's works in use since 1828 is now succeeded by another, the fourth, improving much upon the former edition in every point. Begun in 1903, and still incomplete, the new edition is to be made accessible to English readers in a series of volumes. The first of these is the last work of its scholarly editor, Dr. Samuel Macaulay Jackson, finished just before his lamented death last summer. Most of its contents now appear for the first time in English, miscellaneous in kind, historical, political, and religious—interesting throughout. Zwingli's progressive spirit, humanistic, independent, and open-minded, commend him to us as more modern than any of his fellow-reformers. More in advance of his time than they, he deserves to have been equally well known with any of them, but is gradually coming to his own.

BY THE WAY

The Treasury, it is announced, is at work on new designs for our paper money. The new plans provide for bills of a smaller size and with uniform designs for all bills of the same denomination. Thus, all one-dollar bills will bear the head of Washington, all five-dollar bills the portrait of Lincoln, etc.

To the deadly fly is now attributed another disease—that of infantile paralysis. The Harvard medical faculty announces, as a result of its investigations, that the common stable fly distributes the germs of this disease. Common flies, apparently harmless, are now known to be the carriers of typhoid fever, of the sleeping sickness, of ophthalmia, and of infantile paralysis, and are thus among the worst enemies of the human race.

"Blue sky laws," as discussed at the recent convention of the Investment Bankers' Association, do not, as might be supposed, refer to the height of buildings on city streets, but are aimed to prevent the selling of fraudulent securities. The name is derived from the idea that makers of these securities would capitalize the heavens themselves. "Blue sky" legislation is, it is said, on foot in several States other than Kansas, which already has such a law.

Appropriately enough, the home of an Anti-Window Steaming Company is London, England. The fogging of windows is doubtless a serious trouble to shopkeepers in that city, and the company prevents this by a simple device which blows a current of dry air on the glass. A window which had been steamed to opaqueness is said to have been cleared perfectly within thirty seconds by the new apparatus.

The priceless privilege of European travel, once secured, is often undervalued by Americans. "Lippincott's" tells of two American girls talking together in Paris: "What shall we do this afternoon?" "Let's go to the Louvre." "Oh, no; I've been there already, and it's not the sort of place you care to go to more than once." The Magasin du Louvre would doubtless have been better appreciated by this young woman.

Tecumseh, the famous Indian chief, did not lose his standing among his own people because of his disastrous defeat at Tippecanoe. In the "American Historical Review" an interesting "journal" of the War of 1812 is published which contains this reference to the chief: "I have seen the great Tecumseh. He is a very plane man, rather above middle size, a noble set of features and an admirable eye. He is always accompanied by Six great chiefs, who never go before him."

There are several fashionable auction rooms in New York City which attract people of means who are fond of "bargains." At a recent sale at one of these places an arm-chair brought $315, and a three-piece suite, consisting of a sofa and two side chairs, $1,900. These articles were of carved walnut, covered with fine old figured tapestry, but neither historic nor personal associations entered into their value, as described in the auctioneer's catalogue.

A novelty in the way of a text-book for teaching English to foreign laborers is, it is stated, to be used by the Chicago Young Men's Christian Association. It will be called "Safety First for Foreigners," and each lesson will consist of a picture of an accident and information in simple words as to the best way of avoiding it. It is hoped in this way to reduce the large number of accidents to foreigners in Chicago.

The always original F. Hopkinson Smith, artist and author, has found a new way of sketching the London streets. He does it from a taxicab, which he declares to be the best way. "It rains about every five minutes in London," Mr. Smith is reported as saying, "and when I came to a place where I wished to work I'd just lower the front hood, sit up on the seat, and look out over the heads of the people." The artist has been sketching places made famous by Thackeray or Dickens.

The quantity of material excavated at Panama, according to illustrations in the "Scientific American," would make 63 Great Pyramids, or would build a Chinese Wall 1,000 miles longer than the original wall so called. As the Chinese Wall, however, was faced with granite, paved with bricks, and flanked with towers for at least 1,500 miles, it is a question whether it did not require a greater expenditure of labor than the Canal.

Dr. W. E. Geil, who in 1908 journeyed from end to end of the Chinese Wall, says that with its extensions its total length is really 2,550 miles, and that originally 40,000 stone towers guarded it. His book, "The Great Wall of China," contains photographs showing the Wall crossing rugged mountains 4,000 feet high.

Mrs. Hetty Green, known as the richest woman in America, disclaims a newspaper interview published on her seventy-seventh birthday which tried to make it appear that she is also one of the wisest women in America. Among the aphorisms attributed to her was this: "Don't overdress—that is, don't dress flashily." Mrs. Green might well have indorsed this particular sentiment, for her characteristic attire is described as consisting of "a rusty black suit and a black straw hat."

A new society called the "Spugs" has for its object the "elimination through co-operative effort of the custom of giving indiscriminately at Christmas" *and* "the furthering in every way of the true Christmas spirit." The association's popular name is derived from the initials of its formal title, the Society for the Prevention of Useless Giving.

Children are often fearful of the water, especially at the seashore, and kind-hearted parents will not thrust a terror-stricken baby into the surf. John Muir in the "Atlantic Monthly" emphasizes the need of caution in this matter by relating how he was made miserable as a child by being plunged again and again into the sea by a strong-armed servant, despite his shrieks. "As the time approached for this terrible bathing," he says, "I used to hide in the darkest corners of the house, and oftentimes a long search was required to find me."

Lord Dufferin, according to an exchange, once addressed a Canadian university audience in Greek. The papers complimented him on his Greek as idiomatically perfect. "How did the reporters know that?" a friend asked Sir John Macdonald, who had heard the address. "Because I told them," replied Sir John. "But who told you? You don't know Greek," persisted the friend. "I don't know Greek," the Premier admitted, with a twinkle, "but I know politics."

The Outlook

DECEMBER 14, 1912

LYMAN ABBOTT, Editor-in-Chief HAMILTON W. MABIE, Associate Editor
THEODORE ROOSEVELT
Contributing Editor

The Balkan War: An Armistice

Last week, two months after the Montenegrins declared war against Turkey, and seven weeks after the Bulgarians, Servians, and Greeks joined them, an armistice was signed. But, as Montenegro fired the first shot, so Greece seems inclined to fire the last. Bulgaria, Servia, and Montenegro signed the armistice; Greece did not. Why not? There are several explanations. The most probable is the fact that Greece has lost fewer men in killed and wounded proportionately than have the other allies, and that in any event she has more money. She is therefore in a position to continue the war, if necessary. The second explanation is the fact that Greece is not yet in complete military possession of Epirus—that ancient Greek province to the north of her present territory—nor has she acquired all of the Ægean Islands, although she has most of them. As to some of them, namely, the twelve Sporades captured by Italy during the recent Italo-Turkish war, there is a difficulty. The Treaty of Lausanne, ending that war, declared that the islands were to be given back to Turkey only on condition of guarantees for the proper protection of the inhabitants. Turkey could not immediately give such guarantees. Hence Italy still occupies the islands. Had she evacuated them before peace was arranged, she could not, of course, oppose their recapture and occupation by Greece. But Italy does not propose to evacuate the islands until Turkey is in position properly to protect the inhabitants. Thus this apparently humane arrangement helps Turkey to maintain one of the remaining vestiges of her sovereignty.

The Balkan War: The Greek Advance

With regard to this military and financial position of Greece, the rumor prevailed last week that the allies had made a secret agreement to the effect that, as three of them are now well exhausted, they should sue for peace, Greece, however, continuing to harry the Turk, thus inducing the conclusion of as favorable terms as possible. This was confirmed by the transport last week of many thousand Bulgarian and Greek troops and animals by forty Greek transports and convoying war-ships from Salonika to Dedeagatch on the Ægean Sea, one of the principal ports between Salonika and Constantinople, and the terminus of railway lines from Adrianople and Salonika. The Greek navy has also been reported as bombarding the town of Gallipoli, an important port on the Sea of Marmora, at the entrance to the Dardanelles. Gallipoli was the first conquest of the Turks in Europe. The Greek naval operations in the Adriatic off the Albanian coast, however, have attracted more attention. They include the capture of the Island of Sasseno, not far from Avlona, the principal port in Albania, and the bombardment of that town itself. The Austrian and Italian Governments have made a joint protest against the bombardment of Avlona, and have declared that the Greek occupancy of either Avlona or the island of Sasseno should not be considered as permanent. Importance is attached to this action as illustrating the unity of views of the two Powers on the Albanian question in general and as indicating that no town or island may be separated from the present province of Albania, which, it is expected, will become an independent, autonomous territory. A semi-official statement issued at Athens declares that by agreement among the allies Greece adopted an attitude different from that of the other States. The Treaty of Lausanne, the statement adds, is proof that it is not necessary to precede peace negotiations by an armistice. As the Balkan League, it is generally understood, is due as much to the Greek Prime

Minister Venezelos as to any one, the above statement was received with respect. Persistent rumors, nevertheless, obtain of dissensions among the allies. The main points of the armistice, as reported, are as follows:

1. The armistice is to last fourteen days.
2. The armies are to remain in their present positions.
3. The besieged towns are to be revictualed daily.
4. The armistice is to cover the whole of European Turkey.

Adrianople is the chief besieged city. The besiegers' trenches are now within a few hundred yards of the outer fortifications. The Bulgars are confident that they can, before long, wear the garrison into surrender; the revictualing concession is regarded as an indication that the allies as well as the Turks are agreed upon one thing, namely, that there must be a little yielding on each side in order to bring about an immediate armistice, and so prevent outside interference.

The Balkan War: The Powers

Both sides would lose, it is seen, if the Powers should now step in as mediators. Foreshadowing this, there were last week several important speeches. Two were made in the German Parliament by the Chancellor and the Foreign Minister. Herr von Bethmann Hollweg, the Chancellor, declared, as reported: "When our allies, Austria-Hungary and Italy, in maintaining their interests, are attacked by a third party and thereby threatened in their interests, then we, faithful to our compacts, will take their part firmly and decisively." This sort of thing has been called "the rattling of the German saber." As an offset, Herr von Kiderlen-Wächter, the Foreign Minister, replying to references to alleged discord with Great Britain, said: "These remarks offer a welcome occasion to state that during the whole late crisis our relations with Great Britain have been specially marked by mutual trust, which has not only brought about a most gratifying intimacy in our relations, but also has performed good services toward an understanding among all the Powers." To correspond to Germany's declaration of loyalty to her allies, later in the week, as was expected, a similar declaration with regard to Russia came from France. The occasion was a speech by Prime Minister Poincaré. He, however, was careful to emphasize the fact that "up to the present the Powers have been in accord, recognizing that military operations do not constitute accomplished facts and that no Power has adopted any irreparable initiative." This is as it should be. We hope that the Powers will maintain as much of an attitude of detachment as possible during the forthcoming change in the map of Europe—a greater change than any since the Congress of Vienna divided Napoleon's estate.

Elections in Russia

The political temper of the Russian people has again been shown clearly in the recent election for members of the Fourth Duma. When, in 1907, the Czar violated the Constitution by promulgating a new election law without the consent of Parliament, the Government expected, and had every reason to expect, that by means of this law it would at least get a working majority in the lower house. The whole population had been divided into classes, and every class had been given elective power, not in accordance with its numerical strength, but in accordance with its political complexion. Classes that were likely to support the Government, such as the landed proprietors and the priests, were given large representation in the electoral colleges (which choose the members of the Duma), while classes that were likely to be hostile to the Government, such as the peasants and the factory operatives, were given only a small representation. Most citizens had the right to vote, but a numerically small class could outvote a numerically large one. The landed proprietors, for example, were entitled to representation in the proportion of one delegate to every 2,000 voters, while the peasants had to be contented with one delegate to every 30,000 voters, and the artisans with one for every 90,000. The landed proprietors, therefore, had fifteen times as much political power as the peasants, and forty-five times as much as the factory operatives. In other words, 90,000 landed proprietors could send forty-five delegates to the electoral colleges, while 90,000 peasants could send only three, and 90,000 artisans only one. Under this arrangement an overwhelming majority of the citizens were practically disfranchised, although nominally all of them had the right to vote, and most of them actually did vote. This stacking of the cards against the people, however, did not attain completely its openly avowed object. The Government failed to get a working

majority in the Third Duma, and if the Octobrists (the party of expediency and compromise) had not generally supported its policies, it would have had either to abandon them or to dissolve the Third Duma, as it had already dissolved the First and Second. With the aid of the Octobrists, however, it was able to pursue the policy of reaction and to defeat all the attempts that were made by the Liberals to embody the principles of the Freedom Manifesto in practical and effective legislation.

⚄

The Fourth Duma

When the electoral campaign of 1912 began, the Government, through its official representatives in the provinces, made every possible effort, legal and illegal, to intimidate the Liberals and promote the candidacy of Nationalists and extreme Conservatives. The Constitutional Democrats and the Social Democrats had already been declared illegal parties, and their candidates were now forbidden to hold public meetings or to electioneer by any of the methods practiced in Western Europe and the United States. Liberal peasant leaders who seemed likely to be chosen as delegates to the electoral colleges were disqualified by arrest on trumped-up charges of disloyalty; large classes of Jewish citizens were disfranchised by forced interpretations of restrictive laws; notices of the convening of elective assemblies in Liberal districts were sent out so late that the voters had no time to assemble; places of assembly were so selected that voters had to make long journeys in order to reach them; names of Liberal voters on voting lists were purposely misspelled, so that their votes might be thrown out in the count; and scores of other schemes were devised to prevent the polling of the full Liberal vote. In spite, however, of administrative repression, arbitrary disfranchisement, crooked election work, and strenuous activity on the part of the Orthodox clergy, the Government failed in its chief endeavor. It made a gain of ninety-four seats, but it did not secure a trustworthy majority, nor did it prevent the people from showing at the polls their attitude toward two, at least, of the leading political parties, viz., the Constitutional Democrats and the Octobrists. The former gained nine seats, while the latter lost fifty-two. Milyukof, Rodichef, and Shingaref, the ablest and most distinguished of the Constitutional Democratic leaders, were all re-elected, while Guchkof, the leader of the Octobrists and President of the Third Duma, was defeated. Every possible effort was made by the Church to elect priests; but, instead of gaining seats, it lost one. The political complexion of the Fourth Duma may be shown in tabular form as follows:

Government parties	Conservatives	140
	Nationalists	74
	Non-partisan	7
		221
Center	Octobrists	79
Liberals	Constitutional Democrats	61
	Progressives	33
	Polish Group	14
	Social Democrats	13
	Group of Toil	12
	Mohammedan fraction	5
		138

When the Fourth Duma assembled, on the 28th of November, the Liberal parties and the Octobrists, voting together, organized the house by electing as President M. V. Rodzianko, an Octobrist leader who filled the same position in the Third Duma after the resignation of Guchkof. As the present house consists of 442 members, the Government lacks one of a majority, even if the non-partisan delegates are included, as above, among its supporters. In all probability it will lack much more than this when the Duma comes to the point of action on important questions, and, if so, it will be compelled to rely, as heretofore, on the Octobrists. Whether the latter, after the rebuke that they have received at the polls, will continue to support the Government or not is a question that cannot yet be answered. A loss of fifty-two seats might indicate to such a party that it had been pursuing a mistaken, or at least an unpopular, policy.

⚄

Congress in Session

When the third and final session of the Sixty-second Congress began on Monday of last week, the event emphasized the anomalous and absurd position pointed out in The Outlook two weeks ago. A new President has been elected, but will not take office until this final session of the old Congress is complete. The first regular session of the newly elected Congress, the Sixty-third, does not begin until next December, although a special session will be called for April by the new President. How long will it be before Congress provides for such Constitutional and statute amendment as may be necessary to allow a

newly elected President and a newly elected Congress to begin their work on the first of the year following the election? President-elect Wilson, if we are not mistaken, is in favor of such a common-sense arrangement, and the people of the country at large are in favor either of this plan or of some other plan which would do away with the present preposterous situation. When our Government began, it was a matter of weeks, and sometimes perhaps even of months, for the returns of the election to be gathered, for the Electoral College to meet, and for the elected candidates to come to Washington. Since that day the telegraph and the railway have brought all parts of our widespread country very much closer together, and the reasons which formerly existed for postponing the meeting of a new Congress so many months are no longer existent. The fact that action has not been taken is simply another instance of American inertia in certain classes of political matters. It has been generally predicted that the present session of Congress would do little more than routine work, leaving it to its successor to attack the great problems of government under the mandate given to it by the recent election. Eulogies on Vice-President Sherman and on Senator Heyburn and Senator Rayner were followed by a brief adjournment. Among the measures introduced in one or both houses may be mentioned a plan for pensioning former Presidents, undoubtedly called forth by Mr. Carnegie's proposal, which has met all but universal disapproval; a bill authorizing the Inter-State Commerce Commission to make a physical examination of all railway property in the United States; a proposal for river and harbor improvement which would carry an appropriation of fifty-six million dollars as asked for by the chief of the army engineers, an increase of over seventeen million dollars above the last appropriation; and two proposed Constitutional amendments introduced by Senator Bristow, of Kansas, which would apply the principles of the referendum to certain United States Supreme Court decisions. We must reserve comment on this last bill until it has been explained more fully on the floor of the Senate. The Senate has begun the impeachment proceedings in the case of Judge Robert W. Archbald, charged with personally profiting in railway and coal dealings which were before him as a judge. President Taft has submitted two Messages—one on foreign commerce and foreign relations, the other a general survey.

Battle-Ships and Patriotism

The Democrats in the House of Representatives defeated the two-battle-ship programme in the last session. They were warned at the time that, so far as our navy's requirements were concerned, one battle-ship this year might mean a demand for three or four next year. We are not surprised, therefore, to find in the just-published annual report of Mr. Meyer, Secretary of the Navy, a recommendation by the Naval General Board that Congress provide for the increase to our navy of *four* battle-ships—though only three are included in the Department's estimates for this year—in addition to two battle-cruisers, sixteen destroyers, and seventeen lesser craft. The new battle-ships would simply replace the four which will be twenty years old in 1914, and would then have to be withdrawn from the second line; thus the new ships would not constitute a numerical increase in the fleet's present strength. A total of forty-one battle-ships, with a proportional number of other fighting and auxiliary vessels, is, in Mr. Meyer's opinion, the least that will place this country on a safe basis in its relation with other world powers. It may be objected that we do not need such naval strength, as the opening of the Panama Canal will double our fleet's efficiency. It is true that it will increase our naval efficiency because, if the fleet is in Atlantic waters, the Canal will reduce the time necessary to bring it around to the Pacific Coast. But, as Secretary Meyer points out, it does not increase the number of ships. With our immense coast line, there should be no argument necessary to show that only an efficient fleet of adequate size can guard us from attack and leave us free to work out our destiny in peace. Secretary Meyer concludes: "The possession of great wealth, resources, and population does not carry with it immunity from attack should a nation's interests clash with those of another better prepared." No matter how many agreements for the settlement of international disputes by arbitration we may conclude, "history—including the present—shows the futility and danger of trusting . . . even to the most solemnly binding treaties." We shall find our effective force not alone in our sentiments of good will towards all and in our desire to push the

movement towards arbitration as far as possible, but also in an armed strength ready alike to enforce the laws of peace or the decrees of war.

⊡

States' Rights and the Trusts

Our attention has been called to a recent and very striking illustration of the futility and injustice of attempting to control the inter-State trusts by State regulation. The Tobacco Products Corporation is a new fifty-million-dollar organization recently chartered by the State of Virginia. The certificate of incorporation was approved by a judge, as required by the Virginia law, and is in accordance with the Virginia corporation law. Our informant points out that the charter contains two provisions which deserve the attention, not only of investors, but of the general public. By the fourth paragraph of the charter the stockholders of the company are specifically deprived of any right to subscribe for additional stock, which the directors may issue, in proportion to their interest in the corporation; and the directors are given full power to issue new stock and to sell it in any way they choose to any person they choose at any price they choose, even though that price be less than the par value of the stock. We should suppose that any intelligent investor would regard such broad powers as being highly dangerous to invested values when exercised by an incompetent or unscrupulous board of directors. There is, however, a provision of the Virginia charter of the Tobacco Products Corporation which is even more serious. We quote it verbatim:

Eleventh. No contract or other transaction between the corporation and any other corporation shall be affected or invalidated by the fact that any one or more of the directors of this corporation is or are interested in, or is a director or officer, or are directors or officers of such other corporation, and any director or directors, individually or jointly, may be a party or parties to, or may be interested in, any contract or transaction of this corporation or in which this corporation is interested; and no contract, act, or transaction of this corporation with any person or persons, firm or corporation, shall be affected or invalidated by the fact that any director or directors of this corporation is a party, or are parties to or interested in such contract, act, or transaction, or in any way connected with such person or persons, firm or association, and each and every person who may become a director of this corporation is hereby relieved from any liability that might otherwise exist from contracting with the corporation for the benefit of himself or any firm, association or corporation in which he may be in any wise interested.

Commenting upon this clause, a lawyer writes us as follows: "Notwithstanding its somewhat involved legal phraseology, the idea which this clause contains is startlingly clear. Couched in rough language, this is a license to steal. I do not say that the directors will steal; those who are familiar with workings of insiders in the Tobacco Trust may have their own opinion as to the amount of restraint which the directors of a corporation containing such a provision as this may impose upon themselves. It attempts to abrogate and annul the fiduciary principle which the courts have from time immemorial declared as binding upon persons in trust relations." It is pointed out that the general law of the United States, to use the language of the Court of Appeals of the State of New York, "invalidates all contracts made by a trustee, or fiduciary, in which he is personally interested." In the specific case to which the Court of Appeals was referring, the trustee stood in the attitude of selling as owner and purchasing as trustee. "The law permits," continues the Court, "no one to act in such inconsistent relations. It does not stop to inquire whether the contract or transaction was fair or unfair; it stops the inquiry when the relation is disclosed, and sets aside the transaction or refuses to enforce it." In the charter of the Tobacco Products Corporation, the State of Virginia, with the approval of a judge in one of her courts, has repudiated the very basis of the moral responsibility of a director. If this is a sample of what Virginia corporation law means in the way of protection to investors, the words "incorporated under the laws of Virginia" on a certificate of stock are likely to have the same effect on the intelligent observer as a red flag on a railway. As an argument for a National corporation law the Tobacco Products Company's scheme seems complete.

⊡

Bribery in High Places

The prompt conviction by a jury in New York City of Charles H. Hyde for acts of bribery adjudged to have been committed by him when a public officer proves, like the Morse case, that the administration of law can deal sternly with criminality in the case of a man of financial and social standing as well as with men of the low depravity instanced in the recent trial of the "gunmen"

who killed Rosenthal. The District Attorney, Mr. Whitman, has again made evident his forcefulness and fearlessness, and Judge Goff by his clear-cut rulings prevented the dismissal of the charge on subtle and technical defenses. This remains true as to the effect of the trial itself on the public consciousness even although later proceedings should maintain the claim of Hyde's counsel that the prosecution did not adequately show that Hyde personally benefited by his act. That he did in some way benefit seems morally certain, but motives are not always easily proven in evidence. Briefly stated, the charge against Hyde was that, having in his keeping vast sums of the city's money which he could under certain limitations deposit as he chose, he compelled and induced a certain bank to deposit large funds with a trust company which was in a precarious condition and which afterward failed. This he did, first, by threatening to remove city funds from the bank in question if it failed to comply with his request; and, secondly, by promising to make further future deposits of city funds with the bank if it did as he wished. A sort of excuse has been set forth for this conduct by those who say that others have done the same kind of thing. The same apology was made in the Morse case. It is a defense which is worse than worthless, for the more general such wrong-doing is, the more acute is the necessity for punishment.

Contemptible "Militarism"

In an address last week made in London before the National Union of Women's Suffrage Societies, Lady Frances Balfour said that she felt that the latest form of militancy had done absolutely no good, that the present tactics were simply stupid, and that there was no doubt that militancy was doing the suffrage cause great harm. Lady Frances might have added that these tactics were contemptible as well as stupid. To enter a political protest against Parliament's refusal to enact suffrage legislation by destroying quantities of mail doubtless caused inconvenience, personal distress, or business loss to hundreds of people, but it did not help the cause of the militants a particle and it has deepened the conviction that the antics and outrages of these wild women must be dealt with seriously and severely. Moreover, to put inflammable substances into mailboxes and then run away in safety is as cowardly as it is contemptible. How long the delusion will last that private lawbreaking and shameful violence form the right incentive to fair discussion and reasonable political action remains to be seen. Such vandalism as the destruction of mail in postboxes and the recent incendiarism in Dublin has certainly brought the patience of most Englishmen nearly to an end. What further extremes are at least threatened may be judged from the assertion in last week's cable despatches that "the militant Suffragettes decided at a recent meeting to resort to the use of explosives in the event of the Government refusing to incorporate woman suffrage in the forthcoming Franchise Bill, according to a statement issued by a news agency to-day." This may probably be false or exaggerated, but its mere assertion is a singular sign of the times.

Four Plays Well Worth Seeing

It has sometimes been assumed, despite the great examples of the past, that writing for the stage and writing books were, under modern theatrical conditions, two incompatible arts. This fallacy has of late years had not a few contradictions through successful plays by "literary" authors, and just at this time there are some notable examples of such plays on the New York stage. Mr. Arnold Bennett, in his "Milestones," distinctly adopts a method more common to novels than to the theater in making his three acts present three generations, with the chief actors appearing at all three periods (1860, 1888, 1912), with their children and grandchildren beside them in the second and third acts. The effect of costumes, accessories, fashions of speech, and spirit of the times, changing thus successively, has entertained large audiences, while beneath the externals is the mildly ironic theme that the radical of to-day is the conservative of to-morrow and that the eagerness of youth is followed by the lassitude of old age. As in Mr. Bennett's novels, one may admire the faithfulness of depiction while deploring the lack of any evidence that self-devotion and idealism have the great part in life's drama. Mr. Bernard Shaw's "Fanny's First Play" is also a literary play in a sense; like Sheridan's "The Critic," its prelude and postlude score the dramatic critics mercilessly but humorously, and the audacity of the thing is offset by the inclusion of some very plau-

sible criticism by Shaw on Shaw. The play to which these critics listen and upon which they comment will not hold the stage as "Man and Superman" has done, but it is brilliant in parts, full of surprises and clever turns, and (sociologically speaking) totally unconvincing—all of which was to be expected. A play made from a famous and beloved story, but not by any means a mere reflex of the book, is "Little Women." In this Miss Louisa Alcott's delightful girls are made living characters and fun and pathos are closely mingled. The exceeding great success of this play again shows that fiction and the drama may join hands in a union of arts. A play, however, of a character and quality unlike those already mentioned is Mr. Edward Sheldon's "The High Road," in which Mrs. Fiske assumes the leading part. Since the presentation of "Salvation Nell," written while its author was still a Harvard undergraduate, Mr. Sheldon has been accused of being theatric rather than sincere. Master of most of the tools of his art, he has lacked restraint in their use. The last four acts of "The High Road" are amazingly skillful, but they are not obtrusively so. "The High Road" is the life story of an impressionable country girl and her steady and consistent growth in moral courage and power. She develops during the course of the play from the toy of a wealthy artist to the worthy wife of a Presidential candidate. The final curtain finds her, when the test comes, a "bigger man" than her husband. As a study of character and as a dramatic presentation of certain phases of our present political conditions the play is genuinely remarkable.

Music and the University

In America the art of music has been under a severe handicap. It has had to make its way against the worst of obstacles—a mental attitude. It was not so very many years ago that music was generally regarded as an "accomplishment," to be acquired along with "dancing" and "deportment" in a "finishing school." Of course, thus regarded, the art of Bach and Beethoven was not thought of as a subject of study in a university. During these years, however, America has been growing up. Now rich men not only pay thousands of dollars for pictures, but also support costly performances of opera. Indeed, almost every important city in the land has at least one symphonic orchestra. Not only the art of the painter but also the art of the composer is recognized as a vocation, like banking or railroading or the law, requiring close, hard study by a well-equipped mind. That is a great advance. And yet music still feels the handicap of that old mental attitude. It has found its way into the universities and colleges. The theory of music, which has to be mastered in some way if music is to be practiced as a creative art, can be learned in America now practically as well as in any foreign country; but, as a rule, it is the Cinderella of the family of college subjects. The department of music has to take what the other departments leave; it has to step aside in favor of physical laboratories and chemical laboratories and psychological laboratories. In making music a real university subject Harvard may fairly be called the American pioneer. J. K. Paine for years was practically the only university professor of music in America. The list of American composers, instructors of music, music critics, and advocates of the art who owe their musical education in large part to Harvard is evidence of the useful work done by Professor Paine in those early days. That work, however, was always done under difficulty. A score of years ago the classes in the theory of music—harmony, counterpoint, musical form, instrumentation, and the like—were conducted in a room in old Dane Hall, the building in Harvard Square once occupied, but later abandoned, by the Law School. Professor Paine's students cannot forget his explosions, partly of anger, partly of irritation, partly of humor, and partly of dismay, when, in the midst of some effort to make understandable the difficulties of fugal writing or the intricacies of an orchestral score, some countryman of Verdi's in the square would begin turning the handle of a street piano. Since those days the Music Department (or, as it is now called, the Division of Music) has grown. Instead of the single teacher, there are now two assistant professors and three instructors for some two hundred students. The classes have been delivered from Dane Hall only to be confined to the almost microscopic and ancient Holden Chapel. Now an anonymous benefactor has promised eighty thousand dollars for a new building; but he has set a condition to his gift. This is that fifty thousand dollars be raised for its maintenance. The building is

designed for the use not only of the classes in music, but also of the musical clubs—the Pierian Sodality (the oldest college orchestra in the country, possibly the oldest musical organization in the United States), the College Glee Club, the Banjo and Mandolin Club, and the Musical Club—indeed, for all the musical activities of the University. Most of the maintenance fund has been raised; but the rest, several thousand dollars, must be raised by January 1 if the gift of the building is to be secured. The effort on behalf of the raising of this fund has had the indorsement not only of the head of the Music Department, but also of such men as President Lowell, Mr. Eliot (President Emeritus), Mr. Owen Wister, and Mr. Thomas Mott Osborne. The request is modest. Compared to the amounts given for other purposes, this fund is small. The object should appeal to every one who wishes to see our universities not only making men efficient in material affairs, but also supplying them with resources of the mind and soul.

Robert Collyer

The country has lost a citizen of a noble type and the Unitarian Church one of its most distinguished ministers in the death of the Rev. Dr. Collyer, who passed away on November 30, at his home in New York City, at the fine old age of eighty-nine years. For thirty-three years he had been pastor and pastor emeritus of the Church of the Messiah in New York City. Robert Collyer was born in Yorkshire, England, the son of a blacksmith, and he learned his father's trade. Very early in life he left the anvil for the pulpit and became a local preacher in the Wesleyan or Methodist Church in England. In 1850, when he was twenty-seven years old, he came to this country, and began his American life as a mechanic or iron-worker in Pennsylvania, continuing on Sundays to preach in the Methodist Church. His theology, however, did not stand the test of the Methodism of those days, and in 1859 he moved to Chicago, where he became a regular minister of the Unitarian Church. He left the Methodist Church because, he declared, he "could not accept the doctrine of total depravity and eternal damnation." If this was a fault, it was the fault not of his head but of his heart, for Dr. Collyer was essentially a man of great-heartedness as well as of great physical strength. When, at eighty-seven years of age, he retired from the active ministry and became pastor emeritus of the Church of the Messiah, he stated with pride that he had never been ill in his life, a record which was due partly to his wonderful inherited frame and constitution, partly to the physical exercise of his early years when he worked at the forge, and partly to his temperament, which was that of great cheerfulness, good humor, kindly sympathy with all sorts and conditions of men, and to his belief in "temperance in all things," to use his own words. As a boy and young man he had little education of the book-learning kind. When he was eight years old, he worked in a cotton-mill, and in 1892, when he revisited England, he made the following statement to an English newspaper: "It had fallen to my lot to be a white slave in a factory down there in Yorkshire, where the most infernal bell ever rung called to work at six in the morning, and it kept us there until eight at night. The misery of those years cannot be told, but this was my hope, that in the New World the unborn children might not be yoked to spinning-frames at all." Dr. Collyer was greatly beloved, not only by his own congregation, but by all those citizens with whom he came into contact in his good works. He won respect and confidence, not because of his theological acumen, but because of his sweet reasonableness. Perhaps the great lesson of his life is that man can have real happiness only if he has real faith in something—faith in the universe, faith in God, faith in his fellow-men. At a birthday celebration when he was eighty-six years of age he said to his friends, "I live by faith, by as much faith as I can summon, because I cannot live without it."

The Gramercy Neighborhood Association

The work of the Gramercy Neighborhood Association of New York City should be an inspiration to other neighborhoods in other cities. This particular neighborhood extends from Fifth Avenue to the East River, and from Seventh Street to Twenty-fourth Street. Two years ago the conditions in certain parts of the neighborhood were intolerable by reason of widespread prostitution and similar evils. Young people could not attend certain schools, or even churches, in the district, without being approached. The facilities for recreation were inadequate, the control of parks and playgrounds was poor, and finally there was lack of attention to matters vitally affecting the public schools. Two years ago the

residents of this district, Protestants, Catholics, and Jews alike, met and organized the Gramercy Neighborhood Association. Its purposes are:

(1) The removal of those evils which affect the health and morality of the neighborhood.
(2) The development and support of activities for the protection, education, wholesome recreation, and promotion of health of the residents of the neighborhood.
(3) The encouragement of a spirit of co-operation, understanding, and friendliness among all the forces for good in the neighborhood.
(4) The acquisition, collection, and recording of any information in regard to neighborhood conditions that will lead to a full knowledge of its resources and needs.

The sole qualification for membership in this Association is the desire to be a good neighbor. What is it to be a good neighbor? To take a friendly interest in the things that concern the people about one—the homes, day nurseries, schools, playgrounds, streets, tenement-houses, lodging-houses, furnished rooms, pool-rooms, dance-halls, moving-picture shows. The Gramercy Association's work is specially seen in two activities. The first activity is emphasized by the cheering fact that in two years the number of women soliciting on the streets of the district north of Fourteenth Street has been reduced by ninety per cent. The second activity is the work among the children of immigrant families. Each month a hundred such families move into this neighborhood. As soon as possible after arrival they are visited and told what America offers to their children. The report adds:

They are told about the churches, the schools, the settlements, recreation centers, vacation classes, public baths, classes in English for foreigners, public libraries, and other institutions which make Americans. The importance of this particular work cannot be overestimated. Nobody ever did it before. Immigrant children have been left to find America as best they might after they reached it.

In addition, the Association has been petitioning the proper authorities to establish evening recreation centers for boys and girls separately, to establish study-rooms, and to open a broad open space bordering on the East River for Sunday baseball and for games, providing the supervision therefor. For the children the district provides fresh air excursions, camps, and outings, and vacation homes; there are playgrounds and gardens, games and children's dancing, club-rooms, and open-air concerts at many recreational centers. It has been said that a creed can never be made so short that all religious denominations can subscribe to it: but it may also be said that in such a social effort as that above described men and women of all religions may come together and gladly forget their religious differences while engaged in a common and inspired work.

A Golden Jubilee

That the graphic arts possess a comparatively recent prominence in the cultural development of this country is apparent in the fact that only during the past century have American art museums been in existence. Second among such institutions to come into being was the Buffalo Fine Arts Academy, which had its birth in 1862. This followed the Pennsylvania Academy by fifty-seven years, but it preceded the founding of both the Boston Museum and the Metropolitan Museum of New York City by seven years. Moreover, it is to the distinct credit of Buffalo that the Academy received its charter when the city was scarcely anything but a village. Thus it was a fitting allegory of the local art life that constituted the theme of the pageant enacted in commemoration of the half-century just closed. This was the Spirit of Art that has persisted throughout time from her feeblest savage expression to this day. Together with that of her devotees, her characterization was Greek, in harmony with the Albright Gallery, which is the home of the Academy. Indeed, Joseph Linden Smith, who composed and conducted the pageant, expressed the opinion that perhaps nowhere else in the country could be found so ideal a setting for a Grecian theme. Single shafts of marble compose the colonnade. A vista through two openings affords an impressive perspective, as if leading into a temple. There was built at one side a rising tier of seats to accommodate the spectators. Both platform and chairs were covered with white canvas, simulating, as nearly as possible, the seats in a Grecian theater. In the center of the scene was an altar. The performance consisted of a prologue and three acts. The prologue, which took the form of an invocation to the Spirit of Art, was a festal occasion. The solemn entrance of the priest, the pouring of libations, and the lighting of the fire lent dignity, while the decking of the altar with garlands and strewing with flowers imparted a contagious joyousness to the scene. With the departure of the priest through the portals the prologue was ended. The first act, which symbolized "The Stone

Age and the Beginning of Art," discovered in the semi-darkness the sleeping form of prehistoric man, the chief of a tribe. Near him stood a beautiful Amazonian type of woman. An ill-shapen old woman shambled through the darkness. Strange, uncouth beings crossed the scene bearing a huge animal. Then the most vital situation in the performance took place in the revelation of the first conscious art achievement. A youth entered carrying an earthen bowl which he had molded. Following him was a child, to whom the youth, personifying the First Artist, showed his rude attempt at decoration. The child examined the primitive incisings with wonder and admiration. The youth and child, however, were in advance of their age. Because the Artist would not follow the chase his fellows aroused their chief to slay him, but the woman, Beauty, intervened. The youth then took Beauty's hand. Thence, throughout the play, the opposing forces which have advanced or impeded the Spirit of Art, from darkest antiquity down to the present, governed the forward action. In the closing scene, with the fires of the East and the West brightly burning, the Spirit of Art stood enthroned on a pedestal holding out the light to future generations.

THE PATRICK CASE

About ten years ago a New York lawyer by the name of Patrick, whose standing in his profession was somewhat precarious, was accused of framing with criminal ingenuity a conspiracy to murder an aged man by the name of Rice who was living alone with his valet in an apartment-house in one of the best quarters of New York City, and by fraud and forgery to obtain possession of Rice's property, which amounted to several million dollars. The case was one of the most celebrated which had been tried in the criminal courts of New York during the last quarter of a century. It was alleged that Patrick first approached the valet, Jones, who was morally weak if not wholly vicious, and proposed a method of robbing Rice by forgery, the proceeds of which Jones should share with Patrick. Jones assented, and, having taken the first steps in this proposed fraud, put himself under the power of Patrick. Exercising this power over his weak accomplice, Patrick finally persuaded Jones to murder his employer, Rice, by placing a cone containing chloroform over his face while he was lying in bed. Jones committed the deed because Patrick had persuaded him that it was the only way by which the two accomplices could save themselves from a long term in the State's prison as forgers.

This, in brief, was the basis of the charge of murder brought against Patrick by the authorities. The Grand Jury was sufficiently convinced of the truth of the accusation to bring in an indictment. The District Attorney was sufficiently convinced of the truth of the accusation to bring the case to trial before Recorder Goff, one of the most eminent and most experienced criminal judges of the State. A jury was selected with great care and deliberation, and for six weeks in daily session the jury listened to an elaborate and detailed presentation of all the evidence. The chief witness for the prosecution was Jones, Patrick's accomplice, who had confessed and became a witness for the prosecution, either perhaps because he really repented for his share in the peculiarly foul crime and wished to assuage his remorse by making what reparation he could, or perhaps because he simply desired to escape the death penalty if possible, or perhaps from a combination of both motives. In our judgment, the authorities were not only justified in using the testimony of the self-confessed criminal, Jones, but were bound to use it in accordance with the well-recognized principle of "State's evidence," one of the greatest protections which society possesses against murderous and other criminal conspiracies. Jones appeared upon the witness-stand and told his story in simple, straightforward terms. His story was not only unshaken by the severest cross-examination, but was corroborated in the minutest particulars by a long array of witnesses of high character. Patrick refused to appear upon the witness-stand in his own defense, and also refused to let one of his counsel testify in contradiction of an allegation made in the course of the trial that he, Patrick, had made a confession of guilt to this counsel. The jury is said by all those connected with the case to have been composed of men of more than usual intelligence. One of its members was a lawyer by profession. He was not exempt from jury service in the State of New York because he was not a member of the Bar of the State of New York, but in previous practice in a neighboring State he had had exceptional opportunity to become familiar

with the weight and rules of evidence in criminal cases. With a unanimity of opinion very unusual in such cases, the jury brought in a verdict of guilty. Patrick was sentenced to death. The trial judge denied a motion for a retrial, on the ground that alleged new evidence submitted by the defense was no evidence at all. The Court of Appeals, the highest court in the State, to which the defense carried its case, also sustained the verdict and refused to grant a new trial. No stone was left unturned by the relatives of Patrick, who had large wealth at their disposal, to obtain a retrial of the case; when that effort failed, they endeavored to obtain his pardon.

The late Governor Higgins, of New York State, declined to pardon Patrick, but commuted his sentence from that of death to imprisonment for life. Governor White and Governor Hughes during their terms did not exercise any further executive clemency, although they were familiar with the history of the case. But Governor Dix, as one of the last executive acts of his term, has just pardoned Patrick, not on the ground that he is a criminal who deserves pity or who has been punished enough, but on the ground that he is innocent. And the Governor has taken this action without any consultation with Recorder Goff or with the District Attorney who originally tried the case.

If this action on the part of Governor Dix concerned simply the return to society of one condemned criminal, we should not discuss it, for the pardon is irrevocable, and nothing that we can say will affect the relations of Patrick to society. But something more is involved than the individual merits of the Patrick case. Governor Dix's action has raised the much greater question as to how the State should exercise the pardoning power in its treatment of those who are condemned to prison.

The history of the Patrick case seems to us to make it very clear that no one man, whether he be Governor of a State or President of the United States, should have vested in him, without any check or supervision, the power to pardon criminals. We do not permit the President of the United States to appoint a Justice to a seat in the Supreme Court without the supervision of the United States Senate. Is there any more reason why an executive should be empowered to set aside without some supervision the deliberate judgments of the courts? The so-called "Recall of Judicial Decisions" to be exercised by the joint action of thousands of voters on a constitutional question, after long public and intelligent debate, is considered by some publicists to be destructive of the constitutional foundation of the courts. What must such publicists think of Governor Dix's action in the Patrick case? One man, a layman at that, without debate, without any very careful investigation, without making public the grounds of his decision, has in a single act nullified the careful and painstaking procedure of the entire judicial system of the State of New York in criminal cases. He has recalled the decision of the District Attorney's office, the Grand Jury, the trial jury, the court of original jurisdiction, and the Court of Appeals. No Governor, no matter how great his intellectual equipment or how pure his motives may be, ought to have such power.

A FEDERAL COUNCIL

Very few assemblages in the history of the United States have had such latent force that can be used for the welfare of the country as that which began its sessions last week in Chicago. The meeting of the Federal Council of Churches should be distinguished from most of the great gatherings characteristic of these times. Conferences and congresses abound. There is scarcely a good cause which is not periodically promoted by some gathering of delegates representing an organization. By means of these gatherings public opinion is educated and leaders in various important movements find opportunity for mutual counsel. The meeting of the Federal Council is a gathering of that sort, but much more. It includes the deliberations of a working organization. It represents churches having a constituency of some eighteen million people, and includes practically all of the largest and most important Protestant denominational bodies. It represents these great denominations uniting for work. It has been in existence only four years. This is the second quadrennial meeting. The first, at which the Council was finally organized, was held in Philadelphia in December, 1908. The meeting at Chicago is the first at which reports will be presented concerning work actually done.

Without doubt the most important single department of the Council is the Commission on the Church and Social Service, as it is the most highly organized and most

active. Its importance is indicated by the fact that its secretary has been chosen as the acting Executive Secretary of the Council.

This pre-eminence of the Commission is as it should be. There is nothing that will bring together separated churches so certainly as a common effort to serve society, as a common effort to make the conditions under which men and women work more tolerable and more just. This is the effort which the Commission on the Church and Social Service is designed to lead. Indeed, there is no way by which the churches can serve the community as such except by uniting to serve it. During the past four years the Commission has not been devoted exclusively to the question of organization, although that has been a complicated and necessarily slow task. It has been active in the work of education, and has brought about a joint action on the part of theological seminaries for the consideration of the place which social service should take in the training of a minister. Although separate theological seminaries have made a place for social service in the curriculum, the seminaries have never before considered it together.

The Commission has also made a beginning of bringing the influence of the churches into movements for the prevention of child labor, the guidance of charities and correctional agencies, the study of labor legislation, the promotion of parks and playgrounds, and similar organized movements. It has also distributed a large amount of literature on the subject of social service. The Commission was influential in securing the enactment of the Federal law creating the Federal Commission on Industrial Relations; it has done much to promote what Mr. Frank Morrison, Secretary of the American Federation of Labor, describes as the "mingling of . . . leaders of religion with the leaders of the workingmen;" it has made an investigation of an important strike, bringing to bear in its report the principles of the religion of the churches upon the human problems of modern industry; it has helped to forward the campaign of one day of rest in the seven for all industrial workers; it has been of use in aiding the Men and Religion Forward Movement; it has made a beginning in the study of the country church in its relation to the problem of rural life. Whatever has been done by the Commission has been done by the eighteen million people who have formed this great Federation. Next week The Outlook will print an account of this meeting written by a staff correspondent.

WHY?

In The Outlook for November 23, in an editorial called "What Shall We Do with Life?" you say:

"We revere a Being who is *constantly directing* [italics my own] the life of the universe . . . a Being who directs *all* the life of the universe, from that which is manifested in a globule of water to that which is manifested in the *orderly* [italics my own] movements of uncounted . . . worlds."

Is this knowledge of the author *ex cathedra* stated, or is it mere opinion? This is Paley—pure Paley. *Audi alteram partem;* hear the other fellow.

Whether mere belief or positive cognizance of a fact, the question presents itself: Why did Mount Pelée erupt? Why tornadoes? Why tidal waves to destroy all that the animal and vegetable kingdoms have labored for years to create? Nature, with air, rain, frost, dew, sunshine, and I have co-labored for ten years to raise peaches. I did my share; nature did hers; the trees thrived and grew apace, strong and luxuriant; in the pink blossom was the promise of a bounteous yield; a killing frost, and all was over. M. F. D.

I print here only a part of your letter; the other portion I reserve for possible treatment in some future issue.

We take some things for granted. We do not think it necessary every time we refer to evolution to restate the reasons which lead us to believe in evolution; nor every time we refer to American politics to restate the reasons why we believe in a republican form of government. Nor do we think it necessary every time we refer to the creation to restate the reasons why we believe that the creation is the product of an intelligent mind.

There are many more thinkers who disbelieve in the theory of evolution and many more thinkers who disbelieve in the permanence of republican institutions than there are who disbelieve that the creation is the product of an intelligent mind. If you wish to acquaint yourself with the reasons which have led practically all students of nature to believe that there is an intelligent mind behind natural phenomena, you will find your purpose fairly well served in a recent book by a famous scientist, "The World of Life: A Manifestation of Creative Power, Directive Mind, and Ultimate Purpose," by Alfred Russel Wallace. If you have not access to this book, you will find a very brief summary of it, with some

illustrations of the arguments, in The Outlook of April 22, 1911, in an editorial entitled "The Great Architect." If you wish to see the arguments for a directive mind and ultimate purpose in creation very concisely stated, you will find such a statement in the following three possible ways of thinking of nature presented by James Martineau in his volume "A Study of Religion:"

> There are but three forms under which it is possible to think of the ultimate or immanent principle of the universe—Mind, Life, Matter: given the first, it is intellectually thought out; the second, it blindly grows; the third, it mechanically shuffles into equilibrium.

To us, as to most students, the second and third of these ways of thinking are unthinkable. They need only to be stated to be instantly rejected. We do not know of a single leading thinker of any school of philosophy who is an atheist. Ernst Haeckel is sometimes called an atheist, but he is not one; he might probably be called a pantheist.

The scientist finds in the rocks masses of arrow-heads. From these masses of arrow-heads he concludes that there were living in former times savage races possessed of intelligence, and using that intelligence to fulfill certain purposes which they had in mind. The philosophy which can see the evidence of intelligence in an Indian arrow-head, and can see no evidence of intelligence in the wing of a bird, is beyond our ability to comprehend. The wing of a bird, marvelously adapted by its mechanical structure to the purposes of flight, and marvelously adapted by its infinite gradations of color for purposes of beauty, is one of the most perfect and one of the most exquisitely artistic of organizations.

Doubtless there are phenomena in nature, such as the eruption of Mount Pelée, which it is difficult to reconcile with a benevolent purpose animating all creation. This difficulty led the Persians to believe that there were two directive minds in the universe, the one animated by benevolence, the other animated by malice. This notion of two divinities, a good one and a bad one, was borrowed from Persian theology, and has entered into and affected Christian theology. It there takes the form of a good God who is supreme, and a bad devil who is inferior.

I was once asked to deliver a graduating address before one of the theological seminaries of this country. An orthodox minister wrote to the authorities of that seminary a letter of protest. "Lyman Abbott," he said, "is little better than an atheist, because he does not believe in a personal devil." I neither believe nor disbelieve in a personal devil. History affords some illustrations of embodied spirits of men so malignant that they might not improperly be called devils; and I am not sure that there may not be in the spiritual world disembodied spirits that also may properly be called devils.

But, if it is true that there are malevolent beings, other than evil men on the earth, who interfere with the benevolent purposes of the Creator, this does not indicate that there is no Creator or that he has no benevolent purposes.

The scientist assumes that there is an intellectual order in the universe, and all his investigations and explorations are directed to find out what that intellectual order is. Science does not create either the forces or the laws of light, heat, or electricity. The scientist does not create, he discovers them. He assumes their existence and seeks to comprehend them. Similarly, the moralist assumes that there is a moral order in the universe. He does not create the laws of right and wrong; he seeks to ascertain what they are.

This assumption that there is an intelligent order in the universe involves the assumption that an intelligent being has ordered the universe; this assumption that there is a moral order in the universe involves the assumption that there is a moral being who has ordered the universe. Belief in law involves belief in a lawgiver.

I think it far easier to assume that with my finite mind I am not able to comprehend all the principles of an illimitable universe and an infinite Creator than to believe that there is no order in the illimitable universe and that it is a mere "happenstance." In other words, I think it more reasonable to assume that there are limits to my intellectual and moral wisdom than to assume that I know it all and the limitation is in the intellectual and moral wisdom of the Creator.

I can, however, see that if there were no dangers to be met there could be no development of courage; if there were no burdens to be borne there could be no development of patience; if there were no difficulties to encounter there could be no development of intelligence. If the object of the Creator is the making of peaches, the illustration of your peach orchard would be a conclusive argument against belief in his intelligence;

but if the object of the Creator is the making of men, just such exigencies as occurred in your peach orchard may serve an exceedingly useful purpose in the creation of character.

I make no attempt to solve the problem of evil. But when evils come to me I endeavor to meet them in a spirit, or, if you prefer, with a philosophy, for which I am indebted to Paul: "We glory in tribulations also: knowing that tribulation worketh patience; and patience, experience; and experience, hope: and hope maketh not ashamed; because the love of God is shed abroad in our hearts."

In my life I have rarely, if ever, found any trouble come to me that I could not make use of, if I would meet it in this spirit.

LYMAN ABBOTT.

THE PARDON OF PATRICK

A POLL OF THE PRESS

ON another page we give a résumé of the Rice murder case and the history of Albert T. Patrick, convicted of the crime, together with editorial comment upon Governor Dix's action. Here we record the newspaper opinion concerning the case, and especially concerning the pardon of Patrick by the Governor of New York State.

"Truth is stranger than fiction," exclaims the Nashville "Democrat," as it reviews the history of the man long imprisoned in Sing Sing.

The Chicago "Inter Ocean" says:

The circumstances of the case and the persistence and ingenuity of Patrick's defense, largely directed by himself, attracted National attention. The odds against which he contended may be judged from the fact that four times the date for his execution was set and that he spent over four years in the "death house" at Sing Sing awaiting the summons to the electric chair.

The Washington "Times" gives Patrick's side as follows:

Another man confessed the crime and got immunity for making the confession.

The case against Patrick was not without similarity to the charges of witchcraft, on which some centuries ago the best people were wont to burn folks to death. . . .

That the element of reasonable doubt was left in the case, despite a jury's verdict of guilt, is indicated by the fact that subsequent to the conviction, and following the development of some remarkable evidence in Patrick's favor, all but one of the surviving members of the jury joined in petitioning for pardon for the accused man.

To this the Waterbury "American" adds:

It does not seem as if a man of that kind of ability would resort to murder except under circumstances of greater temptation than existed in the case. This thought gives a sort of *prima facie* justification for executive clemency.

That clemency was at last shown by Governor Dix, who went beyond the mere liberation of the prisoner and granted him a full pardon. The paper just quoted says:

With strong belief on the part of some lawyers of high standing that Patrick is innocent, Governor Dix has done probably the right thing.

"There is no other escape quite like this," the Detroit "Journal" points out:

De la Tude and Casanova made their way to freedom through walls and barriers. King Richard Lionheart was rescued from an Austrian dungeon by the song of Blondel under the castle windows. . . .

But those were escapes by stealth and craft from implacable bars. Patrick lived in a different age. He lived in an age when the only real escape was through wit and force of wisdom. He had to fight with his brain, and in the meantime sleep and eat within a few feet of the heavy chair with burning wires.

But many other organs of public opinion resent the pardon; indeed, on the whole, the weight of journalistic opinion is adversely critical. Says the Philadelphia "Times:"

With all his shrewdness and legal resources, Patrick could not fool the judges who passed cold-bloodedly on his hair-splitting points. Every one of the several courts he tried to impress with the same arguments he used on Higgins and Dix was convinced of his guilt.

The New York "Evening Post" thus puts its objections:

First and foremost it should be borne in mind that the fact that Patrick forged the will his interest in which furnished the motive of the alleged murder has been established in a way which precludes the possibility of reasonable doubt. The judgment setting aside the forged will and establishing the older will was not only affirmed by the Appellate Division, but affirmed in language of exceptional emphasis on account of the peculiarly convincing character of the evidence. The Court of Appeals, to which the case was then taken, did not deem it necessary to file any opinion, but simply affirmed the decision of the Appellate Division.

Furthermore, it is to be noted that neither in this civil case nor in his own trial for murder

did Patrick avail himself of the privilege of taking the stand in his own defense or in his own favor. Therefore, while Patrick has not been convicted of forgery—because he has not been tried for forgery—yet so far as any opinion or any action of persons dealing with him is concerned, he must be regarded as a forger of the worst type. Whether it is desirable to grant not only liberty, but full pardon, to such a man is a question upon which it would seem unnecessary to waste any argument.

That the case against Patrick in the murder trial involved many complexities and some weaknesses must be admitted. But the jury which tried him was an unusually good one and pronounced him guilty; and, although the Court of Appeals was divided, four to three, in its refusal of a new trial, the dissent of the minority was based on grounds to which the practice of to-day would give decidedly less weight than was the case ten years ago.

"It is not the proper province of the Governor," remonstrates the "Post," "to liberate a prisoner simply because in his judgment the trial was not properly conducted," and adds:

The time for reviewing errors of that kind is past when the highest judicial tribunal has rendered its decision. The only true justifications for a pardon are, first, that the man, though guilty of the crime, has sufficiently expiated it on account of extenuating circumstances, or for other reasons; and, second, that in point of fact he is not guilty. The first is, in this case, entirely out of the question, for if Patrick was guilty as charged he was not only a murderer, but a murderer of the most cold-blooded and atrocious kind. The only question, therefore, is whether Governor Dix took his action in pursuance of such considerations as should establish in reasonable minds the fact of Patrick's innocence. That he has made an investigation of the case sufficiently searching for this purpose he gives no indication, and in granting the pardon upon any less solid ground than this he has done an act distinctly calculated to weaken the arm of the law in its dealings with the gravest crimes with which the community has to contend.

"The pardoning of Albert Patrick . . . is arousing sharp criticism," declares the Columbia, South Carolina, "State," and asks these questions:

Why is the opinion of Governor Dix more likely to be correct than is that of the jury that heard the evidence and convicted Patrick?

Why is his (Dix's) wisdom to be regarded as superior to the wisdom of the Court of Appeals that reviewed the trial below?

Is the Governor gifted with some higher penetration and power to see and to sift evidence than are the various branches of the court? . . .

Suppose that New York should elect as Governor a friend of the "gunmen" who assassinated Rosenthal . . . and the Governor pardoned the five assassins, what would or could the people of New York do?

The Springfield, Massachusetts, "Union" admits that "public opinion always has been sharply divided as to Patrick, as it usually is where circumstantial evidence in a murder case is offset by a dramatic fight for life and freedom on the defendant's part."

Governor Dix's statement in granting the pardon strikes the "Union" as "decidedly weak:"

"I trust Mr. Patrick will devote his energies to a complete vindication of his declared innocence." What proof of innocence can Patrick present at this late day that could not have been brought forth long ago? And why should an innocent man who has been imprisoned for ten years on a false charge be under obligation to devote further time and expense to the task of convincing the Commonwealth of its mistake? If the Patrick who spoke out in passionate protest against the executive action that saved him from the electric chair, but still kept him within prison walls, was the real Patrick, he will not take at all kindly to the Governor's pointed reference to a cloud that hangs heavily over the discharged convict, from which he must needs relieve himself as a reciprocatory means of setting the Governor right for his part in the affair.

"The fact that the State has kept Patrick a prisoner so long, and has given him his freedom at last by a piecemeal process without the least fragment of new evidence, taken in connection with the various stays and maneuvers by which his case was carried along, year after year, is a deplorable commentary on the shuffling and shifty manner in which justice is administered by a community that calls itself enlightened," concludes the "Union:"

Such cases as this, along with the freedom with which pardons are passed around to all classes of criminals, as by Governor Dix Wednesday, is far from encouraging to those who believe that a just and wholesome fear of punishment is one of the strongest restraining factors with the criminal and lawless.

"Governor Dix is reported as dismissing his pardon of Patrick as a 'closed incident,'" remarks the New York "Sun," and thus comments:

A great many people, including some who are possibly more familiar than he has been or can ever be with the technical and psychological bearings of the case, do not agree with the Governor. They will continue to discuss the pardon of Patrick both with regard to its effect on the general course of criminal justice and with regard to the unusual manner in which the pardoning power was exercised in this particular instance. . . .

The incident is by no means closed. It may even result in the establishment in this State of a Pardoning Board to share with the Governor the responsibility of decision in difficult cases,

and to prevent the unfortunate exercise of the pardoning power by a weak or sentimentally inclined Chief Magistrate.

To this the New York "Evening Sun" adds the following:

Has not the office of Executive clemency been perverted? Is there any need that the Governor should be compelled to serve as a court of last resort? Surely clemency was originally intended to be exercised only in those rare exceptions where facts coming late to light revealed the courts to have erred unmistakably.

The pressure of skilled and talented lawyers on the Governor makes it necessary for him to review the cases of a great number of the condemned. It amounts to raising him into a supersupreme tribunal.

One reason that blocks efforts to institute a Board of Pardons in this State may lie in the dread lest the creation of such a board should make appeals to clemency still more a matter of course.

The Buffalo "Express" thus sums up the opinions of many papers:

In pardoning Albert T. Patrick, Governor Dix suggested that there should be legislation taking the responsibility for pardons out of the hands of the Governor and vesting it entirely in the Parole Board. The idea is generally favored by criminologists. The effect would be that the granting of pardons would become more of a judicial function and would be less influenced by sympathetic and emotional appeals.

The examination of applications for pardon takes a great deal of the time of a conscientious Governor, and the duties involved in the pardoning power are often painful. The pardoning power is an old kingly function handed down from colonial times. Its exercise by a Governor does not accord with modern theories of government, particularly in a republic.

THE RAILWAYS AND THE GOVERNMENT

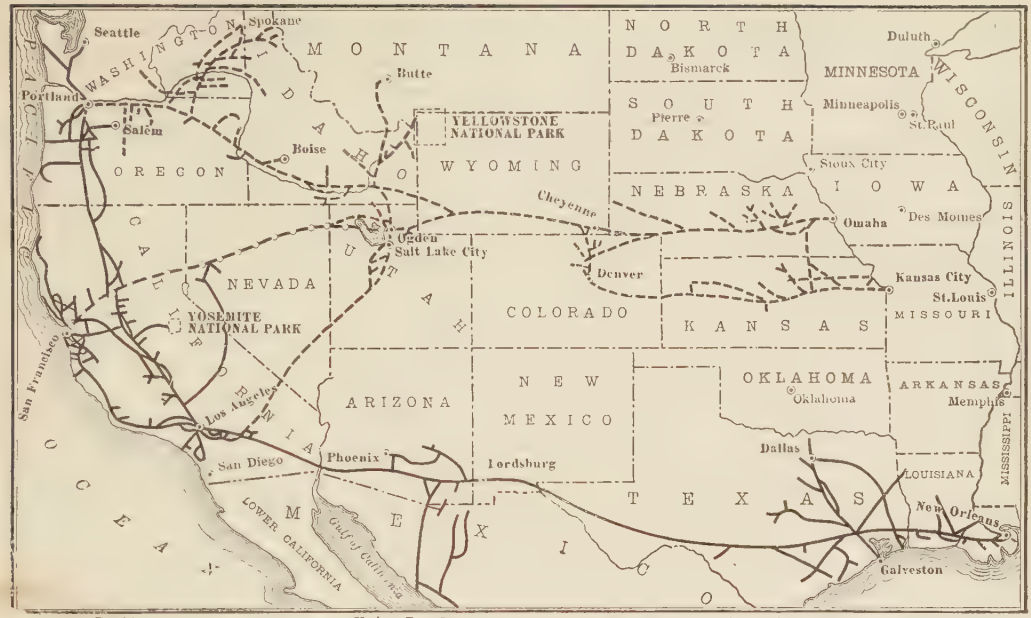
A REVIEW

EVEN the most casual observer, when he stops to think about it, must realize that there has been enormous progress made in defining the relations of the railways to Federal authority since the days of the so-called Northern Securities decision. That decision of the United States Supreme Court, handed down in 1904, pronounced the merger of the Northern Pacific Railway and the Great Northern Railway, which was actual although not nominal, to be illegal. The Court ordered a redistribution of securities with the purpose of making the separation of those two properties as actual as it was nominal. At the time, eight years ago, The Outlook expressed the opinion that the decision was to be welcomed on account of its important bearing upon the question of Federal authority over the railways. We recognized then, and we recognize now, the great value of combination in the administration and operation of railways. Combination produces economy of operation and universality of service; but before the country can have just combination it must be assured, as we then said, of effective and recognized government regulation or control of railways. The Northern Securities case preceded the Hepburn Act, which gave us the Inter-State Commerce Commission in its revitalized and existing form. In our judgment, the Northern Securities case contributed not a little to the passage of the Hepburn Act and to the establishment, not only in our structure of government but in the public mind, of the principle of Federal regulation of railways. The decision of the Supreme Court regarding the merger of what are popularly known as the Harriman lines, namely, the Southern Pacific, Union Pacific, and Central Pacific Railways, is a case in point. The facts regarding this interesting decision are as follows:

THE UNION PACIFIC MERGER

Last week the United States Supreme Court handed down a notable decision. Indeed, nothing so important affecting transportation has come from that body since the Northern Securities decision. The case was that of the Union Pacific merger. As will be seen by the accompanying map, the Union Pacific Railway runs from Omaha and Kansas City to Ogden, Utah, and thence, instead of proceeding directly to the coast at San Francisco, branches northwest and southeast and reaches the coast at two very widely separated points, Portland, Oregon, and Los Angeles, California. The Central Pacific, however, runs directly west from Ogden to San Francisco. The Southern Pacific runs from New Orleans by way of Los Angeles and San Francisco to Portland.

The late Edward H. Harriman, as head of the Union Pacific system, wanted to control



RAILWAY LINES AFFECTED BY THE UNION PACIFIC MERGER

if it

the Central Pacific and Southern Pacific, just as he wanted to dominate every possible railway. But he wanted the Central Pacific more than any other, so that he could get the most direct outlet to the ocean. It was to the public's advantage as well as to the Union Pacific's that this control should be secured. Now the Southern Pacific had acquired control of the Central Pacific. Hence, to get the Central Pacific, as his offer to buy it directly had been refused, in 1901 Mr. Harriman bought for the Union Pacific a controlling amount of Southern Pacific stock. In 1907 the Inter-State Commerce Commission made a report concerning this combination as to the charges that, though the roads were at some points a thousand miles apart, there was suppression of competition. A year later, in the Roosevelt Administration, the Federal Government began a suit against the merger, on the ground that the Union Pacific and Southern Pacific were really competing lines. The Federal Circuit Court found that they were not, and hence that their combination did not violate the Sherman Anti-Trust Act. An appeal was taken to the Supreme Court. It has now unanimously reversed the lower Court's decision.

The decision holds that the Union Pacific and Southern Pacific, prior to their merger, were active competitors engaged in inter-State commerce, acting independently as to a large amount of their respective carrying trade, and that since the combination competition has been suppressed. The combination is thus in restraint of commerce and is within the prohibitions of the Sherman Law. But this is not all. Even were there no overt act, the very scope of such combinations and their power to suppress and to stifle competition or to create monopoly would determine that the law should be applied. Thus the principle of the Northern Securities decision is extended to the present case. Accordingly to enforce the law the Court orders the dissolution of the Union Pacific merger.

But this is only part of the Supreme Court's decision. While it declares as illegal the Union Pacific's ownership of the Southern Pacific, its ownership of the Central Pacific is not so regarded. The Court thinks it legitimate that the Union Pacific should try to get the Central Pacific as a natural and necessary outlet to the coast. Hence, while the Court decrees that the Union Pacific must surrender its Southern Pacific stock holdings, it invites the Union Pacific to submit a plan for separating the Central Pacific from the Southern Pacific, so as to secure the outlet to the coast. This part of the decision was welcomed by those who had been associated with Mr. Harriman. They declared that it was a vic-

tory for him in his wish to secure a through route. This is doubtless true. It is a victory. But the decision is even more significant in another direction. For it again puts the Supreme Court on record as declaring that any corporation designed to throttle competition cannot be allowed to exist under the law. Thus, as upholding the "under dog's rights," the decision may perhaps be held to concern life, as do tenement-house decisions, for instance. Finally, the Union Pacific decision justifies the position, often taken in The Outlook, that we must have either Government regulation or Government ownership of our railways. Anything that emphasizes regulation halts the progress of Socialism, but Government ownership of railways might accentuate its advance.

THE CASE OF THE NEW HAVEN ROAD

A second event of great public interest and industrial importance in the history of the recent relations of the railways to the Government is found in the proceedings which are now being taken by the Department of Justice against the New York, New Haven, and Hartford Company on the ground that it is a combination unjustly restraining trade and is therefore an unlawful combination. What is the history of the New York, New Haven, and Hartford Company? Briefly this: Thirty or forty years ago the steam railways operating in New England were about as numerous, about as unrelated, and about as variable in their quality as the public hacks or cabs at the steamship docks in New York used to be before the days of regulation by municipal ordinance. South and west of Boston there were the New York and New Haven, the New Haven, Hartford and Springfield, the Boston and Providence, the Old Colony, and the Boston and Albany Railway. North and west of Boston there were the Boston and Lowell, the Boston and Maine, the Eastern, the Maine Central, the Fitchburg, and possibly one or two other railways. The traffic was irregular, the connections were often poor, and the inconveniences and expense to the passenger were very great. At New London, for example, the river was crossed in a ferryboat before the days of the modern railway bridge. From Boston to Portland there were two almost parallel lines, called the Boston and Maine and the Eastern, on which competing trains sometimes actually raced. The safety, as far as passengers were concerned, was not wholly unlike that which prevailed on the Mississippi River in the days before the war, when Negroes sat upon the safety-valves of racing passenger packets until one or the other of the boats exploded their boilers. The writer of these lines well remembers the journeys which he took from New York forty years ago as a boy to the home of his grandfather in Franklin County, Maine. He got aboard an antiquated passenger car at the New York and Harlem station, which then stood at the site of the present Madison Square Garden, and was hauled by four or six horses up Fourth Avenue to the present site of the Grand Central Station, then in the outskirts of the city, where the engine was attached, and he probably got as far as New Haven without changing cars. Taking another train there, he was carried to New London; at New London he got out and boarded a ferryboat; on the farther side of the river he entered a new train and pursued his journey to Providence. Sometimes there was a change at Providence, but he eventually arrived at Boston. After spending the night in Boston he took a train the next morning for Portland, over either the old Boston and Maine or the Eastern Railway, whichever happened to be at the time, in the judgment of his parents, the least dangerous to life and limb.

The stations at Boston were alongside one another and the trains pulled out at the same hour, and there was always considerable interest among the passengers as to which train would reach North Berwick, where these two single-track roads crossed one another, first. North Berwick was the most important station on the entire route for the young traveler, for at this point was a railway restaurant famous for its sponge-cake and Washington pie—joyous advantages of the competitive system of railway travel which, alas! have been obliterated by the ruthless hand of combination. Arriving at Portland, the traveler took another train to Lewiston, and there, after some waiting, boarded the final train for his destination in Franklin County, hauled by an old-fashioned, wood-burning locomotive over the Androscoggin Railway. This is a real, even if a somewhat impressionistic, picture of the conditions of travel under competition forty years ago in New England; and if a dry goods box or a ton of coal could speak, it would probably tell the same story.

The New York and New Haven road began the era of combination south and east of Boston, and, absorbing practically every railway line in that region except the Boston and Albany, became known as the Consolidated Road. The Boston and Maine, which was originally a single-track road running from Boston to Portland, began the work of consolidation in northern and eastern New England, and finally controlled, either actually or nominally, every steam railway in that region. Twenty-five years ago Mr. Mellen, the President of the Consolidated Road, and in our judgment one of the most forceful, constructive, and able railway men in the country, conceived the idea of combining the entire transportation system in New England—steamboats, steam railways, and trolley lines—in one great combination. He first acquired some of the steamers and trolley lines, and recently obtained the Consolidated Boston and Maine; thus the New York, New Haven, and Hartford Railroad Company now is the practical dictator, if it is not the practical owner, of the whole industry of transportation in New England.

The volume of complaints against this dictatorship has recently been growing until it has culminated in the accusation that the New York, New Haven, and Hartford Company has prevented, either by force or by cajolery, the Grand Trunk Railway of Canada from building a competing line to Providence, Rhode Island. The Grand Trunk has for many years been endeavoring to get a terminal in a New England seaport free from ice in the winter so that it could compete with the railways of the United States in transcontinental export traffic. A Federal Grand Jury is now considering whether the relations of the New Haven road to the Grand Trunk road, and the alleged acts of competition-stifling which have resulted from the New Haven, Boston, Maine merger, justify the Government in proceeding against the New Haven road as an unlawful combination in restraint of trade.

Those who advocate the breaking up of the New Haven road into its component parts as a remedy for the selfish and discriminatory combination point to the judgment of the Supreme Court in the Union Pacific case, reviewed above, as a ground for their belief that the Government will take judicial action against the New York, New Haven, and Hartford. If the people of the United States were to go back to the conditions which prevailed in the days of unlimited competition, briefly outlined in this article, there would be a general rebellion in less than sixty days. The history of the Northern Securitites case, the Union Pacific case, and the New York, New Haven, and Hartford case, confirms us in our belief that what the people of the United States desire and what they need in the gigantic industry of transportation is not free competition, but efficient combination under strict and unhesitating Government regulation.

We have spoken in this article a word of praise for Mr. Mellen. We think he deserves it, but we also think he deserves criticism. We think that in his desire, highly commendable within certain limits, to maintain the investment value of the stock and bonds of his road, he has sometimes, if not often, waved aside the legitimate rights and demands of shippers, travelers, and consumers. But the way to correct any wrong that Mr. Mellen has committed is not to weaken him or decrease his efficiency, but to have the Government tell him what he may do and what he may not do in the administration of the railways intrusted to his care. We should not object if the steam railway transportation industry of the United States were concentrated in the six or eight great systems or combinations, provided the people of the country would see to it that their Government was made strong enough to regulate and control those systems. When we are told that this would tend to inevitable Government ownership of railways, we say that, if regulated combination cannot be made successful, as we believe it can, then we will accept Government ownership of railways. We shall never cease to protest against going back to the ill-regulated, inconvenient, and economically wasteful method of free competition which prevailed among the railways of the United States from twenty-five to forty years ago.

THE RAILWAYS, THE MAILS, AND THE EXPRESS COMPANIES

There are one or two other incidents in recent railway history that show that the Federal regulation of inter-State commerce can be made a success. Carrying of the mail is inter-State commerce of a most important kind. A committee of responsible officials representing nine great American railways—including the Atchison, the New York Central, the New Haven, the Pennsylvania, and the Southern Pacific systems—

has issued a statement in the form of a pamphlet in which they claim that the steam railways of the country are insufficiently paid for carrying United States mail. This pamphlet is intended to be not merely a statement to the Postmaster-General and an appeal to Congress, but to be an appeal to that greatest of American courts—the court of public opinion. It is clearly written and easily understood. Without endeavoring to report every argument of the committee, we restate here the most striking of their contentions. They assert that the inauguration of the parcels post on January 1 next will greatly increase the cost of carrying the mails without any compensation for the loss on the express business which will follow; they say that instead of being overpaid the railways carry the United States mails at an actual loss when the mail-bags are charged their proper share of operating expenses and taxes. The rates for carrying the mail are now determined by weighing the mail in a given month, once every four years. This is called the quadrennial weighing. The present rates were based upon the business of November, 1909. The committee ask for annual weighing, and assert that the month of November never represents a fair average of the amount of business. There appears to be justice on the face of their claim for annual weighing. They point out that the pay of the railways has dropped from thirty-four dollars out of every hundred dollars of Post-Office receipts in 1901 to twenty-one dollars out of every hundred dollars of Post-Office receipts in 1911. This, however, may indicate, it seems to us, that the Post-Office in paying the railways thirty-four per cent of its gross receipts in 1901 was paying too much, rather than that it is paying too little in giving the railways twenty-one per cent of its gross receipts in 1911. They point out that railway wages have very greatly increased without a corresponding increase in payment from the Government for carrying the mail. In other words, the claim of this Committee on Railway Mail Pay is that the Post-Office is not sharing with the railways the general increased cost of living.

This is the same claim which has been made recently by the railways for permission from the Inter-State Commerce Commission to increase freight rates, and for permission from the Board of Arbitration to decline to increase wages. No doubt the railways of the United States have felt with all its individual citizens the increased cost of living. In our judgment, some expert and impartial body must determine at what points the railways must meet this increased cost of living by increasing their income and at what points by reducing their expenditures. Such a body exists in the Inter-State Commerce Commission. We wish it were possible in some way for Congress to refer the request of the railways for increased mail rates to the Inter-State Commerce Commission. Ten or a dozen years ago it was accepted as a fact that the railways were overpaid because of the subtle influences which they exercised at that time upon certain types of Senators and Congressmen.

It is a wholesome sign of the growth of intelligence and sound public opinion in this country to have such a body as the Committee on Railway Mail Pay appealing in this frank and straightforward manner to Congress and the public. What can be done by an administrative department of the Government like the Inter-State Commerce Commission is illustrated by the reform in the express business. The great express companies of this country are so interrelated with the railway companies that they may be said to be appendages of the railways. Everybody is familiar with the complaints about the express business, which have been loud and persistent for many years. Finally the Inter-State Commerce Commission took action; rates have been regulated, and a system of simple official stamps, already described in these pages, has been devised by the Inter-State Commerce Commission which the express companies must affix to all packages and parcels, showing plainly whether the charges are "prepaid" or "collect." The Adams, United States, American, and Wells Fargo express companies are now advertising these labels in the daily press as being great improvements in their business, under the expressive headline (no pun intended) "EXPRESS LABELS THAT PROTECT YOU," and frankly giving credit to the Inter-State Commerce Commission for the improvement. In a recent public address Mr. Walker D. Hines, a lawyer of New York who has a National reputation as a railway expert, and who is of counsel for some of the express companies as well as for one of the greatest railway systems of the country, paid a specific tribute to the efficiency of the Inter-State Commerce Commission in origi-

nating some of the reforms of the express business which have just been put into operation.

The special point which we wish to make in conclusion is that the present attitude of the Federal Government to the railways, and of the railways and the express companies to the Inter-State Commerce Commission, as we have briefly endeavored to portray it in the foregoing review, clearly indicates that the policy of regulated combination is recognized both by the public on the one hand, and by the railway managers on the other, as practical, and as capable of being carried out in a way to promote both public justice and legitimate business success.

ALBERT K. SMILEY

BY LYMAN ABBOTT

MR. ALBERT K. SMILEY died at his winter home in southern California last week, in the eighty-fifth year of his age. His death brings to its close a life of rare usefulness, characterized by unique achievements, accomplished by a man who combined great gentleness with great force of character, and great generosity of spirit with great business efficiency.

About twenty-five miles south of the Catskills, in New York State, lies what the New Yorker calls a mountain range, but what residents in the Rockies would call hills—a range which attains an elevation of from 1,500 to 2,000 feet. But mountain beauty of scenery is not dependent upon mere size, and in this range of hills are romantic beauties not essentially different from those which one may see in the White Mountains of New England or in the Rockies of the far West. On this Shawangunk range, about twenty-five miles from Poughkeepsie, is a crystal lake perhaps three-quarters of a mile long by one quarter of a mile wide. From one shore of this lake the mountain rises in a precipitous cliff over two hundred feet high; from the other side it slopes away in a series of gradual though broken ascents to a greater elevation some seven miles distant.

On the shore of this lake, in a spot of peculiar mountain beauty, there was in the sixties what the French would call a *cabaret*—a little inn of unsavory reputation. Local prejudice sometimes gives a house a bad name without justification; but, if local prejudice did not misrepresent the facts, this little inn was frequented by men who, under pretense of fishing where there were few fish, and hunting where there was little game, went to get rid of the restraints of civilized society, that they might drink and gamble without criticism. Mr. Alfred H. Smiley either visited or resided—I am not certain which—in Poughkeepsie at the time, heard of the beauty of this spot or chanced upon it in driving over the mountains, and urged his brother, Albert K., to visit the place with him. Albert K. was at the time the proprietor of a then famous school in Providence, Rhode Island, to which, by his executive and scholarly ability, he had given a far more than local reputation. He yielded reluctantly to his brother's persuasions, was captured, as his brother had been, by the beauty of the spot, purchased the lake, the inn, and land enough about it to furnish moderate grounds for a modest hotel. This was in 1869. In 1871 I was editor of the "Illustrated Christian Weekly," and when I visited the spot I found here a summer home, containing about forty guests, characterized by scrupulous neatness, an air of repose, and a homelikeness not often found in any American summer resort. I was so fascinated by the place that the following year I revisited it with an artist, and the illustrations published in the "Illustrated Christian Weekly" served for a time a useful purpose in the descriptive booklet printed by the brothers Smiley.

From this small beginning the Lake Mohonk House has grown to a summer hotel capable of accommodating over four hundred guests. More than fifty miles of mountain drives have been laid out on these grounds, besides innumerable foot-paths. Some of these roads required for their construction no mean degree of engineering skill. Mr. Albert K. Smiley presently sold his school in Providence and came to make Lake Mohonk his home, while his brother,

Alfred H., bought another site on a larger lake seven miles away; and the two estates have so grown in size that now, we believe, they are actually contiguous.

But in this growth the house lost nothing of its original character. It remained a home. The brothers Smiley were twins. They looked so much alike that until the last five years of Mr. Alfred Smiley's life even their intimate friends sometimes mistook one for the other, and no one but an intimate friend could always tell them apart, even when they were together. Nor was this resemblance one of features only; they were singularly alike in character. They were Friends, not merely in a churchly but in a personal sense. They loved their fellow-men, loved nature, loved peace, loved the quiet and the simple life, and loved to be "near to nature's heart;" and they both had from the first the belief that there were in the Eastern States of America a considerable number of people who shared this spirit with them—people who did not wish to make the sole change in their life a transfer from dancing in a ball-room in the city to dancing in a hotel parlor in the country; from bridge whist in their homes to bridge whist in the parlors of a summer resort; people who loved nature, loved the trees and the flowers, the rocks, the mountains, the lakes, the birds; people who wished a simple life without the discomforts and inconveniences which roughing it in a camp life formerly involved.

From the first, therefore, there was in this hotel no bar, no liquor sold or allowed in the dining-room, no cards, no dancing in the parlors, no billiard-room, no hotel band discoursing music. From the first, however, there were substitutes: in the reading-room, which gradually developed into a library of considerable size; in walks and drives that grew in extent with the growing clientele of the hotel. From the first guests were not received on Sunday, nor was any provision made for their departure. Thus not only were the guests sure of a Sabbath quiet, but the horses and the stablemen had their day of rest, which partly accounts for the excellent condition of both at the end of the season. Every morning the guests who wished to do so assembled for morning prayers, at first in the parlor; later, when the hotel grew to its present dimensions, in an assembly-room which served the purpose of parlor, recreation-room, and chapel. Morning prayers in a hotel with four hundred guests will seem to the ordinary reader something of an incongruity; but to the guest of Mr. Smiley it did not so seem, for to the last his hotel was a home, his guests were his personal friends, and until the constant coming and going made the practice impossible, he was accustomed to greet his guests on their arrival and bid them good-by on their departure. Their experience proved that the brothers Smiley were not mistaken in their surmise. Mr. Albert K. Smiley took a pardonable pride in the fact that no summer hotel in America opened its doors earlier in the season or was later in the fall in closing them upon departing guests.

This was possibly partly due to the two conferences which he initiated, one in the fall, begun in 1879, the other in the spring, begun in 1894.

In 1879 Helen Hunt had not written her "Century of Dishonor" (published in 1881) nor her "Ramona" (published in The Outlook in 1884). The Indian was out of sight and out of mind. Eastern sentimentalists pictured him as a child of nature, the noble Red Man of Cooper's novels. The Western frontiersman knew him chiefly through Indian wars or through Indian vagabondage. With him "The only good Indian is a dead Indian" was a favorite saying. The Indians, herded together on reservations without any of the developing influences of civilization except such as the sporadic efforts of mission churches and mission schools might afford, were acquiring the vices far more than the virtues of modern American life. Mr. Smiley conceived the idea that if he could bring together a variety of men who would look at the Indian problem from a great variety of points of view, he might evolve out of their interchange of opinions a common policy. So the first Indian Conference was called in 1879. It included Government agents, Eastern philanthropists, educators, missionaries, representatives of the army, theorists from the closet, practical workers from the field. The morning and evening hours were devoted to free discussion; the afternoons to drives and walks. The facts that all the members of the Conference were personal guests of Mr. Smiley, that in his invitations he carefully excluded both men with axes to grind and men with patent ideas to ventilate, that they were invited into an atmosphere of peace and good will which made the hotel a home, and that the morning sessions immediately followed the brief morning prayers and in the same room, prevented the debates,

which were often very earnest, from ever becoming bitter. There is no space here to trace the history of this Conference in detail. It is enough to say that, in my judgment, it has done more to bring the century of dishonor to an end, more to initiate an honest and consistent Indian policy in our country, more to break up the disastrous reservation system, to put an end to Indian wars, and to bring about a consistent system of Indian education—in brief, more to create a consistent policy of treating the Indian as we treat the immigrant from foreign shores—than all other influences combined. As the Indian problem retreated into the background and the colonial problem came to the front, the Conference was enlarged to include, with a consideration of the Nation's duties to the Indian, a consideration of its duties to other dependent peoples. The same spirit has characterized the enlarged Conference, and something of the same results have followed from it.

In the spring of 1894 Mr. Smiley called at Lake Mohonk an International Arbitration Conference. Though a Friend, Mr. Smiley was not a "peace at any price" advocate. He believed that both an adequate navy and an adequate army are required for national protection in the present stage of civilization. It was characteristic of his breadth of view and his ability as a harmonizer that in each one of these Conferences —we think without any exception—representatives of both the army and the navy have been present and have taken active part, but always as advocates of peace if possible, always representing war as a last resort. In 1894, four years before the now famous Hague Peace Conference, the Lake Mohonk International Arbitration Conference discussed the possibility of substituting an appeal to reason for the appeal to force, and formulated a plan for the organization of a permanent Supreme Court of the Nations, which should do for all peoples what the Supreme Court of the United States does for the peoples of the various States in the Union.

What Mr. Smiley has been the means of accomplishing in a quiet way for America by the contribution of Lake Mohonk House to the Indian problem, and to the world by its contribution to world peace, can never be properly estimated, and yet I doubt whether both these services combined count for as much as what he and his wife have accomplished for the life of their guests by the home which has been opened to them and by the spirit which has pervaded it.

In Mr. Smiley were combined in a remarkable degree the spirit of peace and good will with great force of character, and the spirit of devotion with great catholicity. This combination of devotion and catholicity is illustrated by the fact that at the morning prayers at Lake Mohonk he sometimes himself read the prayer from a book of prayers, sometimes called on clergymen who were present to officiate, and in so doing disregarded all denominational distinctions. I have united in the devotions of this family gathering, led on one day by a Unitarian clergyman, led on another by a Roman Catholic cardinal.

Mr. Smiley's combination of pacific spirit with force of character is illustrated by two instances in his administration, both authentic, with which this perhaps too prolonged sketch must be brought to its close.

A guest resolved to set at defiance the unwritten but common law of the house against the serving of wine in the dining-room, and brought his bottle with him to the table. Mr. Smiley said nothing, waited until the dinner was over, and then quietly sent the guest his bill and with it a notice that his room would be required that afternoon; and the guest departed in a great rage. Another, a multi-millionaire, accustomed to having his will regarded as law, disregarded the sign placed at every entrance to the grounds, "No automobiles allowed," and drove up with a large party to the hotel door in his touring car. Mr. Smiley was notified, met the lordly gentleman, told him, with that quiet vigor which those who know Mr. Smiley can well imagine, that he would rather have lost $100 than have seen this automobile in his grounds, directed the chauffeur to take the car to the public road at once, and, after his guests had been served with the luncheon which they wished, returned them to the car in carriages from his own stables, a charge for which was included in the bill. A gentle spirit and a firm will are not inconsistent.

Mr. Smiley's wife shared with her husband in the ministry which imbued the hotel with the spirit of the home until ill health laid her aside from the public life of the house. The hotel will be carried on by a younger brother, who, with his wife, there is every reason to believe, will maintain in it the same spirit and enable it to continue the same public service.

IS JAPAN PERSECUTING CHRISTIANS IN KOREA?

BY GEORGE KENNAN

A new trial of the one hundred and six Koreans charged with conspiring against the life of Viscount Terauchi, Japanese Governor-General of Korea, is now going on in Japan, and the question as to whether they received aid or advice from foreign missionaries has been touched upon in the testimony. Mr. Kennan's careful study of the history of this case as it appeared upon the first trial is therefore of special and timely significance.—THE EDITORS.

CRIMINAL trials in Far Eastern courts, and especially trials in which the lives and property of foreigners are not directly involved, seldom excite much interest in other parts of the world. Chinese or Japanese by the score may be tried in Peking or Tokyo, and may be sentenced to imprisonment, or even to death, without attracting much attention outside the countries where the crimes were committed. A noteworthy exception to this general rule, however, is furnished by the recent trial of one hundred and twenty-three Koreans in the local court of Seoul upon the charge of entering into a conspiracy to assassinate the Japanese Governor-General, Viscount Terauchi. This particular trial excited unusual interest, not only in the East, but in the West, and was more or less fully reported in the newspapers of Shanghai, Tokyo, St. Petersburg, London, and New York. A partial explanation of this general interest in the Korean conspiracy case is to be found in its relation to the Christian religion. Many of the alleged conspirators were Christian converts, and the foreign missionaries to whose churches they belonged, or in whose schools they had been educated, naturally regarded them with sympathy and believed in their innocence. Through some of these missionaries and their correspondents the case was brought to public attention in the West, and there it soon became, not only a subject of discussion in religious circles, but a basis for the charge that the Japanese Government is showing a spirit of religious intolerance in Korea, and is manifesting a disposition to oppose Christian missions and Christian work in that part of the Empire.

The first trial lately came to an end, and it may be proper to give a brief résumé of it, with a view to ascertaining, if possible, the justice or injustice of the charges made against the Japanese in connection with it. The case of the Government, as presented by Mr. Matsudera, Chief Procurator for the Crown, is as follows:

Early in January, 1912, the Japanese police, while investigating a case of common robbery in central Korea, accidentally discovered facts which seemed to indicate that a Korean patriotic society known as the Sinmin Hoi was encouraging and promoting the assassination of Japanese officials. The particular crime then under investigation proved to be political rather than mercenary in its nature, and some of the arrested bandits confessed that the object of their robbery was not to enrich themselves, but to get funds for the Sinmin Society by means of what the Russian terrorists call "forcible expropriation." Following up promptly the clues that they obtained from the Lapchongchyong bandits, the police not only came upon what seemed to be proofs of conspirative and seditious activity among the Christian converts in Syonchon, Pyengyang, and other centers of missionary work, but gradually obtained evidence to show that the Sinmin society had long been advocating and promoting the murder of Japanese officials, and that it or its sympathizers had brought about the assassination of Mr. D. W. Stevens in San Francisco and of Prince Ito in Harbin; had attempted the assassination of the Korean Premier, Yi Wang-yong, in Seoul; and had killed 926 members of the Il Chin Hoi (a Korean society friendly to the Japanese) in various parts of the peninsula. Guided by confessions of the prisoners already in custody, the police in the early part of 1912 made a large number of additional arrests, and at the end of the preliminary inquiry, in April, they had examined hundreds of suspects, had taken thirty-five volumes of testimony, and had obtained what seemed to be conclusive proof of the existence of a plot to assassinate Governor-General Terauchi when he went to New Wiju in December, 1911, to be present at the opening of the Yalu River bridge.

The number of prisoners finally held for trial on the conspiracy charge was 123, including Baron Yun Chiho, who had been a vice-minister in the Korean Cabinet under the old régime; Major Lyu Tongsol, a Korean army officer who had been decorated by the Japanese Emperor with the insignia of the Rising Sun for services rendered during the Russo-Japanese War; and Yang Keuitaik, a journalist of Seoul, who had been associated with E. T. Bethell in the editorial management of the Korea "Daily News." Most of the other prisoners were school-teachers, students, preachers, farmers, or small manufacturers, and an overwhelming majority of them were professed Christians. They were all arraigned before Presiding Judge Tsukahara, in the Seoul local court, on the 28th of June of the present year. The doors of the court-room were open to the public: there was a fair attendance of missionaries and friends; and the accused were defended by sixteen lawyers. All of the prisoners pleaded not guilty.

The trial, which was conducted in accordance with the Japanese code of criminal procedure, lasted about two months, and was, in the main, a detailed examination of the accused, by the presiding judge, on the basis of the testimony given by them when they were first interrogated at police headquarters. The Japanese authorities assert that in the preliminary inquiry all of the prisoners made full confession; and that they again confessed when they were questioned by the chief procurator. In open court, however, they repudiated their previous statements, and most of them declared that the so-called confessions had been extorted from them by means of torture.

In the investigation at police headquarters some of the prisoners declared that they had received aid or encouragement from the American missionaries, and, when they were re-examined on these statements by the presiding judge, the names of the missionaries were brought out in open court. They included such men as Bishop McKim, of the Protestant Episcopal Church; Bishop Harris, of the Methodist Episcopal Church in Japan and Korea; the Rev. G. S. McCune; the Rev. S. A. Moffett, of California; Dr. J. Hunter Wells, of Oregon; the Rev. William M. Baird, of Indiana; and a number of other Christian clergymen of the highest and purest character. Of course no one believed for a moment that these gentlemen had ever given the slightest encouragement to the alleged assassins, or that they had had any knowledge whatever of the alleged aims of the Sinmin society. In open court the prisoners themselves acquitted the missionaries of knowledge, participation, or encouragement, and declared that the police had forced them, by torture, to accuse the clergymen named, and to charge the latter with participation.

When the Court had finished its examination of the prisoners, on the basis of the testimony taken in the preliminary inquiry, Mr. Ogawa, counsel for Baron Yun Chiho, said to the presiding judge that the decision of the case would apparently depend largely upon the question whether or not the alleged confessions of the accused had been extorted by torture. He therefore asked the Court to further investigate that question by calling police inspectors Kunitomo and Watanabe as witnesses. He also expressed the hope that the Rev. Mr. Moffett and the Rev. Mr. McCune, whose names had been mentioned so frequently in the course of the trial, would be allowed to take the stand and testify concerning matters referred to in the alleged confessions. Counsel for other prisoners joined in this request, and the prisoners themselves named a large number of witnesses whom they desired to have called. After listening to an argument by Assistant Procurator Sakai in opposition to the petitions of the accused and their counsel, the Court decided not to summon the witnesses named. Mr. Ogawa, acting in behalf of his associates, then filed a written motion for "refusal of the judges" (a change in the composition of the court), on the ground of error in the denial of the request to summon witnesses. This motion was overruled, and counsel for the defense gave notice of an appeal to be based on this point.

When, after an intermission, the court reassembled in August, long arguments were made by the chief procurator, by counsel for the defense, and by some of the prisoners themselves in support of their respective contentions. The chief procurator emphatically denied that the accused had been subjected to torture, and declared that physicians who had been directed to make an examination of their bodies failed to discover any signs whatever of ill treatment. He therefore asked the Court to find the prisoners guilty, on the evidence furnished by their own statements, which were comprised in the thirty-five volumes of testimony taken in the

preliminary inquiry, and which were corroborated, at least in part, by the discovery of weapons in the places where the accused said they had been hidden.

The final judgment of the Court was rendered on the 28th of September, in the presence of a large number of foreigners, among whom were a number of ladies, the French Consul, and the representatives of the New York "Herald" and the Associated Press. Seventeen of the prisoners were acquitted, for lack of conclusive evidence against them; but one hundred and six were found guilty, and were sentenced to five years, seven years, or ten years of penal servitude. Among the five men included in the heaviest sentence were Baron Yun Chiho, Major Lyu Tongsol, and Yang Keuitaik. Never before, so far as I know, had a Japanese court condemned to penal servitude a vice-minister who had been ennobled by the Japanese Sovereign, and an army officer who had been decorated by Imperial command with the insignia of the Rising Sun.

The trial of the accused, as above outlined, raises three important questions:

1. Were the prisoners tortured?
2. Did they have a fair trial?
3. Is the Japanese Government hostile to Christian missions and Christian work in the Korean peninsula?

Before considering these questions, it seems necessary to refer to a few of the misrepresentations and misstatements that have been made, in Japan and in the United States, in prejudgment of the case. Long before the trial began a weekly religious newspaper in New York stated, upon the authority of letters written by missionaries to their friends in America, that the number of native Christians then imprisoned in Korean jails was six thousand. This statement, although apparently made in good faith, was a flagrant misrepresentation of the facts. Not more than one thousand persons were arrested in all, and most of them were released after the preliminary examination. In the late spring or early summer, when Viscount Terauchi made a personal examination, the number in custody was 287, and of these only 151 were Christian converts.

The New York weekly newspaper further stated that "the religious persecution in Korea was marked by cruelties comparable to the rigors of mediæval inquisitions," and that "the real impulse to the terrific dragonade was a fierce aversion to Christianity, and a determination to stamp out the Church in the province of Chosen." These assertions also were wholly without foundation in fact, and were apparently the reckless expression of heated partisan feeling. In the official statement to which I have already referred, Viscount Terauchi explicitly and emphatically said: "Neither with the power, desire, wish, connivance, nor sanction of the Government, has any person or persons been prosecuted or persecuted on account of any religious views, beliefs, or practices whatsoever."

The religious weekly that made the above-quoted assertions acquitted Governor-General Terauchi of responsibility for the "fierce dragonade" by saying that "he is not really in power in Korea. The whole civil administration is completely overshadowed by the military establishment, at the head of which stands General Akashi. He and all his officers are typical exponents of the military party, which, in Japan as well as in Korea, is known to be heartily opposed to the whole Christian propaganda."

Every one of these statements and implications is erroneous and misleading. Viscount Terauchi, by virtue of the Imperial Rescript of 1910, was put in command of the whole "military establishment" of Korea; and any one who has had even the most casual acquaintance with Japan's great War Minister knows that he is not at all likely to be "overshadowed" or deprived of power by anybody, and least of all by General Akashi, who, instead of being at the head of the military establishment, is merely the chief of the Police Department. Finally, there is no "military party," either in Japan or in Korea, that is "heartily opposed to the whole Christian propaganda."

A leading daily newspaper of New York recently published in its Sunday editions a series of anonymous letters from a Far Eastern correspondent who described himself as a German subject expelled from Korea by Governor-General Terauchi on account of his sympathy with the oppressed and cruelly treated people of that country. He dates his first letter "On Board Steamship Ping Yang from Chemulpo;" describes his harrowing experience in the "Pelang coast country;" gives the substance of an interview that he had with "Colonel Y. Sudu, commander of the land forces at Chemulpo;" tells a pathetic story of an old Korean who had been robbed of his property and deprived of his daughters by the Japanese authorities

at "Ta-he-lo;" and paints a lurid picture of the "terrific dragonade" to which the unfortunate Korean Christians have been subjected since the annexation. The paper containing the correspondent's first letter has recently reached Korea, and the Seoul "Press" comments upon it, in substance, as follows:

"No steamship named the Ping Yang ever entered or left the port of Chemulpo. There is no 'Colonel Sudu' in the Japanese army in Korea, and there are no 'land forces at Chemulpo.' The 'Pelang coast country' does not exist, and there is no settlement named 'Ta-he-lo' in any part of Korea." "The whole letter," the "Press" says, "is the wildest and most absurd tale ever penned concerning this peninsula."

And upon such evidence as this the Western world is asked to believe that the Japanese—in the words of the headline over the correspondent's third letter—are "determined to down Christianity in Korea."

No story seems to be too wild or absurd to obtain credence in circles that are hostile to Japan. In the United States or in the Far East, since the beginning of the conspiracy proceedings, it has been reported that the accused prisoners would not be allowed to have counsel; that some of them had already been banished to Formosa without trial; that officials of the Japanese Government had prepared charges against Bishop Harris and eighteen leading missionaries; and, finally, that General Akashi, the alleged "head of the military establishment," had spent five years in Russia studying methods of torture that might later be applied to the defenseless Christian converts in Korea. With regard to the last of these extraordinary statements it may be pertinent to say that there was no necessity for going to Russia to study methods of inflicting pain. Torture of both suspects and witnesses was commonly practiced in Korea for centuries, and was not finally abolished until the Japanese put an end to it when they acquired full control of the country in 1907.

I regret the necessity of devoting even so much as a paragraph to these erroneous and misleading statements; but the papers that contain them go into the hands of tens of thousands of readers who know little of Japan and still less of Korea, and who have neither the time nor the means to investigate for themselves the questions involved. This critical examination of a few of the mendacious reports that have recently come to the United States will perhaps furnish American readers with a reason for distrusting Far Eastern rumors, scares, and fakes, or at least for suspending judgment until all sides have been heard. Bishop Warburton must have been investigating stories of religious persecution in the Far East when he said, "A lie has no legs and cannot stand, but it has wings and can fly far and wide."

The first important question raised by the conspiracy trial in Seoul is, "Were the Christian converts tortured?" To this question no positive and unqualified answer can be given. Torture is forbidden by Japanese law, but that does not prove that it is never practiced. Torture is forbidden also by Russian law, and yet Russian political prisoners have often been tortured by their jailers. Officials in all countries have acted at times in disregard of law. The question in this particular case is, "Who shall be believed, the Koreans or the Japanese?"

The average Japanese is more likely to tell the truth, perhaps, than the average Korean, for the reason that the historical conditions of his life have not forced him to resort to untruthfulness as a means of self-defense. Under a cruel and despotic government, a lie is often the only refuge of the weak, and the Koreans for centuries have been forced to lie in order to protect their property or their lives from rapacious and all-powerful officials. This has tended to create a national habit of untruthfulness, which is more discreditable to the Government than to the people. Mr. Homer B. Hulbert, who knows the Koreans well and has high regard for them, thinks that in the matter of truthfulness "they measure well up to the best standards of the Orient, which at best are not too high." He admits, however, that "if they get into trouble, or are faced by some emergency, or if the success of some plan depends upon a little twisting of the truth, they do not hesitate to enter upon the field of fiction. . . . A Korean sees about as much moral turpitude in a lie as we see in a mixed metaphor or a split infinitive."

The Koreans are particularly apt to lie in stating their grievances against the Japanese. One of the most prominent of the missionaries whose names have been mentioned in connection with this trial told a friend some years ago that he had made inquiries as to the truth of various charges made by Koreans against the Japanese, and had found them to be "false in every case."

The Rev. Mr. Watase, pastor of the Japanese Congregational Church in Seoul, writing to the "Christian World" of Osaka, in September last, said: "The prisoners accused of the conspiracy are living very calm and healthy lives under good treatment. I am firmly convinced that the charge of torture is either an invention of the prisoners to appeal to the sympathy of the general public or a magnifying of some trivial affair."

A few of the accused, it should be noted, did not plead torture as an excuse for giving false testimony at the preliminary inquiry. Baron Yun Chiho and three other prisoners said that they had made false confessions because they entertained certain misconceptions, or because they were not in a normal state of health. These excuses may tend to throw discredit on the charge of torture, but they do not disprove it; and the question of cruelty may not be finally settled until the case is reviewed on appeal. From the American point of view, the presiding judge erred in not confronting the prisoners with the police in open court and settling the question of torture before admitting the testimony said to have been obtained by that means.

The question whether the prisoners had an impartial trial or not may be answered with some degree of confidence. They were tried just as an equal number of Japanese would probably have been tried in a similar case. The criminal code and procedure of Japan are based largely upon those of France, and differ in some essential respects from the code and procedure of Great Britain and the United States. A Japanese judge interrogates the accused directly upon the basis of a *procès-verbal* drawn up by the police in a formal preliminary inquiry. The court has large discretionary power in the matter of admitting testimony, and may refuse to call witnesses in support of any particular contention if, in its judgment, the question raised has already been settled. This, in practice, often works to the disadvantage of the defense, and it may have done so in the case of the Korean conspirators. The procedure, however, would have been the same if the accused had been Japanese, and it can hardly be regarded as a denial of justice to the Koreans, as such. It may fairly be said, however, that, from the American point of view, it would have been better and more equitable to settle the question of torture in open court, and to admit freely all the testimony that the defense had to offer. The overruling of the motion made by the prisoners' counsel to change the composition of the court, on account of its refusal to admit further testimony for the defense, is now assigned for error, and the decision will be reviewed by a higher court on appeal.

The last and most important question raised by the Korean conspiracy case is, "Can the Japanese Government fairly be accused of hostility to Christian missions and Christian work in the Korean peninsula?" To this question some of the missionaries answer, "Yes." The "Continent," a Presbyterian weekly published in New York, has said that the Japanese are determined to stamp out the Church in Korea; Dr. J. Hunter Wells, of Pyengyang, in an interview with a New York "Sun" correspondent in London, has been quoted as expressing the opinion that "the Japanese officials are actuated by jealousy of the remarkable strides which Christianity has made" in that part of the world; the Missionary Association in Shanghai has unanimously adopted a resolution in which it "extends heartfelt sympathy to the Korean Christians falsely accused of conspiracy;" and, finally, the missionaries in Korea—or a part of them—have submitted to the Continuation Committee of the Edinburgh Conference a statement in which they say: "We now believe that the programme as laid out extends to the wiping out of the Christian movement in Korea."

A Western reader who is acquainted with the history of missionary work in Korea naturally inquires, When did this anti-Christian campaign begin? All the evidence that is available goes to show that under three successive Governors-General—Prince Ito, Viscount Sone, and Viscount Terauchi—the work of the Christian missionaries in Korea has had sympathetic appreciation and encouragement. In a letter from Pyengyang published in the "Japan Mail" on the 6th of July, 1907, Dr. J. Hunter Wells said: "There are those who, from a political standpoint, see fit to criticise Japan somewhat on her work in Korea; but I do not see how any one interested in the progress of the Gospel or in the extension of Christ's kingdom can do anything but thank Japan for helping along the good work."

A little later, in 1908, Bishop M. C. Harris, of the Methodist Episcopal Church, wrote a letter to the "Japan Mail" in which he referred to Prince Ito's attitude toward the missionaries as follows:

"Let it be well understood that between the missionaries and Prince Ito and the administration there is no conflict, and has not been. The missionary bodies find themselves better off even, and not only is there no obstruction to their work, but much sympathy for all they have done to ameliorate the condition of the people."

In 1909 Prince Ito was assassinated by a Korean Christian at Harbin; but even this did not change the attitude of the Government toward Christian work. The "absolute freedom of Christian religious teaching" which Ito had guaranteed was continued under his successor, Viscount Sone; and in May, 1910, at a dinner given to Bishop Harris in Seoul, Mr. Ishizuka, Director-General of the Japanese Government in Korea, made a speech in which he said: "The Residency-General will neither interfere with nor offer any obstacles to the work of religious propagandism. Far from it, the authorities are always prepared to afford what facilities and aid they can to religious workers."

In July, 1910, Viscount Terauchi succeeded Viscount Sone as Korean Governor-General, and in the first of his proclamations he said: "The freedom of religious belief is recognized in all civilized countries. There is nothing to be said against anybody's trying to gain spiritual peace by believing in whatever religious faith he or she considers to be true. Consequently, all religions shall be treated equally, and further protection and facilities shall be accorded for their legitimate propagation."

One of the missionaries in Korea is quoted as saying that "the Japanese officials are actuated by jealousy of the remarkable strides which Christianity has made in Korea;" but there certainly is no evidence of the alleged jealousy in their published reports. On the contrary, the work of the missionaries receives the most cordial recognition and appreciation. In the Annual Report of Reforms and Progress in Korea for 1911–1912, which was prepared by direction and under the supervision of Viscount Terauchi, the progress of Christianity is referred to in these terms:

"The native Christian converts, who numbered only some hundreds twenty years ago, now reach over 370,000. Such an example of the wonderful increase of converts to a foreign religion is scarcely seen in any other country. This remarkable success of the Christian propaganda was undoubtedly due to the sincere and untiring efforts of individual foreign missionaries in preaching the Gospel of Christ, as well as to the able management of foreign missionary boards and societies."

There seems to be no evidence of "jealousy" in this; it might have been written by a missionary for publication in the "Christian Herald." Even when the Report deals with Christian converts who are actively hostile to the Japanese régime, it sets an example of discriminating fairness and quiet self-restraint which some of the Christian missionaries would do well to follow. It says, for example, that "although some missionaries were very careful not to intermeddle with matters which lay beyond their proper sphere, native converts were so vehement in professing anti-Japanese sentiments that they passed quite beyond control of the former. But even under such conditions one ought not to jump to the conclusion that missionaries are responsible for the fact that a certain class of Christian converts are anti-Japanese, or that certain others joined the insurgents."

The Japanese Government, both in Japan and in Korea, has always shown a disposition to aid Christian work rather than discourage it. When the managers of the Young Men's Christian Association in Nagasaki recently made an effort to strengthen the organization in that city, the Governor of the Prefecture expressed cordial personal interest in it and voluntarily offered to become a member. Japan now has seventy-one Young Men's Christian Associations, with a total membership of about eight thousand. The late Emperor gave ten thousand yen as a personal contribution to the Army Department of this Christian organization, and the Japanese administration in Korea is still giving ten thousand yen annually to the Young Men's Christian Association in Seoul. Even the Salvation Army in Korea received twenty-five hundred yen as a gift and a token of good will from the Residency-General.

At the General Christian Conference which assembled in Tokyo October 5, 1909, to celebrate the semi-centennial anniversary of Protestant missions in Japan, messages of greeting and congratulation were received from Premier Katsura, from the Minister of Education, and from the Governor and Mayor of Tokyo, each of whom sent a representative to the Conference. With the cooperation and sanction of the Government, the Christian college of Doshisha, at Kioto, has recently been made a university, and all the mission schools in Korea have been put

on the same footing as Government schools in the matter of privileges and rights.

In the light of these statements, quotations, and facts, the number of which might be largely increased, what justification is there for the assertions that "the Japanese are determined to stamp out the Church in Korea;" that the "religious persecution" there amounts to a "fierce dragonade;" and that "the Japanese programme as laid out extends to the wiping out of the Christian movement"? So far as I can see, the only basis for such charges is the fact that, after Durham White Stevens had been assassinated by a Korean in San Francisco, after Prince Ito had been assassinated by a Korean Christian at Harbin, and after nine hundred and twenty-six members of the Il Chin Hoi (a Korean society friendly to the Japanese) had been murdered by Korean patriots in various parts of the peninsula, the Japanese Government made an effort to protect itself, its servants, and its friends by arresting and prosecuting a hundred or more Christian converts who were trying to kill the Governor-General. This is not an attack on Christianity, or Christian missionaries. It is merely an attempt to restrain seditious activity that has recently taken the form of conspiracy to assassinate.

The Japanese Government encourages now, and has always encouraged, legitimate Christian work among the Koreans; but it objects now, and always has objected, to what it calls "intermeddling in politics by missionaries." Under the old Korean régime, hundreds, if not thousands, of defenseless Koreans professed Christianity in order to secure the protection that it afforded. The American missionaries at that time enjoyed exterritorial rights, and, with the aid of an American Minister who had himself been a missionary, they were often able to defend their native converts from oppression and injustice at the hands of cruel and corrupt Korean officials. Gradually, and perhaps unconsciously, some of them began to exert political power outside their legitimate field of work, and to regard themselves as champions of the weak against the strong in purely civil and secular controversies. When the Japanese took control of the peninsula, the attempts of these missionaries to protect their native converts from aggression often led to collisions with the Japanese authorities. In many cases the interference of the missionaries was doubtless right, but in some cases it was wrong; and the Japanese officials, who had their own ideas with regard to the management of Korean affairs, thought that religious teachers should confine themselves to religious instruction.

As the government of the country gradually but steadily improved, missionary interference in civil affairs became less and less necessary or justifiable, and most of the Christian workers, American as well as European, ceased to support their Korean converts in non-religious contentions. A few, however, were loth to relinquish the power that they had once exercised; and when they had what seemed to them good and sufficient reasons they took the side of the Koreans against the Japanese administration. This they have now done in the conspiracy case. Such missionaries, however, do not represent the whole body of Christian workers in the peninsula. That body consists of nearly five hundred members, and it is doubtful whether a majority of them approved the statement made to the Continuation Committee of the Edinburgh Conference. The fact that the names of the signers of that statement were not given in the newspapers that originally published it ("Japan Mail," August 17, 1912) would seem to indicate that the men who believe in the intention of the Japanese Government to "wipe out the Christian movement in Korea" are neither numerous nor influential.

The Rev. Dr. S. L. Gulick, author of "Evolution of the Japanese," who is one of the wisest and most successful missionaries in the Far East, published recently in the "Japan Evangelist" an article on the Korean conspiracy case, in which he said:

"From the United States comes the definite charge that the Japanese Government is deliberately persecuting Christianity. In spite, however, of appearances, I believe the charge to be an error, due to misrepresentation of facts. That the Japanese Government in Korea intends to exterminate, or even persecute, Christianity as such, is simply incredible. But, in view of the information it has certainly been receiving from the *gendarmerie*, it would not be strange were the Government-General to suspect the Church of being perverted from its true function and of being made a nursery of disloyalty and sedition. . . . Unless Japan is false to her record for the past forty years, she is not persecuting Christians or Christianity, but merely seeking to root out what is believed to be disloyalty, sedition, and anarchism."

NATIONAL PARKS—THE NEED OF THE FUTURE

BY THE RIGHT HON. JAMES BRYCE, O.M.

AMBASSADOR EXTRAORDINARY AND PLENIPOTENTIARY OF GREAT BRITAIN TO THE UNITED STATES

An address delivered before the Eighth Annual Convention of the American Civic Association, Baltimore, Maryland, November 20, 1912, the Hon. Walter L. Fisher, Secretary of the Interior, presiding.

I HAVE lived long enough in the United States, and have known the United States long enough, having come here for the first time forty-two years ago, to feel just as much interested in all those questions that relate to your welfare, in city and in country, as if I were one of your citizens, and I hope you will allow me to speak to you with that freedom which you would allow to one of your citizens. I do not think I need to feel those limitations when discussing a subject of this kind, so far removed from politics or any other controversial fields.

There is one thing better even than the City Beautiful, and that is the Country Beautiful. I have had a great deal of experience in England in dealing with these questions; for some years I was chairman, and afterwards a member, of a society for preserving commons and open spaces and public rights of way, and member of another society for securing to the public places of national and historic interest, and in the course of such membership I have been led often to think of what is our duty to the future, and of the benefits which the preservation of places of natural beauty may confer on the community. That is a problem which presents itself, not only in Great Britain, but all over Europe, and what Europe is now is that towards which you in America are tending. Europe is a populous, overcrowded continent; you will some day be a populous and ultimately perhaps even a crowded continent, and it is well to take thought at once, before the overcrowding comes on, as to how you will deal with the difficulties which we have had to deal with in Europe, so that you may learn as much as possible from our experience, and not find too late that the beauty and solitude of nature have been snatched from you by private individuals.

I need not descant upon that which the love of nature is and ought to be to each and all of us. The love of nature is the very simplest and best of those pleasures the power of enjoying which has been implanted in us. It is the most easily accessible of pleasures, one which can never be perverted, and one of which (as the old darky said about the watermelon) you cannot have too much. It is a pleasure which lasts from youth to age; we cannot enjoy it in the form of strenuous exercise with the same fullness in age, because our physical powers are not the same, but we have perhaps a more perfect enjoyment in some other ways, because we have the associations and memories of those who have in bygone days visited beautiful scenes with us, and also the associations with which poetry clothes lovely nature. Therefore there is nothing which in the interest of pure enjoyment we ought more to desire and study to diffuse than the beauties of nature. Fortunately, the love of nature is increasing among us. It is one of the tests of civilization that people should enjoy this simple pleasure instead of those more violent and exciting pleasures which may become the source, in extreme forms, of evil. The love of nature, I say, is happily increasing among us, and it therefore becomes all the more important to find means for safeguarding nature. The population is increasing, too, and the number of people who desire to enjoy nature, therefore, is growing larger both absolutely and in proportion. But, unfortunately, the opportunities for enjoying it, except as regards easier locomotion, are not increasing. The world is circumscribed. The surface of this little earth of ours is limited, and we cannot add to it. When a man finds his house is too small, he builds more rooms on to it, but we cannot add to our world; we did not make it, it was made for us, and we cannot increase its dimensions. All we can do is to turn it to the best possible account. Now, let us remember that the quantity of natural beauty in the world, the number of spots calculated to give enjoyment in the highest form, are limited, and are being constantly encroached upon. There are four

forms that this encroachment takes. There is the desire of private persons to appropriate beautiful scenery to themselves, by inclosing it in private grounds around their houses and debarring the public from access to it. We in England and Scotland have lost some of the most beautiful scenery we possess because it has been taken into private estates. A great deal of the finest scenery in Scotland is now practically unapproachable by the pedestrian or the artist or the naturalist because people have appropriated it to their private purposes and keep the public out. This is especially the case where the motive for exclusion is what is called sport. Sport is understood to mean killing God's creatures, and for the sake of killing God's creatures such as deer and birds very large areas in Britain, and some also in other parts of Europe, are shut up.

Then the enjoyment of natural beauty is largely encroached upon by the operations of the lumbermen. That is something we do not have to fear in Britain, because timber is not there in sufficient quantity to be an article of economic value to us, but it is a very serious question here. You have prodigious and magnificent forests; there are no others comparable for extent and splendor with those you possess. These forests, especially those on the Cascade range and the Sierra Nevada, are being allowed to be cut down ruthlessly by the lumbermen. I do not blame them; timber is wanted and they want to drive their trade, but the process goes on too fast and much of the charm of nature is lost while the interests of the future are forgotten. The same thing is happening in the Appalachian ranges in New England and the Alleghanies southward from Pennsylvania, a superbly beautiful country, where the forests made to be the delight of those who wish to ramble among them and enjoy the primitive charm of hills and woodland glades have been despoiled. Sometimes the trees have been cut down and the land left bare. Sometimes an inextricable tangle of small boughs and twigs remains, so that when a dry year comes a fire rages among them and the land is so scorched that for many long years no great trees will rise to replace those that were destroyed.

And, lastly, there is the question of water power, which has in recent years, since the scientific discoveries enabled it to be applied in the form of electricity, become an asset of great commercial value. You fortunately have a great supply of splendid water power. I am far from saying that a great deal of it, perhaps most of it, may not be very properly used for industrial purposes, but I do say that it has been used in some places to the detriment, and even to the ruin, of scenery. It has been used in Niagara, for instance, to such an extent as to change completely the character of what was once the most beautiful waterfall landscape in the whole world. Those of you who did not see it, as I did, forty-two years ago, and are not in a position to contrast it now with what it was then, cannot know what a wretched shadow of its former self it has become—not so much by the diminution of the flow of the river as by the hideous erections which line the shores. It is not too late to repair what has been done, and I hope the day will come when the pristine flow of its waters will be restored, and when the devastating agencies will have been removed. That we will leave for a future which has begun to appreciate scenery more highly than men did thirty years ago, when the ruin of which I speak was beginning to be wrought.

Taking all these causes together, you can see how many encroachments there are upon the unique beauty of your country; and I beg you to consider that, although your country is vast and has scope of natural beauty far greater than we can boast in little countries like England or Scotland, even your scenery is not inexhaustible, and, with your great population and the growing desire to enjoy the beauties of nature, you have not got any more than you need. Fortunately, you have made a good beginning in the work of conservation. You have led the world in the creation of National parks. I have seen three or four of these. I have been in the Yosemite twice, in the Yellowstone twice, and in the splendid forest region which you have around that mountain which the people of Seattle now insist on calling Mount Rainier—no doubt the name given by Vancouver—but which used, when I first explored its forests, to be called by the more sonorous Indian name Tacoma; and also in that superb reserve on the north side of the great cañon of the Colorado River, as well as in others of minor extent in other parts of the country. The creation of such National parks is good, and it has had the admirable effect of setting other countries to emulate your example. Australia and New Zealand have followed that example. New Zealand, in the district of its hot springs and geysers,

has made a public scenic area something similar to your Yellowstone, though not on so extensive a scale; the people of New South Wales have set off three beautiful national parks within thirty or forty miles of the capital city of Sydney, taking regions of exquisite beauty and keeping them for a source of delight to the growing population of that city. Therefore your example is bearing great fruit. I only wish it had come sooner to us in England and Scotland before we had lost so much control of our own natural beauties.

Let me add that it is not only a question of making more parks, but also of keeping the parks in the best condition. I heard the other day that a question has been raised as to whether automobiles should be admitted in the Yosemite. May I be permitted to say a word on that subject? If Adam had known what harm the serpent was going to work, he would have tried to prevent him from finding lodgment in Eden; and if you were to realize what the result of the automobile will be in that wonderful, that incomparable valley, you will keep it out. The one drawback to enjoyment of the Yosemite Valley in the summer and autumn is the dust; the granite rock along the roads easily becomes fine sand; even the feet of the horses and the wheels of the vehicles raise a very great deal of it, which interferes with enjoyment as one drives or walks; but the conditions would be grievously worse with the swift automobile. And, further, the automobile would destroy what may be called the sentimental charm of the landscape. It is not merely that the dust would be there, but the whole feeling of the spontaneity and freshness of primitive nature would be marred by this modern invention, with its din and whir and odious smell. Remember, moreover, that one cannot really enjoy fine scenery when one is traveling at a rate of fifteen or twenty to thirty miles an hour. If you want to enjoy the beauty of such landscapes as the Yosemite presents, you want to see them slowly. You see scenery best of all in walking, when you can stop at any moment and enjoy any special point of view, and you can see it pretty well in riding or driving because in moving at a pace of four or five or six miles an hour you are not going too fast to take in the delicate details of the landscape. But traveling faster than that—and my experience is that chauffeurs so delight in speed that it is hard to get them to slacken even when you bid them—you cannot enjoy the beauty. It was often my duty in the British Parliament to oppose bills conferring powers to build railways through some of the beautiful lake and valley scenery we have in Britain. The advocates of the bills urged that passengers could enjoy the landscape from the windows of the car. But we pointed out that you cannot really enjoy a romantic landscape from a railway window where the beauties are delicate and the scale small. It is different where scenery is on a vast scale, so that the railway is insignificant in comparison, and the objects, rocks or mountains, are huge. One may get the big views from a train, though they are better seen in walking or driving, but you cannot enjoy the small beauties. The focus is always changing in your eye, and it is impossible to have that kind of enjoyment which a pedestrian, or a painter, or any lover of nature has if you are hurrying past at a swift automobile pace. At present the steam-cars stop some twelve miles away from the entrance of the Yosemite Park, and the drive up to it gives you far more pleasure than a journey by rail or automobile possibly could. There are plenty of roads for the lovers of speed and noise without intruding on these few places where the wood nymphs and the water nymphs ought to be allowed to have the landscape to themselves.

Let me pay a personal tribute to the taste and judgment with which, as it seemed to me three years ago, the hotels in the Yosemite were being managed. There were no offensive signs, no advertisements of medicines, no other external disfigurements to excite horror, and the inns were all of moderate size and not more than two stories high. I earnestly hope that the administration will always be continued on these lines, with this same regard for landscape beauty.

Now, a word about additional parks. Although you have done splendidly in creating these I have mentioned and some others, there are still other places where National parks are wanted. There is a splendid region in the Alleghanies, a region of beautiful forests where the tulip trees grow to one hundred and fifty, two hundred feet, or more, a mountain land on the borders of North Carolina and East Tennessee, where there are romantic river valleys and hills clothed with luxuriant woods, primitive forests standing as they stood before the white man drove the Indians away, filled with flowers and traversed

by sparkling streams, containing everything to delight the heart of the lover of nature. It would be a fine thing to have a tract of three or four hundred thousand acres set apart here for the pleasure of the people of the South and Middle Atlantic States, for whom it is a far cry to the Rockies. Then you might have some additional parks in Colorado also. As regards the Northeast Atlantic States, what seems to be most wanted is to preserve the forests of the White and Green Mountains. Perhaps it is not necessary to create in that country a National park in the same sense as that which might be thought requisite in the Alleghanies, because the mountains are so high and rocky, and so little ground is suitable for cultivation in the valleys that it is not likely they will be taken up, and probably hardly necessary that the Government should step in to save them. But I believe that in some parts of the White Mountains, for instance, it would be an excellent thing to create large forest reserves, where the trees should be under protection of the National or State Government, cut by them as required, and the forests replanted as they are cut. In this way you would keep a place where the beauty of the forests would remain for all generations, and where the forests would be so cared for that the present danger of forest fires would be averted.

There is one question that comes very near to you in Baltimore, and also in Washington, on which I would like to speak a word. You know there is a great deal of charming forest country between Baltimore and Washington. A good deal of it is forest of the second growth, some bits of it are of the first growth; but even that of the second contains a great number of beautiful, fine-grown trees. The land is of no considerable value at present, and I believe it could be purchased at a very low price. I have heard it suggested that thirty-six dollars an acre would be an average price for the land, of which there is a great quantity remaining. Having frequently taken walking excursions from Washington into the country from ten to fifteen or twenty miles around, I have been struck with the beauty and profusion of the wild flowers in that district. The flora of that region, being a blend of the flora of the North Atlantic States with some of the plants and flowers which belong to the South Atlantic, is of great interest to the scientific botanist. Baltimore, Philadelphia, and Washington are all swiftly growing cities. What could be done better for the inhabitants of these three cities than to secure for their enjoyment a large part of this forest land and set it apart, forever free from private purposes or use of agriculture, and keep it as a forest reserve to be managed scientifically, so that it should pay for the expense of working it by the timber which could be cut and sold on well-planned scientific lines, and to afford a place where people could go and wander about at their own sweet will, just as the old settlers did when they first came here? Here the automobile would do no harm on the main roads, because there would be plenty of byways and forest footpaths. If the automobilist wants to be whirled along the roads, let him have his way, but keep wide sylvan spaces where those who seek quiet and the sense of communing with nature can go out in the early morning from the city and spend a whole day enjoying one spot after another where nature has provided her simple joys, mingled shade and sunlight, the rustling of the leaves, and the songs of birds. Such things in life the man of the cities can have, and when nature has provided it in such bountiful measure would it not be a shame to lose the benefits she offers?

I am sensible that I may be perhaps accused of treating this subject in a somewhat sentimental way. Well, I confess, I am not addressing my arguments to those who think that man lives by bread alone, or who think there are no values except those measured by dollars and cents. It is because I believe the members of this Association are not of that mind that I venture to address these considerations to you.

And let me try to give some logical quality to my statements by submitting some few propositions in order.

The world seems likely to last a long, long time, and we ought to make provision for the future.

The population of the world goes on constantly increasing, and nowhere increasing so fast as in North America.

A taste for natural beauty is increasing, and, as we hope, will go on increasing.

The places of scenic beauty do not increase, but, on the contrary, are in danger of being reduced in number and diminished in quantity, and the danger is always increasing with the accumulation of wealth, owing to the desire of private persons to appropriate these places. There is no better service we can

render to the masses of the people than to set about and preserve for them wide spaces of fine scenery for their delight.

From these propositions I draw the conclusion that it is necessary to save what we have got, and to extend the policy which you have wisely adopted, by acquiring and preserving still further areas for the perpetual enjoyment of the people.

Let us think of the future. We are trustees of the future. We are not here for ourselves alone. All these gifts were not given to us to be used by one generation, or with the thought of one generation only before our minds. We are the heirs of those who have gone before, and charged with the duty we owe to those who come after, and there is no duty which seems clearer or higher than that of handing on to them undiminished facilities for the enjoyment of some of the best gifts that the Creator has seen fit to bestow upon his children.

THE SPECTATOR

THE Spectator is wondering why, for all his unquenchable interest in the people of the Ghetto, he has waited these many years before visiting an orthodox Jewish synagogue at the time of service. It was in Boston that, strolling through Salem Street on a Saturday morning, he noted at the foot of a blind alley the ugly, dingy-yellow, spireless old church which serves the faithful of this Ghetto. The door stood wide. Not without misgivings on the score of a welcome, he ventured in. As he climbed the stairs to the audience-room an indescribably stirring sound smote his ears—a singular hubbub, a surge of rough male voices, the wild, rhythmless babel of Hebrew prayers. The Spectator paused in the doorway, surveying the congregation rocking on their feet as, with no attempt at unison, they fervently intoned the ancient ritual. Amazingly picturesque, grotesquely incongruous, was the scene before him. The congregation of black-bearded men, robed in the broad stripes and mellowed ivory hues of venerable prayer-shawls, might have been an Oriental group out of a painting by Tissot but for the over-large derby or, in the case of the dignitaries, silk hats jammed low over their ears. There, where the pulpit of a Christian church would be, rose the impressive curtained niche of the Ark of the Law, with the carved lions of Judah supporting the Tables of the Law, mounted over all. But there—oh, the jar of the transition!—on each side, convenient to the chairs of the rabbis, stood a large white uncompromising American spittoon! The Spectator observed that at least two of these conveniences were conspicuously posted in each pew and in constant requisition.

Just then the excited "Bub-ba-bubba-bubba-bub!" of the congregational responses died down and a single voice, a glorious baritone, took up a recitative. The Spectator's eyes came to rapid focus upon the singer. Upon a low platform in the center of the floor of the synagogue, leaning upon a reading-desk draped with rich Eastern fabrics, he stood—a big man in a high black cap of fur, his prayer-shawl, gold-banded at the neck, enveloping him like a robe. The cantor, beyond a doubt. Behind him a little group of white-haired men in silk hats were busy over something which one of them held in his arms. The Spectator caught the flash of blue and the gleam of silver. Then the group separated and he saw that they held the Scroll of the Law. The reading was over. They were adjusting the "shirt" or robe of blue plush, securing the broad silver clasp and preparing to replace it in the Sacred Ark. And now an old man, apparently a mere member of the congregation, rose with the sacred Scroll in his arms, the tall silver ornaments on the rollers reaching above his head, and, descending to the aisle, began a slow progress to the Ark. At every step worshipers crowded round him to touch and kiss the mantle of the Scroll. The curtains of the Ark were drawn back, the Scroll reverently set up among its fellows, the synagogue thrilling meanwhile to the wonderful music of an ecstatic hymn of praise.

For dramatic intensity the intoning of the poems of the Hebrew liturgy, the congregation alternating with the cantor, surpassed any religious music it has been the Spectator's fortune to hear. At times quaintly plaintive, at times soul-stirring, at times fiercely joyful, at times the jubilance quenched in wailing, sobbing agony—it needed no Yiddish to understand that. And then the outbreak of the passionate chorus of the people, rushing, hurried, wild—there was in it the whole thrill of the national experience, the joy of the chosen people, the triumph of Israel, the despair of the carrying away into Babylon, the long patience of the persecution. The Spectator was moved (he says it reverently) as by great moments in opera. To him

all truly great music rises into the realm of the religious.

All this time the Spectator had been standing unnoted in a pew by the door. Instinctively, on entering he had removed his hat. Now a late comer stopped beside him and said courteously, "Excuse me, sir, but it is the orthodox custom to wear the hat in the synagogue. Would you like a better seat?" So the Spectator, feeling as if he were breaking something, replaced his hat and followed down the aisle. Coming to anchor in a bare pew in the transept from which his eye was free to range the whole room, he shortly discovered the women, herded by themselves in a gallery running round three sides of the building—a black-habited, negligible element in the scene. A Yiddish-English prayer-book he had purchased before coming in bore eloquent testimony as to the place of woman in the synagogue. For do not all the men say, "O Lord God, Eternal King of the Universe, I thank thee that thou hast not made me a woman"? And all the women submissively murmur, "O Lord God, Eternal King of the Universe, I thank thee that thou hast made me *according to thy will.*"

Vainly the Spectator strove to reconcile with the primitive grandeur of the service the apparent informalities all about him. There were the Jewish boys in their little blue-striped talliths, staring coolly about or even parading guilelessly from pew to pew unrebuked of their elders. And this although a bulletin in the vestibule commands not only that there shall be no spitting on the carpet, but that none shall walk about or talk "during the speaking." The elder Hebrews too, arriving late, betrayed none of the self-consciousness and guilty slinking of a Gentile who gets to church after the first prayer. They marched unconcernedly to their places, leisurely extracted their prayer-shawls from their velvet bags, adjusted them robe-fashion, looped the folds over their arms, found the place in the service-book, and began the curious rapid, rocking bob with which the orthodox Hebrew accompanies his intoning. All this without any special manner of Sabbath sanctity, but with a business-like directness. From time to time in similar nonchalant fashion such as were impelled flung off the tallith, carefully folding the great striped fringed square, stowed it in its bag, and informally departed. During the monotonous murmuring of the prayers one aged Jew turned his back to the cantor, leaned both elbows on the top of a pew, and serenely surveyed the congregation, his lips moving steadily the while. Why, even the cantor, at a pause in the service, undisguisedly and audibly yawned.

At first considerably shocked, the Spectator by and by began to wonder whether there was not something rather fine in the absence of ostentatious show of reverence—whether, at least, it was not better than a superstition-chidden punctiliousness in the form of devotion. As to the depth and genuineness of their reverence when stirred, not the least impressionable of Gentiles could doubt. The Spectator doesn't suppose it was manners for them to take these frank vacations during the service. They are a primitive people in Salem Street. But it was as if their age-old faith were too majestic, too assured, to need the tribute of trivial observance. At least it might be looked at that way.

To the best of his recollection it was September when the Spectator found himself one evening in Salem Street watching the mixed multitude of Jews and Italians thronging the pavements. He knows that the night was warm. Down from the open window of a tenement there floated the sound of a crowd of men singing. His eyes, seeking the open street door of the tenement, met those of a beautiful little Jewess, a child possibly twelve years old, idling in the vestibule. "Why do they sing?" asked the Spectator. "Because of the holiday," said she. "What holiday?" The child wriggled shyly. "Simhat Torah," said she. "I don't know the name of it in English, but it's the happiest holiday in the whole year. Go up and ask. They will tell." The child seemed so sure he would not intrude that the Spectator took the risk and climbed the stair. Through an open door he commanded a view of two long rooms and a group of venerable Jews sitting round a table. For an instant the scene conveyed a faint suggestion of the Last Supper. The Spectator advanced a step, and the illusion vanished. For there were the ubiquitous orthodox hats, and there on the table was spread a supper of sausages and ginger ale. At the sight of the Spectator a young Jew sprang up, calling out heartily, "Would you like to come in?" The Spectator drew back, apologetic, confessing his curiosity and his admiration for the singing. "You are very welcome," said the Jew, drawing him forcibly into the room. "We are glad to explain." He set a glass of ginger ale at the elbow of the unbidden guest. The holiday, the Spectator gathered from the talk that followed, was in celebration of the completion of the yearly reading of the five books of Moses. These people had been present at the ceremonies in the synagogue, where, according to custom, all the Scrolls of the Law had been taken from the Ark and borne in solemn procession round the synagogue; and now with music and modest feasting they enjoyed the close of this "happiest holiday in all the year." As the Spectator withdrew, for he could not convince himself that he was not out of place, he could not help wondering whether in any society of

Gentiles joy is associated with the public reading of the Word. Reverence, awe, devotion—yes. But joy!

⚄

The impression was but deepened when, on the ensuing Sunday evening, walking down Hanover Street, he heard from the top of a tall building the sound of mighty fiddling. He paused in amazement. A so-called "social," a promiscuous dance, on Sunday night? Shades of the Watch and Ward Society! Somebody ought to see about that. Being so far out of the Ghetto, he did not think of the Jews. Yet when he had mounted two flights of steep stairs he encountered a young man of unmistakable Jewish connections. Eying the Spectator's Gentile features, the youth asked, eagerly, "Are you from a newspaper?" He seemed so disappointed at the negative that the Spectator added, "But I am from a magazine." The young man's face brightened, and he promptly led the way toward the door of a large hall. Looking in, the Spectator saw a roomful of people capering about to the music of two squeaky fiddles. Men danced with men and women with women. All but one substantial matron, who revolved alone, hugging in her arms what looked like the Scroll of the Law in its "shirt" of crimson plush! While he gazed, open-eyed, the music stopped and a man jumped upon a platform, hammer in hand, and began a spirited bout of auctioneering. But auctioneering what? In vain he looked to see *what* was going, going, gone. The Spectator turned, bewildered, to his guide. It seemed that the congregation of a synagogue had just achieved the purchase of a new Scroll of the Law, and the auction-dance was to help pay for it. The last two or three lines of the fifth book had been on purpose merely penciled in by the scribe. They were now auctioneering off the right to ink in these words, one letter at a time. Amid wild applause the highest bidder ascended the platform and with a quill pen—no steel touches the Scroll—inked in the letter which had cost him so many good shekels. Then the dancing began again, more joyful than before; and so it would go till the last letter was inked and the last dollar auctioned out of its owner's pocket.

⚄

What interested the Spectator most was to see how these people love Judaism—love it with a deep and abounding joy. All that dry formalism, that mass of curious regulations—they not only reverence them, they adore them. Somehow we Gentiles seem to have lost the joyfulness out of religion—our devotion is apt to lie nearer to tears. The Spectator has known Gentiles who kissed their Bibles, but he never saw one dance with his Bible in whole-souled, unhysterical joy. That spirit goes back to the days of the Old Testament worthies who danced before the Lord and made a joyful noise. The Spectator wonders if we could not do with a little of it to-day.

⚄

Without much doubt, one technically versed might pick flaws in the Spectator's story. He may have erred in detail or in interpretation. This is not, be it noted, a treatise. He has told simply how it looked to an outsider.

THE NEW BOOKS

Philostratus, The Life of Apollonius of Tyana. Translated by F. C. Conybeare, M.A. In 2 vols. (The Loeb Classical Library.) The Macmillan Company, New York. $4.

Philostratus, In Honour of Apollonius of Tyana. Translated by J. S. Phillimore. In 2 vols. The Oxford University Press, New York. $4.

Tacitus, The Histories. Translated by W. Hamilton Fyfe. In 2 vols. The Oxford University Press, New York. $4.

It is pleasant, in this day of the practical, to be able to record the simultaneous appearance of books by Greek and Latin writers from two sources: the Loeb Classics and the Oxford Series. The physical aspect of the volumes will at once catch and hold the eye of the book-lover through the unusually clear type, wide margins, and general air of academic dignity which they convey. In the case of the Loeb Classics there is the added attraction that text and translation appear on opposite pages as against the translation merely in the other series; and in this form the beauty, learning, philosophy, and wit of the great writers of ancient Greece and Rome should make a strong appeal, not alone to scholars who care for uniform series of the *best* texts, but also to college graduates who wish to renew and enlarge their knowledge with the aid of text and translation; while for those who know neither Greek nor Latin and who are anxious to familiarize themselves with ancient genius and wisdom the books will be beyond price. There may even be some specially ambitious spirits who, enticed by the mystic text, will be induced to obtain an elementary knowledge of Greek and Latin. These books will be a new reminder of the truth that, to the present at least, much of the philosophy and wisdom relating to man's nature and aspirations were definitely stated by the great writers of ancient times. Goethe believed strongly in the cultural influence of the classics, and commends

them urgently to the attention of readers. "Study Molière," he says, "and study Shakespeare, but, above all things, study the ancient Greeks, and ever and again the ancient Greeks." The Loeb Classical Library is to include all that is of value and interest in Greek and Latin literature from the time of Homer to the fall of Constantinople; and most of the translations will be entirely new, made by the best scholars in Great Britain, England, and Canada, so that in themselves the translations are live works of literature.

Philostratus's "In Honour of Apollonius of Tyana," in two volumes, appears among the initial volumes from both presses. It is a romantic recital of adventure, this life of a "heathen Saviour," who, on the death of his father, distributed his inheritance among his poor relations, spent five years traveling in Asia Minor, maintaining absolute silence, later went about healing the sick, raising dead men to life, casting out devils, prophesying future events which afterwards came true (so say his apostles), and who, in his vehement and persistent denouncement of the sacrifice of animal victims to the gods, prepared the ground for Christianity. One of the most interesting facts made clear about Apollonius is the extensive recognition he obtained and the ease with which he found acceptance of his pretensions. Toward the end of the third century, when the struggle between Christianity and paganism had reached its bitterest stage, it even occurred to some of the enemies of the new religion to set up Apollonius as a rival to Christ, and temples and shrines were erected to him in various parts of Asia Minor. Apollonius claimed a commission from Heaven to teach a pure and reformed religion and to perform miracles. Perhaps the truth about him is that he was a physician and had obtained some real knowledge of the methods of curing diseases. In India, too, he probably learned to practice what is now called "animal magnetism," and, when he found he had a real power on the nervous system of hysterical patients the nature of which he himself did not understand, he may have believed that he was endowed with a divine and supernatural power. It shows that mankind was then, as it is now, and always will be probably, ready to mistake hopes and imaginations for evidence of truth, and to run like sheep after any one who professed to hold the key of the mystery which it was so passionately anxious to solve. Apollonius we see through a mist of illusion which adds charm to the tale.

Book of Hand-Woven Coverlets (A). By Eliza Calvert Hall. Little, Brown & Co., Boston. $4.

In writing this new volume Eliza Calvert Hall, whose tales of "Aunt Jane of Kentucky" and "The Land of Long Ago" charmed all readers, appears to have strayed into a new and perhaps foreign field of literature. Under this title we expect an array of accurate facts concerning the treasured coverlets of our great-grandmother's day that have recently been rescued from burial in attics and cedar chests. Nor are we disappointed. The early history of hand-woven coverlets; the old-time processes of coloring the wool for the "filling" with barks, roots, leaves, and flowers from field and forest; the carding and spinning, with the twin methods of preparing the flax or cotton for the white warp of the coverlet; the long lists of half-forgotten names of drafts, and brief sketches of some olden draft-worker especially noted for skill in coverlet-weaving—all these facts are garnered into one treasure-house. And over these bare facts is thrown the gracious fancy of the writer, and they are transformed into a fascinating folk-lore tale. It was the sight of a farm wagon entering a Kentucky town with its load of tobacco covered with an old faded and tattered fragment of a coverlet that inspired the writing of the book. Four years were lovingly spent in gathering and arranging the material. Pathos and poetry were found interwoven with utility in the history of the American hand-woven coverlet. The lists of names of the old drafts, or patterns, arouses interest and curiosity. What fancy led one weaver to name the draft her skill invented "Braddock's Defeat," and another to soar to "Sunrise on the Walls of Troy"? What of the woman whose bold, geometrical pattern was christened "Flowers of May"? What means "Bachelor's Thumb," "Shuckeroons," or "Fool's Puzzle"? Was "General Lee's Surrender" (and there are two drafts with that name) so called in sorrow or triumph? The "double wove" coverlet ranks highest, and is now an almost forgotten handicraft. Of the olden weavers of this most difficult method of weaving but two names of women are preserved, Sarah La Tourrette Van Sickle and Ann Hay; while the names of the professional male weavers represent five nationalities. They traveled from town to town, weaving from house to house the thread the goodwife had dyed and spun. Weaving was an inherited craft in the family, each generation perfecting the work of the previous one. The book is generously illustrated with many colored and half-tone plates of rare historical or especially beautiful hand-woven coverlets.

This and That and the Other. By H. Belloc. Dodd, Mead & Co., New York. $1.25.

The author truly says that when a man has to deliver a cartful of rubbish at your house you have to be the annoyed recipient. But no one need read his book nor even pick it up to read. Perhaps some specimens of the wares offered may help a possible reader to decide. This Englishman with a French name plays in clumsy fashion and with but small wit about such subjects as appeal to his fancy. Among other tilts he rides against the charlatan and

aims a blow at Lombroso "the ridiculous," "who was no more of an Italian than Disraeli," but whose foreign name was intended to deceive, and whose "base connections" are Nordau and Ferrero. Omitting the common usage in England of "silly" as applied to those who differ from the author's opinion, Lombroso is dismissed with the exclamation "The Ass!" However, there are pages of a different tone in the book, but one fails to discover the reason for its being and is depressed by the fear that it may be mistaken for something better than rubbish.

Increasing Home Efficiency. By Martha Bensley Bruère and Robert W. Bruère. The Macmillan Company, New York. $1.50.

Several of the chapters which make up this volume first appeared in The Outlook, and we venture to say that very few articles or series of articles published in this journal have attracted so much interest and have been so productive of thought and definite results. This was so largely because Mrs. Bruère, in the articles to which we refer, now admirably supplemented by several from her husband's pen, followed new lines and reached out for the vital and controlling needs which underlie real home efficiency. The keynote of the articles and of this book is that immediate saving is not the fundamental idea of home administration, that efficiency is a large word with a broad meaning, and that not merely housekeeping, but culture and the gain of power for usefulness and intelligent enjoyment, must always be kept to the front. It should be added that the book is written in a cheerful, agreeable, and friendly manner, and that it makes good reading for home-makers everywhere.

Wild Life and the Camera. By A. Radclyffe Dugmore. The J. B. Lippincott Company, Philadelphia. $2.

Mr. Dugmore has a high reputation as a hunter with the camera. This book will be a joy to all who take pleasure in bird and animal photography. The sport of photographing the wild birds seems to have attracted the author long ago, and his work in this direction is particularly fine. He shows us also the migration of the caribou, the opossum in his famous game of playing 'possum, and he describes with pen and photograph some notable adventures in fishing, in tramping through the woods in the heart of winter, and in camping.

Leading American Inventors. By George Iles. Henry Holt & Co., New York. $1.75.

An excellent book, especially for boys and young men interested in American invention, for whom it would make a capital holiday present. Mr. Iles, it will be remembered, is the author of "Flame, Electricity, and the Camera," than which no modern book has done more to show the fascination and romance of recent science in its application to practical life. The present volume tells about John Stevens, who adapted the screw principle to ship propellers and invented the sectional boiler; Robert Stevens, who designed the T-rail, and was a railway engineer of note; Fulton, the inventor of the first practical steamboat; Ericsson, whose name will be inseparably connected with the "Monitor," but who did much else in invention; and a long list of famous American inventors in the field of mechanics, telegraphy, machinery, and other things now in constant daily use, such as wood paper, the typewriter, and the linotype, to say nothing of the older inventions of the harvester, sewing-machine, and cotton-gin.

International Critical Commentary (The): Haggai, Zechariah, Malachi, and Jonah. By Hinckley G. Mitchell, D.D.; John Merlin Powis Smith, Ph.D.; Julius A. Bewer, Ph.D. Charles Scribner's Sons, New York. $3.

This volume, completing the commentaries on the minor prophets, includes the work of Professor Mitchell, of Tufts College, on Haggai and Zechariah; of Professor Smith, of Chicago University, on Malachi; and of Professor Bewer, of Union Seminary, New York, on Jonah. In putting Jonah after Malachi, the last of the historical prophets, the unhistorical character of the book is admitted. This, however, is by no means conceded to detract from its value and its right to stand among the canonical books. It is shown as teaching one of the noblest of prophetic lessons in the form of parable, though not of literal history, namely, that

> "the love of God is broader
> Than the measure of man's mind."

The ripest fruits of modern learning are made accessible in this volume, as in others of the series, both to the plain Bible reader and the scholarly student, the portion appropriate to each being distinguished by its typography.

Thirteen Years of a Busy Woman's Life. By Mrs. Alec Tweedie. The John Lane Company, New York. $4.

The bulky volume made up of more or less interesting gossip collected by a writer with journalistic talent goes far to prove that written personalities have a sure hold upon the public. Why written gossip should be considered literature and spoken gossip frowned upon no one knows. Mrs. Tweedie was a brave woman of unquestioned available ability, and she met the crises in her life "like a woman," than which there is no higher praise. Her hurried writing is necessarily superficial. In America there will be many quietly amused smiles at her good-natured and quite inaccurate reports of us and our country. We have given over denying our alleged sensitiveness, and our smile only broadens slightly when we are told we are jealous of England, but we have perennial joy in realizing that, impossible as it seems to the English, they amuse us even more than we amuse them. So we are all content. Mrs. Tweedie's talk about

Mexico and President Diaz is always interesting. The long list of men and women whom she knows and has had cordial, friendly relations with makes a brilliant succession. First of all indomitable courage, then adaptability and a sincere devotion to systematic work, have brought to Mrs. Tweedie the rewards of a success she won against great odds. The chapter on women nowadays is sensible and attractive.

Our House and London Out of Our Windows. By Elizabeth Robins Pennell. Houghton Mifflin Company, Boston. $2.50.

A new edition of one of the most charming books by Mrs. Pennell has been issued, enriched with illustrations by Joseph Pennell. The title of the first edition, "Our House and the People in It," is enlarged to include the changes. Any one who has looked out of the high-hung windows of the "House" will rejoice in the impressions of the views made by the artist, and be glad once more to read the witty, unforced character sketches with wise comments written by the other artist.

Development of Religion and Thought in Ancient Egypt. By J. H. Breasted, Ph.D. Charles Scribner's Sons, New York. $1.50.

Within the last two years the oldest body of literature in the ancient world, the so-called Pyramid Texts discovered in 1880–81, have been made easily accessible. They open to us the earliest chapter yet preserved of man's intellectual history. What these show of religion in the making during thirty centuries is the subject of this volume of lectures at Union Theological Seminary by Professor Breasted, well known by his "History of the Ancient Egyptians." Nature furnished the earliest idea of deities. Reflection on the fabric of the State brought them down, intellectualized, into the arena of human affairs. The emergence of the moral sense is next apparent in shaping religious thought. A further advance is made by the emergence of social forces in view of the moral unworthiness of society. "A surprising group of pamphleteers" rises to protest for social justice. This brings about "the earliest social regeneration" on record, and now the happy future life of king and noble is democratized to include the peasant. But magic here begins to intrude into religion, and moral degeneracy ensues. Imperial power aspiring to world-wide empire next makes its mark on religious thought, and monotheism appears in a "lonely idealist," Ikpnaton, "a God-intoxicated man," in the fourteenth century B.C. Here we find the earliest manifestation of personal piety, the individual in religion. It is the age of the psalmist and the sage. But sacerdotalism triumphs; intellectual stagnation ensues; the development ends in conservation of the past by scribes. As Professor Breasted remarks, the general drift of the Egyptian development was analogous to that of the Hebrew, and the same forces continue to mold religion in our day. Many pages of these lectures, written for a popular audience, bring us into close and sympathetic touch with minds that wrestled millenniums ago with problems that engage us still.

Soul of a Tenor (The) By W. J. Henderson. Henry Holt & Co., New York. $1.35.

From the view-point of an expert musical critic, we are led into the inner sanctum of the ideal meaning of music. The actors in this romance-drama are real to the mind's eye, thoroughly human, noble or ignoble. Whether the soul of the great tenor was worth the cost of saving is exactly the question that always rises in the presence of great sacrifice. His way led through very waste places of spiritual and sensual experience and showed him to be by nature selfish, disloyal, and an ingrate, yet possessed of a wonderful instrument in his voice. Through that he was able finally to sink himself in a true comprehension of ideal art. Probably no one could give a more realistic and intimate view of opera-land than Mr. Henderson discloses in this clever book, and, as he says, Opera-land is a real country.

Epistles of Paul to the Thessalonians. By James Everett Frame. (International Critical Commentary.) Charles Scribner's Sons, New York. $2.50.

This latest of the multitudinous commentaries, ancient and modern, upon these epistles satisfactorily vindicates their genuineness from the objections advanced by modern critics. They still hold their ground as the earliest of all the extant apostolic writings, dating from A.D. 50, only twenty years after the death of Jesus. The famous passage in the second epistle (ii. 3–12), the earliest prediction of the great rebellion prophesied again forty years later in the Revelation (chapters xvi, xix) has occasioned an enormous literature. Professor Frame's review of this finds it impossible to determine whom Paul meant by "the man of sin" more nearly than "an extraordinary man" possessed by a devilish spirit. The volume is a fine specimen of the best American scholarship.

Johannine Epistles. By Rev. A. E. Brooke. (The International Critical Commentary.) Charles Scribner's Sons, New York. $2.50.

An accomplished British scholar limits himself in this work to the task of determining precisely what a Christian pastor wished to say to his flock at the end of the first and beginning of the second century in the circumstances which his language enables us to outline. The character of his writings imposes this limitation. The unity of their authorship is fairly established, but the first epistle is so closely allied to the Fourth Gospel that its authorship cannot be separately discussed. Recognizing the difficulty of that problem, the writer seems inclined to a middle ground between the traditional and the radical conclusion. The purely critical portion of the volume exhibits special learning to the utmost.

LETTERS TO THE OUTLOOK

DOES IT PAY?—ANOTHER WOMAN'S VIEW

After reading "Does It Pay?" in The Outlook of November 2, between jobs, I felt a great need to protest. The first sentence is one of those sweeping assertions so easy to fall into: "As a rule, the home-making woman does not wish work or care." I hope that is not true even of the probably limited class with whose problems and attitude toward life the critic is familiar—a class able to spend $65 each month for help, and pay $2 per lunch and $3 per dinner for extra help; able to buy a child's frock at $20!

Outside of that class we of the Great Majority stand, and I protest, for the honor of my fellow-women, most of them far defter and more competent than I, that, if they err, it is in the direction of false economy—they spend their own strength too readily to save money, toiling often through hours stolen from sleep over garments that would far better be bought ready-made: and all to save a few pennies' difference in first cost or wearing qualities.

How can a woman who economizes by paying $20 rather than $25 for a child's frock comprehend the problems, wisely teach, or justly criticise the home-making woman as a class, much less the working-girl? What real difference does it make whether she pays $20 or $25 for the little dress, when the five dollars diverted (by means of a darn) from that particular luxury goes for some other, equally unnecessary?

The "increased cost" by which H. P. T. is "appalled" is not "increased cost of living" in any sense; it is increased cost of luxury. For she lays the increased cost "largely to labor," and servants, expensive clothes, leisure for "handwork" on "fancy lingerie," are luxuries pure and simple.

It is not surprising that $20 per month no longer satisfies the cook—the price of one child's frock! And it is not altogether increased cost of living, by way of finer clothes and more leisure, that has driven cook on to demand $30. Work is esteemed honorable largely according to the hard cash it commands in way of fees, wages, or salaries. When cooks become scarce enough to get the prices that professional polishers and other workers get, we will employ them much as we do trained nurses—a heavy expense perhaps, but the truest economy at times when a mother's strength is to be hoarded for the children's sake.

I think that H. P. T. will find, if she investigates the working-girl's twelve waists at $24, that they were of a kind to require little or no laundering (silks, flannels), as the working-girl cannot afford the laundry charge of 25 cents to 35 cents each for the six tailored waists H. P. T. recommends. And it may even be that there are women so far removed by money that a child's frock at $20 will sound tawdry, and who will forget that the little shop-girl is also a daughter of Eve who loves finery, whether it be fig-leaves or bargains at $1.98 or $20.

The process of equalizing the division of the world's good things is slow in working out because the people have not themselves known what they needed; but that day is past, and the wheels will turn more swiftly now, with so many eager hands laying hold upon the task—mistaken hands, some of them, with their sabotage that would make wrong right.

Gentlemen first! So off came the frills and laces that adorned the sons-of-too-much-ease in the "good old time"—and for which the many sweated. And the many, with juster portion of labor's earnings, laid aside the stiff leather breeches and got their multitudinous frost-bitten legs into some warm machine-made clothes.

Ladies follow! It is the order of the day, and the lopping off of all these useless luxuries is a real advantage to the souls that have been half smothered under the heaped-up trifles of a luxury paid for by such long hours of labor, such bitter skimping of the loaf that feeds the many.

Oh, please do not teach us new ways to make our money buy more luxuries—more things with which to clutter our lives. Teach us rather to spend what is necessary for complete and noble living, that we will not be appalled when cook, too, joins the onward march and gets the increased wage that is everywhere the first step upward toward increased respect and self-respect as a class worker, and a very necessary concomitant of better, fuller living for many.

E. S. B.

THE PASSING OF THE COOK-STOVE

Oh, yes, the cook-stove is doomed! All the rural betterment writers and investigators of farmers' wives have so decreed. Natural gas, electricity, and alcohol are now the only permissible fuels, and what one ultra-modernist cleverly calls "the prehistoric, wood-consuming, four-lidded quadruped" is on its way to extinction. "Such utensils have long ago gone to the junk heap," writes a progressive Westerner. The clattering lids of my battered old "Brightwood," with one broken leg, would be to her truly "as the crackling of thorns under a pot." But the more highly perfected the appliances for any given kind of labor, the less divergence in the resulting product and the less scope there is for individual control. Hence the reaction from machine-made articles which has given rise to the Arts and Crafts movement.

Then, too, cookery is, or may be, one of the

creative arts, and as such demands a favoring environment. Eunice's squash pies would somehow fall short of ultimate perfection were there no roaring fire of sugar-maple to insure the desired chestnut-leaf brown to crust and filling. As well conceive an artist without her painting-apron, or dissociate the old envelope episode from the immortal Gettysburg address and substitute the shade of a stylishly coiffured stenographer!

Must the reluctant school-boy be deprived of his pre-academic task of splitting kindling and filling up the kitchen wood-box? What daily duty shall we assign in connection with that elegant piece of culinary mechanism inlaid with blue and white enamel? Efficiency is an important test, without doubt, but are we not in danger of employing it a bit too exclusively—letting it defeat its own ends, in fact? For what is efficiency for but to help men and women to self-expression and to make those selves worth expressing? The doing seems quite as important as the product, when so considered. Despite a smattering of "book l'arning" and a lively interest in the affairs of the Nation, I find myself sympathizing with Martha Bruère's indignantly quoted farmer, who ingenuously asked, "What *would* my wife be doing on a Monday if it wa'n't for the washing?"

Howbeit, New England, at least, has still a few back-country towns and untraveled cross-roads, and her little band of reactionaries. Long may it be before the rising generation has to consult an encyclopædia for key to the expressive comparison "as smiling as a basket of chips"!

ROSE G. DAYTON.

Georgetown, Connecticut.

FOR A SANE NEW YEAR'S EVE

It must be that there are hundreds of your readers who, year after year, on New Year's morning have laid down their newspapers with a shock of dismay and resentment after reading of the wild and heathenish revelry on Broadway, drunken orgies indoors that found their echo in the cry heard everywhere in the street last year: "To hell with the old year, hooray for the new!" One feels resentment because of the impression sent abroad that this is the New York of our love, our care, and our work and pride. Another New Year's eve is close at hand. It is said that weeks ago every seat in the cafés and restaurants along the White Way was sold at high prices to the revelers getting ready for another debauch and to the sightseers who come from far and near to see how the metropolis welcomes the New Year.

Is it not time that an organized protest were made against this wicked folly, that shall convince the world that New York is not yet ready to hand over either the old year with its cares or the new with its hopes and duties to the devil? I believe that if a great chorus were to stand in, say, Madison Square or Long Acre Square in the last hour of the old year and sing it out with the old familiar hymns and patriotic songs, hailing the new with "America," not only would a rebuke be administered to the spirit of barbarism let loose in the city, but the real soul of New York would come out and a hundred thousand voices join in. That would be a protest indeed!

Which augurs best for the New Year—the slogan of the street I quoted above, or the swelling chorus of "O God, our help in ages past"? What if we put it to the test this year?

JACOB A. RIIS.

I WILL, IF YOU WILL

I will, if you will
  devote my Christmas giving to the children
    and the needy,
  reserving only the privilege of, once in a
    while,
  giving to a dear friend a gift which then
    will have
  the old charm of being a genuine surprise.

I will, if you will,
  keep the spirit of Christmas in my heart, and,
  barring out hurry, worry, and competition,
  will consecrate the blessed season, in joy
    and love,
  to the One whose birth we celebrate.

JANE PORTER WILLIAMS.

Howe, Indiana.

ANOTHER SEVENTY-FIFTH ANNIVERSARY

The article in The Outlook of October 19 on "Seventy-five Years of the Higher Education of Women," apropos of the celebration at Mount Holyoke College, strikes a sympathetic chord in Judson College, Marion, Alabama. We are now planning to celebrate next May the completion of our seventy-fifth session, for in the year 1839 the first session extended from January 7 to the last of August, and the second session began in September.

This college is one of the twenty-two mentioned by your contributor as opening between 1830 and 1850; but, instead of "ending with the Civil War," it has not only continued successfully to the present time, but *it did not lose even a day all through that disastrous period.* This cannot be said of Howard College for young men, in the same town, because all the students ran away to join the army.

In 1836, while Mary Lyon was engaged in the unheard-of task of getting subscriptions from private individuals to found an institution for the higher education of women in Massachusetts, down in the little town of Marion, Alabama, off the main roads of travel, two people were revolving the same object in their minds. They came independently to the same conclusion as Mary Lyon did, that, if there was to be

any permanent advance in the education of women, it could not be in the school owned and controlled by private teachers and for their benefit; but it must be endowed either by the State or by private gifts.

In the fall of 1838 Mrs. Julia Barron, a woman of considerable means, and General Edwin King, a wealthy planter, with this object in view, were seeking for a man to be president of a school which they were planning to found. About this time there arrived in Tuscaloosa, the seat of the State University, a cultured gentleman, with his wife, from New York, who was seeking a location for a school. Dr. Basil Manly, the President of the University, wrote to Mrs. Barron about him, and thus Dr. Milo P. Jewett was invited to come to Marion, and engaged to take charge of the new enterprise.

On the 7th day of January, 1839, the school opened, and was named Judson Institute. This was the beginning of Judson College. For sixteen years Dr. Jewett was its successful President; then he returned North, and soon after the war was the power behind Matthew Vassar in founding Vassar College.

Judson College is hoping also to raise, like Mount Holyoke, a permanent endowment fund for its celebration next year. A. M.

Marion, Alabama.

AN ANCIENT CITY

In a recent issue of The Outlook you strongly supported the duty of the people to preserve the ancient ruined city or stronghold at the head of Windermere. Forty-eight years ago I carefully examined the marvelous constructions and munitions of Claperyate, for this is the name of the ruined citadel as Camden writes it. And, as I have shown in my book, "Landmarks," etc., Edinburgh, 1877, this ancient name has its straitest English in the words of my interpretation, viz., the bulwark or fortified town (or strength) of the lord of the Gevets or Selgovians. The Celtic words used in this ancient appellation are *cladh*, *air*, and *Guicheadh*. Scholars and capable critics have indorsed my interpretation.

Ambleside is old Danish *eatna boel*, the "giant"-warriors' town, plus "side," and refers to Claperyătĕ—four syllables.

THE BRITISH-IRISH QUESTION

In reply to the protest of many citizens of Ulster against being forcibly separated from their long-accustomed relations with the rest of the United Kingdom, there has been but one argument advanced of any moment—that the religious and governmental preferences are very nearly evenly divided among the inhabitants.

It should be remembered that it is one thing to give a people a new status at their expression of desire, and quite another thing to tear them from relations which have long been endeared to them. Where a small majority seeks to impose a new and objectionable condition on a large minority, the result is quite likely to be civil war.

If two-thirds of the inhabitants of Ulster desire a change so ultra, it should not be granted by the Imperial Parliament so long as the other third, including the great majority of the business stability and best intelligence, desire to retain their close loyal relations with Great Britain. In this instance the attempt would be to force an English-speaking people down under the direct, all-Ireland rule of a people who are determined to bring the Gaelic into use as the language of Ireland. It is to compel a Protestant and loyal people to become separated from Great Britain in such manner that the caprice or discontent of the volatile people of the rest of Ireland may, by Act of Dublin Parliament, terminate entirely the relation known as the United Kingdom when the British Empire shall be grappling with foreign enemies.

The majority of the people of Ulster are aroused at the danger of such an ultimate fate, and feel justified in resisting local separation from Great Britain to the last drop of blood in their veins.

For strategic reasons Great Britain should have a naval base on the island of Ireland where the loyalty of the people is unquestionable. Such a base is Ulster. This is a British-Irish Question. WILLIAM WHITING.

Newark, New Jersey.

THE PARCELS POST AND THE COST OF LIVING

All political parties are pointing out the high cost of living, but none has yet suggested any method that will positively reduce it. To advocate reclamation of arid lands and swamp lands is merely trying to add more available lands for farming purposes, that will make competition among farmers keener, and further reduce the small profits they are now obtaining. The one solution to this high cost of living is a cheap parcels post for the necessities of life. Give the people a rate of one cent a pound, with a limit of twenty pounds for a maximum distance of fifty miles, on all vegetables, meats, butter, and eggs, and the cost of living will be reduced thirty per cent forthwith. FRED. W. OKIE.

Marshall, Virginia.

PREMIUMS AND THE COST OF LIVING

Just at this time, when there is so much talk about the high cost of living, wouldn't it be pertinent to inquire why it is necessary to have premiums given with so many of our materials for cooking and prepared foods?

The thinking public must concede that all such premiums are paid for by the consumer, or there would be no premiums offered. S. D.

Claremont, California.

BY THE WAY

One of the most interesting "finds" of the year is that of a portrait of Cervantes, discovered by a Spanish collector of curios in Seville. The portrait is by Juan de Jaurigui, and is alluded to by Cervantes in the preface to an edition of his novels. This picture, according to the "Century Magazine," which prints a reproduction of it, "has been sought for all over the world for three centuries by admirers of Cervantes."

In the battle of electricity against steam an important victory for the former agency is the announced intention of the Denver and Rio Grande Railway to electrify its main line in the near future. This, says the "Electrical Review," will be the largest experiment of the kind which has yet been undertaken in this country.

"From each according to his ability, to each according to his need," would seem to be the principle of a Chinese storekeeper whom a traveler tells about. The Chinaman asked $2.50 for five pounds of tea, while he demanded $7.50 for ten pounds of the same brand. His business philosophy was expressed in these words of explanation: "More buy, more rich—more rich, more can pay!

Imports of cocoa are now almost three times as large as they were ten years ago. Tea shows an increase of only twenty per cent, while coffee imports are actually less than in 1902. The United States now consumes more cocoa than any other country, Germany following, with France third and Great Britain fourth.

A writer in "Good Housekeeping" tells how he reduced the high cost of living in his own household. He began first where a man would usually begin last—on his cigars, saving $78 a year on this item. Economy in gas and electric light formed the next largest saving—$69. Shaving, shampooing, and lunches were cut $53. The list does not show any personal sacrifices on the part of the economizer's wife—perhaps because she had already done her share in the sacrificial line.

The largest railway shop in the world is, according to one authority, that of the London and Northwestern Railway, at Crewe, England, which employs 10,000 men. A rival claimant for the distinction is Altoona, Pennsylvania, where the Pennsylvania Railroad employs 12,000 men in the busy season.

Sarah Bernhardt will appear in vaudeville performances in this country this winter, in person as well as in moving pictures. She will also present a one-act play by her son, in which she will take the part of a vivandière or camp-follower—thus attesting, at the age of sixty-seven, her irrepressible youth.

North Dakota farmers to the number of 513 entered a corn-growing contest last spring. The winner is the youngest farmer on the list—Harper Brush, aged twelve. On a four-acre plot he grew an average of 71.7 bushels of corn to the acre, for which feat he receives a prize of $50 in gold.

The latest musical innovator in Germany, Herr Schoenberg, is, according to a critic whose views appear in "Musical America," in music what the Futurists or the Cubists are in painting, "or that still crazier cult that represents a hand in motion by painting a succession of overlapping hands. . . . In his music there is no harmony, no polyphony, no rhythm, no form, no logic." Which makes one curious to know why it is called music.

All kinds of weather come to those who wait. Mississippi had a snowstorm in November. There is no previous record of snow in that month in that sunny State; and no snow whatever, it is said, had fallen in the State for ten years.

Many a professional man must envy two recent witnesses in famous trials their wonderful memories. Jack Rose, in the Becker trial, could not be trapped in his statements as to the most minute particulars; while Ortie McManigal, the dynamite informer, is said to have corrected his cross-examiner frequently as to dates and names, though the lawyer had the advantage of written memoranda.

Structural iron workers have been much chronicled of late in the press in connection with dynamite outrages, and it is pleasant to see an item of a different character about one of them. This is to the effect that a Pennsylvania iron worker has just received an unexpected legacy of $10,000 because, years ago, he refused to allow the elderly woman with whom he boarded to chop kindlings or carry coal, but insisted on lightening her labors by doing these chores himself.

Transcontinental travelers, who nowadays in their journey through the West seldom see any game larger than a prairie dog or a jack-rabbit, will be interested in this item reprinted from the "Rocky Mountain Herald" of forty years ago: "Passengers report that antelope have never been seen so numerous as now. Herds of antelope larger than any flock of sheep in the world are frequently spoken of."

The popular idea of the astronomer, says a writer in the "World's Work," as one who spends his time in sleeping by day and peering through the small end of a telescope by night, must be dismissed. "The greater part of the modern astronomer's time," says the article, "is spent in studying photographs," often with a microscope. "Paradoxical as it may seem, an astronomer to-day gazes more often through a microscope than a telescope."

In her book on "Old Irish Life" Mrs. J. M. Callwell says that her uncle, Major William Poppleton, one of Napoleon's guards at St. Helena, received a gold snuff-box from the Emperor. Forty years after the Major's death an inquisitive visitor at his old home in Ireland found a closely folded paper in the box, which proved to be a letter from Napoleon to the Count of Las Cases. The long-concealed letter was finally delivered to Las Cases's son.

Mrs. Callwell tells a story illustrating the wit of the Irish religious controversialist. A Protestant mission meeting had been held, and this was the gardener's contribution to the controversy that ensued: "'Pratestants!' he said with lofty scorn. 'T'was mighty little St. Paul thought of the Pratestants. You've all heard tell of the 'pistle he wrote to the Romans, but I'd ax ye this, did any of yez iver hear of his writing a 'pistle to the Pratestants?'"

England and the Panama Canal

Sir Edward Grey, the British Minister of Foreign Affairs, has made an official communication to the Government of the United States through Ambassador Bryce which fully states the grounds of England's objections to the Panama Act, and her reasons for asking that the questions at issue be arbitrated if the Congress of the United States is unwilling to repeal the objectionable sections of the law. The document is written not only in courteous language but manifestly in a friendly spirit. There is, however, little or nothing in it to change the views which we have already expressed regarding the Panama Canal Act. On one point Sir Edward Grey does not seem to us to make his position clear. At the beginning of his letter, in language that fairly intimates that he himself looks with favor upon the principle of ship subsidies, he states that the British Government does not in the slightest degree deny the right of the United States "to encourage its shipping or its commerce by such subsidies as it may deem expedient." Later on in his letter he declares that the exemption of coastwise vessels from Canal tolls is practically a form of subsidy which is debarred by the Hay-Pauncefote Treaty. These two positions do not seem to us to be consistent. The general objections to the Panama Act stated by Sir Edward Grey are those previously made by British and Canadian newspapers and already summarized in The Outlook. He claims that the Clayton-Bulwer Treaty of 1850 was an agreement between Great Britain and the United States that neither of them would independently build or operate the Panama Canal; that Great Britain agreed to the substitution of the Hay-Pauncefote Treaty for the Clayton-Bulwer Treaty on the distinct understanding that the ships of all nations, including the United States, should be treated on equal terms; that the exemption of American coastwise vessels from tolls is not treating all nations on equal terms, because it makes other nations pay more than their share of the expense of operating the Canal, and because he fears that under the guise of coastwise traffic the United States ship-owners will endeavor to carry on foreign commerce. If the Congress of the United States decides not to repeal the section admitting American coastwise vessels to the Canal free, he urgently expresses the hope that the question may be submitted to arbitration. As our readers know, we do not regard the exemption of legitimate coastwise trade from tolls as a discrimination against foreign commerce. If there is the slightest danger of American foreign commerce masquerading under the guise of coastwise commerce, that is an evil which ought to be dealt with by our own Congress. Moreover, if there is any arbitration of this question, the United States must be assured that every possible step is taken to provide an impartial arbitration. So far as we know, nothing like it has come up in the history of arbitration before. Every civilized maritime nation in the world has important interests at stake in the Panama Canal. What nation, under these circumstances, would Sir Edward Grey propose as the arbitrator?

The Balkan War: The Armistice

During the past week the reasons for an armistice in the Balkan war have become increasingly evident, in so far as Bulgaria is concerned. At the Tchataldja forts outside Constantinople the Bulgarians apparently suffered no real defeat in their recent attack. On the other hand, the Turks apparently won no real victory. But as they were able to fend off the Bulgarian demonstration, this fact has given the Turkish army great heart and enabled it to recover some of its *morale*. The pause in the fighting, extended by preparation for the armistice,

has also given the Turks opportunity further to fortify Constantinople, so that three lines of prepared positions now separate the Bulgarian army from the capital; and of course the strength of these intrenchments will prove a more or less important factor in the definite armistice negotiations. If the Bulgarians were now to rout the Turks from Tchataldja, they probably would have to expend twice the number of rounds fired during the eight days' battle that ended in the victories at Lule Burgas and Bunar Hissar. Indeed, it is claimed by those who know that the taking of the present positions held by the Turkish army would be as expensive to the attack as was Liaoyang to the Japanese eight years ago. That does not mean, however, that the reinforced Turkish army could not be beaten by the Bulgarians; but many believe that if the Bulgarian army were kept in the field another three months it would be morally and materially exhausted. Hence, from the Turkish standpoint at least, though Bulgaria appears diplomatically to be in a position to dictate, in a military way she is not. The same applies to Servia and Montenegro, but not so strikingly to Greece, which as yet has not signed the proposal for an armistice, although, like the other allies and Turkey, she has sent representatives to a conference in London. The Turkish delegates, however, have been instructed by the Ottoman Government to decline to treat with the Greek delegates until Greece has signed the armistice. The Greek activity last week in Epirus would hardly indicate any great anxiety on the part of Greece for an armistice.

The London Conference: The Allies

Last week the delegates from the allies and Turkey arrived in London to decide upon conditions for an armistice. It may seem strange that a place so far away from the seat of war as London was chosen. But it was considered desirable that the meeting should occur at one of the great capitals; and of them all, London was thought to be the most neutral. A like reason controlled the choice of London as the meeting-place of the Ambassadors from the six Great Powers—England, France. Russia, Germany, Austria, Italy. Other things being equal, the capital of a neutral state like Switzerland or Holland would have been preferable. But the Powers accredit Ministers to Berne and The Hague, not Ambassadors. Only the most completely empowered plenipotentiaries will answer the present purpose, and the Powers were unwilling to raise their representatives at Berne or The Hague to this dignity. Nor was there time to appoint and find acceptability for special ambassadors. As it happens, the present representatives of the Powers at London are on the highest plane of efficiency and ability and are severally acceptable to all the Powers. Besides this, no Foreign Minister enjoys greater confidence than does Sir Edward Grey. There were thus good reasons for the choice of London for this Conference of the Powers' representatives. The Conference of the delegates from the Balkan allies and Turkey are to meet in the historic old St. James's Palace—where certainly they will find themselves amid surroundings conducive to peace. The conference room overlooks a century-old, grass-grown quadrangle entirely shut off from street noise. A long table stretches down the middle of this room, and on the table are placed silver-mounted portfolios for all the delegates. The subjects before the Conference are:

The new boundaries in the provinces of Thrace, Macedonia, and Albania as the result of the successful advance of the allies.

The disposition of the fortress of Adrianople and the city of Salonika.

The disposition of the district of Novibazar.

The question as to whether Albania is to be erected into an independent state.

The claim of Servia to an Ægean or Adriatic port.

The claim of Greece to Crete and the islands in the Ægean Sea.

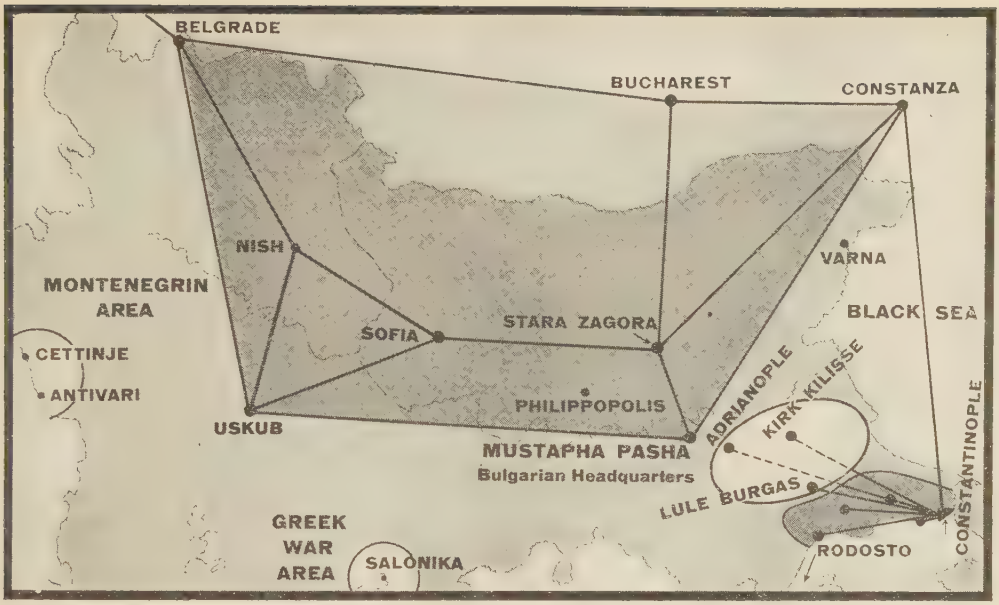
The question as to what indemnity, if any, Turkey shall pay to the victors.

The adjustment of the Turkish debt.

The guarantees to be given by Turkey for the well-being of Christians in any territory now occupied by the allies but to be restored to Turkey.

The London Conference: The Powers

Of the questions before the Conference of the Great Powers, the most insistent is that of Albania. Regarding it the position of Austria and Italy will challenge interest owing to the joint statement made by their Governments that they would not allow any partition of Albania. Aside from this, Austria will see to it that her special commercial interests, particularly at Salonika, are preserved; and Italy will see to it that her general influence in the Balkans, now immensely heightened by her success in the Italo-Turkish war, is increased, for the Italians do not forget Mazzini's prophecy concerning that increase whenever the Turk-



FROM THE LONDON "SPHERE" THE WAR CORRESPONDENTS IN THE BALKAN WAR

This diagram shows in white areas some of the principal war regions. The war correspondents were assigned to the dark areas

ish Empire shall fall! Interesting also will be Russia's attitude, not only in demanding that at last the Dardanelles be freely opened to her Black Sea fleet, but, as the head of all the Slav nations, and especially as the moral protector of Bulgaria, Servia, and Montenegro, in guarding their interests, particularly Servia's. Thus the Conference may represent, in condensed form, the might of Pan-Slavism pitted against Pan-Germanism—France and England guarding the Slav interests as represented by Russia, and Germany and Italy the Germanic interests as represented by Austria. Out of this clash there may and should come a measure of far greater justice than has yet been enjoyed by the Balkan nations, and this with entire conservancy of the interests of the Powers. There is a reasonable prospect of this. For, as Sir Edward Grey said last week in the House of Commons, the very fact that the Powers have agreed to come to closer quarters for discussion may be taken as evidence that no one among them believes in the impossibility of amicably solving present international difficulties; or, indeed, that an agreement is not much more probable than a deadlock. Certainly, when the Ambassadors are in a position to discuss the questions before them around a common table, they will be in closer touch with each other, and there should be less danger of any of them drifting apart.

The Balkan War: War Correspondents

As the accompanying map shows, war correspondents are not now, as they were once, ubiquitous. The events of the Boer War indicated to the English generals the advisability of restricting the correspondents' freedom. Acting on this, at the very outset of the Japanese War only a few chosen correspondents were allowed to follow the forces. In the present war in the Balkans the correspondents have been still further restricted. Only one, Lieutenant Wagner, of the Vienna "Reichspost," has been permitted to accompany the forces of the allies. Other correspondents have not been allowed to approach nearer the chief war area than the towns of Stara Zagora and Mustapha Pasha. It is even said that not one of these men has seen a gun discharged, though some declare that they heard firing at various times! The accounts sent by Mr. Ashmead Bartlett, correspondent of the London "Telegraph," Mr. Martin Donahoe, correspondent of the London "Chronicle," and Mr. Ward Price, correspondent of the London "Mail," would indicate that the Turkish Government had been much more lenient. The accounts sent by these correspondents will take their place alongside of equally noteworthy accounts of other fighting of other days in the Balkans sent by MacGahan and Archibald Forbes, and the

men of their time. The correspondents of 1912 in Bulgaria descended in swarms on Sofia, the capital, and the military authorities began to consider what to do with them. The London "Times" correspondent says:

A number of officers . . . set about the business of organizing the Censor's Bureau. Through the irony of a wrong reference to a page in a dictionary, they called it in English the "Office of Censure," instead of "Office of Censor," and amateur critics started to work very hard trying to live up to the mistake.

The Censurers drew up a booklet of close upon a score of pages, setting forth what the correspondents might not do and might not send to their newspapers. After reading this volume carefully, one correspondent ventured the suggestion that evidently it would be permitted to write only about the weather. "Oh, not about the weather, I think," suavely and seriously answered the Censurer; "it might contain information in regard to the difficulties of a winter campaign, or the effect on the troops; in any event, it would come under the rule forbidding news about the state of the roads and highways, because they are in these parts much affected by the weather."

So much for what the correspondents might not write. Now as to where they might not go. They were long kept bottled up in Sofia, living, as the "Times" correspondent says, at expensive hotels, "the corridors of which were littered with the paraphernalia of a camp." They were kept "more or less quiet with assurances that to-morrow and to-morrow and to-morrow they would 'proceed to the front.'" Eventually they were put on a special train and left Sofia "one jolly morning like the members of a Sunday-school picnic party." But what was their surprise, on arriving at Stara Zagora, to find that they had been simply traveling west to east parallel with the general fighting line, and were actually no nearer it than they had been in Sofia. They were kept for a week at Stara Zagora, during which Kirk-Kilisse and Lule Burgas fell. After this the correspondents were put into another special train and taken south to Mustapha Pasha, "which, at any rate," the "Times" correspondent writes, "was over the border in the enemy's country." The correspondents remained in Mustapha Pasha, and, as the "Times" man adds, "they remain there to this day."

Bavaria's Regent

Last week, at the ripe age of ninety-one, Luitpold of Bavaria died. We are accustomed to think of the Emperor of Austria as an old man, but Luitpold was nearly a decade his senior. Indeed, the late Prince Regent of Bavaria was the oldest of rulers. It has been Bavaria's good fortune to have him as her ruler for a quarter of a century; and his loss will be severely felt. Bavarian history should accord him a high place. Before 1870 he had been a notable military leader. He was to become a notable factor not only in Bavarian but also in German history. He it was who had much to do with persuading the German rulers to offer the Imperial German crown to King William of Prussia. As, after Prussia, Bavaria had always been by far the largest factor in the federation of kingdoms and duchies which now make up the German Empire, Luitpold's service was vital to the success of that Empire's formation. In particular he induced his eccentric nephew, King Louis II, to write the letter conveying the wishes of his fellow-rulers to the King of Prussia regarding the proclamation of the Empire and inviting William to assume the Imperial dignity. Louis had shown much reluctance about the matter, and at one time it almost seemed as if his objections might prove an insuperable obstacle to the Empire's formation. It was thus fitting that Luitpold should be the representative and plenipotentiary of Louis to William and should hand the letter to the victorious Prussian monarch at Versailles. In 1886 Louis died. He had become, like his brother, the present King Otto, hopelessly insane. Luitpold, in the event of King Otto's death next in succession to the throne, assumed the regency. But he would not listen, then or since, to the constant suggestions from Bavaria's best friends that he assume the title of King. He argued that nothing in the Bavarian constitution warranted the barring of a Prince from the throne even on the score of madness. He placed principle above expediency. A like rectitude characterized his relation to the civil list provided by the constitution for the monarch. He could have used this revenue with his subjects' approval; instead, he devoted it to paying Louis's enormous debts. As to his relations with the country, he was alert in developing it agriculturally and commercially. As to its capital, Munich, Luitpold, a notable patron of the arts and crafts—indeed, his very last public gift was to art and artists—developed the city more and more as an art center; in all respects it has now come to be, from one of the poorest of the European capitals, one of the most prosperous and advanced. Luitpold's relations

to his subjects may be indicated by citing the German Emperor's act twenty years ago or so, when he wrote in the Golden Book in the Munich town hall: *Suprema lex regis voluntas* (the King's will is the supreme law). But some years later Luitpold wrote in the same book *his* guiding motto, *Salus publica suprema lex* (the public good is the supreme law), to which he modestly added, "If I have succeeded in winning, as it seems, the affection of the Bavarian people, it is because I have had wise counselors who have perpetually reminded me that the good of the whole people is the only supreme law." Finally, Luitpold was immensely popular because Bavarians saw in him an embodiment of their own virtues. Kindness of heart and simplicity of manner are certainly Bavarian characteristics, and he exemplified them. Moreover, he was a real democrat: his comradeship with his trusted servants and guides was unaffected. Portraits of him in simple mountaineer's costume, with a rifle over his shoulder, are seen in every Bavarian village tavern. They will long remain there.

The Chinese Loan

In reviewing, in our issue of November 30, the Clark University conference on China and Chinese affairs, we commented on the address of Mr. Willard Straight, formerly Consul-General at Mukden, and now a representative of the American bankers concerned in what is known as the "Six Power Groups" of American and foreign financiers who have been negotiating a loan of three hundred millions of dollars with the Chinese Government. Mr. Straight now writes to us to say that our report of his speech was in some particulars inaccurate. It will be recalled that groups of bankers representing six of the civilized Powers of the world, namely, England, France, Germany, Russia, Japan, and the United States, have entered into an affiliation or syndicate or agreement by means of which Chinese bonds representing the three hundred million dollars of which China is in need shall be underwritten and sold in the financial markets of the world. In our editorial we said that the delay in recognizing the Republic of China was to some extent occasioned by the influence of these Six-Power Groups, and that this feeling was strengthened among some members of the Clark University Conference by Mr. Straight's address. Mr. Straight writes to say that he cannot see how any careful examination of his address can justify this statement, that he knows it to be untrue that the American group has exercised any influence to delay American recognition of China, and he believes it to be untrue of any of the foreign banking groups. He states that the Six-Power Groups have never claimed the right to make the only loan which shall be made to the Chinese Government, and that they have protested against independent loans only when those loans violated the terms of contract in accordance with which the Six Groups had already advanced money to the Chinese Government. Mr. Straight's contention that we did not adequately report the conditions upon which the Six Groups are willing to loan three hundred million dollars to China we think is well founded. These conditions are briefly as follows: That the Groups shall have a full knowledge as to the purposes for which the loan is to be expended; that the Groups shall have some voice in auditing the spending of this enormous sum of money; that the Groups through a proper representative shall have some supervision of the salt taxes which guarantee the payment of the loan; that the price of the series of bonds issued by the Groups after the first series has been issued shall depend upon the market price of the first series, thus giving China the chance to increase the returns she gets from the sale of these bonds by improving her credit; that China shall not borrow from anybody else while she is borrowing the three hundred million dollars from the Six Groups; and that for five years the Six Groups shall be recognized as the financial agents of China. A reading of the complete copy of Mr. Straight's address further indicates that he believes that a Six-Power loan thus administered is not only not a hardship upon or a disrespect to China, but is practically the only way in which the geographical and national integrity of China can be secured. We are glad to print this statement as to Mr. Straight's actual position. For our part we simply add that the main object which we wish to see accomplished is the maintenance of the national, geographical, and commercial integrity of China. China has been so exploited in the past that it is not unnatural for those who sympathize with her political and social development to be suspicious of the influence of the great financial powers of the world in her reorganization.

Of course it is philosophically unjust to consider that the Six Powers in their relations to China are guilty until they are proved innocent; but students of recent English history have not forgotten how even so fine and human a type of statesman as Lord Palmerston was led, by the power of British finance which he was unable, or thought he was unable, to resist, to promote the unjust opium trade with China. The moment that the Six-Power Groups make it clear to the world that they are determined to defend China from partition we shall support them heartily.

The Conference of Progressives in Chicago

If a victorious party, in the flush of its triumph, with the prospect of a successful administration of the Government, were to hold a ratification meeting for the exchange of mutual congratulation and for the consideration of methods in the exercise of governmental powers, it would be an unusual and noteworthy event. There was such a gathering last week at Chicago—the only difference being that the party whose representatives assembled was not a triumphant party, but a defeated one, and, with the exception of two or three States, had little or no governmental power intrusted to it. On Monday, Progressives from various parts of the country began to gather. On Tuesday morning several hundreds of them, representing all the States in the Union, crowded the great ball-room of the Hotel La Salle. The observer, whether a believer in the party or not, could not fail to notice the fact that these people, men and women, were devoted to a cause in which they thoroughly believed. One observer, not a supporter of the party, remarked upon another feature of this assemblage—the character of the individuals of which it consisted. This was not a convention in any sense. Those who attended it were not delegated representatives. The members of the Progressive National Committee were, of course, for the most part there, and many State chairmen, county chairmen, and members of State and County Committees. There were also, however, many members of the party who had no official position. The Conference, therefore, could take no action with regard to political matters as a Conference. It was what it was called, a "family gathering." Whatever definite action was taken as a consequence of this Conference was taken by the National Committee of the party or the party's Executive Committee. The Conference, however, served as a reflection of the general sentiment of the party membership throughout the country. In that respect it was exceedingly interesting, not only to the supporters of the party, but also to the party's opponents. As they gathered, probably uppermost in the minds of the great majority was the invitation which had been informally extended by certain Republican leaders to the party to enter the Republican fold. The assumption in this invitation seemed to be that the Progressive party was an offshoot or faction of the Republican party, that its distinctive object was ephemeral, that it was organized for the purpose of retaliation against certain Republican leaders, and that, now that those leaders had suffered a severe political defeat, the four million Progressives would only wait the word from Republicans to return to the old party. The first reference to this suggestion made it perfectly evident that the informal invitation was emphatically declined. In fact, those who were present were not in the mood even to consider the suggestion seriously. There were two reasons explicitly given. First, that the Progressive party was committed to a certain great programme in which it thoroughly believed, and for which it was determined to contend; that therefore, while the party would welcome to its ranks any one who believed in this programme, and while it would work with any one, whatever his party affiliation, who would promote the programme, it could not consider for an instant any abandonment of its position as a distinctive party, because such an abandonment would be an abandonment of its convictions. Second, that the party was not composed solely of those who had formerly voted the Republican ticket, but of a considerable number of those who in times past had been Democrats. As was natural, the Chairman of the National Committee called the Conference to order when it first assembled on Wednesday morning, and the party's candidate for the Presidency in the recent campaign, Mr. Roosevelt, made a speech expressing his view of the present situation. The Conference then proceeded to the consideration of two subjects, one the furthering of the principles and policies in which the party believed, and the other the maintenance and financial support of the party as a working force. A plan to deal with the first subject was offered by Miss Jane Addams, of Hull House,

Chicago. This plan covered the purpose of extending a knowledge of Progressive principles, and, so far as possible, embodying them in law through whatever agencies might be available. Her plan comprised the establishment of what is called the Progressive Service, comprising the six following bureaus: Education and Publicity, devoted to the creation of public sentiment: Legislative Reference, devoted to the expert task of providing bills and presenting them to legislative bodies; Social and Industrial Justice, for the further study of questions under this general head; Conservation, for the study of conservation questions; Cost of Living, which would include in its subjects the tariff and the trusts; Popular Government, including such questions as the initiative, referendum, recall, suffrage, etc. According to this plan there would be a Chief of the Service and a Director of each subsidiary bureau. A plan regarding the other subject—the maintenance and financial support of the party—was then proposed by Dr. Walter Weyl. He pointed out the weakness of the proposal that the Government appropriate money for the use of political parties, and cited in contrast the advantages of the plan followed by certain parties in other countries, and the Socialist party in this country, under which members contributed to the funds by regular payment of dues. For the rest of the time the Conference was transformed into what was practically a public forum, at which suggestions were received from a great number of speakers. These suggestions were referred to the Progressive National Committee as the only body that could take action. At the close of the Conference the National Committee met, chose New York as the permanent party headquarters, adopted virtually Miss Addams's plan with regard to the Progressive Service, adopted rules applying to itself the principle of the recall, and submitted a plan with regard to financial contributions for the immediate needs of the Headquarters and the Progressive Service.

The Freedom of the Press

If the bald proposition were made by itself that the United States Government should exclude from its mails papers advocating prohibition on that ground solely, the protest on behalf of freedom for the press would be universal. The right of Congress to do this was maintained by the Solicitor-General of the United States in arguing before the Supreme Court a case growing out of recent legislation intended to increase Federal regulation over the mails. The words of the Solicitor-General (we quote from a report in the New York "Sun") were as follows:

> We submit that Congress has the unrestrained power to say what, in its opinion, is so hurtful to the public welfare that it should not pass through the mails; and that it may enforce that opinion without its correctness being subject to judicial review. . . . It surely may prescribe any conditions concerning the mail matter itself, whether as to size, weight, *character of contents*, purposes for which sent, etc. . . . If such views [those of a newspaper's owners] are expressed in the paper, Government can doubtless exclude them, just as Congress could now exclude all papers advocating lotteries, *prohibition*, anarchy, or protective tariff if a majority of Congress thought such views against public policy.

The distinction between such absolutist control of the press and that which the United States Constitution forbids as "abridging the freedom of speech or of the press" seems to many to be one of shadow and not of substance. Mr. James M. Beck, in maintaining in behalf of the press the fallacy of the dogma propounded, quoted Daniel Webster's utterance when an attempt was made to exclude anti-slavery papers from the mail: "Any law distinguishing what shall or what shall not go into the mails founded on the sentiments of the paper and making a deputy postmaster a judge, I should say, is expressly unconstitutional." The fact, however, that such power as the Solicitor-General ascribes to Congress could be used for the injury of the people is not of itself a proof that it is unconstitutional, or even that it ought to be made unconstitutional. Congress has many powers that it can abuse. The way to prevent the abuse of those powers is not to take them away by Constitutional provisions but to elect a Congress that will not abuse them. Whatever the theoretical rights of Congress may be, any practical attempt to exclude expression of opinion or belief which did not actually incite to crime or revolution would meet swift condemnation from the people.

James Wilson's Sixteen Years of Service

The American Government does not exist merely for the purpose of governing. It also exists for the purpose of benefiting those it governs. This has been emphasized, as much as anywhere else, and perhaps more, in the Department

of Agriculture. When the Department was formed, its first Secretaries did what they could towards obtaining statistics concerning the production and movement of crops. But when Mr. Wilson took charge, he saw that the Department, in order to be entirely efficient, should be something more than merely a statistical bureau. Accordingly, we find pages in his reports devoted to such a subject as Agricultural Credit, for instance, as many more devoted to the Weather Bureau, and very many devoted to the other bureaus that have sprung up during his administration—those of animal industry, of plant industry, of soils, of entomology, of biological survey, etc. Let us take the subjects treated in the first bureau alone and we will find that they cover meat inspection, horse and cattle-breeding, sheep and goats, poultry and egg investigations, the eradication of animal diseases, especially tuberculosis and hog cholera, the distribution of vaccine, dairy-farming, manufactures and research laboratories, milk investigations, and the export and import of animals. To the various bureaus there is always to be added the Forest Service, and the report this year is of particular interest owing to the impending assault of the Democrats in Congress on Federal ownership of forests and in favor of their favorite States' right doctrine. Thus, while Mr. Wilson has been criticised for some limitations, he has accomplished a very great work in emphasizing the diversification of agriculture, especially in showing how land, to be truly efficient, should produce different kinds of crops. In this Mr. Wilson gave as much rein as possible to the scientists and investigators under his control. As he says of the Department:

> During sixteen years it has progressed from the kindergarten through the primary, middle, and upper grades of development, until now it has a thousand tongues that speak with authority. Its teachings, its discoveries, and its improvements are permeating the national agricultural life. The forces that are at work must cause ever-increasing results.
>
> The great and growing movement carried on by the Department for agricultural betterment has not been sustained solely by one man or by a few men. A choice corps of scholarly experts in their special lines of endeavor has been growing in membership, in breadth of view, and in the practical application of their efforts. They have been and are men both good and true, men with high ideals, often sacrificing greater remuneration and private employment for love of the great results of their public service.

Agriculture and Character

Now as to agricultural production. During these sixteen years it has advanced from an annual value of about four billion dollars, and ends with a production for this year worth over nine billion five hundred million. Sixteen years ago, as the Secretary writes, "farmers were loaded with debts that were a painful burden. . . . The farmer was a joke of the caricaturist." But "now he is like the stone that was rejected by the builder and has become the head stone of the corner." The production from the soil and the farmers' live stock has grown to more than twice the value of the wealth produced on farms even as late as 1899—and during the sixteen years the farmers' wealth production has increased by no less than 141 per cent. The chief crops, in value, are now, in order, corn, hay, cotton, wheat, oats, potatoes, barley, tobacco, flaxseed, rye, rice, buckwheat, and hops. All of the above cereals, except wheat and rice, produced their largest crops this year. Live-stock products now amount to a third of the value of the annual wealth production of the farm. Interesting as are these results, our interest in them is far outdistanced by the thought that the greater production of crops is the most effective move toward a reduced cost of living. The greater crop movement has been more remarkable in the South than elsewhere, because the South has needed it most; and hence the Department made there its greatest effort. The result has been a gratifying increase from the South in food supplies. But this is only the material part. The Southern farmer has been taught self-reliance, and to help himself in so far as related to the practices of the farm; any effort made to help him by mere object-lessons in which he did not actively participate was found to be a failure. The scope of the work has been gradually enlarged from simple demonstration in cotton culture to a comprehensive system of instruction in general agriculture, including the organization of boys' corn clubs and girls' canning clubs. There are now enrolled in the boys' clubs nearly seventy thousand boys, and in the girls' clubs about twenty thousand girls. While all the Department's work seems not only an economic but a very human endeavor, this work among the boys and girls of the South has been, to our mind, of most value, for it has not only increased production prodigiously, it has also developed character. A Department with about twenty-four hundred

employees in 1897 has increased to one now having nearly fourteen thousand employees. That this is not merely a bureaucratic increase may be inferred from the fact that in 1897 there were but about five hundred requests a week for department publications; now every week brings no less than fifty-two thousand requests. Of all this force of men, and of all these various engineries, Mr. Wilson has been the directing and responsible head. He approaches retirement at the age of seventy-seven with a double distinction. Under him, his Department has seen a development and a diversification such as has no other department; and he has the longest record ever made by a Cabinet officer. He has served continuously for sixteen years.

Worse Than Useless Giving

Some of the daily papers have amused themselves by facetious comment on a word newly coined—"Spug." There is nothing at all amusing in the facts that have called into existence the Society for the Prevention of Useless Giving, from the initials of which the word is made. One kind of giving against which this Society is earnestly striving is worse than useless, for it is a kind of blackmail. In some of the great stores, for instance, it appears that the clerks are called on by collectors who are gathering together money to make Christmas presents to persons in minor authority in the store. Giving of this kind is almost obligatory, and the girls who have been subject to this exaction fear to lose their places if they refuse to contribute. Even where this kind of pressure is not brought, the collection of money for this purpose is an unfair burden on the girls, and in some known cases has been carried to an extravagant point. We have been told, for instance, on good authority, of one young saleswoman on a weekly salary of twelve dollars, who gave for presents in the store the (to her) immense sum of seventy-five dollars, and of another who, having been independent enough to refuse to give five dollars, has been boycotted by others. It was in such instances as these that the Society for the Prevention of Useless Giving took its origin. It was a natural outgrowth of the Vacation Savings Fund which encourages saving for self-supporting women in New York, and has now on its books over six thousand women, who have deposited thirty thousand dollars. The kind of Christmas presents above described are not unlike presents made to teachers of schools. This kind of giving is usually an embarrassment to the teachers, and is an unfair burden to many of the parents and pupils. The practice has, we think, generally been abandoned, although it still exists in some places and at this season of the year often produces ill feeling and local agitation over the question. Apart from the question of semi-obligatory useless giving, the new Society points out in all its literature the evils of indiscriminate and extravagant presents at Christmas, and emphasizes the fact that Christmas is in its essence not so much a time for present-giving as for showing good will in all sorts of ways. It adds: "The charm of a gift lies wholly in the fact that it is given by a friend. It ought to show unselfishness, some personal effort to please by thoughtful selection, appropriateness."

Better Housing: Improved Health

The problem of housing is one of the most human and humane of problems. Last week occurred an important step in the crusade to secure better residential conditions for the wage-earner. The occasion was the Philadelphia Housing Conference. There were two hundred delegates from all parts of the State. But, as the evil transcends the bounds of any State, so the addresses were of a character to be suggestive to those who deal with the evil in other States. The address of Mr. Lawrence Veiller, the Director of the National Housing Association, was notable because it brought out the fact that the things which strike the experienced as showing bad housing are not so detrimental to health and morals as other things not so evident on the surface. Mr. Veiller said, as reported:

> For instance, a house may present a dilapidated appearance from the outside, have a leaky roof, clapboards and shutters off or hanging by a single hinge. But dilapidation is not nearly so dangerous as bad plumbing. Then there is the evil of the vault, which cannot be overestimated. In fact, I consider it the greatest evil in the country, and the most potent source of disease in America.

Concerning another phase of the situation, Dr. Bliss, editor of the "Encyclopædia of Social Reform," asserted that unsanitary environment was driving the girls to the dance-halls and the men and boys to the saloons; thus an overwhelming number of the girls of New York City were known to

frequent dance-halls, where their associations could not be said to be elevating; but, he asked, where else were they to go? They craved society, and rightly so. If they went to certain places provided by social workers, they were patronized, and, as free American girls, they resented it. Dr. Bliss advocated following the plan already adopted by several German cities, Berlin and Ulm, for instance, where the municipality owns a large proportion of the area of the city and encourages the building of low-priced homes on the land, which it sells and leases at cost to those who improve it in this manner. This is certainly far better than the erection of homes on so-called "easy payment" plans, where the builder is practically at the mercy of land speculators. If this were done, our cities might be better compared with the best municipalities abroad. Certainly it would lessen the charge of such a keen critic as Mr. Bryce that the main trouble with American civilization lies in the government of our cities.

Sunday Attendance at Art Museums: Europe

The Sunday attendance at our art galleries and museums is increasingly and gratifyingly large. In New York and Chicago it amounts to a third of the total attendance; in Buffalo and Toledo to two-thirds. This might indicate that our custom may ultimately follow that of Europe, where, with the exception of London, Amsterdam, and Berlin, the museums are generally opened Sunday mornings as well as Sunday afternoons. They are not open Sunday evenings, or any evenings, because most of them have no facilities for artificial lighting. In London the National Gallery, the British Museum, and the South Kensington Museum are open after 2 P.M. In Amsterdam the Ryks Museum is open after 12:30 P.M., and in Berlin the Old and New Museums and the National Gallery are open after 12 M. In the other cities, however, a more liberal plan prevails. In Paris the Louvre, Luxembourg, Cluny, and Arts Décoratifs; in Munich the Pinakothek and Glyptothek; in Milan the Brera and Castello; and in Florence the Uffizi, Pitti, and Bargello, are all open on Sunday morning. Thus, on the Continent, those who wish to visit the museums on Sunday have, as a rule, ample opportunity for so doing. On Monday, however, there is generally a different schedule from other week days, in order to give opportunity for a thorough cleaning of the museums after the visit of the Sunday crowds. They would be cleaned at night if they were equipped with facilities for lighting. In some cities, as in Paris and Amsterdam, the museums are closed entirely on Monday. In others they are open a little later in the morning; in others still they are open all day after ten o'clock, the cleaning being done very early in the morning. Many American directors believe that our galleries and museums should be open all day on Sunday, and one of them writes to The Outlook as follows:

> Our Museum is never without a guard. On Sunday mornings we leave instructions that if any one from out of town comes, or any one of the members who cannot visit the gallery in the afternoon comes, he or she shall be allowed to enter. Monday mornings we always allow strangers to enter, even though the cleaning is going on. We leave Monday mornings free to clean the gallery after the great crowds which always frequent museums on Saturday and on Sunday afternoons. . . . Personally I do not believe in ever closing a museum.

Sunday Attendance at Art Museums: America

The Outlook's recent editorial on the attendance at art museums, in which the Sunday attendance was mentioned, has elicited some interesting correspondence indicating three prevailing opinions on the subject. The first is that the museums should be closed on Sunday; the second, that they should be open half of Sunday; and the third, that they should be open all of Sunday. The first is based on the supposition that those who have no time to visit the museums during week-days could visit them during the evenings of the week, were the museums so opened—as they should be; it is also based on the assumption that otherwise there would not be one day's rest in seven for the museum employees; in other words, that the museums could not be opened on Sunday unless they had two sets of guards, which of course would be expensive. According to the second opinion, while the guards of a museum should not be asked to give up all their Sundays, they can come at one or two o'clock on Sunday and remain until five or six o'clock, for extra pay and without very great hardship. The third opinion is that the museums should be opened all day on Sunday, and that the guards can "make up" the time for rest by taking it on Monday, the museums being closed on Monday, as in Paris. The secretary of one of our museums writes: "We have overcome the difficulty of our guards

working seven days a week by having one extra guard for every six men. In this way the extra man gives each of the guards one day of each week." In addition, there is the question of cleaning. If the museum is to be opened all the week and all day Sunday, when can it be cleaned? This could be done Monday mornings, as in Europe. A more reasonable objection is that our museums would not have many visitors on Sunday morning compared with those on Sunday afternoon, because Sunday morning is a time generally set aside for church attendance and home life, whereas Sunday afternoon would be preferably the time for visiting the museums. Moreover, if the museum were opened on Sunday morning, it might seem like setting up opposition to the churches. Some of those who oppose Sunday morning opening would, as an offset, favor extending the time into the evening—a good idea. Such a plan is in force at the Art Institute of Chicago, which is, so far as we know, the only museum in the world open on Sunday evening. While our museums may ultimately be open all day Sunday, the custom of Sunday afternoon opening is probably the one wanted by most visitors at present.

A Good Example

In recent investigations in New York City as to the prevalence of vice it has been repeatedly stated that gambling-houses and other evil resorts were in many instances owned by men of at least nominally high standing and of great wealth who in many cases were entirely ignorant of the character of their tenants. Where this ignorance exists, it is due entirely to the fact that often such men put their property in the hands of others and pay little personal attention to its management. We are glad to note in the papers of last week that Mr. Vincent Astor, who only last month became of age and took over the large estates which have been standing in his name since his father's death, has undertaken what is described as a minute as well as a general inspection of all his properties, with the purpose of finding out whether or not any are used for wrong purposes. The personal investigation seems to have been made quietly and without suggestion from others. It has every appearance of being a genuine and unsensational attempt by a property-owner to inform himself intimately and thoroughly of the conditions of the property for which he is ultimately responsible. Such an incident is encouraging in itself, and may well afford an example to other large property-holders.

The Young Men's Christian Association and the Panama Canal

A new demonstration of the growing demand for social, religious, and recreative influences and conveniences by large numbers of American men isolated geographically, from the nature of their work, will reach its culmination in the late summer of 1913, when the waters of the Pacific and Atlantic Oceans meet in the Panama Canal. The Young Men's Christian Association will then have proved, if proof were necessary, its ability also to perform a colossal feat—that of surrounding a vast army of men working and living under the most trying conditions with personal conveniences and comforts, human requisites, sufficient to keep them contentedly at their tasks. The Association has consistently "followed the flag" since the Spanish-American War; its work among the soldiers was no less distinguished than that of the Red Cross or any other agency having to do with the human side of armies. In the days which followed the American occupation of our Pacific possessions the organization had a thoroughly salutary effect as a factor in the social and moral life of the islands. Its trained secretaries also followed close upon the commercial awakening of Japan and China, and are to-day prominent in the development of those two countries. While virtually a foreign field, the Panama Canal offered difficulties rarely found abroad. Conditions of climate, sanitation, and general surroundings in which American engineers and artisans were forced to live and work during the early days of Canal building were such that few native Americans had the hardihood or the nerve to undergo them. In fact, the men were in a state of exodus when the Young Men's Christian Association secretaries arrived there to establish their educational, social, recreational, and religious facilities and equipment. Mr. A. Bruce Minear, railway secretary of the International Committee, who was sent to the Canal Zone to investigate conditions and establish Association work, makes the statement that the workmen were returning by the first boats to the States almost as rapidly as they arrived.

The problem of stemming this return tide had been as perplexing as the problems of engineering and sanitation. But the Association came with a solution; the effect was soon apparent. The workmen stayed to finish the job. To-day every department of the successful, aggressive Association plant flourishes there, with no abatement in activities due to the tropical heat. Indoor and outdoor athletics, classes in all educational branches, religious meetings and Bible study, entertainments by "home talent," imported lectures and entertainments, recreational games, amusements—even ice-cream soda fountains—characterize the work of the Association on the Canal Zone. In some communities the membership is as high as ninety-five per cent of workmen and the buildings are centers from which the social and religious activities of the people radiate. The fifteen secretaries, trained for their work, are in reality "moral engineers" who have cultivated the moral sentiment which originally was so conspicuously absent. This is the first time the Government has ever provided in such a thorough manner for the social and physical welfare of its employees, but officials are now convinced that the expense assumed for buildings, equipment, light, water, repairs, and salaries for secretaries is really a high-interest-bearing investment. It seems doubtful, indeed, if Colonel Goethals could have saved time so enormously without the aid of this work. Judging from this present success, perhaps it is not too much to expect that all future Government enterprises in which regiments of workmen are engaged will include the employment of Young Men's Christian Association secretaries and the maintenance of properly equipped buildings.

The American Civic Association

The recent annual Convention of this vigorous organization, held in Baltimore for the good of that city, emphasized again the growing strength and practicability of the civic impulse in America. Men and women from many States and from Canada came together, not to recount hackneyed experiences, but to present concrete statements of actual advances in that sort of community betterment which makes for the highest citizenship. The keynote of the present day effort was struck in President McFarland's annual address on "Not Only the City Beautiful," in which he argued for community advance upon a plane which makes of mere beauty an incident to the provision of all that tends to true individual and collective working efficiency. Miss Miller's illustrated experiences in the provision of a place for children in city planning continued the humanitarian note, while Mr. Parker's presentation of his novel scheme, which is in actual operation, for using only one-fifth of the calculated average recreational time and expenditure of the public to make a great park system more useful and also entirely self-sustaining, offered a new resource for combating wrong and ill health. Wasteful coal smoke, disease-carrying flies, and the distressingly blatant billboard came in for adequate attention. There was reiteration at many angles of view of the need and value of wise community planning. The need of the Nation for planning and concrete management in connection with its constantly assailed and yet unorganized National parks was brought out by Secretary of the Interior Fisher, at a session over which he presided, while the Hon. James Bryce, the retiring British Ambassador, delivered the notable address on the future of our National parks which was published in The Outlook of last week. A pleasant tribute was paid to Mr. Bryce when he was, at the following session of the Convention, made the third honorary life member of the Association, his fellows being Mr. Roosevelt and Senator Theodore Burton. In a notable symposium on capital cities, Mr. Walter Burley Griffin described and illustrated his extraordinary plan for the new capital of Australia, for which he won first prize in a world competition. The completeness of provision for a national capital, from every standpoint of use and life and dignity, in its relation to the features of the land and the location, gives a fair hint of what might be if ever we should make cities as wisely as we know how in America. Through all the sessions of the Convention there flowed the strong current of earnestness, practicability, and enthusiasm which has made the American Civic Association an organization of such great value to America.

Scandinavian Art

At the American Art Galleries in Madison Square, New York City, the American Scandinavian Society has opened an art exhibition to which general attention should be directed.

It is perhaps the first occasion when the three Scandinavian countries—Denmark, Sweden, and Norway—have united in such an endeavor. This exhibition is under the patronage of Kings Christian X of Denmark, Gustaf V of Sweden, and Haakon VII of Norway. They have delegated as their representatives, respectively, their Ministers to the United States, Mr. Brun, Mr. Ekengren, and Mr. Bryn. Americans know little about Scandinavian art. The little that they know is, for the most part, represented by Anders Zorn, the Swedish painter and etcher. Zorn's peasant types have made us acquainted with Swedish life as well as Swedish art, and there has been from the first for this painter's work an enthusiasm which, while never a "craze," has been a steadily growing appreciation. But another name in Swedish painting may now take high place. We refer to Prince Eugene, brother of the reigning monarch. Prince Eugene was born in 1865. Princely in his attitude towards the welfare of the people, especially of those engaged in the arts and crafts, he himself has also been a notable worker in the arts and crafts. He is specially well known as a landscape painter, and any one who has journeyed in Sweden and enjoyed the loveliness of the landscapes there, as distinguished from the more rugged scenes in Norway, would appreciate the sincerity of the art displayed on Prince Eugene's canvases. The most noted Swedish painters after these two are doubtless Larsson and Liljefors—one a *genre* artist and the other an animal-painter. Turning to Norwegian painting, there is of course the distinguished name of Gerhard Munthe, who, more than any one, seems to give adequate expression to northern mythology and history. The place of honor in the Norwegian room is held by the interesting canvases of Edvard Munch. As to Denmark, painting there is now apparently under the influence of the Spaniard Sorolla, if we may judge from the emphasis put on sunlight and atmosphere by such painters as Hammershoi and Willumsen. It seems strange that the Scandinavian countries are not stronger in sculpture than they are, for from early ages their wood-carving has been notable. The present exhibition, while indicating interesting evidences in such sculpture, does not show that any one in the three countries is now doing any work to be placed in the same class with that of the mighty Dane Thorwaldsen—doubtless the greatest name in all Scandinavian art.

WANTED—A CAMPAIGN OF EDUCATION

What the country needs for the next three years from the Progressive party is not a National political campaign, but a National campaign of education. The report of the recent meeting of Progressives in Chicago given on another page indicates that the leaders of the Progressive party understand and appreciate the difference. It is much like that between the work of the soldier on the battlefield and that of the recruiting sergeant at home. The soldier has to fight an enemy; the recruiting sergeant has to persuade the uncertain, the hesitating, the indifferent.

There are a great many voters in America who believe in government of the people, for the people, by the people, who do not believe in the Progressive party; a great many who are progressive in spirit who are not party Progressives. Some have been too long identified with one of the old parties to break easily away from it; some believe in the Progressive principles, but for one reason or another distrust the Progressive leaders; some do not understand the Progressive platform—it is all new and strange to them; some accept it as a whole, but demur to particular planks and will not accept the party because they cannot accept all its proposals; some are simply too busy about private concerns to have studied the questions involved, and continue in the old way because it is the easiest way.

Those men are not to be fought; they are to be persuaded. The ties which attach them to the old parties are to be gradually and gently loosened; their personal prejudices removed by better information; the platform which they do not understand explained and interpreted, over and over again, until it no longer seems new and strange; the difference between its fundamental principles and its special methods expounded, so that they can accept the principles even though they do not accept all the methods; their indifference overcome by pointing out the fundamental importance to the people of the questions involved.

Two concrete illustrations may serve to make our meaning clear.

The first plank in the Progressive platform affirms that "behind the ostensible Government sits enthroned an invisible government, owing no allegiance and acknowledging no responsibility to the people," and that "to destroy this invisible government, to dissolve the unholy alliance between corrupt business and corrupt politics, is the first task of the statesmanship of the day."

This is a fine statement of a fundamental principle. Senator Beveridge's illuminating phrase "invisible government" has made it visible to thousands of his fellow-citizens. But there are still thousands of voters in America who are quite unconscious of any invisible government, and are only vaguely conscious of any unholy alliance between corrupt business and corrupt politics. They have heard of "ward heelers," and have a vague impression that "ward heelers" are very bad men. They have read of Tammany Hall and of the Philadelphia Ring, and wonder why New Yorkers endure the one and Philadelphians the other. There is doubtless a "boss" in their county, but they have never met him, or, if they have, were impressed by his courtesy or possibly are indebted to him for a favor. They have never had to bribe a policeman or a sanitary or building inspector. The special interests which their county boss serves are remote, or seem so to them. They do not know that his influence has helped to prevent them hitherto from getting their packages by parcels post both more speedily and more cheaply than they have been able to get them by the express companies; that his influence has helped delay the revision of the tariff and the regulation of the Sugar Trust, and so kept up the prices which they pay to the grocer and the dry-goods merchant; that his influence has given them roads ten per cent poorer and twenty per cent more costly than they might have had from an honest State administration; that the local paper on which the voter depends for his political information is mortgaged to the boss and controlled by him, and that the voter gets just so much information or misinformation as the boss chooses. What this voter needs is lectures or literature, or both, which will explain to him what the invisible government is, tell him what the invisible government is doing, and show him exactly how the invisible government is affecting his pockets.

Nor is this enough.

There are a great many voters who do know about the invisible government and what it is doing, and who are as desirous to rid the country of its baleful power as the most enthusiastic Progressive. But they do not believe in the remedies proposed by the Progressive party—direct primary, short ballot, initiative, referendum, and recall. This is all new to them. They think it is new in political history. Their remedy is independent voting. It may be defined briefly thus: "If the boss nominates a bad man, scratch the ticket and vote for his opponent; the power of the boss depends upon the voters, and the voters can compel him to be decent if they will." The Independent is not persuaded that there is any need for a new party. His plan is, Reform the old party from within.

Until last summer independent voting was the remedy for boss rule recommended by all reformers. That over four million voters have concluded that independent voting is not an adequate remedy is extraordinary. There are probably at least as many more who are opposed to boss rule but still think independent voting is an adequate remedy. One object of a campaign of education should be to persuade these voters of the inadequacy of independent voting as a remedy for boss rule, a truth of which most of the Progressives were persuaded less than twelve months ago.

In special localities and in local elections there must doubtless be men against the invisible government. Perhaps a general campaign against the invisible government may be necessary two years from now. But in the meantime the best way to conduct a campaign against the bosses is to conduct a recruiting campaign of education—a campaign which will explain to the average voter what the invisible government is; how the invisible government works; and why direct primaries, the short ballot, the initiative, referendum, and recall are effective instruments with which to overthrow it.

The other great demand of the Progressive platform is for social justice. It is not necessary for us here to specify the particular wrongs to be righted, most of which have grown out of the factory system. That these wrongs exist and continue is due rather to ignorance and a false political system than to any conscious spirit of injustice. Half the world does not know how the other half lives. If the American people have not heeded "the cry of the children," it is

because they have not heard the cry. The facts brought together and presented to the Supreme Court of the United States in the extraordinary brief of Louis D. Brandeis proved to the satisfaction of that conservative tribunal that unlimited hours of work by women are destroying the life of the Nation, because destroying the possibility of wifehood and motherhood in the women workers. If the American people have as yet paid but little attention to these facts, it is because they do not know them. The newspapers are too busy reporting individual homicides to pay much attention to wholesale homicide.

It should be the work of a campaign of education to tell the progressive half of the American people how the other half lives; to acquaint them with the social injustice perpetrated under the forms of law; to make them hear "the cry of the children;" to voice to them the plea of American women for the right to live womanly lives that will make it possible for them to become wives and mothers.

Nor is this all.

The American theory, borrowed from a past age, proved by experience to be false, and yet half believed in by more than half the American people, is that every man can take care of himself if he is left free to do so. Thus the average American is very slow to accept any method of governmental regulation which puts limits on the industrial liberties of the individual. The campaign of education for social justice must not merely show the prosperous half of the people how the other half lives, but must also convince them that it is the duty of the Government to protect the weak, both against the intentional injustice of the strong and also against the unintentional and unconscious injustice of our modern industrial system.

What is wanted now is not a political campaign waged on the assumption that both the Democratic and the Republican parties are committed to the perpetration of social injustice and political corruption, but a campaign of education carried on upon the assumption that the majority of Americans, whatever their political affiliations, are not willingly supporters of either political or social wrongdoing—a campaign the object of which will be to explain what these social and political wrongs are and to point out to the people what methods can be employed to achieve a real and lasting political purity and social justice.

GOODNESS IN BEAUTY

The following letter, written by the Director of the Carnegie Institute in reply to one addressed to him by the Editor-in-Chief of The Outlook, was not originally written for publication, but we have obtained permission to give it to the public:

Carnegie Museum,
(Department of the Carnegie Institute,)
Pittsburgh, Pennsylvania, U. S. A.

Your remark that the "movement for the development of art in this country appears to be one of the hopeful signs of our national life" interests me. I hope you are right, but, being an artist myself to some extent, familiar with the artists of the world, some of whom are "the salt of the earth," but others of whom are a decidedly queer lot, "I hae me douts." The reading of history tends to show that when a people become wildly addicted to art there has not been, as a rule, a corresponding progress in morals. I love the beautiful, and wish all men derived from it that which it is intended to teach; but beauty in form and color, unless accompanied by beauty of soul, is a vain thing. After all, "it is *righteousness* that exalteth a nation," and in these days, when so many in high places and in low places do not seem even to understand the teachings of the Decalogue, I feel no increment of hope when I see these same lawbreakers either buying masterpieces or, when they cannot buy them, spending their time in admiring them in the possession of others. Yes, let us cultivate art, but what this country needs is an infusion, it seems to me, of some of the fearless honesty in word and deed which characterized our forefathers, and an anointing with that spirit of love the eulogy of which you and I know by heart as it is recorded in the thirteenth chapter of the First Epistle to the Corinthians. If the Corinthians, in whose ancient city art flourished, needed to hear such words as those of Paul, much more the great masses of our heterogeneous population, who are not so much given to emulate the art of the old Greek capital, which made it famous, as the vices which made it infamous.

With very kind regards, I am,
Yours very truly,
W. J. Holland,
Director Carnegie Museum.

We absolutely agree with Dr. Holland that love of beauty is no substitute for righteousness. It is quite possible for an age, as it is possible for an individual, to be both artistic and immoral. And yet it is not true that there is no connection between morals and art. There is a real and vital connection between the two. That this is a general belief is indicated by the facts that the Greeks used the same word to express beauty and goodness, so that the phrase in the New Testament, "good works," might with entire propriety be rendered "beautiful works,"

and that we in our common language speak of a "beautiful character."

Beauty is harmony. Harmony of sound makes beauty in music. Harmony of color makes beauty in painting. The common chord sounded on the organ has a certain quality of musical beauty. Harmony of color on the painter's palette has a certain quality of artistic beauty. The writer, visiting a manufactory of pottery with an artist friend, was shown a "spoiled" vase: the colors had run together and represented nothing. But the artist was charmed with its beauty because the formless colors were a harmony in color, and the vase was straightway purchased for its chaotic beauty.

But in a picture the beauty involves more than harmony of color. It involves harmony of form and composition. Harmony of composition, of form, of color, all are needed to make the perfect picture.

But more is needed.

The artist, like the musician and the author, is an interpreter of life. The portrait-painter does not merely transfer to his canvas the features of his sitter. If that were all, the photographer would compete with him. If he is a true artist, he discerns his sitter's character and interprets that to the onlooker. The portrait must not only be a harmony of composition, form, and color, to be a great portrait; it must also be in harmony with the character of the original to be a true portrait; and the character of the original must be, or at least appear to the artist to be, a harmonious character to make the portrait one of supreme beauty. Whistler is right in saying that "art should be independent of claptrap—should stand alone and appeal to the artistic sense of eye and ear, without confounding this with emotions *entirely foreign to it*, as devotion, pity, love, patriotism, and the like." But Ruskin is also right in saying that "the whole function of the artist in the world is to be a seeing and feeling creature, to be an instrument of such tenderness and sensitiveness that no shadow, no hue, no line, no instantaneous and evanescent expression of the visible things around him, *nor any of the emotions which they are capable of conveying to the spirit* which has been given him, shall either be left unrecorded or fade from the book of record."

That these two contrasted views of art are not inconsistent will appear to any one who will compare the passages which we have italicized and ponder their meaning. If the artist is painting the portrait of a cynic or a sensualist, he must interpret the cynicism or the sensuality; if the portrait of a devout or a patriotic soul, he must interpret the devoutness or the patriotism. If he does this with efficiency, and his portrait is a harmony in color, form, and composition, the one portrait will be as true art as the other. But that the one picture will be as beautiful as the other can be claimed only by one who believes either that the artist cannot depict character, or that the cynic and the sensualist are as beautiful characters as the saint and the patriot. Franz Hals's picture of the jolly merrymakers exhibited a few years ago in a collection at the Metropolitan Museum of Art may be as true art as the Sistine Madonna. But the world can never be persuaded that it is as beautiful a picture.

Raphael's saying, "We paint nature not as she is but as she ought to be," is a somewhat hazardous course for the artist to follow; nevertheless it contains essential truth. The artist is not a mere copyist. He perceives a life in nature veiled to ordinary observers, and by his art enables them to see it. No one who has studied Monet's pictures of the Thames Bridges will ever look upon the London atmosphere as he once did. We by no means get all the value of Monet's service to mankind by merely looking at his pictures. He teaches us how to look at nature. Under his tuition we also become "seeing and feeling creatures." "Consider the lilies of the field," said the Master, "for Solomon in all his glory was not arrayed like one of these." The artist enables us to consider the lilies.

We think, then, that the art development which has characterized the last twenty years of our National history is a matter for self-gratulation. It indicates that the American people are beginning to see something else in a forest than so many cords of fire-wood or so many feet of lumber; something more in the waterfall than a blind giant to grind our grists for us. Love of beauty is no substitute for a love of righteousness; but neither is a love of righteousness a substitute for a love of beauty. Surely the love of righteousness is far more important than the love of beauty, as the foundation of a house is more important than the frescoes on its walls. But the nation which has both love of righteousness and love of beauty has a fuller and richer life than the nation whose

people are blind to beauty, however masterful their consciences. And he who believes, as we do, that the divine Lawgiver is also the Creator of the world of beauty may also well believe, as we do, that the artist as truly as the preacher makes us acquainted with our Father.

A WORD ABOUT OURSELVES

Among the advertising pages in The Outlook for November 30 there appeared a statement by the publisher regarding some of the articles and editorial features which it is believed will make The Outlook of special interest to its readers during the year 1913. We think a word of explanation from the editors regarding the publisher's announcement will interest our readers.

The field which The Outlook endeavors to cover, and its avowed purpose in carrying on its work, make it not only impossible, but undesirable from the reader's standpoint, that an elaborate and inflexible programme of articles or of subjects should be prepared and promised beforehand for any given period of time. The purpose of The Outlook—and, however difficult it is to express in a single brief phrase the characteristic aims of an individual or a group of individuals, we shall here try to look at ourselves objectively and venture upon a definition of our aims—the purpose of The Outlook is to interpret life. Perhaps it is a platitude to say that life is a continuous and ever novel succession of events, phenomena, and experiences. No man to-day can foretell the events and currents of activity of the year 1913. This is the reason why a journal like The Outlook cannot wisely or successfully propose to its readers an elaborately arranged programme. The main thing that we have to do, the main thing we believe our readers want us to do, is to report the events of the year as they occur, and to interpret them in accordance with what we believe to be the principles that underlie the ever-developing life of the human race in this universe.

Even the articles which we select from those submitted to us, or which we ask particular men and women to write, who are specially fitted to discuss the subjects assigned to them, are chosen beforehand in accordance with this general purpose. For example, the "Pete Crowther" stories deal with the adventures and the practical philosophy of a traveling salesman in commercial life. Now the commercial life of the American people forms a large and important part, both in bulk and in influence, of their whole living, breathing, and thinking life. It is our belief that altruism, imagination, poetry, prophecy, and visions of the spirit form a surprisingly influential element of American commerce. Pete Crowther's philosophy will be found to be not only eminently practical but to have a very decided spiritual quality underlying the vigor, picturesqueness, and even slang with which it is expressed, and Pete Crowther is a real, red-blooded man withal. These stories by Mr. Elmer Ferris which the publisher's announcement promises for 1913 have been chosen because we profoundly believe that nothing worth while doing is done in life which does not have in it the element of poetry, imagination, and spiritual vision.

No man can live his own life with all possible completeness, interest, and happiness, unless he knows how other men live and what his relations to other men in other parts of the world are. For that reason Mr. George Kennan has told us something about the Japanese during the past year in a series of articles which, judging from the letters and personal comments we have received, aroused widespread interest. During the first few months of 1913 Mr. Hamilton W. Mabie will be in Japan, delivering a series of lectures at some of the Japanese universities. He will continue this interpretation of Japan by giving some account in the pages of The Outlook of the impressions he receives of the Japanese people, their past, their present, their future, and the place they occupy and ought to occupy in the great human family of civilized nations.

The laymen of the country, as well as the lawyers, are more than ever before asking questions about our judicial system. Is justice delayed in the courts? Or is it obstructed? Is there too much red tape in judicial procedure? Shall the people have more opportunity than they now have of cutting this red tape when they think they are unfairly bound by it or snarled up in it? Mr. Frederick Trevor Hill will tell a series of stories in The Outlook, based on his own actual experiences as a lawyer, which will both raise some of these questions and answer them. They were written and they will be published in accordance with our desire both to interpret and to contribute to our readers' own interpretation of daily actual life.

To those who believe in Mr. Roosevelt's

altruism, skill, and statesmanship, we need hardly say anything about his autobiographical reminiscences which will appear in these pages during the year 1913. May we be permitted to say a word to those who do not believe in him—to those who dislike him? Let us assume for a moment that he embodies in his striking personality all the dangerous elements of American life—unrestrained power, the tendency to act first and think afterwards, the eager desire to win by fair means if possible, by any means if necessary. Ought not the intelligent man who entertains these views—with which of course we do not agree in the least—avail himself of an opportunity, when it is presented, to understand those personal qualities which made Mr. Roosevelt at the recent election the accepted leader of four and a half million voters? His "Chapters of a Possible Autobiography" which will appear in The Outlook during 1913 will afford such an opportunity. The first installment is already in our hands, and we do not hesitate to say that it is full of the most unusual human interest. Take one phase of it, for instance. Mr. Roosevelt has both an American and a European reputation as a practical authority on natural history. In his first chapter he tells how, when he was a small boy, an impulse was given to his instinctive interest in natural history by an amusing adventure with a seal; how in making his collection of specimens he saw things only by running against them or stumbling over them, because he was very near-sighted; how the fact that he was near-sighted was suddenly revealed to him one day when hunting wild animals in the country; how his father thereupon got him his first pair of spectacles; how these spectacles revealed to him a world of beauty up to that time unseen and unrealized; and how this experience gives him today a keen and personal sympathy with every effort made by social reformers to improve the conditions of the physical life of American children. Mr. Roosevelt's story is in this way full of anecdote and of touches of humor, and is yet, in our judgment, in the best sense of the word, interpretative.

And yet, interesting as such articles are, they do not, we believe, constitute the most important element in the work of The Outlook. If The Outlook is worth reading at all, it is worth reading chiefly because it is a continuous weekly record, with intelligent comment, of the human life and activities of the time. At this time of the year scores of letters are received daily in this office which express the very friendly and very welcome appreciation of our readers of some particular quality of The Outlook which has been of service to them during the past year. If we, the editors, were to write a letter of this kind to the publisher, it would read some thing like this:

Dear Publisher: It may interest you to know that next to the English dictionary and the encyclopædia, the most useful and most often consulted work of reference in the library of the editorial office may easily be said to be the bound volumes of The Outlook. They constitute a storehouse of facts, statistics, and opinion, both foreign and American, that we cannot find anywhere else. The Panama question comes up, and we want to know some of the details of the Clayton-Bulwer Treaty. We find them in The Outlook. The Supreme Court renders a decision on the Union Pacific merger, and we desire to see exactly what the Supreme Court did in the Northern Securities case. We find it in The Outlook. The other day a distinguished lawyer who was preparing an address to be given before an association of lawyers in the West wrote, asking us to aid him in obtaining information about the Progressive views regarding the courts. We sent him bound volumes of The Outlook covering the first eight months of the year 1912, with contributed and editorial articles on the subject marked. In returning the volumes he writes: "I have examined with interest and profit the articles on the courts and the people and the delays in judicial procedure." We do not know where in so brief a compass we could obtain so complete a treatment of the subject. Whatever else The Outlook may be, we certainly find it to be a useful reference library.—THE EDITORS.

It is possible that this article, in which we have discussed our own work as impersonally as possible, may nevertheless to some of our readers seem too personal. Our only apology is that the Christmas season is preeminently the season when friendly personalities are most appropriate. We should like at this time, if we could, to write a personal letter to every reader of The Outlook, thanking him, thanking her, for that friendly attachment and support which has made our work possible. As it is physically out of the question to write many thousands of personal letters, we venture to ask those who have been patient enough to read to this point to accept this article—in which we have thrown off the restraints of editorial convention and have talked somewhat frankly about ourselves—as written in the spirit of a personal letter. It conveys to every reader of these pages cordial wishes for the best joys of the Christmas season.

THE GOVERNORS' CONFERENCE

A POLL OF THE PRESS

THE United States of America is in some aspects a federation of forty-eight States—forty-eight sovereignties. As the powers not granted by the Constitution to the Federal Government are reserved to the several States, certain subjects fall within the province of State Governments in which uniformity of treatment is much to be desired. Such subjects are, for instance, education, the management of roads, the treatment of convicts; above all, marriage and divorce laws. On all these points "it will not do to secure uniformity of action through the action of the Federal Government," affirms the Lynchburg, Virginia, "Progressive." It thus argues why:

Take a single example of the evil which would result from the Federal control of marriage. Here in Virginia and other Southern States there are stringent laws against the intermarriage of the races. These laws are felt to be wise and necessary in order to preserve the purity of the two races.

Such laws do not exist in many of the Northern States. The moral sense of the country is just now shocked by the marriage of the notorious black pugilist, Jack Johnson, and a white girl. Such a marriage could not take place in Virginia, and it ought not to take place anywhere. A race of hybrids would be a deplorable spectacle in this country. The colored people, if they have any race pride, ought to be as much opposed to miscegenation as the whites. It is not likely that Congress would enact a law forbidding this miscegenation, and therefore, if the Federal Government should assume control of marriage and divorce, miscegenation might be forced on these Southern States, to the disgust and abhorrence of all defenders of race purity.

The first Governors' Conference was called by President Roosevelt in 1908. It met at the White House to consider the subject of Conservation. So immediately evident was the desirability of co-operation that Governor Willson, of Kentucky, sprang to his feet at the close of one of the sessions and said, "Gentlemen, let me detain you a moment." He went to the platform, and there unfolded a plan for a Conference of the Governors, to be called by themselves. This was held at Washington in 1909. The third meeting of the Governors occurred at Frankfort, Kentucky, Governor Willson's own capital, in 1911; and the fourth meeting occurred at Spring Lake, New Jersey, in 1912, under the direction of ex-Governor Fort, of that State, although Governor Wilson had already assumed office. All these meetings were productive of good results. In the first place, they brought many men of many minds together. In the second place, distinct movements were started, quite independent of political party—as, for instance, the position taken with regard to the Inter-State-Intra-State Railway case now before the Supreme Court, in which Governor Harmon, a Democrat, and Governors Hadley and Aldrich, Republicans, were put upon a committee to voice the prevailing sentiment of the Conference.

The Governors' Conference is apparently becoming something of a fixture in our political life. The New York "Tribune" remarks concerning this:

Five years ago it was looked upon with doubt, as not likely to survive more than two or three sessions. But each year has confirmed belief in its usefulness, and it is expected that this fifth meeting will command a more general and continuous attendance of the Governors than any of its predecessors, though, indeed, none of them has been neglected. There is real need of such inter-State conferences, and no other existing agency could supply it. Representatives of the States come together, it is true, in both houses of Congress; but even in the Senate the States are not so much sovereign entities as fractional parts of the Nation, and all the business of Congress has to do with National, not State, affairs. But in these Governors' Conferences the States, through their executives, meet as sovereigns to consider State interests.

At previous conferences of the Governors much has been done of no permanent value because of the lack of proper organization. The controlling idea expressed by Mr. William George Jordan, late Secretary of the Conference, is that of concentrating the wisdom of all for the benefit of each. Hence, as the New York "Times's" regular editorial contributor, "J. C. H.," says, the most important thing now to do is to perfect a permanent organization, with headquarters preferably in Washington. "J. C. H." continues:

This organization should be placed under the direction of a permanent secretary of approved character and competency—not a political underling, but a big man, possessed of strong initiative and never-failing industry—and the support of the organization so perfected should be provided by the States. It would cost, if fully equipped, not less than $50,000 a year, and this sum should be provided by the States according to population or wealth. The sum required, divided among the States, would be

the merest bagatelle for each, and the benefits for all would be inestimable. Besides paying the expenses of such an establishment the amount suggested would be sufficient to cover the expenses of the Governors attending the conferences, so that a full representation would be assured. At the headquarters there should be a library filled with the revised statutes of all the States, and a close watch kept upon the legislative, administrative, and judicial doings of the different States, of which the Governors should be constantly advised. There should also be prepared at these headquarters a full digest of the messages of all the Governors, and of these digests copies should be sent to each of the Governors, so that each would have in this convenient form a full understanding of what all the others were doing.

This year's Governors' Conference has lately been held in Richmond, Virginia. Its programme was elaborate. Some persons and papers considered it too elaborate. The New York "Evening Post," for instance, thus protests:

What can be seriously expected as a practical result of a programme that sprawls over a series of topics, many of which do not concern the majority of the Governors assembled? The success of the first Conference was due as much to the limitation in this respect as to its choice of a topic that was uppermost in the public mind. But this year, for instance, the Governors are to listen to addresses on "Modern Penology," "A State Income Tax," "The Development of Inland Waterways," "Uniformity of Marriage and Divorce Laws," "What the State Can Do to Check the Drift of Population from Farms to Cities," and "Rural Credit." Instead of having their hearts burn within them as they go their several ways after the close of the Conference, what can they have to take home but buzzing heads? It is true that the programme-makers have recognized the advisability, not of concentration upon a single topic, but at least of selection of such subjects as are likely to come up in the various Legislatures this winter. They say as much. But what have they actually done? How many Legislatures will deal at their approaching sessions with the question of a State income tax? The number having to consider inland waterways is still less. It would have been much better to have chosen the one topic of uniform marriage and divorce legislation, and then to have arranged for speakers and discussion upon it that would have attracted the attention of the whole country, and sent the Governors back to their respective capitals with the draft of a bill that should hold first place in their legislative programmes.

The newest subject to be proposed at any of the conferences was that of agricultural credit. It was discussed. not at Richmond, but at Washington, at the invitation of the President. Several months ago Mr. Taft wrote to all the Governors, suggesting the advisability of establishing a system of agricultural banks in this country similar to those existing abroad. At the Washington Conference the other day he made the principal speech, and said in part:

An easy exchange between capital and farmers, with proper security, has been established in European countries, where the rate of interest has been lowered so that the farmer is on practically the same basis of advantage in the borrowing of money to aid his farming as the business man is in borrowing money to aid and carry on his business. If this can be done abroad, it can be done here; and if abroad we find that Government institutions adapted to form the conduit pipe between capitalists and farmers are successfully operating, why should we not adopt them here?

The subject to attract most attention at this latest Governors' Conference was that of the punishment of criminals. Governor Shafroth, of Colorado, advocated lenient but certain punishment to criminals, and cited his own State as an example where this system had worked well. He was followed by Governor Baldwin, of Connecticut, who took a much more drastic view, advocating restoration of the whipping-post for certain classes of criminals and sterilization for others. The Governor declared, as reported:

There is a certain crime of which one seldom speaks; its very name has come to be banished from our newspapers. Yet the thought of it is a daily terror to every woman in the South, and brings a sense of uneasiness and constraint into the life of her Northern sisters. It is the cause of most of those lynching cases which disgrace our civilization. It is to be kept down only by the severest methods.

Is it too much to say, if the courts are not ready to apply these, the people will? Has a conviction ever yet been had in the United States of any one of a mob of lynchers?

That crime does wrong to a woman which many of them have deemed worse than death. Such a man is no fit subject for an indeterminate sentence. In every clear case of this nature, in my judgment, there should be an operation of sterilization.

But the day's sensation was furnished by Governor Blease:

I have said all over the State of South Carolina, and I say it again now, that I will never order out the militia to shoot down its neighbors and protect a brute who commits the nameless crime against a white woman. Therefore, in South Carolina, let it be understood that when a negro assaults a white woman, all that is needed is that they get the right man, and they who get him will neither need nor receive a trial.

Thereupon, in the words of the Detroit "Journal:"

Governor Kitchin, of North Carolina, made a speech for law and order worthy of Blackstone, and ended by saying there had been no lynching in his State for six years. Governor Gilchrist,

of Florida, took the same high ground. Governor Mann, of Virginia, who has won golden opinions as an old school executive, declared he would call out all the troops in the State to insure any criminal a fair trial. It is to be hoped the control of politics and government in the South is passing from the Bleases to the Kitchins and Manns.

On the following day Governor Carey, of Wyoming, asked Governor Blease if he had not taken an oath to uphold the Constitution and laws of his State, and if those laws did not protect Negroes as well as white men. Mr. Blease replied:

I will answer that question, and I hope the newspaper men will get it right, for in my campaign in South Carolina they found that I am a fighter—and a cold-blooded fighter. When the Constitution steps between me and the defense of the white women of my State, I will resign my commission and tear it up and throw it to the breezes. I have heretofore said, "'To hell with the Constitution!'"

On this, many of the ladies present left the hall, and the Governors consulted as to what should be done. Governor O'Neal, of Alabama, declared that he also represented a State with a large Negro vote, but that the remarks that had just gone forth were of a nature repugnant to law-abiding citizens, and that "the Conference should, without delay, repudiate them." Another Southern Governor, Gilchrist of Florida, heartily supported this sentiment. Thereupon another Southern Governor, Mann of Virginia, offered the following resolution:

Resolved, That it is the sentiment of the Conference of Governors in session at Richmond, Va., December 6, 1912, that the whole power of the several States should be used whenever necessary to protect persons accused of crime of every kind against the violence of mobs and to provide for speedy, orderly, and impartial trials by courts of competent jurisdiction, to the end that the laws for the protection of life and property be duly enforced and respected by the people.

The resolution was carried by an overwhelming majority. The three or four Governors, others than Blease, who voted against it favored the sentiment of the resolution, but thought that it interfered with the privilege of the Conference as to personal expression.

The Northern and the Southern press alike are unanimous in the condemnation of Blease, even if some, with the Washington "Times," think that he may be credited "with a certain kind of courage," as he publicly expresses "what is tacitly the policy of numerous Southern Governors." Be this as it may, the Governor is not the representative of the South, either according to Northern or according to Southern papers. The daily "Argus-Leader," of Sioux Falls, South Dakota, declares:

The Governor, in wishing to uphold the rights of Southern womanhood, did not show that real chivalry which from time immemorial has been credited to the South. And the most significant rebuke he received was from some Southern women, who left the hall as soon as he had uttered the ill-advised words.

Some papers advise impeachment. The New York "Tribune" says that "if South Carolina does not find a way to impeach such an Executive, the world will have good reason to think that he really exemplifies its judgment and desire."

The Southern papers are not a whit behind the Northern in condemnation. Those of Governor Blease's own State are interesting; first of all the Charleston "Evening Post" says:

Boasting of his wholesale pardoning of criminals, blatantly advocating lynch law, . . . Governor Blease has revealed himself as faithfully to the Conference of Governors at Richmond . . . as he has to the people of this State.

The Charleston "News and Courier" says:

How do the cities of South Carolina like the advertisement they are getting? Does the Governor speak for them, and does he act for them? If not, are they or are they not going to repudiate what he says?

Finally, the Columbia "State" says:

So far as the "State" may speak for those in South Carolina who are not of Governor Blease's friends, we repeat that they are glad that the Governor has introduced himself frankly to the people of the country, however much we may regret that his position as Governor permitted him to degrade the Conference of Governors into an instrument of advertisement of himself.

The papers of every Southern State are severe in criticism and stern in their demand for a change—the Baltimore "News," the Louisville "Herald," the Nashville "Democrat," the Nashville "Star," the Raleigh "News and Observer," the Atlanta "Journal," the Florida "Times Union," the Montgomery "Advertiser," the Mobile "Register," the New Orleans "Item," the Arkansas "Gazette," the Dallas "News," and the Galveston "News." The last named agrees with the Northern papers already quoted in concluding the whole matter as follows:

If there is nothing in the laws of South Carolina to justify the impeachment of Cole Blease, those laws are sorely in need of revision.

A COMBINATION IN RELIGION

STAFF CORRESPONDENCE FROM CHICAGO

BY ERNEST HAMLIN ABBOTT

"WHAT have they done?" asked the newspaper man. "The newspapers aren't going to give space to them unless they've done something. The Secretary of the civic society in the city where I live told me that he used to go to the churches for help when there was any general undertaking for the good of the city, but that he has given that up because they were of no use."

That was the way the newspaper man replied when I asked him why the newspapers had paid so little attention to the meeting of the delegates to the Federal Council which has just held its session in Chicago.

"What do they represent?" he had at first asked.

"Thirty-two Protestant denominations, including all the greatest—Methodist, Baptist, Presbyterian, Episcopal, Congregational, Lutheran, Evangelical, Reformed—embracing some fifteen or sixteen million people."

"How are they chosen?"

"These delegates are the official representatives of the denominations, chosen by the authorities of the denominations themselves."

Then came that final Missourian question —"What have they done?"

By the answer to that question this new great attempt of American Protestant Christians to create a united Church is going to be tested. These are days when mere professions count for very little. The political word "platform" is sharing with the ecclesiastical word "creed" the disrepute that nowadays attaches to mere belief without deeds. This disrepute is recognized by church leaders and political leaders alike. While the Federal Council was in session some reference was made to the official statement on social questions as a social "creed," and the objection to the word was so strong that nothing more was heard of it. Two days later, during the meeting of Progressive party leaders in the same hotel, one of the speakers apologized for referring to the party's "contract with the people" as a "platform." The question that is being asked of the churches, just as of political parties and public officials, is not, "What do they think?" but, in the terms of the newspaper man, "What have they done?"

The Federal Council of Churches of Christ in America has been in existence just four years. It was organized in Philadelphia in December, 1908. Before it could be organized there were long preliminaries. Each of the constituent denominations had to select its representatives. Some of these denominations could take no action except at their National assemblages, and in some instances (as in the case of the Methodist Episcopal Church) these meet only once in four years. The task of uniting thirty-two existing organized constitutional bodies is not as simple as creating a new body. It is like the movement of a fleet—it must wait on its slowest member. When, however, it is organized, the impact of the whole mass is enormous. As one speaker at the Council last week put it, two acting together are ten times one; for, though one can chase a thousand, two can put ten thousand to flight. The parallel with the thirteen colonies has been often drawn. So, although the process of bringing these thirty-two denominations together extended over more than eight years, it is only four years since the organization itself has been in existence. In that brief period of four years, "What have they done?"

As I sat as a spectator of the deliberations of that body, it seemed to me that the fifteen million people represented there had done two things: they had made a great discovery, and they had created a great "system."

The discovery, in this case as in many another, is very simple; it is that people who are separated from one another, and even antagonistic to one another, in belief and in formal observances, are not only ready but eager to unite with one another in doing something to put an ideal into practice.

For example, there are scattered all over the land institutions known as theological seminaries. There are no institutions in the world so separatist as these seminaries. Every denomination has its own seminary or seminaries, for every denomination wishes to preserve its own existence by inculcating its own doctrines. These seminaries have consequently emphasized theology. To the ordinary man of the twentieth century the peculiar tenets for the sake of which a little

theological seminary with more professors than students may be cherished have no more real meaning than the speculations of mediæval monks. In some cases a theological seminary represents not merely a denominational doctrine, but the doctrine of a particular faction within the denomination. In the old days when creeds and forms were exalted, if representatives of sixty theological schools could have been brought together there would have been nothing but wrangling and disputation. Now let us see what has happened. When the Federal Council was organized in Philadelphia, the delegates adopted a declaration regarding the great social and industrial problems of to-day—child labor, the overworking of women, fair wages, decent conditions of work, industrial accidents, and the like—and created a Commission on the Church and Social Service to deal with such questions. The Secretary of that Commission a few months ago communicated with the seminaries of the denominations represented in the Council with regard to these practical questions, and, receiving favorable replies, arranged for a meeting of representatives of these seminaries. As a consequence, just before the meeting of the Federal Council there was a conference of sixty seminaries! More than that, a committee of the seminary representatives was formed to draw up suggestions for instruction in social problems and social questions. By means of the Federal Council the denominations have discovered something unsuspected until now—that even in the homes of dogma men are eager to come together in order to apply real religion to the practical questions of life.

That is one thing "they have done."

Another thing they have done is, as I have said, to create a system. What was it that made the Becker case possible? It was not that policemen are necessarily more corrupt than other men. It was because there has been in the New York Police Department an organized alliance between certain police officials and a certain class of criminals, known as the "system." What is it that has produced scandals in the world of high finance? Again it is something known as the "system." It is because corruption has been organized that it has been powerful in the police, in politics, in business. Now, over against this the churches, which ought to represent, and in large measure do represent, the conscience and unselfishness of the community, have been disorganized—they have had no "system." So when the forces of evil in a city have appeared to be irresistible and the forces for good to be weak, it has seemed as if the decent part of the population were in the minority, when the fact has been simply that the corrupt and brutal have had a system, and the rest have not had a system. Now the Federal Council has created a system on a National scale. That is the other thing that "they have done."

What this lack of system—this habit of each little sect and little congregation going alone—has cost the country cannot be estimated. "We are a wasteful Nation," said Professor Rauschenbusch, of Rochester, in a speech before the Council; "we have wasted our water power, we have wasted our forests, our soil, our sewage, we have wasted child life in the factories, we have wasted the pangs of motherhood—but the greatest waste of all has been the waste of religious enthusiasm." It is this waste, it was frankly acknowledged at the Council, that is keeping and even driving self-respecting men out of the ministry. It is the local and sectarian jealousy, the eagerness for one denomination to build up itself, whether at the expense of another or not, that makes it impossible for a man to see anything superlatively honorable in the ministry as a profession. A young man may be content to do his work obscurely if he only has a chance to do it well, but he finds it intolerable to take part in squabbles. It is not self-seeking ambition that leads him to turn away from that as an uninviting career. Many a minister has said, "My sons shall not go into the ministry. I have been a fourth of a man. I want them to do a whole man's work." That was the straight talk of some of the ministers about this wastefulness. The severest critics of the Church never talked more plainly or more truthfully than these accredited representatives of the great denominations.

It is the Federal Council that has made this frank speech possible. The very fact that three hundred and fifty delegates representing thirty different denominations were acting together as a federal body put every apologist for denominational differences on the defensive. Indeed, whenever a speaker made avowal of pride in his denominational affiliations, he did so with an air of courage, as one withstanding the current of public opinion, and the applause that greeted his

statement was in part a tribute to his boldness and in part a stimulus which the listeners felt it necessary to administer to their own denominational loyalty. Of course such protestations of denominational loyalty were not necessary, for the Federal Council in no respect supersedes any denomination and has no authority over any denomination's affairs. It simply provides the machinery by which the denominations can do together what they could not do alone. As Dean Mathews, of the University of Chicago, pointed out, it is a human trait to magnify our secondary enthusiasms, to be more interested in the prosperity of our own business than in the building up of the wealth of the country, to be more excited over the fortunes of a group wearing blue buttons or one wearing red than over the fortunes of the organization to which both groups belong. But these secondary enthusiasms can be used to promote the greater ends. So denominational loyalty, so far from being superseded, may be a useful force in behalf of the work of all the federated churches.

Here and there in various parts of the country there is to be found an occasional organization, local in character, which has undertaken to do in part, within a certain area, what the Federal Council has undertaken to do for the Nation. These local organizations the Federal Council is not to supersede but only to bring together. Thus the State of Maine has what is called an Interdenominational Comity Commission, the city of New York has a Federation of Churches, the State of Rhode Island has a State Federation, and so on with other cities and other States. From some of these there were reports. For example, Mr. Wood, a representative from Baltimore, explained how fifteen denominations in that city were united in a common organization which brought the churches together with various educational institutions in order to make provision for students, resisted successfully efforts to weaken the law on hours of labor and the safeguards in the building code, and co-operated with the Police Board and the Federation of Charities in dealing with vagrants. Mr. Laidlaw reported some astounding facts regarding human conditions in New York City which had been collected by the Federation of Churches there, and told of the agreement between the United States Government and the Federation of Churches by which the census in that city was made much more complete than it otherwise would have been.

Then there were stories of fruitful efforts at union in smaller communities. One delegate told briefly of a New England village in which property values had been increased a hundred per cent and general conditions of life greatly improved by the union of two churches into a single federated church with a double denominational affiliation, but with a minister in common, a single building, and a united organization for all local purposes. Another delegate, Professor Anthony, of Maine, explained the arrangement of "reciprocal exchange," by which two denominations agree to substitute for two weak churches of each kind one strong church of each kind—an arrangement which the Federal Council formally indorsed and adopted as a part of its policy. By this means one denomination yields a church in one place for the sake of strengthening another church of another denomination; and in return the other denomination yields a church in another place for the sake of strengthening a church of the first denomination There were many delegates who regarded this as the most significant action taken by the Council, for it amounted to a self-denying ordinance. It corresponded to the action of representatives of independent States recommending the cession in some degree of States' rights for the general welfare.

The four features of the Federal Council may be stated as follows

1. Using the spirit of religion for
2. The elimination of waste by
3. Bringing together existing denominations on a basis of
4. Service in practical work.

The Federal Council is a product of this age of co-operation. It is a combination in restraint of competition. However one may think of competition in the field of business, there is no doubt that in the field of the churches the cutthroat competition of to-day ought to be restrained. The Federal Council is not a religious trust or holding company. It has no ownership of the stock or control of the management of the constituent bodies. If there is any parallel between this combination among the churches and the commercial combinations of this age, it might be drawn between this great Council and what in business circles is known as a "gentleman's agreement." There is, however, no real similarity in form between this religious federation and any business combination I know

of. The likeness is closer between this and political federations. Each constituent body is entitled to a certain number of members of the Council based upon the size of the body in question. Moreover, on certain questions the vote is taken not only by polling the individual members but also by polling the delegations, and can be carried only by a majority of both the delegates and the delegations. This makes it impossible for any one denomination, no matter how great its size, to outweigh the others, while, on the other hand, it prevents a number of small delegations from carrying any question against the preponderating will of the whole number of delegates. The Council, therefore, combines in a single chamber the characteristics of both the Senate and the House of Representatives in the Congress of the United States.

The members of the Council, moreover, are elected for a term of four years or until their successors take office. They are not merely delegates to a meeting, like the delegates to a charity conference, but are members of a continuous body that may be summoned together at any time. The regular meetings of the Council are held quadrennially, but special meetings may be held whenever authoritatively called. It is, for example, expected that the Council may be called into special session in 1914. Still further, the Council is represented between sessions by a smaller body called the Executive Committee, in which the denominations are, somewhat as in the Council itself, proportionately represented. This Executive Committee has frequent meetings and is served by an Executive Secretary and such other secretaries as it wishes to employ.

Subsidiary to the Executive Committee are a number of Commissions. Each of these Commissions is in charge of some special department. Thus one is devoted to the federal principle in the field of Foreign Missions, another in the field of Temperance, another in Home Missions, another in the vast and complex field of Social Service, and so on. The Commission on the Church and Social Service is in itself a body of such size that its executive work is conducted by an employed Secretary under the supervision of a sub-committee called the Committee of Direction. This brief outline can only inadequately indicate the extent to which these fifteen or sixteen million Christians in thirty-two denominations have become organized for common action.

With regard to matters within the jurisdiction of the several denominations the Council has, as I have said, no authority; but with regard to joint action by the denominations there is scarcely any limit to the field of the Council's activities. It might fairly be said that the limit can be set only by the limitations on the wisdom of its leaders. There are few men in modern times who have had to bear such responsibility as is laid upon them.

How complicated and difficult the task laid upon these leaders is may be indicated by an illustration. Each of the great denominations has a society formed to carry on home missions. The relation of these societies to the respective denominations which they serve varies according to the denominational forms of organization. The officials of ten of these societies have formed a voluntary association or league called the Home Missions Council. This is unquestionably one of the results of the Federal Council, but it is independent of it. Here, then, are two federal organizations devoted to home missions. One is a federal organization created by the denominations, the other one created by the home missionary societies; one rising from the churches which support home missionary work, the other from societies and officials that administer it. One may be said to represent public opinion, the other expert opinion. They are working together; but it will require statesmanship to see that each aids the other and that neither duplicates the other's work. Another illustration is even more pertinent. Several of the denominations have their own social service commissions. These vary very greatly in their efficiency. That of the Presbyterian Church (the Northern body) is composed of virtually three divisions of the Presbyterian Board of Home Missions; one is called the Bureau of Social Service, one the Department of Church and Country Life, and one the Department of Immigration. This threefold Commission has resources in money and expert service far greater than those commanded by any other similar denominational commission and even by the Federal Commission itself. Yet there is nothing in social service, whether it concerns housing or industrial conditions or the immigrant or anything else, that is distinctively Presbyterian, or, for that matter, Baptist or Methodist. There is no Congregational or Episcopal brand of social justice.

The fact is, however, that the Presbyterian departments devoted to social service have been doing work which under present circumstances any other denomination, and even the Federal Council, could not undertake. For example, Charles Stelzle has, more than any one else, been instrumental in bringing about a friendly attitude among the trades unions toward the churches. A little over ten years ago, I spent some three months in traveling over a large part of the United States. If there existed at that time any general feeling of friendliness on the part of labor unions toward the Church, I found none of it. To-day the American Federation of Labor admits to meetings as "fraternal delegates" men whose sole title to admission is that they are accredited by church organizations. This, I think it is fair to say, is the result of Charles Stelzle's influence, and he is the head of the Bureau of Social Service of the Presbyterian Board. The Methodist Church has been a leader—I think I may say the leader—in expressing the changed view of the churches toward industrial problems. The remarkable declaration on social questions adopted by the Federal Council four years ago was modeled upon that of the Methodist General Conference. In certain places Episcopal churches have been distinguished for leadership in practical and efficient social service. The Baptists have done much to promote the publication of social service literature. So in one respect one denomination has led; in another, another. It will require statesmanship of a high order to utilize these different forces without duplication.

The greater part of six days was occupied by the meetings of the Federal Council. The sessions began by an evening meeting on Wednesday, December 4, to hear the report of the Executive Committee and the address of the retiring President of the Council, Bishop E. R. Hendrix, of the Methodist Episcopal Church, South. Thereafter (except on Sunday) the sessions in the morning and afternoon were held in the Assembly Room of the Hotel La Salle, when reports of the Commissions were heard and discussed and business transacted. Two other evening sessions were held—that on Friday evening being addressed by the Vice-President-elect of the United States.

Necessarily much of the business concerned questions of organization. A working body such as this great National Federation of Denominations is, as I have said, rendering its chief practical service in creating and keeping in order a "system." Fortunately, it has had the service of a man who puts zest into solving questions of organization—the Rev. Dr. W. H. Roberts, the retiring Chairman of the Executive Committee. He comes near to being to the church of to-day what a great corporation lawyer is to the business of to-day—with this difference, that in being counsel for the combination Dr. Roberts is also "counsel for the people."

The most important single piece of business transacted was the election of a President of the Council for the coming four years. The choice most happily fell upon Dr. Shailer Mathews, Dean of the Theological School of the University of Chicago. His leadership in the movement toward broader views of religion and conceptions of religious obligations in this time of social unrest has been one of the explanations for the state of public opinion in the churches that has made the Federal Council possible. As he stood before those delegates guiding the deliberations, the casual visitor might have guessed him to be a physician, or a lawyer, or a public official; and yet, if he was an intelligent visitor, he would have not been surprised to find him a former professor of theology and editor of a well-known magazine. The titles of three of his books, "The Church and the Changing Order," "The Social Gospel," and "The Gospel and the Modern Man," indicate perhaps as well as anything can, in as few words, the nature of his service to the modern religious movement. It is a happy augury for the Federal Council that Bishop Hendrix, whose wise and genial leadership has kept the new organization well guided between grave difficulties, is to be succeeded by one so forceful, courageous, and progressive as Dean Mathews.

Dr. Macfarland, who has been Acting Executive Secretary as well as the Secretary of the Social Service Commission, was elected Executive Secretary.

The practical character of the work of the Council is indicated by two subjects on which it took action. One concerned preparations for dealing with the inflow of immigrants that is expected upon the opening of the Panama Canal; the other concerned the world-wide war upon one of the worst and most disabling plagues known to man—the hookworm. Fifteen or twenty years ago the effect of a widespread parasite upon the human race or the social conse-

quences of the opening of a great waterway would hardly have been accepted by the churches as coming within their sphere.

The reports of the Commissions, of course, excited discussion, because the action which the Council took upon them was to determine the Council's policy on many great questions during the coming four years.

In the consideration of two of the reports there was shown a tendency to accept general statements because they sounded well and seemed to be what was to be expected; these were the reports on temperance and on international peace. Even Mr. Stelzle's statement that the consumption of liquor per gallon had steadily increased under the traditional methods of dealing with the liquor question made only a passing impression. Temperance is good and international peace is desirable; therefore let us commend the prohibition of liquor and the abolition of war: that seemed to be the attitude of the delegates on those two questions.

On the other hand, concerning questions which the churches or their agencies have been studying broadly, and not merely in the spirit of the propagandist, opinion was independent and discussion illuminating. Home missions was one of those subjects. There was no tendency to regard this as merely a matter of starting Sunday-schools and establishing new and dependent churches. Rather it was clear that the delegates understood that it was but another way of putting the question, What is to become of America? Here are foreigners coming in by hordes. Here we have frontiers changing almost overnight into settled communities. What kind of citizens, what kind of communities, are these to be?

The other subject which served as an occasion for intelligent discussion was that inclusive one comprised under the name of social service. The Commission on the Church and Social Service had prepared a report which went somewhat beyond the declaration of four years ago. The Commission took its advanced ground with caution. It was not sure that the Council would be prepared for the more progressive position. Then a surprising thing happened. After the discussion the Council recommitted the report to the Commission with instructions not to qualify but to enlarge the statement. The Commission had cautiously said nothing in the brief statement of policy in favor of organized labor—though in the report it was indorsed—but the Council told the Commission to insert it specifically in the statement of policy. Similarly, it was by instruction from the Council that a specific declaration was made regarding the necessity of applying Christian principles to the acquisition of wealth and resisting all practices by which, contrary to the principle that reward should be not for power but for service, men attempt to get something for nothing. Ten or fifteen years ago the churches would have thought such matters beyond the province of religion. Today their official representatives insist that on such matters their convictions should be unmistakably expressed. This is the statement adopted by the Council:

The Churches must stand:

1. For equal rights and complete justice for all men in all stations of life.
2. For the protection of the family, by the single standard of purity, uniform divorce laws, proper regulation of marriage, and proper housing.
3. For the fullest possible development for every child, especially by the provision of proper education and recreation.
4. For the abolition of child labor.
5. For such regulation of the conditions of toil for women as shall safeguard the physical and moral health of the community.
6. For the abatement and prevention of poverty.
7. For the protection of the individual and society from the social, economic, and moral waste of the liquor traffic.
8. For the conservation of health.
9. For the protection of the worker from dangerous machinery, occupational diseases, and mortality.
10. For the right of all men to the opportunity for self-maintenance, for safeguarding this right against encroachments of every kind, and for the protection of workers from the hardships of enforced unemployment.
11. For suitable provision for the old age of the workers, and for those incapacitated by injury.
12. For the right of employees and employers alike to organize, and for adequate means of conciliation and arbitration in industrial disputes.
13. For a release from employment one day in seven.
14. For the gradual and reasonable reduction of the hours of labor to the lowest practicable point, and for that degree of leisure for all which is a condition of the highest human life.
15. For a living wage as a minimum in every industry, and for the highest wage that each industry can afford.
16. For a new emphasis on the application of Christian principles to the acquisition and use of property, and for the most equitable division of the product of industry that can ultimately be devised.

The greatest meeting of the sessions was held on Sunday afternoon. The two chief

addresses were by Professor Walter Rauschenbusch and Professor Edward A. Steiner. The subject was social service, and the chairman was Dr. F. M. North, of the Social Service Commission. Professor Rauschenbusch's spare figure, his brown-bearded face, his quiet, serene manner, announced the scholar even before he spoke; but when he spoke he said things that first made some of the more conservative of his audience gasp for a moment and then brought rounds of applause. Dr. Steiner, on the other hand, short in stature, fiery in manner, demonstrative by every inflection of the voice and every gesture of the body, thrust truth at his hearers in profusion, and mingled it with audacious humor. When the meeting was over, a prominent clergyman, representing a denomination that has been in its influence extremely individualistic, candidly acknowledged to one of the speakers that he had been converted to the social view of religion.

The churches, in fact, have converted themselves. They have discovered that the message intrusted to the churches is not a message that concerns merely individual men and women, but concerns the city and the way it houses its poor, the Nation and the way it treats the immigrant, the great industrial system and the way it acquires and distributes wealth.

And that represents, perhaps, after all, the most important thing "they have done."

A MUNICIPAL THEATER

AN INTERESTING EXPERIMENT IN CITY LIFE

BY AN OBSERVER

THE city of Northampton, Massachusetts, has initiated what is a new experiment in American life, a theater owned by the municipality and operated under its control.

There is nothing new in a municipal theater. Such theaters date back to the early days of the Christian era, and probably grew out of the still earlier custom of pagan Rome of furnishing entertainment for the people. Such theaters are familiar to the people on the Continent of Europe. A well-informed writer in the Boston "Transcript" says that "the European takes his municipal theater as a matter of course, just as he takes his municipal schools, his municipal art museum, his municipal playground." There is really no reason why the people should not provide for themselves a cheap and pure entertainment as well as a cheap and good education; no reason why they should not own and operate for their own benefit a theater as well as a museum. This, however, never has been done in America, nor, so far as we know, in England. One contrast between the results of the English and the German system is noted by this writer in the "Transcript:" "In Germany there are practically no traveling companies. Each city, even the smallest, has its independent local playhouses, whose actors and stage directors mount new pieces as soon as some experimenter has proved them successful or interesting elsewhere, and use them as part of a large and shifting repertory. In England it is the opposite. There you find only one center for theatrical production—London—and a play once successful runs for many months. In America we have many cities all bound together by a great touring system over which a play travels from town to town. The resident stock company of merit is almost unknown, especially in the smaller cities. Repertory and change of bill is rarer than in England."

Another result of this contrast is that the smaller towns and cities in America rarely get good plays, and still more rarely good companies. Apprentices learn their trade on the road. One-night performances are the rule. Plays which are to legitimate drama what pictures chalked on the sidewalk are to legitimate art are customary. The managers depend on striking, sensational, and bizarre effects. The actors and actresses, having no reputation to win and none to maintain, have very little spur to their artistic ambition.

It was perhaps these considerations which led Mr. Lyman and his wife in 1892 to present to the city of Northampton a house to be "devoted and used solely and exclusively for the delivery of lectures, the production

of concerts and operas, and the representation and delineation of the drama of the better character." A committee of five persons was constituted to take charge of this property. It included the Mayor, the President of the trustees of Smith College, Mr. Lyman, and two other citizens. Until last fall this theater, for the entertainments afforded in it, had been dependent upon such traveling companies as could be induced to visit the city, with the result that, while only a few entertainments of the poorest description were palmed off upon the citizens, few entertainments of the best were obtainable. It became more and more apparent that the city was not getting the class of entertainments which it desired and for which the committee believed its citizens would be willing to pay. So last spring the trustees decided that the people of Northampton should no longer depend upon what the New York managers felt inclined to send their way, and, after much deliberation, they concluded to provide a citizens' company of competent actors and actresses to which they might dictate their own wishes. Through Mr. Henry Miller, of New York, the trustees engaged Mr. Bertram Harrison and Miss Jessie Bonstelle to choose and direct a permanent company in the Academy, which is to give the best and newest plays possible for the moderate price of twenty-five, fifty, and seventy-five cents. This new work is an effort on the part of the trustees to take the Academy away from the disposal of the New York managers and make it more truly useful to the people whose property it is. Formerly the house was dark more than half the time. Now it is opened every night in the week and for two matinées, so that no one need ever lack for a place where he may find wholesome entertainment.

Mr. Lyman having in the meantime died, his son, Mr. Frank Lyman, felt the desirability of the work so strongly that he pledged a generous guarantee fund, which is being used to start the new company in business, and as a safeguard against possible loss to the city. The management of the theater has been placed in the charge of Miss Charlotte Bannon, who is a graduate of Smith College, and has had experience both before and behind the footlights, especially in the management of a high-class vaudeville entertainment in Boston. She is enthusiastically devoted to the difficult task intrusted to her—that of so combining the practical and the ideal that the theater shall draw audiences sufficient in size to make it self-supporting and sufficiently elevating in character to furnish always pure and healthful recreation, and, sometimes at least, real inspiration and instruction.

A stock company has been brought together, known as the Northampton Players. The night I visited the theater they were playing "Mary Jane's Pa." The title will indicate to the reader that it was not a Shakespearean performance. The play was light, entertaining, perfectly clean from start to finish, and performed by a stock company that had in it neither sticks nor stars, but was, as a company, decidedly better than the average that one sees on the New York boards.

I asked Miss Bannon if the company did not find the work very difficult. A long run is impossible. There is not a population in Northampton to support a long run. The players perform one play for a week, with two matinées, thus giving eight performances. While they are performing this play they have to be learning and rehearsing another play for the next week. To me, to whom the memorizing of a single verse of poetry is an exceedingly difficult undertaking, the weekly task of the Northampton Players seemed incredibly difficult. Miss Bannon replied that they were enthusiastic in their enjoyment of their new position. They have a home, a social position in the community, an opportunity to do good work and get credit for it, and the pleasure which always comes from new undertakings, for every play is a new undertaking.

In the ordinary theater the actor often plays but one part in a season, as the manager is thus saved the expense and trouble of rehearsing all his company every few weeks. It is perfectly obvious that this is no way to learn to act. It is the great merit of a permanent company that the actor not only plays a great number of parts in a season instead of one, but that these parts are widely different in character. Thus, with the Northampton Players the actor faces the same audience each week in a different rôle, which must stimulate his endeavors to achieve truer impersonation than if he played the same part to a new set of faces every night for a year. In permanent companies there are no stars, and it is the effort of those who direct permanent companies wisely to choose plays which have a number of well-balanced parts, in order to bring out, so far as possible, the talents of the different members of their

company. This in itself is a sane, healthy movement toward better work and better acting on the stage. Then, too, the members of the permanent company become residents of the city in which they find their work, and the townspeople become interested in them as citizens. They become interested in going to see them play in different parts from week to week. This personal interest in the same actors' work also leads to a great interest in the plays which they give. Stock audiences, unlike those on Broadway, get to know well each member of the company. Often they become very fond of their favorites, and very much interested in observing the way in which they take different parts. This permanent-company idea, therefore, thus creates in a community a theater-going habit on the part of the people, who frankly and freely discuss the plays and players. This cannot but conduce in the community a healthy interest in the theater and tend towards its elevation.

Nor is it the actors only who are thus stimulated to take a vital interest in their work. The scene-painter is busy throughout the week in preparing the stage setting for the next play. He has always something interesting to do, always an opportunity to try it on the audience, and always an opportunity to improve in his effects the following week from a study of the results on the audience of his work of the preceding week.

I asked Miss Bannon if she did not have difficulty in getting plays. She replied that leading writers were taking an interest in the experiment, and she had received permission already from several of them to use their productions. The student body of Smith College affords, of course, a rarely cultivated and critical audience. This of itself inspires the actors, and makes the playwriters more willing to have their plays used in the theater. In truth, a week's performance cannot possibly interfere with the commercial value of the play elsewhere, and may indeed help to promote its more extended use. Moreover, it is not unreasonable to expect that in time some student of Smith College may furnish a play which will get its first interpretation from the Northampton Players. The students are already, in compliance with Miss Bannon's request, sending in occasional suggestions for plays.

It may be noted incidentally that the municipal theater is not without its economic value to the city. Hitherto the road shows which played in Northampton took out of the city large percentages of the receipts. With this new idea in operation, all the money spent for the theater by the citizens remains in the community. The members of the company find their homes in the city, and all materials for scenery and work upon the stage are supplied by the residents of the city. Therefore large amounts of money which hitherto were taken out of Northampton by road shows are now returning through the channels of mercantile business into the pockets from which they came. This fact is worth being borne in mind by the citizens of other municipalities in considering the practicability of establishing a municipal theater for their own community.

Although the theater of Northampton has been in operation under its new management with a permanent stock company for only a few months, the idea is already extending to other cities. In fact, almost, if not quite, simultaneously with the new birth of the municipal theater in Northampton a similar project was started in Pittsfield, Massachusetts. Fifty public-spirited citizens of that town bought a theater which had before been run as a purely private enterprise, and have established there a permanent company of their own on lines similar to those followed in Northampton. In both Pittsfield and Northampton traveling companies are occasionally invited, but the towns are no longer dependent upon such companies and such plays as the New York managers see fit to send them. They are able, within certain limits, to choose for themselves.

It is not unreasonable to hope that other New England cities will follow the experiment initiated in Northampton and Pittsfield, if it should prove a success. If a municipal theater could be established, for example, in the cities of Springfield, Hartford, Worcester, and Providence, by a combination between these six New England cities, it would be perfectly possible to make occasional and perhaps frequent or even regular exchanges of plays and companies, to their mutual advantage. The Northampton municipal theater has already attracted widespread interest and discussion. Numbers of letters of inquiry have been received from other communities, notably one from the Department of Municipal Research in the Mayor's office in Cleveland, Ohio, stating that public-spirited citizens in that city had discussed for some time a similar undertaking, and asking for information as to methods of operation.

The New Map of Europe

BY ALBERT EDWARDS

SPECIAL CORRESPONDENT OF THE OUTLOOK IN THE BALKANS

This is the first of a series of articles in which The Outlook's representative in the Near East will describe what he there finds as the outcome of the war which has now been stopped, temporarily at least, by the armistice to be followed by negotiations for the final settlement. The present article is introductory in its nature, and was written *en route* to the scene of the recent hostilities. It gives an answer to the question, "What is it all about?" and makes clear the story of the "Trouble in the Balkans." Albert Edwards has traveled much in Mohammedan countries, has made a special study of the questions now uppermost, and his articles in The Outlook on the Panama Canal and stories from Algeria and Morocco will be remembered with appreciation by our readers.—THE EDITORS.

A MAN from Chicago, a Professor of Greek, a retired English army officer, and I were playing a peaceful game of bridge in the smoking-room. The steamer was seven days out from New York, somewhere between the Azores and Gibraltar. We were suddenly interrupted by a burst of wild cheering from the steerage.

There were eighteen hundred Greek Reservists aboard, going home to the war. And, as we learned by rushing out on the promenade deck, the captain was reading to them a message just received by wireless. The Bulgarian army had broken through the line of forts about Kirk-Kilisse. The Greek army was entering Salonika.

It was late in the evening of an overcast night when this news of victory reached us, and the faces of the Greeks, as they crowded forward to catch every word of the despatch, were illumined by an electric flare. How they cheered! A few weeks before these men had been peddling vegetables or blacking boots for us—some of them had been selling flowers on the sidewalk. Hundreds on hundreds of their countrymen and allies were lying stark on the field of battle. But if the Moslem Saul had slain his thousands, the Christian David had slain his ten thousands. Their century-long oppressors were defeated. The power of Turkey was broken. And so they cheered. We could see very little of them, through the darkness, except their white teeth and the flame in their eyes—it was something more than the reflection of the electric lamps.

When the captain had finished his little speech of congratulation, a bugle began a strange and moving melody—one bar, and they were all singing the Greek anthem. It was something to remember, more impressive than their cheering—that somber, solemn, but daring song, out there in mid-ocean, from the lips and hearts of these men who a little while ago had been bootblacks and who were going home to fight.

"What's all this row about?" the man from Chicago asked as he picked up the cards for a new deal when we had returned to the table.

"It reminds one of the story in the First Reader," the Englishman said. "No one took it seriously. They've yelled 'Wolf! Wolf!' too often from that quarter. I can't remember a year when there have not been rumors of 'trouble in the Balkans.'"

"Yes," the Professor chimed in; "it is an old story. It goes back at least to Demosthenes. 'Trouble in the Balkans' was the subject of his philippics.

"Dinky little toy countries—no bigger than postage stamps," the man from Chicago said. "They're worse than our Central American Republics. Why doesn't somebody give them a spanking?"

"Spanking?" the English officer exclaimed. "My word, man! Why, sir, Bulgaria alone has a bigger army than the United States—bigger, and a whole lot better. Toy countries? Why, there are more men in the field to-day than there were in the Franco-Prussian War. And back of the actual hostilities in the Balkans there is—there can't help being—a European crisis. It's the biggest thing our generation has seen!"

"Well," the man from Chicago persisted, only half convinced that the matter was serious, "what's it all about?"

"Trouble in the Balkans" goes much further back than Demosthenes. The peninsula which lies between the Black Sea and the Adriatic is the front yard of Europe. The very first men there were, the men with fur like monkeys, invaded Europe by this route. The low-browed skulls which archæologists dig up in the British Isles belonged to a race that fought their way through the Balkans. One invasion followed another. It was not until after history was invented that the Asiatic hordes began to enter Europe by the route north of the Caspian Sea.

But from a modern point of view the Balkan question dates from the diplomatic congress which met at Vienna to rearrange the map which Napoleon had so desperately disturbed. In reading the history of that conference it is well to remember that the titled and beribboned gentlemen who met in Vienna were the lackeys of the kings who had—or who thought they had—suppressed the French Revolution. The entire absence of any modern idea in that council is not surprising. These diplomats did not think that the citizens of even their own countries had anything to say about how or by whom they should be governed. They could not be expected to consider the desires or needs of the people who inhabited the Balkan Peninsula. They treated that section of the map as cynically as they did Poland.

The idea that nations might live together as friends on any basis of justice was foreign to them. The only right they recognized was might. As the amount of booty to be distributed was limited, it was evident that everybody could not be satisfied. The best they could hope for was a *modus vivendi* until Europe could gather breath for a new war. The other Powers were too jealous of Austria and Russia to allow either of them to take the Balkans, so the territory was left to Turkey.

The people of this peninsula were not then, any more than they are now, Turks. The hordes of immigration which had passed through had each left its mark, if not by pure blood groups, at least by hybridization. Since the Osmanli Turks conquered the country in the fifteenth century the principal elements of the population have been three: 1, the pure Slavs, Serbs, Montenegrins, Bosnians, Croats, etc.; 2, the Bulgars, who, although of quite different origin, have been thoroughly Slavonized; 3, the Greeks—one of the most mixed-blooded races of Europe, for they have cross-bred with every Mediterranean people. There is also a considerable number of Jews and Armenians. And scattered all over the peninsula there are smaller groups (the Albanians are the most important) over the origin of whom the ethnologists are continually writing ponderous and contradictory volumes.

The mixture of religions is even more intricate. The Turks are not proselyters, like the Arabs, and very few of the native peoples have embraced Islam. But, besides the Jews, there are Christians of every confession—Gregorians, Nestorians, Protestants, Catholics, and, above all, Greek Orthodox. But of these Orthodox Christians some give allegiance to the Patriarch of Constantinople, some belong to the Russian schism. The Serbs have a Patriarch of their own, and the Bulgars get along without any.

In the days of the Vienna Congress the Balkan Peninsula was the Dark Spot of Europe. Christendom was becoming enlightened only in spots. We are apt to think of the centers of culture, to forget that while Raphael painted and Dante sang, the mass of the Italian people were still in the dark ages; while Voltaire and Diderot were illumining the minds of men, the French nation had not yet escaped from feudalism. Most of the people born in Europe during the life of Napoleon never learned their alphabets. But there was no corner of Christendom at the beginning of the last century as dark as the Balkan Peninsula.

It was the scene of the worst despotism Europe has ever seen. And the tyranny of the Unspeakable Turk had been upon it for close on to four centuries. The people had forgotten their ancient liberties. No Serb remembered the thirteenth-century glories of Ouskoub. No Bulgar knew the legends of the brave old days—just a thousand years ago—when Czar Simon I ruled from sea to sea and besieged Constantinople. The Greeks had forgotten Pericles and Marathon.

Only the people of the Black Mountain held their heads erect. The history of the world does not recount a more heroic struggle than that by which the Montenegrins kept their independence. Nor does history record a social organization more utterly mili-

tary. Cowardice was forbidden by law. Even to-day a Montenegrin who appears in public with his revolver unloaded is liable to arrest. Five hundred years of constant fighting has left its mark on these people.

With the exception of this tiny kingdom—hardly more than a mountain clan—no light shone in the Balkans. The people were utterly cowed and utterly poor, for the Turkish masters were as greedy as they were cruel.

But even Turkish rule is not light-proof; the wonderful march of progress which the last century brought to western Europe had its effect even in this forgotten corner. It was a Greek—Alexandre Ypsilanti—who, in 1821, first raised the flag of revolt. It was in 1829, after many suppressed uprisings, after great loss of life, that the independence of Greece was at last conceded. This was the first serious rupture of the *status quo* contrived by the diplomats in Vienna. They did not like to see their plans deranged, and were slow in acknowledging the new country.

In 1856 the two northeastern provinces of Turkey, Moldavia and Wallachia, won their independence. Five years later Prince Couza united them into the Principality of Rumania. Once more the *status quo* had been ruptured. The diplomats could not turn back the hands on the clock of progress, so they contented themselves by putting Charles von Hohenzollern on the throne in place of the native prince.

Partly because of the pressure of European capitalists, and partly because of a short-lived Liberal Ministry at Constantinople, the first railways were laid in the Balkans in the early sixties. Locomotives are powerful missionaries. They carry ideas as well as commerce. The rumble of the Crimean War shook the peninsula. The Serbs, inspired by the heroic example of Montenegro and encouraged by promises of help from Austria, made a desperate and futile revolt. But the fire could not be put out. In 1875 the Bulgars rose.

Russia, always looking for a warm-water port, and having recovered from her Crimean reverses, seized the pretext of a Slavic Orthodox people in distress to declare war on Turkey. The important thing to note in regard to that conflict is the undisputed fact that Russia would not have won the battle of Plevna without the help of the Rumanians and Bulgars. Finally, camped on almost the same ground where the latest despatches tell us the allies are preparing for a final battle, Russia forced from Turkey the Treaty of San Stefano.

By its terms a semi-independent principality of Bulgaria, under nominal Turkish suzerainty, was created. This new nation was to extend from the Danube to the Ægean Sea. Russia was to be allowed to station troops in this new Bulgaria. The territory of Montenegro was tripled, taking in most of the present Servia, and so cutting off the provinces of Bosnia and Herzegovina from the rest of Turkey.

But this solution of the Balkan question did not suit the other Powers. This new Bulgaria would stretch straight across Austria's hope of some day reaching Salonika. The famous "*Drang nach osten*" had already set in. The German people were turning their eyes to the rich markets of the Levant and Orient. In those days the Russian Bear was the particular nightmare of England. A Slavic power in control of the Dardanelles threatened her supremacy in the Mediterranean. Lord Beaconsfield issued a call for volunteers at home, and began rushing troops westward from India.

Russia, expecting the support of the all-powerful Bismarck, consented to a European congress. It convened at Berlin on June 13, 1878.

None of the circumstances which somewhat excuse the lack of foresighted, enlightened statesmanship of the Vienna Congress can be cited in extenuation of the stupidities decreed by that of Berlin. Europe was three-quarters of a century older. With the exception of the two belligerents, every Power represented had accepted the principle of constitutional government. A man named Darwin had written a book which had persuaded almost every one that a *status quo* was as abhorrent to politics as a vacuum is to nature. Nevertheless, these plenipotentiaries deliberated in the spirit of their predecessors. Instead of trying to erect a structure of peace on the base of justice they followed the dreary old routine of secret conspiracies. No one asked, "How much do you deserve?" but, "How much will you give me if I let you have what you want?" *Quid pro quo* is another classic phrase of diplomacy.

Justice? No. They were searching for a *modus vivendi*. Having weighed the military force that was back of each representative, having called each bluff, they began work on the map. Bismarck had cynically betrayed

Russia. So all they had to do was to balance the ambitions and hatreds and force of the Austro-German combination against the force and hatreds and ambitions of Russia.

Bessarabia, a province inhabited almost exclusively by Rumanians, was given to the Czar; he was also allowed to keep the Armenians of the Transcaucasus. Austria was given the administration of Bosnia and Herzegovina and the right to establish garrisons in Novi-Bazar. This cut a lane through the Balkan Slavs and left the way open to Salonika.

These two principal rivals having been attended to, the Congress proceeded to what Bismarck cynically called the distribution of tips (*pourboires*).

The complete independence of a small section of the Serbs was decreed. Rumania also was declared independent; to compensate her for the loss of half her people to Russia she was given the province of Dobrudja, which is inhabited by Bulgars. The independence which Montenegro had never lost was recognized. What were left of the Bulgars were divided into two sections; those to the south, in Eastern Rumelia, were given back to Turkey; the northern sections were formed into a principality in fief to the Porte. England was given Cyprus, France the permission to take Tunisia. And then the Congress, having divided up half of Turkey-in-Europe, solemnly guaranteed the integrity of the Ottoman Empire and adjourned.

The people of the Balkans were not satisfied. No more were any of the Powers. But no one was prepared to fight. So it was a *modus vivendi*.

The little principalities so artificially established began to misbehave at once. They commenced to develop. And of course growth or progress of any kind was a violation of the solemnly decreed *status quo*.

The period immediately following the Treaty of Berlin was for the Balkan people an era of rapidly expanding thought, of immense gains in material prosperity, and of an intense development of the national spirit. The young people went abroad to school—to Paris, Vienna, or St. Petersburg. They became European. The present King of Servia is a graduate of the French Military Academy of Saint-Cyr. Freed from the curse of the Turkish tax-gatherers, the immense natural riches of the land began to be changed into wealth. The youth of Servia and Bulgaria began to read in the historical text-books of Europe of the ancient glory of their ancestors. Long-forgotten national songs were revived, old customs and costumes were fostered.

Two picturesque characters stand out as typical of this period: Nicolas of Montenegro, and Stambuloff, Minister and Dictator of Bulgaria.

The first, true to the traditions of his people, has centered every effort on military development. There are very few more industries in Montenegro to-day than there were a hundred years ago, very little more commerce. But there is still a law against cowardice. Within the last few years Nicolas has sent to jail some of his subjects who lacked the spirit to avenge the murder of their kin. The vendetta is compulsory. But the old muzzle-loading flintlocks have given place to the most effective modern rifles. The old tribal, brigand organization has given place to regularly recruited regiments. The village chieftains have been superseded by highly trained officers from Saint-Cyr. Nicolas has not ruled his 250,000 subjects gently, but he is extremely popular, because he has personified the national spirit of his people—the five-century-old tradition of war with the Turks.

Stambuloff, a tyrant as arbitrary as Nicolas, also, like him, bore a marked resemblance to Diaz of Mexico. By methods which were often high-handed and despotic he developed a people just emerging from serfdom into a compact, ambitious, and violently patriotic nation. More far-sighted than Nicolas, he also laid a firm basis of material prosperity. He was assassinated in 1895. But on his death, Prince Ferdinand, the present Czar of the Bulgars, found himself at the head of a real nation.

During this last quarter of the past century—the period when the people of the Balkans were coming to life—Austria and Russia continued their struggle for predominance in this much-coveted territory. First one side of the balance, then the other, rose; but in general it was a deadlock. The absorption of their brethren of Bessarabia, and the well-founded fear that the same fate awaited them, threw the Rumanian principality into the arms of Austria. The mass of the Bulgars, feeling that they owed their liberties to Russia, were grateful, but Stambuloff, the Dictator, was pro-Austria. He succeeded in forcing the abdication of the

Prince whom the Congress of Berlin had chosen, and had Ferdinand, an Austrian army officer, put in his place. But Ferdinand, as soon as he was freed from his powerful Minister, decided to follow the evident wishes of his people, and had his son Boris baptized according to the rite of the Russian Church. The thirteenth and fourteenth century traditions, which were being studied with such fervor, showed that Serbs and Bulgars were hereditary enemies, so, as the latter made friends with Russia, Servia turned to Austria. Montenegro, fearing that it would follow Croatia, Bosnia, and Herzegovina down the Austrian maw, tied up to Russia. Nicolas married two of his daughters to Grand Dukes. Every year Montenegro publishes a budget according to which about $50,000 a year is devoted to the Ministry of War. But Montenegro maintains in time of peace an army of from thirty to forty thousand men; they are well equipped. Any student of military finances will at once discover a discrepancy. The extensive artillery which is to-day thundering about Scutari represents by itself a larger expenditure than the budget indicates. No one believes that the money for this military establishment falls from the sky. The Greeks, with their Anglo-Danish King, were supposed to prefer Austria to the Slavs.

The light of modern ideas, which was so rapidly expanding in the Balkans, penetrated also into Constantinople. Young Turks, as well as Christians, were studying in western Europe. The American mission establishments, like Robert College, and the hundreds of French schools, missionary and laic, were sowing modern thought throughout the Empire. European railway engineers and mining experts were circulating everywhere. European "construction men" were building docks and public buildings. Everywhere the "Western contagion" was spreading, helped along here and there by "modernized" Turks, impeded in other places by fanaticism.

"All the world"—who did not know Turkey from the inside—was surprised by the revolution of 1908. Christian constitutional governments sent congratulations to the new Parliament, and cynically grasped the opportunity furnished by internal dissensions to take what they wanted.

The first shock came from the Bulgars. They doubled their territory by annexing the province of Eastern Rumelia—almost entirely populated by Bulgars—and announced themselves a sovereign nation. Prince Ferdinand took the title of Czar of the Bulgars. This action was in line with what the diplomats call "manifest destiny." The ambition of the ruling family, the greed of commercial interests, undoubtedly had part in it, but the overwhelming motive was the desire of the Bulgars to relieve the very real distress of their brothers across the artificial frontier and to unite their race in one nation. The annexation was received with wild joy by the people affected. It was a "national act," rectifying an egregious blunder of the Congress of Berlin.

Austria, all the while protesting against Bulgaria's violation of the sacred *status quo*, raised her flag over Bosnia and Herzegovina. It was an "action of the Cabinet." It in no way interested the mass of the Austro-Hungarian people. It was violently resisted by the peoples annexed. And it was also an act of very doubtful political wisdom. It was so evidently a step forward to Salonika, an advance in the "march to the East," that it broke the last thread of friendship between Servia and Austria, a friendship already strained to the breaking point by Austria's tyrannical economic policy towards the smaller state. It frightened Greece. The annexation of Bosnia and Herzegovina made the Balkan Federation possible. Legends of thirteenth and fourteenth century wars began to look very small in the face of the evident menace of extinction.

Italy's raid in the Tripolitaine, while not a matter of Balkan politics, was a part of the general movement of Christian Europe to grab something—territory or financial concessions—from Turkey, weakened internally by its effort at reform.

These changes in the map of course caused a vast amount of diplomatic correspondence. The Russian Bear growled. The Kaiser banged his mailed fist on the table. The balance of power was threatened. More billions were sunk in armaments.

But none of the diplomats seemed to realize that, instead of the *status quo* in the Balkans decreed by the Berlin Congress, there were a million men armed with modern rifles and Creusot artillery; that the Turkish army, in spite of its German instructors, had become utterly disorganized by political intrigue; that, instead of some insignificant little "buffer

states," which could be tossed at will into either pan of their balance, a spirit of Balkan unity was developing; that even Greece, traditionally hostile to the Slavs, had entered the combine; and that the Balkan people were conscious of their power.

The blindness of Europe in this matter is inexplicable. Less than a year before the hostilities broke out a Bulgarian Minister announced, in a public session of the Sobranje, that the army was ready; that a plan of campaign had been arranged with the allies; that they could count on sufficient strength to drive Turkey out of Europe any time the nation ordered an advance.

Europe laughed. Columns of ironical comment appeared in the best-informed journals of London, Paris, and Berlin. Field Marshal von der Goltz, the man whom the Kaiser had lent the Sultan to reorganize the Turkish army, announced that it would take the German army three months to reduce the fortifications of Kirk-Kilisse.

The Bulgars took it in three days. Their boast had not been in vain. Their army was ready. When the day arrived—apparently chosen with great foresight by the Balkan statesmen—when the day came which made effective intervention by the Powers least probable, the Balkan Federation, which the diplomats had said was impossible, was announced, and King Nicolas of Montenegro invaded Turkey.

Still Europe laughed. How little the rest of the world thought of the outbreak is apparent from the issues of the "Illustrated London News" and "L'Illustration" of those first weeks. But when the Turkish frontier had been crossed by four different nations, when it gradually became apparent that the allies had developed their plans as definitely as had von Moltke for his invasion of France in 1870, and that these plans were working out with clocklike regularity, the amusement gave place to amazement and dismay.

The news we received by wireless at sea announced the utter bankruptcy of European diplomacy. Those little Balkan states, created offhand by the Congress of Berlin, had calmly defied their creators. For close to a century the diplomats have been bolstering up the Sick Man of Europe, keeping him alive at the price of shameful complaisance in the endless massacres of Armenians and Macedonians. Well, he is dead now. Europe at last will have to face the realities of the Balkan question, which have been so adroitly avoided by various *modi vivendi*.

The papers we bought on landing, the latest despatches from the front, have not changed the situation. The Turks, aided by the Austro-German interests, are preparing a last and heroic effort to defend the Crescent which for nearly five centuries has crowned the dome of the ancient cathedral of Santa Sophia. Adrianople and Scutari still hold out. Janina, of great importance to the Greeks, and Durazzo, equally desired by the Serbs, have not yet been invested. The Turkish flag is still flying in five widely scattered important European cities. Even if the allies do not enter Constantinople, even if peace is reached on the terms now proposed—leaving the Turks a narrow strip of land along the straits—the feat of arms already accomplished by the Balkan peoples is without parallel. The results of their two months' campaign are as amazing as is the sudden birth of a new European power.

Rather breathlessly the diplomats are asking themselves and each other what to do about this disconcerting eruption. But it seems very evident that, unless they can sow discord—and they are clever at that trick—among the allies, they will have very little to say in the future about the map of the Balkan Peninsula. If the Federation holds together, it can control its own destiny.

And out of this collapse of diplomacy has come the fear of a European war. No one wants it. No one can see any reason for it. But everybody is afraid. For so many decades now the diplomats have sown their traditional seed of discord that it will take very cool-headed statesmanship to avoid the harvest of war.

The old order changeth. The old alliances and combinations are tottering. The prestige of the diplomats, with their secret treaties and whispered conferences, and their bartering behind closed doors, is broken. The men in the street are talking it over. The women are discussing the crisis at their afternoon teas and from one back yard to another. The papers are publishing lurid accounts and hideous photographs of the carnage. Every one is thinking about the cholera.

In this lies the hope of peace. Not even the Czar of all the Russias could to-day force his people to a war against their will. Those days are happily passed, and neither Ivan nor John, Jean nor Johann, wants to kill or be killed to support obscure ambitions or commercial designs.

THE SPECTATOR

"BUT how did they dare to put that on the stage?" asked the Spectator's friend.

They had just come from the afternoon performance of a New York vaudeville theater, where several scenes from Dickens's "Christmas Carol" had been acted.

"It was so simple and childlike and so clean," his friend continued. "And yet the funny thing is that the audience seemed to like it. You wouldn't expect such a crowd to enjoy anything quite so good."

"You're wrong," said the Spectator, in a tone which indicated a conviction which is not at every season of the year so firm as he would wish. "You're wrong. Everybody prefers what is good, what is best, if we can only present it to him in such a way that the worst won't always appear so tremendously more attractive."

"Humph!" was the only comment made by his friend.

"Come with me to-morrow afternoon;" the Spectator ignored completely the reflection implied as to the soundness of his judgment. "You shall be Scrooge and I shall be the fairy to lead you around and transform you into as hopeless an optimist as you accuse me of being."

It was very cold. It was such weather as the Spectator remembered to have been described in an old German story which he had read at college as *ganz gutes Weihnachtswetter*. The wind was beginning to drive all wanderers upon the Bowery on this Sunday afternoon near Christmas time into whatever sort of shelter they could find, no matter how miserable it might be. The sky above was of that gray color which betokens the approach of a snowstorm. The Spectator and his friend had had a very busy afternoon. Over on Mott Street they had listened to a Sunday-school class of Chinese boys and girls sing their Christmas-time songs and talk about the story of the first Christmas with an interest and enjoyment that was truly unfeigned. Thence they stepped over to the large old church near by, where they took part in what was known as the "Happy Hour." Here they found men, women, and children—Italians, Russians, Jews, Chinamen, and some of American birth—who seemed to receive a vast deal of pleasure from the service.

And the Spectator thoroughly appreciated it himself. There were the moving pictures, marvelous in their coloring and accuracy of detail, which told to the straining eyes of the gazers the Christmas tale. The shepherds watching their flocks, the journey to Bethlehem, the discovery of the child in the manger—these were pictured in a way that made the Spectator resolve to discover some day how such reproductions were made. Then there was the short sermon, some enthusiastic if not very melodious singing from all those present, and, finally, a performance by a phonograph.

There were about ten in the party which left the church at four o'clock to visit one of the cheap lodging-houses along the Bowery. Four of them were women, one of whom possessed a beautiful soprano voice, which she shared with the occupants of these places on Sundays; another had consented to play once a week the little organ which two of the men carried upon their shoulders. The doorway to the first lodging-house was very narrow, and opened upon a stairway which was not exactly of the size one would find in the Waldorf. Neither did the living-room on the second floor completely resemble the parlor which one would expect to find in an up-to-date hostelry. The room was probably about forty-five feet long and twenty-five feet wide. The floor was uncarpeted, and indicated very clearly that some of the mud from an excavation near by had been unintentionally carried to a new abode. The guiding god of cheap lodging-houses was being religiously propitiated by the incense offering which arose from the pipes and cigarettes of men of all ages. Cigars were evidently not considered as especially appropriate for these rites.

In the midst of the smoke which floated through the hall the Spectator caught sight of a big iron stove, glowing almost red, whose vicinity seemed the favorite location for all on this day. Near the end from that by which they had entered was the inclosure of the cashier, who received the daily payment of fifteen or twenty-five cents from each man before he was given a check for a bed. The dormitories were located on the floor above. A few tables were placed here and there, covered with those inevitable accompaniments of civilization—the Sunday newspapers. The walls were painted a dull brown; the woodwork suggested in a most unobtrusive manner that it had once had the honor of being covered with a coat of white paint. Only a few steamship advertisements and calendars adorned these walls; not a single obscene or even suggestive picture, the Spectator was glad to see, was anywhere visible. The only sign of the Christmas season which he could discover were the half-dozen forlorn-looking wreaths which were suspended by narrow red ribbons before the windows.

But it was the occupants of the room who pleased the Spectator most. He did not expect to find them as he did. The majority had on

fairly clean shirts and soft collars, with no ties. Their suits were well worn and showed signs of considerable mending, it is true, but there were none in tatters and there were few outlandish costumes. Some of the men had on stiff shirts which had been recently laundered, with white celluloid collars and faded ties which had been hurriedly tied into a bow that resembled a colored dish-rag knotted in the center. The collars were in most cases too large, and sometimes they were so split and cracked that one end stubbornly refused to slip into its proper place, and instead flapped out in a manner which forced the wearer to keep his head upright, like a tightly checked horse, if he wished to avoid chafing his neck on its rough edges.

The Spectator became particularly interested in one young man, who had on a new cheap hand-me-down suit of brown, a linen collar, and a bright fifty-cent tie. During the entire service he sat quietly near the stove, with the yearning, perplexed look on his face of an animal caged up within bars. It pleased the Spectator to let his fancy play with the story that this boy, so plainly a newcomer to the city, would work out for himself. Had he come from the country after reading one of Horatio Alger's fairy tales of youths who had found fame and fortune in New York? or lured by the tales of some native of his home who had achieved success there? Would he sink into failure as he discovered the harshness and hardships with which he must contend? The Spectator at last decided to imagine him as Lemuel Barker, and he breathed a prayer that, like Mr. Howells's hero in "A Minister's Charge," in spite of ups and downs, he would finally achieve a modest degree of success.

During the brief exercises all the men were wonderfully attentive. Newspapers and books were laid aside, and before the service ended those who at first gave attention through respect were listening with genuine interest. The faces of the men as they were turned toward the speakers were not the faces of strong, resourceful, determined men, it is true, but very few of them showed signs of excessive dissipation or of criminal disposition.

"No," said one of the men who had come with the Spectator's party, "they are not very bad; many of them are simply out of a job for a week or two; others have regular employment, but have got in the habit of staying here."

The talks given on this afternoon were delightfully colloquial and heart to heart. The Spectator wished that he could be addressed oftener in this simple manner. The old Christmas times which many of these men had spent with mothers and fathers, with wives and children, in happy homes, were referred to, and the hope expressed that all of them, even those who had in the past never enjoyed such a Christmas time, might possess them in the future. Then was told once more the old, old story of the Christchild and how he had been born into even poorer and worse-furnished places than most of the homes on the big East Side, and how he could thus understand all the troubles and yearnings of those who are poor, and can guide them and help them. But it was the singing which, after all, really won the hearts of the audience—that the Spectator could plainly see. They joined in the familiar hymns with almost boyish enthusiasm. And when the clear, pure notes of the soprano, as she sang a simple Christmas hymn, filled that room, not a whisper, not a rustle of a paper, could be heard. In response to the applause which greeted her first song she rose again, and, to the accompaniment of a few chords from the organ, she sang very softly:

"Stille Nacht, heilige Nacht,
Alles schläft, einsam wacht."

As he walked down the Bowery, the Spectator realized that the experiences of the afternoon had evidently left an impression very clear upon the countenances of himself and his friend, for they were stopped half a dozen times by ragged men or women or children, who seemed to discern that their hearts had been unusually softened. In spite of all his convictions as to the ill wisdom of giving to those who begged upon the streets, each time the Spectator drew out his pocketbook without a single murmur or complaint. He smiled as he noticed that his friend followed his example and that several times he endeavored to be the first to offer a coin to the hand which seemed to need it most.

"You're a confirmed old idealist; you're hopelessly unpractical," said the Spectator's friend.

They had come out from the city on a late train to the suburban town where the Spectator had his home. The open grate was blazing away cheerily as they sat before it on the roomy divan of mission oak. Outside the snow was whirling about; the wind was whistling and singing around the house in genuine story-book style.

"And what are you, pray?" said the Spectator in a tone of righteous indignation. "If I had not kept tight hold of you to-night in New York, you know that you would have come back here without any overcoat. How much did you give to that woman near the Bridge?"

"Stop your quarreling; you're both very bad boys."

It was my Lady in Maroon who had spoken.

She had glided silently into the study and now placed a hand softly over the lips of her brother and of the Spectator.

"I was looking out of the window when you came home," she continued, "and I know that you walked all the way from the station in this storm because you both gave away every cent that you had with you."

The Spectator forced his head around so that he could gaze at her face. The light from the blazing fire was playing upon it in a way that reminded him of one of the scenes in "The Return of Peter Grimm." He glanced quickly at his friend and then back at the burning logs, where the sparks were merrily chasing one another up the chimney.

"Well, what else could one do at Christmas time?" he asked, very quietly.

THE NEW BOOKS

Prints and Their Makers. Edited by FitzRoy Carrington. The Century Company, New York. $3.50.
American Graphic Art. By F. Weitenkampf. Henry Holt & Co., New York. $2.75.

In popular appreciation of art, the subject of prints has never received as much attention as it should. The appointment of Mr. FitzRoy Carrington, editor of "The Print Collector's Quarterly," to a curatorship at the Boston Museum of Fine Arts and to a lectureship at Harvard University has fortunately—at least for the moment—focused the minds of American art lovers on this department. Thus the publication very recently of two notable books on the subject is timely. The first is edited by Mr. Carrington himself. It consists of essays on etchings, engravings, and other prints by the late Mr. Keppel, by Mr. Caffin, Mr. Cortissoz, Mr. Metcalfe, Mr. Weitenkampf, and others. They tell us about the woodcuts of Dürer, the engravings of Mantegna, Marcantonio, Morin, and Nanteuil, about Piranesi, who combined the arts of etching and engraving, and about the etchings of Rembrandt, Goya, Fortuny, Méryon, Bracquemond, Lepère, Seymour Haden, Anders Zorn, and Herman Webster. The quality of the book may be gathered from this excerpt taken from Mr. Cortissoz's appreciation of Fortuny:

It is impossible not to feel a certain indignation over the ignorance of those who have tried to wave Fortuny aside as a painter of bric-à-brac.

We saw too much of that sort of thing when the works of Sorolla and Zuloaga were shown at the Hispanic Museum and people went into hysterics over them, talking especially about how the first of these painters was rejuvenating Spanish art. I used to hear such talk in Madrid, some fifteen years ago, amongst the younger men who were even then hailing Sorolla as a pioneer. They were right, and it is right, as I have argued elsewhere, to recognize in this painter's work an influence of the highest value to the modern Spanish school. But there were great men before Agamemnon, and it is stupid to ignore what was done for Spanish painting by Fortuny long before any one ever heard of Sorolla. I have great respect and plenty of admiration for that accomplished technician, and yet I think that he himself, if pressed in the matter, would cheerfully admit that nothing he ever painted could quite touch the portrait in the Metropolitan Museum, "A Spanish Lady," which Fortuny painted in 1865. Outside of France this was not a particularly good year amongst painters, but Fortuny, then twenty-seven years old, was proving himself not unworthy of Velasquez. He was drawing with mastery and he was painting blacks with amazing skill and taste, with amazing sensitiveness to the beauties lying entangled in one of the most difficult of a colorist's problems. . . .

The artists and critics who think that the history of painting began with Manet are wont to damn Fortuny with faint praise, talking about his dexterity as though that were a very ordinary and perhaps specious gift. Well, there is a dexterity, there is a sleight-of-hand, as honest as anything that you will find in Manet, and Fortuny had it. There are moments, no doubt, in which it takes your breath away as though by some deceptive stroke of conjurer's work. But at bottom there is a sterling sincerity about it, and this, I think, is sharply perceptible in the etchings.

Paradoxically, these do not proclaim Fortuny what the master of etching is wont to be—a lover of line for its own sake, a user of it as a language possessing its own special character and charm. Rembrandt's strength and Whistler's exquisiteness were alike unknown to him. The truth is that Fortuny employed the needle somewhat as he employed the pen, simply for purposes of swift and free expression.

The plates for the illustrations in Mr. Carrington's book have evidently been very carefully made from the original etchings. The collection of illustrations is extremely interesting and valuable. Somewhat less so are the illustrations in Mr. Weitenkampf's book, but the larger print of the text is grateful to weak eyes. If the preceding volume ranges over the entire field of engraving and etching, Mr. Weitenkampf devotes himself to telling us about our own art. He reviews the whole field and brings out our characteristic tendencies. It is time that we had such a grouping of scattered facts. As Mr. Weitenkampf says:

There are such monographs as W. J. Linton's excellent and partly polemical record of American wood-engraving and Ripley Hitchcock's very useful volume on etching in the United States, both published in the eighties of the last century. There is, too, D. McN. Stauffer's alphabetical record of our engravers on copper, an invaluable book of reference. But the only connected and comprehensive account of American graphic art appeared, strange to say, in Germany. In the last decade of the nineteenth century, the Gesellschaft für Vervielfältigende Kunst, of Vienna, issued its monumental four-volume work on "Contemporary Reproductive Art," the history of the achievement of the nineteenth century. In this the American section was covered by the late S. R. Koehler for etching and wood-

engraving, and by the present writer for lithography. The story is well worth telling in English.

Fine Books. By Alfred W. Pollard. G. P. Putnam's Sons, New York. $7.50.

This work is itself an example of fine book-making. It forms one of the beautiful volumes of the Connoisseurs' Library, and, as in all those volumes, the choice of type, paper, and margins, and the skill with which the photogravures, line drawings, and color plates are produced, are worthy of the highest praise. The present book deals with such subjects as the invention of printing, collectors and collecting, early illustration, engraved illustrations, and modern fine printing. Naturally a book prepared with such art and at such expense is for a comparatively few readers, but it should be in all public libraries and on the shelves of those who have an interest in the "art preservative."

Children's Reading (The). By Frances J. Olcott. Houghton Mifflin Company, Boston. $1.25.

Miss Olcott has had long experience in children's libraries and may fairly be regarded as an expert in this intensely important part of library work and home culture. Her book is far from being a mere list of books desirable for children, although each chapter has a selected list of books applicable to its subject, and an appendix contains a list of perhaps two hundred such books. There is concrete advice and information as well as sound theory in Miss Olcott's remarks as to the influence of good books and the effects of bad books, on the fiction of to-day, on books which are practically useful to children, and on the various divisions of child library lore.

The Book of Woodcraft. By Ernest Thompson Seton. Doubleday, Page & Co., New York. $1.75.

The author is eminently qualified to prepare a book covering the subjects here treated. His aim is to give boys and young men practical information about outdoor life, and, as he phrases it, "the activities, customs, laws, and amusements" that have developed in the camps which he has carried on. Much of the lore here collected and made workable is derived from the Indians, and Indian dances, songs, and ceremonies are included, while the special chapter called "Some Indian Ways" is full of clear and interesting information. Apart from this phase of the book there are talks about outdoor camping, camp games, natural history, trapping, forestry inspection, and many other things connected with the great and delightful subject of woodcraft in its broadest sense. The book is handsomely printed, and would be a capital holiday present for almost any boy.

Trails, Trappers, and Tenderfeet in the New Empire of Western Canada. By Stanley Washburn. Henry Holt & Co., New York. $3.

Mr. Washburn's book describes the Rocky Mountains in that part of British Columbia which extends from the Canadian Pacific Railway to the Yellowhead Pass. Through this pass the Grand Trunk Pacific is to go. It is a road from ocean to ocean. Its opening gives a touch of timeliness to the descriptions in this volume of the Athabasca and Fraser River regions—regions rich in water-power possibilities. The Grand Trunk Pacific terminus is at the port of Prince Rupert, five hundred miles north of Vancouver. This, with the low grades over the mountains, means that one to three days should be saved in the journey from England to Japan and China—reason enough for the new road. But it will be a vital factor in the making of Canada itself. In time to come, Charles Melville Hays, the President of the Grand Trunk, who lost his life on the ill-fated Titanic, may be remembered as the man who brought about "the greatest benefit to Canada that has come to her since she has been a nation," to quote Mr. Washburn's words. While the present volume gives interesting information concerning British Columbia—a vast territory; were it set down on the Atlantic seaboard it would extend from Maine to Key West—it has another and more intimate value. It belongs on the "nature book" shelf, for it breathes the atmosphere of the trail. And the trail means the companionship of mountains, glaciers, waterfalls, passes, rivers, brooks, torrents, forests. The text is reinforced by many illustrations from the author's photographs. In them, as in the crisp, direct style, we have a vivid glimpse of noble scenery. Mr. Washburn's expressions of appreciation of nature appeal the more because sandwiched in between descriptions of the joys and trials of the droll or pathetic "tenderfeet." The book has thus a threefold interest, for it is a description of British Columbia, an appreciation of nature, and an introduction to trappers and tenderfeet.

> We did not think we were tenderfeet. I suppose no one ever does. We had six-shooters, shotguns, rifles, hundreds and hundreds of rounds of ammunition, and enough fishing-tackle to have eliminated all of the finny tribe for ten square miles around. On the contrary, we considered ourselves to be hardy pioneers as we trudged off down the trail behind our long-legged guide. . . . We did not know that we were tenderfeet.

There is much pleasant humor in the unfolding of the discovery that they were. Finally, not the least charm of the book is its expression of sympathy with animal life—the goodly fellowship with all the denizens of the forest, but especially with the patient little pack-animals that made the arduous journey possible.

Net (The). By Rex Beach. Harper & Brothers, New York. $1.30.

The first part of the story in laid in Sicily, the second part in New Orleans. By an ingenious plot development the author transports the perpetrators of a Mafia murder in Sicily to New Orleans, where they carry on their evil practices and become involved criminally in

those outrages which led to the famous lynchings of Italians in New Orleans and the international complications with Italy which followed. The plot part of the story is forceful and exciting, but the romantic part, particularly the talk of what are meant to be typical Southern girls, seems lamentably weak and unnatural.

Lure of Life (The). By Agnes and Egerton Castle. Doubleday, Page & Co., New York. $1.35.

This will hardly rank with the best books by these popular and readable authors. Its contrast of character between the young Englishman of scholarly character and tendencies who becomes an inmate of a French family in which intrigue and social tragedy are imminent are too slowly developed to make the book either powerful or in any degree entertaining.

Kiss (The), and Other Stories. By Anton Tchekhoff. Translated by R. E. C. Long. Charles Scribner's Sons, New York. $1.50.

Anton Tchekoff died in 1904. His was a premature death and caused just lamentation all over Russia, indeed all over Europe, wherever his novels and stories had been translated and read. The present volume of his stories is really a volume of sketches. Each one is a Meissonier, so minute and so sure are the touches. As with most Russian literature, there is here the continual note of analysis, of introspection, of self-examination. But there is also in each sketch the evidence of art, and of high art.

Royal Road (The). By Alfred Ollivant. Doubleday, Page & Co., New York. $1.35.

A moving, almost too painfully moving, record of the life of an English cockney artisan, naturally independent and even cheeky, but borne down in the end by the hard conditions of industry, personal weakness, and finally tuberculosis. The book tries one's sensibilities, for no writer can depict suffering and struggling more vividly than Mr. Ollivant; and it may well be worth the suffering which undoubtedly the reader feels that his sympathy should be aroused and his indignation be stirred against the modern social order which makes such things not only possible but common.

Childhood. Verses by Burges Johnson. Pictures by Cecilia Bull Hunter and Caroline Ogden. The Thomas Y. Crowell Company, New York. $3.

A volume rich in verse and pictures is that to which Burges Johnson has furnished the poetry and Cecilia Bull Hunter the pictures. It is published in sumptuous form.

Peterkin. By Gabrielle E. Jackson. Duffield & Co., New York. 75c.

Peterkin is a Russian lad. His father comes under the dislike of the governmental authorities and the family flees to America. The parents die of typhoid fever almost upon the moment of their arrival in the New World. Little Peterkin becomes a little human derelict. Gabrielle Jackson tells us how he "makes good," and Maxfield Parrish prefaces the text by a delightful frontispiece representing Peterkin carrying his father's monstrous green umbrella. The book should appeal to many children.

Fairy Tales from Many Lands. By Katharine Pyle. E. P. Dutton & Co., New York. $1.50.

From the author of "Where the Wind Blows" we have a right to expect attractive text and pictures, and the present volume does not disappoint us. The stories and their illustrations do equal credit to Katharine Pyle.

Christmas Garland (A). By Max Beerbohm. E. P. Dutton & Co., New York. $1.35

In this little book the well-known English humorous writer and caricaturist parodies the style of many famous English writers of our day, taking for the subject of his parodies matters relating to Christmas. In this disguise appear, for instance, Mr. Galsworthy, Bernard Shaw, Arnold Bennett, H. G. Wells, and others, and those we have just specifically named appear to us to be most faithfully rendered. Such a book has no lasting value, but if it is well done, as this most certainly is in many respects, it affords an hour's enjoyment.

Photograms of the Year 1912. Edited by F. J. Mortimer. Tennant & Ward, New York. $1.25.

This handsome annual contains reproductions of photographs from prominent workers, both professional and amateur, in all parts of the world. The book being of British origin, it is perhaps to be expected that among its hundred-odd reproductions more than a third are by London photographers. The pictures are many of them beautiful, and give a fair idea of the endeavor of present-day photographers to cultivate the art side of their process. The accompanying essays give various views as to the present status of photography, that concerning the United States being perhaps unduly pessimistic.

China's Revolution, 1911-1912. By Edwin J. Dingle. McBride, Nast & Co., New York. $3.50.

The Chinese Revolution broke out a year ago. Its result has been beyond anything the world expected. Indeed, what event of our time is more striking than China's breaking away from the imperial tyranny of centuries to a government of, by, and for the people? Just how the Chinese Revolution began and what it means is adequately, though not ideally, explained in Mr. Dingle's book. He calls it "a popular history." But it is more than that. It is a treasure-house of information, and some of the information is, so far as we are aware, entirely new. In the disposition of the material Mr. Dingle seems to have given rather too much space to the military operations about Wuchang, with which the revolution was opened. Yet, as an eye-witness of the operations and a personal friend of the revolutionary leader, his account has vividness

and value. As an answer to the question, Why did not the Chinese rise long before against their Manchu oppressors? we see that a principal reason lay in the lack of facilities of intercommunication. This leads to a consideration of present conditions of transportation and trade. China will now be opened to both to an extent impossible under the old rule. The question, then, for the commercial nations is: Which of them shall most profit by this opportunity? Mr. Dingle's conclusion is: "No matter how many rivals, I should think that no two nations have better prospects for the securing of China's new trade than Great Britain and the United States." He is careful to add, however, "It needs alertness." There must indeed be special alertness, first with regard to German and next with regard to Japanese rivalry.

Hygiene for the Worker. By W. H. Tolman and Adelaide W. Guthrie. The American Book Company, New York. 50c.

Many of the recommendations here made are excellent for everybody, but the special purpose is to help workers in mechanical employment to keep themselves in the best possible condition and safe from injury. The chapters on occupational dangers, for instance, abound in specific directions as to things that should and should not be done about machinery, as to poisonous workshop conditions, and as to precautions which should be taken. The book is sensible and clear.

Echoes from Vagabondia. By Bliss Carman. Small, Maynard & Co., Boston. $1.

Still another "Vagabondia" volume brings the tinkling notes of Mr. Carman's mandolin to our ears. At his best, Mr. Carman has at times achieved the colorless sweetness of a boy's voice. He has never learned how to employ the deep resonance of manhood or the full, tender notes of a woman. The "echoes" in the present volume are thin and faint. That the book contains some skillful verse goes without saying.

Home Book of Verse (The). Compiled by Burton E. Stevenson. Henry Holt & Co., New York. $7.50.

The distinguishing mark of this collection seems to be that it includes several hundred recent writers of verse (with emphasis on the work of Americans), very few of whom have appeared in any other general anthology of poetry. The poems are arranged by subject; and how wide a field is covered is shown by the classifications, which include, among others, children's rhymes, love poems, nature poetry, humorous verses, patriotic and historical poems, reflective and descriptive poetry. Containing over three thousand unabridged poems from some eleven hundred authors, the work is valuable as a reference book; and that it fails, with all its voluminousness, to include some of one's favorite poems is but another illustration of the truth that no anthology can be final where individual taste is the determining factor of selection.

Songs of Happiness. Words by Carolyn S. Bailey; Music by Mary B. Ehrman. The Milton Bradley Company, Springfield, Massachusetts.

This collection ought to prove an attractive addition to the kindergarten and nursery library. The text of the seventy-three songs that compose it have to do with the things and ideas of prime interest in a child's life—birds, animals, flowers, the wind and the rain, the sun, toys, holidays, and getting up and going to bed—and the music interprets the words successfully. The cover shows the flight of three bluebirds against an amber sky surrounded with blue; and doubtless children will find within the book's covers a taste of that which the Blue Bird stands for in our literature.

Bayreuth Letters of Richard Wagner (The). Translated and Edited by Caroline V. Kerr. Small, Maynard & Co., Boston. $2.50.

In the present volume we have an account of Wagner in Bayreuth as told in his letters, translated and cleverly edited by Caroline V. Kerr. The book is eminently practical, for it resumes the autobiographical story about where the recently published autobiography left it. We are specially informed concerning the origin and development of the Bayreuth Festival idea, the preliminary rehearsals, the first festival, and in particular about that music-drama, "Parsifal," which, more than any other, we associate with Bayreuth. We wish that the book were more worth while in the side-lights thrown upon the characters of a number of Wagner's contemporaries—in particular, Dr. Hans Richter; Louis, the late King of Bavaria; and Cosima Wagner, who, the daughter of Franz Liszt and the Countess d'Agoult, was the wife of Hans von Bülow when she came into Wagner's life.

German Emperor and the Peace of the World (The). By Alfred H. Fried. George H. Doran Company, New York. $2.

For a long time men spoke of the present German Emperor as a "war lord." They now see that he has been a famous upholder of peace. When the intimate history of our times is written, this will be appreciated. But enough is now known of Germany's relations, especially with England and France, to disclose the Kaiser's guiding hand. We are glad that Mr. Fried has written a book in which William II's services in this direction have been celebrated.

Aspects of Algeria: Historical—Political—Colonial. By Roy Devereux. E. P. Dutton & Co., New York. $3.50.

Algeria is not a colony, like Canada, peopled almost exclusively by emigrants from the mother country. Nor is it a purely foreign territory, like the Dutch East Indies, regarded as an outlet for home commerce, capital, and influence. Algeria is particularly interesting because it partakes of the nature of both types.

Hence we welcome this new book by Mr. Devereux. For the ordinary reader, it is true, there is occasionally an over-amount of statistical matter. But not for the student. For any reader Mr. Devereux has prepared, on the whole, a very entertaining and instructive work on the French Protectorate. Together with a résumé of history, the political and domestic economy of Algeria is fully reviewed. After reading the volume we have a clear idea of the colony's industrial capabilities and agricultural prospects. The conditions of social life are also included in the author's study.

Doctrine of the Person of Jesus Christ (The). By H. R. Mackintosh, D.Phil., D.D. Charles Scribner's Sons, New York. $2.50.

Jesus. By George Holley Gilbert, Ph.D., D.D. The Macmillan Company, New York. $1.50.

Strikingly opposed in their conclusions, while each by a Christian scholar, these two volumes came together to the reviewer's desk. The first named, belonging to the international series designed for students of theology, is from the Professor of Theology in New College, Edinburgh, and represents the teaching of the United Free Presbyterian Church. Its first half is a critical survey of historical Christology from the earliest to the present time, in orthodox, heretical, and mediating lines of thought. The second half is devoted to a reconstructive statement of the doctrine of the person of Christ, which takes account of its history, the immediate utterances and transcendent implicates of faith, and objections to the conclusions reached. These are, in brief, not far from Dr. Lyman Beecher's famous thesis, "Jesus Christ is the acting Deity of the Universe." Dr. Mackintosh concludes from the saying in the Fourth Gospel—"Jesus knowing that the Father had given all things into his hands"—that the sway of Christ extends throughout the universe, and that he "is eventually to share in the omnipotence and absoluteness of God." As to the God-consciousness undeniably characteristic of Jesus, it is maintained that "at least in high moments of visitation he knew himself to be God, conditioned in and by humanity."

From this volume, whose massive argument is suffused with religious warmth, one enters a cooler atmosphere in the negations of Dr. Gilbert's exclusively critical study of the sources for positive knowledge of the life of Jesus. It contrasts likewise with the tone of his former works on the same subject. He acknowledges that since the more recent of these, the "Student's Life of Jesus," appeared, some fifteen years ago, he has shared with some other scholars in a changed estimate of the historical value of our sources. To exhibit it he adduces their various discrepancies and incompatibilities in minute and copious detail. These seem, in a number of cases, to depend on the critic's point of view, and allowance for possibilities. Dr. Gilbert is justified, however, in affirming the fact of a legendary element in the sources which more conservative writers refuse to recognize. He also affirms that, after his criticism has done its work upon the records, there remains a story of the life of Jesus "abundantly suited to inspire confidence in him as the spiritual leader of mankind."

Benvenuto Cellini. By Robert Henry Hobart Cust, M.A. A. C. McClurg & Co., Chicago. $1.

Rodin. By Muriel Ciolkowska. A. C. McClurg & Co., Chicago. $1.

The latest additions to "Little Books on Art" are appreciations of two artists widely placed by time from each other, namely, Benvenuto Cellini and Auguste Rodin. It is hard to say which is the more interesting volume. Of course one inevitably compares Mr. Cust's essay on the great Florentine master with that of the late John Addington Symonds, and the comparison is naturally not altogether favorable, if for no other reason than that Mr. Symonds had much more space at his command. But Mr. Cust's text is well worth reading. So is Madame Ciolkowska's. She interprets Rodin with sympathy and discrimination. She attempts to place him in his historical position, and in particular she repels the charge that he is a "revolutionary" by showing that in certain things he is in agreement with the great traditions. Rodin has been called the Michelangelo of modern times. His latest biographer agrees that he is doubtless the Michelangelo of our day, because, in her opinion, his task is more stupendous in its versatile profusion, deeper in its significance, and wider in its reach than that of any sculptor of recent times.

Russia in Europe and Asia. By Joseph King Goodrich. A. C. McClurg & Co., Chicago. $1.50.

History of Russia (A). By V. O. Kluchevsky. Translated by C. J. Hogarth. Vol. II. E. P. Dutton & Co., New York. $2.50.

The Outlook recently commended Mr. Joseph King Goodrich's book on China; attention should also be drawn to his just-published volume on Russia. As he says, there is an enormous amount of literature at the disposal of the student of Russian affairs, and yet there is little to satisfy one who wishes to get a comprehensive glance at the whole Empire in its many and various aspects. Mr. Goodrich mentions several books about Russia which, excellent at the time of their publication, have now grown rather obsolete. His aim, we assume, in the present volume has been, therefore, to condense into a smallish volume many up-to-date facts concerning Russia in both Europe and Asia. The author certainly gives us much for our money. Of course he tells us about the Government, but, what is more important, he tells us about the people, the cities and towns, about transportation, about colonization, about exiles and convicts, about religion and education. His conclusions as to Russo-Japanese relations are

interesting because of his residence at Kyoto, the ancient Japanese capital, as professor in the Imperial Government College there. It seemed at first, he says, as if Japan had been brought to see that in the game of diplomacy she could not trust Russia, whose wiliness is so selfish, and that all of her best interests would be served by co-operating with America and Great Britain in furthering China's welfare. Now, however, "it is evident that Japan considers Russia a better ally than any other Power." Hence Mr. Goodrich asks himself the question: Will Japan make it certain that Russia's plans for expansion will never include her own island empire? Such a suspicion, so it seems to us, does not promise any abiding peace in the Far East. As to China, Mr. Goodrich believes that the recovery of full autonomy in Manchuria and Mongolia will be one of the republic's first ambitions. The English translation of the second volume of Kluchevsky's "History of Russia" has now appeared. The work is extremely informative and the author writes in a convincing manner.

LETTERS TO THE OUTLOOK

THE COAL QUESTION

As usual, The Outlook has gone to the heart of the coal question in its discussion in the issue of December 7. About fifty million tons of hard coal constitutes the annual consumption of this country. It is stated upon excellent authority that five railway companies control the mining and distribution of coal through holding companies. There need be no shortage in coal only as the coal monopoly wills it. The mine supply is inexhaustible; the cost of transportation has been about the same for fifteen years, also the cost of mining. The strike of last April was put forward by the monopoly as a probable reason for an advance in price to the consumers. But the fact is that the price per ton of hard coal has advanced in the past decade from $6 to $9 per ton in Michigan. Within the railway zone of Detroit, Michigan, it is now estimated that there are ninety thousand tons of coal on cars. The shortage argument is a myth, and put forward by the coal monopoly to pull the wool over the eyes of shivering consumers. One coal dealer in Lansing, Michigan, asked an outside town to take off his hands two car-loads of hard coal to cover up the *shortage declaration worn threadbare* here.

If there was *ever* a need of investigation and regulation of a commodity, it is the coal supply.

D. E. McCLURE,
Assistant Secretary State Board of Health.
Lansing, Michigan.

ULSTER AND HOME RULE

In The Outlook dated November 16 I notice a letter from Mr. T. J. Quinn on "Ulster and Home Rule" which is very misleading. Ulster has a Protestant population of 886,333 and a Roman Catholic population of 690,134. Out of 33 constituencies the Unionists have 17 Members and the Nationalists 16; but the reason that there are only 17 Unionist Members is that nine of the Unionist constituencies are overwhelmingly Protestant. Four of these Unionist seats have an electorate of 48,900, while the entire counties of Donegal, Cavan, and the borough of Newry have an electorate of only 45,444, yet they return seven Nationalists. Mr. Quinn gives the population of Belfast as 255,000, while according to the Government Blue Book the population in 1911 was 386,947, and of these 93,243 are Roman Catholics. More than three-fourths of the Belfast population are Protestants. Belfast is the third port in the United Kingdom, and has five of the greatest industries of their kind in the world. This city pays 71 per cent of all the taxes paid in all Ireland, and has only 107 paupers to the 10,000, while Dublin has 298 and Cork 329. On Ulster Day, September 28, 1912, more than 218,000 men of Ulster signed the covenant pledging themselves that they would never submit to Home Rule, and over 223,000 women signed a covenant that they would stand by the men in resisting Home Rule. Ulster Protestants will never submit to a Dublin Parliament, though Ulster has been a law-abiding province. In the Protestant counties of Derry, Antrim, and Down there are only 12 policemen to the 10,000; in Galway there are 48, and in Clare 43. These figures speak for themselves.

WILLIAM PATTERSON,
Minister of May Street Church.
Belfast, Ireland.

THE WAY TO WORLD PEACE

Everybody should desire world peace, merely on a basis of humanity, and even of ordinary intelligence; for the path of world peace is the path of world progress. Why should we obstruct the pathway of human advance by the artificial and unnecessary obstacle of war, when nature has placed before us such barriers as the race needs for its development of intellect and will? But why cry "Peace, peace, when there is no peace" yet? Why stolidly pass resolutions at conferences and conventions calling for a treaty of arbitration on all possible disputes—an omnibus treaty, in short—when we ought to realize that

the people at large will not hold to such a contract under irritation and the goad of self-interest? If we make such a treaty as that, we are either stupid or dishonest; to make such a treaty, expecting it to be kept, under "jingo" pressure, is stupid; to make it, half expecting it to be broken, is not educational, as has been urged, but simply dishonest. The only sound method of advancing world peace by arbitration treaties (as was urged by Theodore Roosevelt last winter, in New York) is to negotiate as many specific cases as possible, taking each as it arises. Mr. Roosevelt himself during his term as President negotiated twenty-four of these. Better even than commissions and arbitration boards would be a permanent world court ever with doors open and ready to hear cases. Its always open doors would more encourage nations to submit questions to it than does the Hague Conference, with its intermittent sessions. Joined with this august world tribunal should go a widespread campaign among all European nations for peace education—a slow, laborious process, but an essential one; for the voice of the people, whether or not the voice of God, is the ultimate authority for peace or war.

BRADLEY GILMAN.

Boston, Massachusetts.

AMERICAN POETS AND THE STARS

In The Outlook for September 28 last Mr. Hamilton Mabie has given an excellent sketch of the more recent work of the younger American poets, and from it one chiefly gains the idea that they desire to be modern and show themselves acquainted with the knowledge of their time. This being the case, there is one point in which they seem to fail—that is, in modern knowledge about the stars. To show that they are real poets they feel obliged to say something about these orbs, but they generally get into trouble when they mention them.

There are seven specimens of their work in this article, of one or two verses each, and four of them lug the stars into their descriptions of earthly toil and poverty. No. 1 says, "the stars are shining blue." No. 3 says, "down the ladder of the stars there comes the whisper and the word." No. 4 says, the "earth rolls through a golden weather that lights the Pleiades where they play"—play rhymes with Milky Way in this verse. No. 7 speaks of "the sun that has led us." The reference to the sun in the last one does not seem very helpful, and the references to the stars in the others have no meaning.

Now, if the poet is to be modern and know the world of his day, cannot he find some celestial aspects which are not only modern but highly picturesque? And he may then find something to add to that which was so well said in the Book of Job, and which is still his stock in trade.

So far as I remember, Milton was the last of the poets to write about astronomy with knowledge. He, while in Italy, made a pilgrimage to the home of Galileo, and when he speaks of "cycle on epicycle, orb on orb," he shows himself acquainted with the discussions of those days concerning the heavenly motions.

The only foreign poet who is commonly read by Anglo-Saxons was a Persian astronomer, and it is a pity that Omar Khayyám has told so little of his conception of the heavenly bodies. He at least would not have given us the absurd distortions of the great facts which are every day being revealed concerning them. The subject is perhaps a trap for poets, and even Tennyson, who is usually so true in his metaphors, puts "a shining star in raiment white and clean."

Those of us who have seen the recent exhibition of independent artists in Paris may think appropriate the extremely warm seat which Kipling assigns to them when

> "each in his particular star
> Paints the things as he sees them
> For the God of things as they are."

Is it too much to expect of the poet of our times to remember that fixed stars are too hot to wear raiment or serve as places of residence; that they do not whisper to the next star, with a request to pass it on to earth, words concerning human destinies?

In this connection, let me finish by recalling the scientific statement that Shakespeare puts unexpectedly in the mouth of Hotspur. That old Welsh bore Glendower says that a comet blazed across the sky and the stars were changed in their courses at his birth. Hotspur explains that such signs come in their appointed order without reference to human importance, and that a comet would cross the sky and the stars would change their courses just the same if his mother's cat had kittened.

J. M. CRAFTS.

Ridgefield, Connecticut.

THE RURAL HOME SCHOOL

What is the rural school as it actually is to-day, and what are its qualifications for improving rural and National life? In general, the rural school is a small, box-car-like, one-room, poorly lighted and ventilated building with a few children of various ages and a miserably paid young woman of little education and less professional training as a teacher of the elements of the three R's. On the average, this young woman who "keeps the school" remains a teacher less than four years, and her average schooling is little more than a common elementary school training of a limited kind. Evidently into the hands of untrained novices with such meager equipment cannot be intrusted the evolution of rural life.

Among the many means of improving the rural school—such as increasing school funds

and improving their apportionment, professional supervision, separating school officials from bad politics, consolidating several small schools into one large graded school, with consequent transportation of the pupils and the development of a modern curriculum—probably the most important consideration is the general all-round and professional improvement of the teachers.

Rural life will hardly rise higher than its source. The person who should teach how to live in the country is one who knows life, and especially rural life; one who has professional training for his most delicate work; one who can remain in the profession and in a given community for many years, as a man in banking, medicine, or trade. Such permanency can never come from women. Permanency can come only from the man with a family working on his farm and living the life of the country. The rural school teacher should be a living example of what a good farmer should be. His farm should be a veritable experimental agriculture station.

Now, how can we get such ability and such permanency in the rural school? We propose the rural home school or the rural social center. In many places in the West the agricultural river valleys are not long, narrow troughs with flat bottoms, but are shaped more like a flat chain with round or oval links. The separate valleys are often almost perfect circles some five to ten miles in diameter. These great level farming areas surrounded by high hills make natural community centers. There are generally four to seven small schools, with a few pupils each, scattered about, and, typically, a two-room school at the cross-roads village in the center. Life is very slow, tiresome, and individualistic for young and old in these places; every one is at work most of the time; the outlook is very limited; there is little of recreation even in connection with the few scattered, poorly supported churches of various denominations, separated by technical theology; there are hardly enough children at any one school to make up a game of tag, even where land enough about the school has been left for that purpose; and so the enterprising youth of the valley break home ties and leave the valley as soon as possible. There is "nothin' doin'."

In the village at the center of this natural community is the place for the Rural Home School. Here within a four or five miles' ride of practically all the farmers' homes should be located the consolidated school. About this school building should be a farm of ten to twenty or more acres. On the farm near the school should be the home of the principal and his family, with a barn and stable big enough not only for his own use, but for the horses which bring the vans of children to school each day. All that the principal, preferably trained at an agricultural normal school, raises in the way of produce on his farm should go as a part of his annual salary.

This would provide for a well-trained and permanent principal, agricultural expert, or social center director. In the school there will probably be four or five other teachers. In the past, poor or long-distance boarding-places and lack of society have driven those of ability out of the separate little drab school-houses. Now they can board with the principal or can live co-operatively in another house on the farm under the direction, possibly, of the teacher of domestic science.

The farm will provide opportunity for the teaching of agriculture, not only through books but through observation and doing. Every school farm center could be in touch with all the best movements in better farming in the world; and the principal would have opportunity to test the truth of the knowledge offered by his curriculum. The school would naturally increase into a rural elementary and high school, but the curriculum of the latter would be conspicuous by the absence of most that now masquerades as secondary education. Its mission would be to help young people to understand, to appreciate, and to work efficiently in the world to-day, especially the rural community with its world-wide connections. Some of the subjects which would help to make up the life of the school above the elementary grades (probably shortened to six years) would be: agriculture, domestic science, rural hygiene, botany and horticulture, farm economics and law, farm carpentry, literature, geography, history (taught in such a way as to illumine the present-day problems), English, rural recreation, elementary sociology (a study of social relationships, including civics, social improvement, and a general knowledge of the leading social problems of the home, business, the church, politics and government, the school)—in general, subject matter and activities which help children and young people to live and to prepare to live in the actual world of to-day.

But the school would not be all on this public farm. Here would be the public library, the grange or town hall perhaps, the center for parcels post and mail delivery to the community, the public moving picture show and other recreational features. Here would be the place for a play center, baseball, field sports, and field days. Here also could be held the community fair once a year. The possibilities are unlimited.

These are not dreams impossible of realization. Consolidation of schools is, and has for a long time been, rapidly taking place. One community in the State of Washington has the only church of the community on the school property. Very few localities have as yet gone forward enough to provide the school home farm, but it is coming. Where a valley is too large for one community center there must be more,

and where a valley like the Mississippi covers several States we have the problem a practically universal one. LOUIS W. RAPEER.

Training School for Teachers, New York City.

THE MARKETING OF FOOD PRODUCTS

If Carlyle were alive to-day, and were still trying to impress upon the population of fools for which he wrote—to use his own words—the absurdity of that system of *laissez faire* which he so cordially detested, he could scarcely hit upon a more illuminating example of it than the method of distributing food in this great and enlightened land. In this business every man has looked out for himself in the most approved fashion, and now the devil is getting not merely the hindmost, but very nearly every one concerned. So acute, indeed, has the situation become that it comes near to occupying all our thoughts. The cost of living was one war cry in the Presidential campaign, and one party had the sense to put into its platform (in New York State) the words, "We favor a better supervision of the marketing of food products." The first Food Investigating Commission in the country was appointed at the beginning of the present year by New York State, to be followed by Philadelphia, Baltimore, and Chicago, as well as by New York City with its Market Commission. The Federal Government has also taken the matter up, and various unofficial bodies are studying it.

As a result of all this investigation there has been revealed an almost unbelievable state of chaos and confusion in our marketing facilities. Whatever share in the cost of living may be due to trusts and tariffs, it has been clearly shown that in New York City—and the situation is said to be much the same in other Eastern cities—about half of the consumer's dollar is eaten up by unnecessary handling and transportation. It was a member of the Housewives' League who discovered that the retailer from whom she bought her vegetables and the farmer who produced them were in the habit of taking the same boat to Manhattan, where one bought the produce of the other, took it back to Staten Island, and sold it to the observer and others at prices sufficient to cover its traveling expenses, together with his own and those of the farmer. Long Island housewives discovered that the vegetables and fruits which cost them so dear were taken past their very doors to Brooklyn and then brought back to them; and the Food Investigating Commission, in its first report, issued a few weeks ago, shows that such methods of handling the means whereby this great city of five million inhabitants and all the adjacent regions live are all but universal. In the case of green vegetables it takes seventy cents of the consumer's dollar to bring produce from the farm to his table. The farmer, finding that the remaining thirty cents doesn't pay him for his trouble, has ceased to produce, and a hungry and thoughtless public is reviling him for not practicing intensive agriculture.

It seems natural to blame the farmer for the high cost of food supplies. It also seems natural to those who think a little further to blame the middlemen. But neither the farmer nor the middleman in the singular is to blame, it seems. Even the much-abused railways get only eight cents of the dollar above referred to. The remaining sixty-two is divided among so many middlemen that there seems to be no room for any considerable rake-off by any one of them. As the report puts it, stuff is carted from the railway and steamboat terminals to the various and numerous places of the commission men, then sold to wholesalers, jobbers, speculators, and storage men and carted to their respective places. It is often sold to other jobbers and speculators and storage men and again carted. Finally, it is sold to the consumer and delivered. All these dealers make profits or charges against the stuff, which aggregate from forty to seventy per cent of the amount finally paid by the consumer. The cost of the last handling, it has been found, is the greatest of all, amounting to nearly half of the retailer's operating expenses, and in the case of perishable products the quality deteriorates as the price climbs.

No completely comprehensive plan for remedying the present conditions has been presented by any of the bodies that have had them under consideration. The proposal of the Market Commission to establish a wholesale market in lower Manhattan has been bitterly opposed by large bodies of citizens. The wisdom of the Investigating Commission's recommendation that a State Department of Markets be created cannot be questioned. This is the first step, and ought to be taken at once. As to details, the most radical plan is the one submitted by Ezra A. Tuttle in a minority report of the Investigating Commission, and further elaborated in an address before the New York State Agricultural Society. Mr. Tuttle would have the State, by the power of eminent domain, acquire property for a series of district markets covering the whole city, and also for two or three large receiving terminal warehouses and at least one manufacturing establishment to pickle and preserve products that would otherwise go to waste. This system of markets he would have operated, under the supervision of the State Department of Markets, by a Consumers' and Producers' Company, with a capital of $5,000,000, divided into shares of $5 each. This reform, Mr. Tuttle estimates, would soon save the city between fifty and a hundred millions a year and give the producers of the State half as much more.

MARY DUDDERIDGE.

New York City.

BY THE WAY

The shades of Crœsus, Lucullus, et al., might be interested in the announcement of a New York City furrier that he will make coats to order from Russian sable for $12,000, $26,000, and $68,000 each, according to the grade of skin selected. The $68,000 garment is composed of "110 skins of rarest quality." The Russian Government, the advertisement states, will after December 31 prohibit the killing of sables or the exporting of their skins.

The Library of Congress is growing at the rate of 88,000 volumes a year. During the last twelve years its accessions have exceeded the total number of volumes accumulated during the entire preceding century.

The heroism of Billy Rugh, the newsboy who gave his life, through a hospital operation, to save that of a young woman who had been severely burned, is to be commemorated by a fountain to be erected on the site of his news-stand in Gary, Indiana. The portrait of Billy which accompanies an appeal of the Memorial Fund Committee shows such a fine face that one wishes that it might appear in some way on the memorial.

Few indeed of the Major-Generals of the Civil War are left. Major-General Julius Stahel, who recently passed away, was almost the last surviving officer with that title. He fought with Kossuth for Hungarian independence in 1848, and, like many other of the revolutionists of that period, came to America and won lasting fame in 1861–5. He was, with his "German Brigade," complimented by President Lincoln for his bravery at the battle of Bull Run.

Cincinnati, Ohio, owns a real railway—not a municipal subway or trolley line, but a steam railway running to Chattanooga. The building of the road was authorized by a referendum as far back as the eighties. The railway is at present operated under a lease by a privately owned company.

A new life-saving apparatus consists of a buoyant mattress. It is so constructed that it can be used either singly or joined to other mattresses to form a raft. It has the advantage over the ordinary life-preserver that it will support a person above the water, not in it.

One of the rarest books in the United States, there being only five or six known copies, is William Cullen Bryant's "Embargo, or Sketches of the Times: A Satire, by a Youth of Thirteen." A copy recently sold for $3,000. It was printed in 1808. Two years after its publication, the poet further signalized his precocity by entering Williams College.

Milk cans in Russia must be larger than in America, for a Siberian exile, Liotte Dunin, who has just come to America, is said to have made his escape from captivity by hiding in a milk can. Dunin was serving a life sentence for revolutionary activities.

The well-kept lawns of a public square in Detroit, Michigan, are said to be preserved from injury by placards bearing the single word "Please!" This is doubtless fully as effective as the stern prohibition to be seen in another city—"Keep off the Grass—$10 Fine."

The Assouan Dam in Egypt, with its associated irrigation works, has cost the large sum of $53,000,000; but it is estimated that, as a result of the expenditure, the value of adjacent land has increased more than a billion dollars. Philæ has been submerged, it is true; but this loss to the archæological world will to most people seem more than offset by the gain to present-day Egypt.

The eternal feminine of the juvenile variety still concentrates its affections on dolls as gifts, with the result that no other toy is sold so largely at holiday times. Boys, say the dealers, scatter their affections on various military toys, tin soldiers, trumpets, and bugles being their favorites. The boy's voice, it seems, is still for war, while few little girls have become so "advanced" as to despise the make-believe baby.

The Washington Irving, a mammoth steamer intended for passenger traffic on the Hudson River, was launched at Camden a few days ago. A novelty attending the launching was that the christening was done with a bottle of water from the Sunnyside well on the old estate of Washington Irving. The steamer will accommodate more than 6,000 passengers.

According to a recent statement of the United States Geological Survey, 3,062,022,020,000 tons of coal still remain to be mined in the United States—about 99.5 per cent of the original supply. At the present rate of consumption, the supply would last for 4,000 years. The consumption, however, is rapidly increasing, and if the ratio of increase continues, the 4,000 might be reduced to 400.

Chinese women, says a Russian writer, have the most beautiful hands in the world; next come those of the Spanish woman, then those of the Russians, French, and Italians; while the American woman has hands that are fine in appearance but hard in texture. One would like to read an essay on this fascinating subject by, say, Pierre Loti or Maurice Hewlett.

New York City's subway carried 302,973,858 passengers this year—twenty-six millions more than in 1911. And last year New Yorkers thought they were crowded to suffocation!

Seven books sold for a total of $227,200 at the recent Hoe Library sale. Two of these books were Bibles, one of which, a Gutenberg Bible printed on vellum, brought the highest price ever paid for a book—$50,000.

A New York City department store appeals to women to take advantage of its offer of a "seven-course dinner, from noon to 2:30, for seventy-five cents," on Thursdays, that being "the maid's day out," in order to have "a full day's freedom from housekeeping cares." If mistress as well as maid is to desert the house on Thursday for "a full day's freedom," who will prepare for the goodman's return?

Captain Ruser, one of the best-known sea captains of the transatlantic service, states that not long ago he saw a genuine reptilian object, twenty feet in length, close alongside his ship, the Kaiserin Auguste Victoria. This sea serpent was, as usual, a-lashing of its tail. Notwithstanding his statement, it is announced that Captain Ruser will be promoted to the command of the giant steamship Imperator next year.

The Outlook

DECEMBER 28, 1912

LYMAN ABBOTT, Editor-in-Chief HAMILTON W. MABIE, Associate Editor
THEODORE ROOSEVELT
Contributing Editor

A Sane New Year's Celebration

The country has heard much during the last two or three years of the need for a "safe and sane" celebration of the Fourth of July. Last summer public opinion heartily supported the Mayor of the city of New York in his successful plan for directing Fourth of July enthusiasm into better and more enjoyable channels. The same sort of practical reform is needed in the public and incoherent treatment of New Year's Eve. Many of the large American cities appear to be growing tired of the reproach that has come upon New Year's Eve through the revelry and rough-housing to which it has been given over for years. The spirit of the crowds in the streets—largely a spirit of thoughtlessness, we think—was well expressed by the slogan that was so often heard last year, "To hell with the Old Year; hooray for the New!" Chicago, San Francisco, and Boston are endeavoring to supply public festivities of a different type during holiday week. New York has now actively joined this admirable movement by forming a committee of a dozen well-known citizens who propose to mass brass bands and great choruses in some of the public squares along Broadway in the last hour of the Old Year and sing it out, and the New Year in, with such songs as Julia Ward Howe's "Battle Hymn of the Republic," "O God, Our Help in Ages Past," "Auld Lang Syne," and "America," when the clock strikes twelve. The man who saw this vision, who got the committee together, and who by personal enthusiasm started the movement which has now grown into a practical organization, believes that all outdoor New York will join in the chorus and that a new pace will be set for New Year's Eve in the future. He knows the spirit and temper of New York, high and low, perhaps as no other one single citizen knows them, and if he has confidence in this plan every one else may too. His name is Jacob A. Riis.

A Christmas Greeting from Henry Street

Mr. Riis is interested in a sane and joyous celebration of the holiday season not merely for Broadway and Fifth Avenue but for the lower East Side. One of the most useful of the so-called "settlements" in New York is the Jacob Riis Neighborhood House, which was named in honor of Mr. Riis and of which he is the President. This is appropriate, for perhaps no other one individual in New York City represents as distinctively as he the spirit of helpful comradeship which finds in Chicago its embodiment in Jane Addams. Those who are reading Mr. Riis's "Life Stories of the Other Half" as they appear in The Outlook will be glad, we believe, to read also the following note from him about Henry Street:

> We also keep Christmas in Henry Street. Gifts we have none to send, but we give you good will and neighborly greeting. It is a fair return for your money, for without these the money helps us little, and you not at all. If any one were to put a nice summer home in our stocking this year, he would hit us just right, for we shall soon lose our grip on Twin Island. The city will want it back. If you haven't that, our treasurer will be glad for your checks, lean or fat, with your holiday wishes. Just make them out to Lilian House Brooks, Treasurer, 48 Henry Street, New York City. She can use them.

The Peace Centenary

The end of a hundred years of unbroken peace between Great Britain and the United States is an international event of immense significance. It is to be observed on both sides of the water impressively and in several ways. Elsewhere in this issue of The Outlook will be found the first of two articles by Senator Lodge, of Massachusetts, in which are discussed in brilliant and incisive fashion

the disagreements which have arisen during the past century between the two countries. The obvious lesson to be drawn is that, the more trying these differences have been, the more creditable and honorable it is to both countries that a peaceful way out has invariably been found. Last week a notable meeting was held at the historic Mansion House in London under the auspices of the British Committee which was organized a year ago. The Lord Mayor of London presided and urged that the centenary be celebrated "in an imperial, imposing, and impressive manner, worthy of the great occasion, in the United States, Canada, Great Britain, and all English-speaking lands." Earl Grey, who is President of the British Committee, read a letter written by the late Whitelaw Reid only a few days before his death, in which he expressed the most ardent interest in the movement and declared that failure to give it worthy celebration would be a crime. Letters from members of the American Committee were read, giving the assurance of appropriate action on this side the water. Earl Grey stated that one method of celebration which had been submitted to the American Committee was that commemorative monuments of a suitable character should be erected in England, the United States, and Canada. Specifically it has been proposed that a monument should be erected in Westminster Abbey to George Washington. This proposal was heartily approved by the British Committee, as well as the proposal that the ancestral home of the Washington family, Sulgrave Manor in Northamptonshire, should be purchased and maintained as a place of pilgrimage for Americans and all interested in the history of English-speaking peoples. This ancient building has over its doorway the Washington coat of arms, which was the origin of our Stars and Stripes. The British Committee showed eagerness to honor George Washington in recognition of the influence for good exerted on successive generations of both peoples by his splendid qualities. Another proposal which has been commended by both British and American Committees is for promoting in various ways educational plans which should mark the essential union of the two peoples, such as peace centenary prizes for essays on Anglo-American relations, international lectureships, and other means for promoting through educational channels the growth and increase not only of the mutual respect and good will between the two peoples, but also fuller knowledge by each of the other. The American Committee, which originated this movement, gave a farewell dinner to the retiring British Ambassador, Mr. Bryce, about two weeks ago, at which the proposed celebration was eloquently approved by the guest of the evening, by ex-Ambassador Joseph H. Choate, and by the Hon. Alton B. Parker, who presided. An international conference of delegates from the British, the Canadian, and the American Committees is to be held in New York next spring, at which definite plans will be formulated. Among the proposals of the American Committee are the erection of a statue of Queen Victoria at Washington, the placing of statues of the Earl of Chatham and Edmund Burke in appropriate localities, the erection of a free International Bridge at Niagara Falls, and the historical study of the Century of Peace by the children of the public schools during the autumn of 1914.

The London Peace Conference

The sessions of the Conference at London between representatives of the Balkan allies and Turkey opened last week. The personnel of the Conference recalls that of the similar Conference at Portsmouth, New Hampshire, in 1905 between the Russian and Japanese representatives which closed the Russo-Japanese War. As a counterpart to the calmness and conviction of Count Komura, Japan's chief ambassador, there is the attitude at London of the Greek Prime Minister, Venezelos. As a counterpart to the shrewdness of Count Witte, Russia's chief ambassador at Portsmouth, there is the attitude of that astute Turk, Rechad Pasha. There are other interesting personalities—the Bulgarian Danef, who has much of the "hustle and bustle" of an American; the Servian Novakovich, ex-Premier, and an experienced statesman; finally, the Montenegrin, Miyuskovich, who has been called as keen a diplomatist as any of the delegates. The sessions of the Conference quickly developed the fact that the contests over other points were subsidiary to that over the possession of Adrianople. The Turks, it seems, will not give up that fortress except after a strenuous struggle, which is natural, for their attachment to Adrianople is threefold. First of all, it is historically the most notable city in Europe to them; it was the first Moham-

medan capital of Turkey-in-Europe; indeed, it was the capital of the Ottoman Empire, 1361–1453. Its former large population has now shrunk to about seventy thousand. Nevertheless, its material importance is enormous, and affords the second reason for Turkish attachment. Situated at the junction of three rivers coming from Bulgaria, it commands eastern Bulgaria. Moreover, situated on the only railway connecting eastern Bulgaria with the Ægean Sea, it commands any territorial gains to the south which, as a result of the war, might be assured to Bulgaria. In the third place, Adrianople is the greatest of Turkish fortresses; it has resisted a two months' close investment by the Bulgarians, and gives little sign of any immediate fall. With regard to Adrianople, as with regard to the other conditions of peace, the Turkish delegates at London seem doing everything for delay. They thus hope, through the possible interposition of the Powers, to obtain better terms. But, if they must cede territory, they hope to do it on pressure from those Powers rather than at the command of the Balkan allies whom they have hitherto more or less despised.

The Balkan War: The Greek Advance

At the London Conference the Turks refused to treat with the Greeks, who, alone of the Balkan allies, had not signed the armistice. The position of the Turks was logical, but when they were reminded that they themselves had negotiated peace with Italy even though still at war with her in Tripoli, they agreed to meet with the Greek delegates. Thus Turkish and Greek delegates are treating for peace while the war between Turkey and Greece continues apparently as vigorously as ever. In it the most important event of the week was a naval battle in the Ægean at the entrance of the Dardanelles. Though the Turkish fleet included four battle-ships and they fought practically under the protection of the guns of the Dardanelles forts, the Turks were forced to beat a retreat and retire in disorder into the Straits. During the engagement the commanders of the Greek and Turkish fleets exchanged pleasantries by wireless telegraphy. For instance, the Greek admiral telegraphed: "We have occupied the island of Tenedos and await your orders," to which the Turkish admiral replied: "Your shells are falling wide. I would recommend you to take better aim." On land the principal event was an increase of the Greek pressure upon the Turkish fortress of Janina, the principal place in Epirus and not far from the Grecian frontier. The population is estimated at about twenty-five thousand, more than one-half being Greeks, in whose hands is most of the trade and industry of the place. Though the Greeks are daily pouring a larger number of shells over the crumbling walls, the Turks continue to return the fire with much show of spirit, as they have many siege guns distributed among the four forts which defend the city; the strength of the garrison there ranges from twenty thousand to thirty thousand men. The continued cessation of fighting between Turkey and the three Slav Balkan allies, despite the completion of the period at first set for the armistice, indicates that the armistice was to continue until the peace negotiations at London were settled.

Whitelaw Reid

Whitelaw Reid, American Ambassador to Great Britain, died in London, after a short illness of a bronchial and asthmatic nature, on Sunday of last week. His death removes another of the personalities that were both developed in character and brought into public prominence by the Civil War. The country also loses a journalist of distinguished ability and accomplishments who believed that journalism is not a mere trade for money-making but is a profession imposing upon its members high intellectual and ethical standards. Mr. Reid was born in Xenia, Ohio, in 1837, and was graduated from Miami University, in the same State, with honors both in science and in the classics. On graduating from college he became a teacher, teaching Latin, French, and mathematics. He then turned to journalism and became the editor of a local paper in his native town. Next he took up the work of legislative correspondent and later of war correspondent for several important American newspapers, finally finding a responsible position as Washington correspondent of the Cincinnati "Gazette," of which newspaper he was later one of the proprietors and editor-in-chief. In 1869 he joined the staff of the New York "Tribune," and during the campaign of 1872 succeeded Horace Greeley as its editor. In this capacity he was the associate and friend of some of the best-known literary men of the country. Under his direction

the "Tribune" was not only a newspaper, but a literary journal. He never had the slightest sympathy with that form of journalistic "enterprise" which has developed into what is known to-day as "yellow journalism." A few years ago a New York editor, at that time President of the New York Press Club, described New York journalism as a mere manufacturing process in which the proprietor bought white paper (his raw material) at two cents a pound, ran it through a machine called a printing-press, supplying it with something called printers' ink, and sold his finished product (or newspaper) at ten cents a pound. This manufacturing view of journalism was entirely foreign to Mr. Reid's taste, attainments, and practice. If he were remembered for nothing else, he should be remembered because he exercised a fine and thoughtful influence upon American journalism. He doubtless, however, will be chiefly remembered because of his political career. Twice, in 1877 at the invitation of President Hayes and in 1881 at the invitation of President Garfield, he refused an appointment to the post of Minister to Germany. In 1889, however, President Harrison appointed him Minister to France, and he accepted and served three years with success. In 1892 he was nominated as the Republican candidate for Vice-President of the United States, but was, together with ex-President Harrison, defeated by the election of Mr. Cleveland to a second term. Returning to his editorial desk in the "Tribune" office, he was during the next few years sent on several important special ambassadorial missions, serving, for example, as special ambassador to the coronation of King Edward VII of Great Britain during the administration of Mr. Roosevelt, who finally in 1905 appointed him Ambassador to the Court of St. James's, which distinguished office he held to the day of his death. With great wealth at his command, he lived in princely fashion in London, taking Dorchester House, one of the famous and palatial houses of that capital, as his residence. Although his position and his money enabled him to assume a social position in English life that can hardly be called democratic, he did not lose his efficiency in protecting American interests. His addresses in England at various public functions were often admirable expositions of American statesmen or American political philosophy, one of the best of these addresses being a review of the life and character of Abraham Lincoln, delivered two years ago, which was marked not only by felicity of language, but by a patriotic spirit and critical judgment of a high order. He received many academic honors in this country, and the University of Oxford conferred upon him in 1907 the degree of D.C.L., which is given only to men of first rank in the intellectual world. Mr. Reid was a man of refined, modest, and agreeable personality, and no one can review the almost romantic development of his career, from the day when he was a teacher to the day when he reached the highest diplomatic post that an American can obtain, without feeling that he was a man of more than ordinary gifts of mind which he put to excellent and useful service in behalf of his profession, his time, and his country.

Governor Wilson's Recent Speech

Those who regard public office as a perquisite will criticise Governor Wilson for remaining in the Governor's chair after he has been elected President of the United States. Those who regard public office as an opportunity for public service will be glad to see him continue the fight against the "invisible government" in New Jersey as long as he can do so without neglecting his larger duties to the Nation. Those official duties do not begin until the 4th of next March, but there will be not a little to do meanwhile in preparation for them. His speech last week before the Southern Society in New York City has the true ring. It is, as was appropriate for an after-dinner speech, the expression of a spirit rather than the definition of a policy; and that spirit we can better interpret to our readers by two or three single sentences than by an attempted abstract. For example:

"The important thing now is what you, and men like you, think. The Nation is made up of its thoughts and purposes."

"What we ought to think to-night is not that the Democratic party won a great victory, but that there is a vast deal to do with the United States, and that it can best be done by forgetting that we are partisans, and forgetting everything except the work for the prosperity and integrity of the Nation."

"Some men had the idea that they had been appointed trustees to do the thinking of mankind, and the building up of wealth in conformity with their own plans and purposes. That sort of intolerance no longer characterizes audiences like this, as it once did."

"The amount of wealth is less important than

its accessibility. The more accessible we make this wealth to the people, the more energy you set free, and a nation rises up under your wand greater than the world has ever seen."

This last sentence recalls Mr. Beveridge's "Pass prosperity around," and Professor Sidgwick's "The problem of the political economy of the future is not the accumulation of wealth but its distribution." Mr. Wilson has earned the reputation of being a good fighter. If in the Presidency he attempts to carry out these sentiments in practical measures of social justice and political reform, he will have on his hands quite as bitter a fight with the bosses of the Democratic party as Mr. Roosevelt has had with the bosses of the Republican party. And in such a fight he should have the moral support of all men who believe in a democracy of education, opportunity, and wealth, and something more than a nominal democracy of political power.

Some Current Railway Questions

No other American industry affects so intimately the lives, welfare, and fortune of so many people as the railway industry. Merchants are interested in the transportation of their goods; investors in the dividends and interest they receive; wives and mothers in the safety of their families; travelers in the comfort and speed with which they reach their destination; school-girls who are going home for their Christmas vacation in the prompt delivery of their baggage; lovers in the safe carrying of their letters; scores of thousands of employees in their wages; railway presidents and superintendents in the enormous and sometimes heartbreaking load of responsibility which rests upon their shoulders. There is not an individual in the United States whose daily life is not affected in a very important way by the railways of the country. Every individual, therefore, young or old, ought to take pains to be informed about some of the railway questions which are at the present time topics of public discussion in the newspapers and periodicals, in State Legislatures and in Congress. Shall the wages of railway employees be raised? Shall freight and passenger rates be increased? Are the holders of railway stocks and bonds being paid too high a rate of interest because of over-capitalization? Are the evils of private ownership of railways so great that we shall be compelled to adopt Government ownership as the only adequate remedy? The public press is constantly reporting news which is of the most distinct human interest when it is read in the light of some of these questions. One of the unions of locomotive firemen has just made a demand for an increase of wages of the firemen, as a result perhaps of the increase in engineers' wages, based upon the decision of the semi-official Board of Arbitration which was fully reported in The Outlook of December 7. But, in their turn, the railway managers ask how they are to obtain the money for these increases of wages in view of the fact that the Inter-State Commerce Commission has recently denied their application for permission to increase freight rates. It is replied by some students of railway conditions that too large a share of railway earnings is paid out to stock and bond holders, and that a general physical valuation of railway properties in the United States will show that the railways are over-capitalized. Touching upon this aspect of the problem, the "Wall Street Journal" recently reported that the Lehigh Valley Railroad, one of the great coal-carrying railways of the country, has just finished a physical valuation of its property, which has been carried on for many months by experts not officially connected with the road. Their report estimates that the road is actually worth to-day $300,000,000. If this valuation is at all correct, the "Wall Street Journal" points out that the Lehigh Valley Railroad is earning less than five per cent upon the actual value of its property—not, of course, an excessive figure. We do not say that we accept these figures, but they certainly are of interest as throwing light upon the general railway problem. They cannot, however, be taken as a basis for legislation. Whenever physical valuation is made the basis of laws regulating the railways, the appraisers should be officers of the Government and should carry on their work under the closest public scrutiny.

Government Ownership of Railways

The problems presented by such questions as those raised in the foregoing paragraphs are so complicated and so confusing to the average layman that it is not surprising to find men turning to the possibility of Government ownership of railways as a kind of refuge in a time of economic and intellectual distress. The "Atlantic Monthly" for December contains an

article on Government ownership of unusual significance, not merely because of its intrinsic ability, but because it is written by a railway expert. The author, Mr. B. L. Winchell, has been a practical railway man for nearly forty years, and is one of the executive heads at the present time of a great railway system in the Far West. He begins by saying that "there is an unmistakable drift towards Government ownership of railways in the United States," and he concludes by asserting that the best way by which we may solve the railway problems of tremendous import which we are facing in this country, and avoid the manifest dangers of Government ownership and operation, is to adopt "a conservative, wise, just policy of regulation." Perhaps one reason why Mr. Winchell's article appeals to us is that we have taken exactly the position he now takes and have maintained it for many years. Mr. Winchell gives many striking statistics regarding the management of government-owned railways in Europe. He admits that railways in France and Germany are in some respects well conducted, but even in Germany the figures show, according to Mr. Winchell, that the German Government receives a smaller net income from its State-owned railways than the Government in the United States receives from the privately owned railways in the form of taxation. The French and Italian State railways do not make as good a showing as the German railways, and in Australia the State-owned railways paid during the last six years a yearly average of $244 per mile to the Government in net earnings, while during the same period the privately owned railways in the United States paid $386 per mile to the Government in taxation. While we are in accord with Mr. Winchell's main contention, on one point we disagree with him. He believes that Germany and France are much more competent to run State-directed industrial enterprises than America, because a "democratic government is a very bad form for managing large industrial concerns." We ask if the Post-Office Department is not a large industrial concern, and whether it is conceivable that a private corporation could possibly carry the mails as efficiently and with a service as satisfactory to a hundred million consumers as the post-office, with all its defects, actually does carry them. The comparative history of the post-office and the private express companies, the only actual competitors of the post-office, does not, we think, sustain Mr. Winchell's contention that efficient administration is incompatible with a highly democratic form of government.

The Parcels Post At Last

Next week in every post-office in the country the new parcels post law will go into operation. It is not the purpose of this paragraph to argue once again the desirability or undesirability of such a law. The matter has been settled by Congress, and while the present law ought to be amended and improved, it is safe to predict that the parcels post (or, as the law calls it, parcel post) has come to stay. Neither is it our intention here to point out the undesirable features of the law. The point of interest now is: What will the average citizen next week find it possible to do in the way of sending parcels through the post-office, and how is this to be done? As to the weight and character of the matter that may be sent, the law permits anything to go as fourth-class mail matter which does not exceed eleven pounds in weight, is not greater in size than seventy-two inches in length and girth combined, and is not of a perishable nature or of such a character as to be likely to be injurious to those who handle it or to the other mail matter. Eleven pounds in weight is of course a great advance over what it was permissible to send under the old law, namely, four pounds, but is less than the weight that may be sent under the laws of several of the countries abroad which have long enjoyed the privileges of the parcels post system. It may be added that any attempt to abolish that system in any of those countries would meet with a protest which would quickly end the agitation, and travelers abroad who have had the comfort sometimes of even sending their steamer trunks by mail will look forward to the time when our limit as to weight will be extended. The question of distance and prevailing rates for the varying distances will seem at first very complicated. It is not so intricate as it may at first seem. The zones in which the rates vary are not established once and for all for the whole United States, but are supposed to be drawn round about each individual unit as a center. An immense number of small squares, each of which is thirty geographical minutes every way, are established as the units of area. In the whole United States there are many hundreds of these units, and to

facilitate the work of ascertaining distance and rates it has been necessary to print a map for each and every one of these units with the zone circles drawn around it as the center. Every post-office will be supplied with such a map, and every user of the mails can readily obtain one, and with it a parcels post guide which renders the use of the map easy. All the rates are based partly on distance under the zone system and partly on weight. Thus, a parcel weighing one pound can be sent for five cents, locally (to the limit of any rural delivery route starting from the post-office), and also to the fifty-mile limit of the first zone; for six cents to the limit of the second zone, which means to a distance of a hundred and fifty miles; for seven cents to the limit of the third zone, which extends to three hundred miles; and so on up to the limit of the last or eighth zone, which includes all distances over eighteen hundred miles and requires a rate of twelve cents for the first pound. A package of two pounds does not require double the postage of the parcel containing one pound, although the increase varies systematically with the distance; while for packages from two to eleven pounds the rates increase successively, though not on a fixed mathematical ratio. Practically, what will happen with most of us is that we shall go to the post-office with our parcels and ask the postmaster to tell us what the weight of the parcel is and what its rate will be to the point to which we wish to send it. Large shipping houses, however, will have the maps and guides which will render it practicable for them to make their own calculations, and a little practice in this will make the work simple although not altogether without some burden of labor. The extent of the preparations which have been made by the Post-Office Department is shown by the facts that it had to print at the outset an issue of one hundred and twenty-five thousand maps and that it had to purchase over thirty thousand new scales for use in weighing, as the old scales in the post-offices were not constructed to weigh much above four pounds. An immense amount of work will be entailed for the rural delivery department, but that service can easily extend its facilities for the purpose, and it is through the work of the rural service that much of the benefit of the law is to be derived. Special postage stamps, twelve in number, have been provided for use on the postal parcels; these stamps very fitly through their designs illustrate all phases of the work itself and of the American industries which are to be helped by the system.

Twenty Thousand Navy-Yard Men Under the Merit System

President Taft has placed more than twenty thousand skilled workers in the navy-yards throughout the United States under the protection of the civil service. The executive order was issued with the approval of the Civil Service Commission and with that of the recent conference of navy-yard commandants. The classification should have a salutary effect on the employees, who will feel secure in their positions and emancipated from political coercion. The order must become effective not later than June 30 next. It affects all navy-yard employees except common laborers. First of all, the present occupants of positions are to be classified on their efficiency being certified by the various commandants, or by being examined and found qualified by the Labor Board, and being recommended by the commanding officer under whom they are employed. Second, there is to be a competitive examination for all applicants. The navy-yards as well as the post-offices should be filled only by the rule of merit, and the President's latest action in extending the merit system will be applauded as much as was his action some weeks ago in extending the merit system to apply to the fourth-class postmasters, which The Outlook has already heartily commended. It is a long step towards the establishment of a merit system to cover all postmasters. This should mean promotion as well as appointment for merit. As the late Whitelaw Reid worked his way up from the editorship of a little paper in a little town—Xenia, Ohio—to the editorship of a great paper in the metropolis, why should not the postmaster at Xenia be promoted, for like merit, step by step, until he becomes postmaster of our largest city—indeed, Director of Posts?—a permanent position in a department the head of which may remain politically appointed. So far, so good. But, as the recent executive orders have occurred near the close of the President's term, they are resented by some Democrats hungry for office and devoted to the old "spoils system" rather than to the newer merit system. Later action by the President in connection with the postmasters has also called forth adverse criticism, this time from Progressives, not from Democrats.

We refer to the removal of certain postmasters because of their alleged "pernicious political activity" during the recent campaign in opposing the President. Mr. Taft's critics say that if he could not have been nominated except by his own office-holders' activity he should not now make removals for what he required of others.

The Watts Gallery

No living portrait-painters and allegorical painters are more distinguished for spiritual power than was the late George Frederick Watts. He died in 1904, full of years and honors. He had accomplished a great work. He had painted very many portraits and figure pieces which, with time, seem to grow only more worth while. It is not generally known in this country, we believe—and hence the reason for this paragraph—that a new Watts Gallery has been opened. It is the expression of Mrs. Watts's devotion to her illustrious husband's memory. The gallery is doubly notable. In the first place, it is happily located. It is situated at Compton in Surrey, close to the artist's country house. For many years Watts divided his time between Little Holland House, his London home, and his country house. Here, close to that ancient highway made famous centuries ago by the pilgrims journeying to the shrine of St. Thomas at Canterbury, is a high ridge called the Hog's Back. On the sunny slope of this ridge Mr. Watts built a house now overgrown with clematis and Virginia creeper, passion-flower and jessamine vines. Its interior expresses all that an artistic temperament could design. The site is only twenty miles from the metropolis, yet is as rural as anything in England. The surroundings are in entire harmony with the loveliness of Watts's work and the simplicity of his character—a simplicity shown in his repeated refusal of a baronetcy. It is thus fitting that his works should be shown in quiet Compton instead of in noisy London, where we see a number of his masterpieces at the Tate Gallery. The Compton building is of red brick and is Romanesque in style. Over the portal one reads Watts's motto: "The Utmost for the Highest." The second reason why this gallery is notable is because it comprises examples of every period of Watts's career. Consequently lovers of art visit Compton with pleasure and profit as an adequate shrine. In the center of the principal gallery hangs "Paolo and Francesca," that wonderful representation of the two souls beheld by Dante in his vision of the second circle of the Inferno. Near this is the equally impressive "Court of Death"—Death as the sovereign power holding in her lap an infant form as a symbol that the beginning and end of life lie there. Increasing numbers of visitors are resorting to Compton to see these and the other evidences of a great career. Just outside the gallery another long-cherished hope of the artist and his wife now finds form in a hostel where young artists and craftsmen are housed. The hostel is a home for the disciples of Watts and for the artists who wish to spend some time in studying the paintings in the gallery, and it serves the craftsmen who are learning to do clay work in the pottery close by. These craftsmen have organized themselves into a "Potters' Art Guild." Their aim is to use, in Watts's words, "to the best purpose the very noble material provided by English clay."

The Dreibund's Renewal

Last week it was officially announced that the Dreibund, or Triple Alliance, had been renewed. Occurring some months before its period of existence should expire, the event is significant. Thirty years ago, moved by Prince Bismarck, Germany, Austria, and Italy entered into an agreement to help themselves, to check France and Russia, and to preserve the peace of Europe. It seemed entirely natural that Germany and Austria should make such an agreement; it did not seem so natural that Italy should be a partner to it. But, despite Italian racial leanings to France, the Dreibund has benefited Italy, and last week the Marquis di San Giuliano, the Italian Foreign Minister, replied in the Chamber of Deputies at Rome to those who questioned the necessity for its renewal. The Triple Alliance has been the strongest guarantee of the peace of the whole of Europe, said the Minister, for the agreement is essentially pacific and defensive in character, and its spirit obliges each Power to do its utmost not to involve the others unnecessarily in complications. As to Italy in particular, the Dreibund has contributed to the achievement of wonderful progress despite great external difficulties. There is, then, the Marquis claimed, no reason on Italy's part to modify the terms of the Alliance, and no one of the parties has asked to have them modified. The speech was doubtless made with reference to the interests in the Balkans of the three na-

tions composing the Alliance. The Dreibund was eminently able, declared the speaker, to guarantee the interests of those nations in the Balkan Peninsula; it gave assurance to them of mutual support, not only now but in the future. With special reference to the Albanian question, the Foreign Minister added that Italy and Austria are the two Powers most interested in preserving the situation on a footing of equality and liberty in the Adriatic Sea, and that they have agreed on the fundamental outlines of the solution of the Albanian problem, both in conformity with the principle of nationality and with due consideration for their own equal interests; namely, that Albania, neutralized with the guarantee of the Great Powers, shall become an independent State, presenting an open field to the world's free commerce, and at the same time being a factor of political equilibrium both in the Balkan Peninsula and in the Adriatic. Thus the Italian Premier's speech may mark an important turning-point in history.

CHRISTMAS—1912

There are turning-points in the life of men. Something done, something experienced, determines the future course of their life and the very structure of their character. Such a turning-point in the life of Luther was the day when he affixed his theses to the doors of Wittenberg Cathedral and aroused a tempest wholly unanticipated by him. Such a turning-point in the lives of Hampden and Cromwell was the day when, by the order of a fatuous government, they were arrested on the eve of their departure for New England and compelled to remain and lead the Puritan revolution in the mother country. Such a turning-point in the life of Lincoln was the day when, despite the protestations of his friends, he left in the first speech of his debate with Douglas the declaration that this country could not permanently remain half slave and half free.

There are similar turning-points in the history of nations, when, by some heroic choice or the receipt of some great message, the nation is new-born and begins a new life. Such a turning-point was the wresting of the Magna Charta from King John, when feudalism received its death wound. Such a turning-point in the history of France was the calling of the States General which signed the death warrant of Bourbonism for all eastern Europe. Such a turning-point in the history of America was the signing of the Declaration of Independence.

There has been such an event in the history of the world. It was the birth of Jesus of Nazareth at Bethlehem. Then was the world new-born.

Liberty was not first born on the Fourth of July, 1776, but it received a new impulse and a new significance. The spirit of faith and hope and love did not first appear with the appearance of Jesus; but in his message and his life it received a new endowment of power.

It was seven years after the Declaration of Independence before the Colonies were really free and independent. It was more than half a century after the summoning of the States General before the hand of the last Bourbon was loosened from the throat of throttled Europe. It was centuries after the Magna Charta before feudal England became democratic England. And now, nineteen centuries after the first Christmas, the spirit of paganism lingers in the Christian Church and obscures its message. Nevertheless Christ gave to the world a new conception of God, a new ideal of humanity, and the vision of a new social order. Because of him we this day:

Conceive of God not as a King to be feared, but as a Father to be trusted.

Of religion, not as a reverence of fear which drives us from God, but as a reverence of love which attracts us to him.

Of fellowship with God, not through temple sacrifice to appease his wrath, but through life-service rendered to his children.

Of punishment, whether human or divine, not to deter the wrong-doer through fear, but to cure the wrong-doer through discipline.

Of the divine government, not for the glory of the Sovereign, but for the benefit of the governed.

Of human governments, not as a rule exercised by the few over the many, but as a service rendered to the many by the few.

Of education, not to create an aristocracy of special culture, but to create a democracy of general intelligence.

And we have added a new beauty to painting, a new meaning to music, a new chapter to literature. To painting as a decorative art we have added painting as an interpreter of life; to music as a dirge and a dance, an expression of the sorrows and the gayeties of humanity, we have added music as a psalm

of divine thanksgiving; and to literature as an expression of the joy and the tragedy of human love we have added literature as a voice of the spiritual life..

Christmas is the birthday of a new world; the advent of a new life of the spirit; a turning-point in the history of humanity.

A BLOW AT AN OLD EVIL

Three hundred and sixty convicts pardoned by Governor Donaghey at one time—that was the startling announcement sent out, early last week, to the rest of the country from Arkansas. Coming at a time when the President's pardon of the financier Morse, Governor Dix's pardon of the convicted murderer Patrick, Governor Blease's numerous pardons, including the pardon of the assailant of a woman, and the pardons issued by Governor Comer and Governor Patterson, had been inclining many to believe that the pardoning power ought not to be lodged in any one man's hands, this wholesale pardoning of convicts by Governor Donaghey, of Arkansas, seemed like a challenge to public sentiment, if not an irresponsible use of authority. It was, however, something besides a mere releasing of prisoners, a mere manifestation of pity, a mere exercise of executive clemency; it was a resounding blow that landed squarely on what is a gigantic evil. Whether Governor Donaghey was justified in striking the blow in just this way is a matter on which decent men can hold two opinions; but there is no question that the hostility which Governor Donaghey expressed against this monstrous evil is to his credit as a man and as a representative of the people.

The enemy at which Governor Donaghey aimed his blow was the convict lease system, or the system of contracting out convict labor for the profit of individuals and private concerns. Undoubtedly Governor Donaghey was convinced that in each of the cases he was securing justice for an individual prisoner; but what he had primarily in mind was the whole evil system by which the State's machinery for correction and punishment is turned into a machine for money-making and for creating special privileges. Under this system, which exists in various forms in, we believe, over twenty States, offenders against the law are farmed out to contractors—sometimes to work in quarries, or mines, or lumber camps, or elsewhere outside of actual prisons, sometimes within the prisons at some form of manufacturing, so that the prisons are turned into privately conducted factories. Of course the labor is not the best labor, because it is not the labor of contented and willing workmen. It is more like slave labor than that which keeps modern industry going, though that is not always, in practice, free; but this contract prison labor is cheap labor, very cheap.

We have in our possession what we are assured is a true copy of a circular sent out by one of these contracting companies. It is an advertisement of the sale of its stocks, and it puts forth, therefore, the financial advantages which the company secures by its use of prisoners as laborers. "Its factories," says this circular of the company, "are located inside prison walls. . . . There are no strikes or labor troubles in prisons. . . . This company pays for its labor 52 cents per man per day; its competitors who employ free labor pay an average wage of about $2 per day. This company is supplied free of rent with factory buildings, storage warehouses and grounds inside the prison walls, and with free heat, light, and power. To acquire similar facilities as this company has obtained free with its contracts would necessitate an additional investment of approximately $1,000,000. Having to make no investment for factory buildings, storage warehouses, heat, light, or power, the company's funds are kept actively engaged in liquid assets such as raw materials, finished goods, and accounts receivable. These are ideal conditions for profitable manufacturing."

Of course they are ideal conditions from the point of view of the contractor. What manufacturer would not be glad to have turned over to him free of charge a million-dollar plant? What manufacturer would not like to get labor at forty to sixty cents a head without any responsibility for keeping the laborers contented with the conditions of work or the wage? With ordinary laborers there is a limit to which the employer can drive his employees. With contract prison labor, on the other hand, the more the contractor can force out of the prisoners the greater his profits. This is slavery, without the personal responsibility of the master for the servant which every slave system at least theoretically recognized. It preserves all the evils of slavery and none of its mitigations. Such a system, whether carried on in quarry,

lumber camp, mine, or prison-factory, is devised for the purpose of profit to the contractor, not for the purpose of either the reform of the prisoner or the protection of the State. Against this evil system there has been repeated and constant protest. In this The Outlook has borne its part. Some of the States have abolished the system, but in many others it still exists, and where it exists it is the cause of misery, injustice, and peril to the public welfare. Sometimes Americans seem to wait before attacking an evil until they are aroused by some dramatic event. In this case the dramatic event has been supplied by the Governor of Arkansas.

Of course Governor Donaghey's method of attacking this evil of farming out prisoners will not cure it. Those particular prisoners whom the Governor of Arkansas has released may no longer have to bear not only the legitimate consequences of their wrong-doing, but also the intolerable burdens laid upon them by those who have bought the power to oppress them. Yet even these may not escape. Contractors who can get their labor cheap are as a rule glad to promote anything that increases its supply; and in this case that means that these contractors are interested financially in the supply of criminals. It is not to be doubted that in some cases when prison labor has seemed to be falling short it has been renewed by the simple process of making arrests on trumped-up charges; and it is perfectly certain that in some cases—probably in an innumerable host of cases—offenses which would otherwise have been punished by comparatively slight penalties have led to long terms of years, for long sentences tend to make the labor supply stable. Among these specific cases which Governor Donaghey cites, one is the case of two Negroes who were sentenced to serve thirty-six and eighteen years respectively for forging orders for eighteen quarts of whisky! There can be little doubt that such excessive sentences are induced by the convict lease system; and it is certain that the sort of unmitigated slavery which is undergone as the result of such sentences is defensible only from the point of view of those who measure the value of the system by the money that they receive from it. It is an ancient retort of those who defend the convict lease system that its critics are arguing for the maintenance of prisoners in idleness and luxury. That retort presupposes a lack of intelligence on the part of those whom it is supposed to influence.

Prison labor is not only permissible, it is essential, in any proper prison system. It provides occupation and is therefore a measure of mercy; it should provide education and be therefore a measure of reform; it should provide support for the dependent families of the prisoners and be therefore a measure of justice; and it should bring some benefit to the State and be therefore a measure of economy. But when prison labor is made a matter of personal profit for private concerns it scarcely has the advantage that is supposed to accompany providing occupation for the prisoner, for in almost every case it brings in its trail disease and fatigue which may be as maddening as idleness.

To catalogue all the evils of the prison contract labor system in brief space is impossible. It not only injures the prisoners, but it also brings injury upon outside industries, for it introduces a feature of unfair and ruinous competition. It is a means for spreading contagious diseases. It, moreover, turns out upon the community men untrained for self-supporting work, strange as that may seem; for the industries controlled by contract prison labor are for the most part either monopolized by the prison contractors or are the sort in which the underpaid labor of women and children outside is employed. There is no reason why the prisoners of a State may not be employed, as those in New York are, in manufacturing goods for the use of State institutions. In New York the convict lease system has been abolished; but, as with other States that have done away with this bad system, that State has become the dumping-ground of the convict-made goods of its neighbors that still retain the evil. The only way to end this wrong without waiting for every last State to pass the necessary law is by the enactment of a Federal statute. There is a bill now before Congress designed to protect the free labor States from the convict labor States. This is known as the Booher Bill. We described this measure in an editorial last May and shall doubtless have occasion to refer to it again. It has already passed the House of Representatives. It now awaits action in the Senate.

If the people of the United States object to the kind of thing to which Governor Donaghey has called attention, they should insist on National legislation to drive it out of the land.

THE HEAD-HUNTERS; AND HULL HOUSE

EDITORIAL BY THEODORE ROOSEVELT

WHILE in Chicago recently I visited the Field Museum on one afternoon, and on one evening I went to see the Hull House Players in Galsworthy's "Justice."

Everything was interesting at the Field Museum—the zoölogical collections, the ethnological exhibits concerning our own Indians, the exhibits concerning the Philippines, the material accumulated from China and Tibet. In one hall there was a tablet to the memory of a martyr to science, a young naturalist and ethnologist named Jones, who on behalf of the Field Museum had been sent to the Philippines and there had been killed by savages. His story, as told me, doubtless with substantial though not with minute accuracy, was a story of what could have happened only in our own age, with its extraordinary juxtaposition of the highest civilization and of savagery, and the no less extraordinary suddenness with which some small part of a race of immemorial savagery in its growth becomes deflected into a part of the current of advance of an old civilized race.

Jones, who was of mixed blood, white and Indian, had studied at Hampton Institute. He then went to some New England school, I think Andover, and finally to Harvard. When he graduated from Harvard he had become a scientific man. The Field Museum sent him to the Philippines, where he penetrated into the interior of one of the wilder islands and joined a tribe of head-hunting savages, with whom he soon came to be on the most intimate and friendly terms. Head-hunting was merely one of their conventions, and was compatible with great gentleness and simplicity of life in many other matters.

Jones speedily became thoroughly identified with them. They told him all the intimate circumstances of their strange psychic and mental life, and for a year he lived with them collecting invaluable material in his note-books. Then he told them that he must leave them.

They were greatly grieved; they hated to have him depart. Some of their number who were especially friendly accompanied him to the confines of the tribal domain. Then their feelings overcame them (at this point of the narrative readers of Frank R. Stockton will be startlingly reminded of the possible attitude of the griffin toward the minor canon). They felt that they really could not bear to part with Jones, so they killed him and took back his head to their village. My informant, a profound student of wild ethnology, told me that he was convinced that their main feeling was friendship, that they had become devoted to Jones, that they liked him and liked to talk with him, and hated to have him go away; and so they felt at the end that, as they would otherwise lose him entirely, it would be far better to take his head back and have that permanently with them, because no doubt they would somehow or other get counsel and inspiration and friendship from it.

Wide as the poles apart from the phase of life of which I thus got a glimpse was that phase of life shown in the play produced by the Hull House Players. It was played in a delightful little theater, which I am sorry to say on the evening I was there was not as full as it ought to have been. The play was Galsworthy's "Justice," which he had given the Hull House Players special permission to play without a royalty.

The play itself is a most powerful indictment of that cruel legalism which not merely is divorced from justice but which may do the most frightful injustice. Any man or woman seeing it cannot but be intensely interested and at the same time roused to generous indignation against the forcing of the forms of law into the service of injustice—this forcing, mind you, being done, not by men who are scoundrels, but by men who have no idea that they are doing anything wrong, who, on the contrary, feel that they are upholding the cause of civilization, but who lack vision, sympathy, understanding.

The players were all men and girls from among the frequenters of Hull House. Their names showed them to be of Jewish, German, Irish, and native American origin. They played astonishingly well. How well they played is testified to, in the first place, by the fact that they appealed so much to Mr. Galsworthy that he gave them the right to play "Justice" free, and, in the second place, by the fact that they have been asked to come to Ireland by the remarkable group of men and women who within the

last few years have done so much for a national Irish stage. The "star" was a young Jew engaged in the manufacture of tobacco at $17 or $18 a week. What the Hull House Players were doing and the way in which it was being done showed the immense possibilities for enjoyment and usefulness open to all our people if they only have the right initiative, and the right guidance to enable them to take advantage of the opportunities.

These players one and all were hard-working young men and young women, but they had in them the quality that enabled them to take advantage of the chance that offered itself, and fortunately there were those prepared to offer the chance. In consequence, they now represent one of the appreciably valuable assets of American life. They are rendering service and giving enjoyment to others, and as an incident doing service and getting enjoyment for themselves. A window has been opened for them into the larger life of the Nation, and they are not merely lookers-on at this life; they are doing their full part in making this life larger and better and more beautiful.

THE PRESIDENTIAL TERM

A POLL OF THE PRESS

WHEN SHALL THE TERM BEGIN?

REPRESENTATIVE HENRY announces his intention of pressing the proposed Constitutional amendment to change the date of the President's inauguration. The Henry resolution, as reintroduced at last winter's session of Congress, would make a number of important innovations. The term of President and Vice-President would be extended to the last Thursday of April, 1917; that date thereafter would be the beginning and termination of their term and the date of subsequent inaugurations; Congress would meet annually on the second Tuesday in January, and the second Tuesday in January would be the beginning and termination of the official term of Senators and Representatives; finally, the short session of Congress would be eliminated.

Thus Mr. Henry has not confined his attention to the simple problem of giving the inauguration pageant a more attractive open-air setting. But that alone, says the New York "Tribune," would be a decided gain, for the inauguration of a President is an important National ceremony. The paper continues:

> It draws hundreds of thousands of people to Washington, some in the line of official or military duty and the rest as spectators. Since the present date is unsuitable and a far better date can be provided without any special embarrassment, it is only sensible to try to make the occasion one of greater comfort and added impressiveness.

In the same spirit Mr. Frederic J. Haskin, a well-known daily contributor to many newspapers, writes:

> In addition to the important political considerations involved in the Henry resolution, there is the matter of better weather for the inaugural day. Thousands of people have been stricken, some of them fatally, as a result of bad inauguration weather. The death of at least one President is attributed to such weather, and many prominent men have succumbed to attacks of pneumonia caused by it. The Henry resolution is by no means a partisan measure. The ideas incorporated in it have been advocated by the leaders of both parties. The provision for Presidential succession is identical with that passed by a Republican Senate upon two occasions. The provision for the change of the inaugural date has been widely indorsed by men of all political faiths. The provision for changing the meeting day of Congress seems to be in accord with the intentions of the framers of the Constitution.

The opinion of most newspapers seems favorable to a change in the time of inauguration. But many would not defer it. They would advance it. They are convinced that the President and Congress should enter upon their duties as soon as possible after they have received their mandates from the people. After his election in 1860 Mr. Lincoln remarked to Judge Gillespie:

> I would willingly take out of my life a period in years equal to the two months which intervene between now and my inauguration, to take the office now. . . . I, who have been called upon to meet this awful responsibility, am compelled to remain here, doing nothing to avert it or lessen its force when it comes to me.

Hence the suggestion, not to defer but to advance the date, say to January 1. It has much more to commend it, claim its advocates, than has the suggestion to defer the date. As to the pageant that accompanies the induction of a President into office, the Tacoma "Tribune" says:

> The inauguration ceremonies and festivities are of the side-show brand, and could be elim-

inated without fracturing anything but precedent and the financial hopes of the hotel-keepers in Washington.

HOW LONG SHALL THE TERM LAST?

President Taft suggests that the Presidential tenure of office be limited to one term and that term extended to six years. His chief argument is that if a man knew he were to have but one term, he would confine his attention to the duties of his office and not to campaigning for re-election. His second argument is that four years is too short a period in which to work out the administrative plan desired by a President. Mr. Taft's position seems about the same as that of the Democratic party in the platform adopted at the Baltimore Convention last June. That platform declared for a single term, but made no recommendation as to length.

"Only twice in the history of the Nation since Washington first refused a third term," says the Aberdeen, Washington, "World," "has the question of extended tenure of the Executive office arisen." That may be, so far as widespread popular discussion is concerned, but, in speaking of Mr. Bryan's espousal of the single-term idea, the South Bend "Tribune" thus refers to three notable opinions:

Andrew Jackson suggested a similar limitation in his first inaugural address.

Rutherford B. Hayes, in his letter accepting the Republican Presidential nomination in 1876, as Mr. Bryan shows, virtually added a plank to the platform of his party. Hayes held that while he did not assume to add to the declaration of principles, he could not help noting that nothing was said in favor of a single term, and added that the restoration of the civil service system could best be accomplished only by a President under no temptation to use the patronage of his office to promote his own re-election. . . .

Mr. Cleveland, in his letter of acceptance following his first nomination for President, assumed a position similar to that taken by Hayes, except that he omitted to declare he would not be a candidate for a second term. Cleveland, however, did urge an amendment to the Constitution disqualifying a President for re-election.

In its financial editorial columns the New York "Sun" thus endeavors to report the opinion of what we call "Wall Street:"

It is a matter of great and almost supreme satisfaction that the desire of the Democratic majority in Congress seems strong to take the first steps toward such an amendment of the Constitution as will make the President of the United States ineligible to succeed himself. It is not going too far to state that a measure of this sort is considered by the great mass of people in the business and financial world as the greatest reform in our government system that could possibly be adopted. The circumstance that the Democratic party pledged itself to this end won it very many conservative votes at the last election; and that this proposition is now being taken up in Congress as a party measure in itself refutes the idea . . . that with the Democratic party in power in the National Legislature nothing but disorder and assaults upon the future can be expected.

The Aberdeen, Washington, "World" thus voices what it thinks the general view of the voters:

There appears no doubt but that the opinion of the majority of the people of the country is against more than one term and probably inclines toward one term of six years.

The sharpest criticism from those who oppose the single-term idea comes from the Florida "Times-Union:"

A proof of Mr. Taft's inability to interpret properly the meaning of prevailing tendencies is seen in his selection of the present time to propose . . . that the Presidential term be lengthened to six years. Has it not been appreciated that a President elected for four years is already too far removed from the consequences of popular displeasure? Had a recall been provided, it is more than probable that Mr. Taft would have lost office before the end of four years—why should we risk an unacceptable official for a longer term? Is it not to be supposed that a proposition to shorten the term would meet with better favor than the agitation for an extension?

In general, those who oppose the single term quote Thomas Jefferson as an advocate of frequent elections, say short terms are better for the people and for the President, and arrive at the conclusion that a four-year term is not long enough for a good President and too long for a bad one.

Another point of view on the part of the opposers is put forth by the Louisville "Post:"

The President is the only officer in the United States elected by all of the people. He represents no constituents for whom he would feel inclined to labor to the detriment of other sections of the country. He alone is designated as the leader of the Nation. His constituency is the Nation as a whole.

Now it is suggested that he should be debarred because he has attained the very experience which, above all others, would fit him for the Presidency. Because he has been a President, he should never be President again.

The choice of the people should not be limited in matters in which they have shown again and again that they are perfectly able to deal. In the past those Presidents who have been elected to a second term have been the men most worthy of respect and of a continuance in the office which they have filled with ability: Washington, Jefferson, Jackson, Monroe, Madison, Lincoln, Cleveland, McKinley, and Roosevelt. This array of names shows that when the people

have found a man of power they have put him in the position where he could exert his power for the best interests of all.

Those Presidents who have been inefficient, who have been negligent, who have been weak, have been denied a second term. The examination of the record shows that the American people have uniformly proven themselves capable of deciding correctly whether or not a President should be elected a second time.

Certainly if the people are able to choose a President for a first term they are able to decide whether or not he is capable of serving them again.

THE COAL MONOPOLY AND THE SUPREME COURT DECISION

THE case of the Government against the anthracite monopoly came to an end last week in a decision by the United States Supreme Court. But the case of the people against the anthracite monopoly is only just begun. The immediate effect of the decision has been to arouse public interest in the right and wrong underlying the legal aspects of the case. If it is true, as is asserted, that the ton of coal which costs the New York householder seven dollars or more costs two dollars at the mouth of the mine, then that householder has a live personal interest in knowing whether all of the five dollars added to the cost between mine and house is a just charge. There are many things that may be said about the decision just rendered. It is not by any means clear that the result is altogether a victory for the companies, and still less clear that even under the present laws there does not exist a way to deal with monopoly. But, before these points are considered, let us, as a matter of far more fundamental importance, look at the broad question of industrial monopoly as exemplified in the anthracite business.

And this particular business is perhaps the best existing example of monopoly, because nature, aided by law, has made close restriction possible. Perhaps its only equal in this respect is the monopoly which has gathered about the oil business. The superiority of anthracite for domestic and some manufacturing purposes is incontestable. People will have it if they can get it at a decent price. Certainly, within a reasonable distance of the anthracite mines, people should be able to get it at a price which would make competition by soft coal brought from a greater distance impossible. A conservative journal has stated since the Supreme Court's decision that, if excessive and unnecessary items were eliminated, anthracite could be sold on the Atlantic coast at between $2.75 and $3.50 per ton. Just now indignation at the high cost of coal is centered upon recent advances. Naturally, the man who has to pay bigger coal bills this year than last is angry about it. There is ground for this anger, because the excuse made by the Coal Trust for the advance of the prices—namely, that it now has to pay higher wages—is inadequate. It is alleged that known statistics show that the added expense to the Trust was about six and a half million dollars, while the increase in price must already have given some fifteen million dollars of increased revenue. That leaves a net gain to the Trust of some eight and a half millions. But all this is the temporary aspect of the coal question. Beneath it, as in the oil combination, there are much larger and broader problems.

Most fundamental of all is the question whether the idea of unrestricted, private ownership, such as a man has in a horse, should be applied to the gifts of nature which all men must use and in which all have an interest. Such things are land, mines, water, and oil: one such universal gift of nature, and one alone, has escaped the hand of monopoly—the air we breathe. If we were to imagine that a new, unoccupied territory as large as New Zealand were to be freshly taken possession of at one time by a large body of intelligent people well versed in modern ideas as to industry and economics, it is probable that they would adopt such common ownership in land, minerals, and oil as would prevent monopoly in the use of their products or unrestricted transfer of title from one person to another. The principle we now apply to patents and literary copyrights, through which absolute ownership forever is debarred, might find a similar application in the use of forests, mines, and water-rights. It is said that such a method would now be impossible because of the existence of vested rights. It may be so;

but assuredly such drastic and merciless use of legal possession as we have seen in the anthracite monopoly prompts one wide inquiry. This is whether in the future National legislation and economic development will not step in in behalf of the rights and needs of the people. For centuries now the absolute right of a man to control the ownership of his land after his death has been limited; yet the dead hand and the right of entail were not more absolute in themselves than is the claim of unlimited power over that which nature has intended for all.

Meanwhile, and for immediate advance, the lesson of the Supreme Court's decision is obvious: control is better than lawsuits. One of three things must exist as regards monopoly—absolute private ownership, public ownership such as the Socialists want, or powerful, effective regulation by Government. What we have done in a measure with the railways through the Inter-State Commerce Commission should be done through a similar body which should have similar power and control over great corporations existing or newly planned, if they are of the nature of monopolies or in restraint of trade or oppressive to the consumer. It may be added that this decision, like the decisions dealing with the Standard Oil and Tobacco Trusts, contains new evidence that the power of government to exercise such control is recognized by the Supreme Court; and that the so-called "rule of reason" idea does not mean to raise the question whether restraint of trade as forbidden by the law is reasonable, but whether it is reasonable to suppose that the action complained of is actually in restraint of trade.

What, then, is the decision of the Court in the anthracite case? Judge Lurton, who delivered the opinion of the Court (which, by the way, is of enormous length), prefaced it by a summary which we here quote in full. The Court, according to this summary, finds:

First—That the general combination alleged by the Government to exist between the defendant roads for an apportionment for total tonnage to the seaboard by an agreement in the nature of a pooling arrangement has not been established, and therefore the relief sought by the Government upon the assumption of such combination is denied.

Second—The Court finds, however, that the principal defendants did combine, for the purpose of shutting out from the anthracite coal field a projected independent line of railroad, the New York, Wyoming, and Western Railroad, and to accomplish that purpose it is found that the stock of the Temple Iron Company and of the Simpson and Watkins Collieries was acquired for the purpose of and with the intent, not of normally and lawfully developing trade, but for restraining inter-State commerce and competition in transportation, which would have presumably come about through the construction and operation of the proposed competing line of railroad between the mines and tide-water.

Third—The Court holds that certain contracts made with purchasers covering between twenty and twenty-five per cent of the total annual supply of coal, known as the sixty-five per cent contracts, by which such independent producers bound themselves to deliver the output of their mines, or any other mine which they might acquire, to the railroad companies for sixty-five per cent of the average market price at tide-water, were also void because in violation of the Anti-Trust Act as abnormal and illegal restraints upon inter-State commerce.

Fourth—The Court reiterates the declaration in the Standard Oil case, that an act of Congress does not "forbid or restrain the power to make normal and usual contracts to further trade by resorting to all normal methods, whether by agreement or otherwise, to accomplish such purpose." Nevertheless, it holds that the acts which it finds in this case to be illegal, the Temple Iron and sixty-five per cent contracts, were not within such class, but on the contrary were abnormal in their character and directly tended to and were intended to illegally restrain trade and commerce, and therefore came within the statute as illustrated by the rulings in St. Louis Terminal Association and Swift & Co. vs. United States.

Three things, roughly and broadly speaking, were at issue (besides smaller matters), which may be here enumerated: One was whether there existed between six railways which carry coal, and their subsidiary companies engaged in coal-mining, such a combination as is forbidden by the Sherman Law as in the nature of a monopoly, and whether their combined action was in illegal restraint of trade. On this first question the defendants won a victory. But it should be pointed out that the decision does not mean that such a combination does not exist, but that it has not been proved to exist. It does not mean that under the Sherman Anti-Trust Law it might not be possible in another case to prove the existence of mutual relations and combinations which were not laid before the Court in the recent suit. The points passed upon were largely questions of fact, and we doubt very much whether the principles of law propounded essentially change the view of the Sherman Law already propounded in former decisions of the Court. It has been said (we quote the New York "Sun") that "each case for construction under the Anti-

Trust Law will be considered under the separate and peculiar circumstances pertaining to it, and that very many existing trade combinations and agreements are not in restraint of trade at all." But this is nothing more or less than what was known before. The Sherman Law is not perfect; but it is not helpless; it is not aimed at every combination of capital; and it ought not to be. Whether or not the Supreme Court had evidence enough before it to bring the anthracite combination under the law is important enough, but its belief that the evidence was lacking or that the Government's method of procedure was imperfect does not give a license to this or any other monopoly in the future.

The second important point involved relates to the right of railways to own coal mines. The "commodities clause" of the Hepburn Law forbids this. The men who control the coal railways are not, however, so simple and unresourceful as to be stopped by such a prohibition. What has happened has been that practically the same men own the railways and the mines, but through different companies with separate organization. This has been passed upon as allowable by the Supreme Court in the famous Commodities Case, which even went so far as to say that while the railway company may not transport a commodity which it owns or in which it has a legal interest at the time of the transportation, the railway may own the stock of a mining corporation. Under this decision the coal railways have found it easy to keep down the price of coal at the mine (and thus make out a case against increased wages because the mines are not making money) and put up the price of railway carriage for coal to a point alleged to be necessary in order to pay dividends on railway stock regardless of the actual investment represented by that railway stock. The present decision does not, so far as we can judge, change the attitude of the Supreme Court. On this point it simply says that, as to some of the acts, they were committed before the Hepburn Law was passed, and that it does not, therefore, apply; and that, as to other acts, the prohibitions of the Hepburn Law do not apply at all.

The third main issue resulted in a victory for the Government. Independent coal-miners, under pressure from the Trust, had entered into an agreement to pay to the Trust thirty-five per cent of the value of their coal at tide-water in addition to the regular railway charge for carrying. It was practically a special tax put on the business of the independents; a sort of paid license or permission to do business. The Supreme Court is strong in its condemnation of the contracts, and abrogates them as illegal; while it also orders the dissolution of the Temple Iron Company, the organization through which the railway companies have in the past fought off genuine competition. The Attorney-General, in commenting upon this part of the decision, has said: "The annulment of the sixty-five per cent contracts was a very important victory for the Government. It opens the way for competition in the coal trade. It is also important because the Court declares that, although a contract may be innocent in itself, a bundle of contracts may constitute a violation of the law." It is said, on the other hand, by some of the coal magnates, as evidence that they have not been hard hit by the decision, and also by some of those who take a gloomy view of the effect of the decision on the people's interest, that the sixty-five per cent agreements and the Temple Iron Company are now practically devices of the past, no longer of practical value; and that in large part opposition from independent mining companies has ceased by the simple process of absorption.

Whatever view may be taken of this decision and its effects, there is universal agreement, among those who wish to get the coal from the mines to the household furnace and to the manufacturer at a reasonable and a living price, that the ultimate problems involved will not be allowed to drop. We may quote as to this the comment of that sound and conservative paper, the New York "Journal of Commerce:"

> A monopoly once established and "going" is hard to get rid of so long as there is a common interest in keeping it up. This coal "combine" is so close and so confident of its cohesion that it seems to be invulnerable. What is the Government going to do about it? The supply of anthracite is contained within a limited area, and these seven railroads afford the only means of getting it to its chief market. The only real competition with it is that of soft coal from other districts, and so long as the railroads are allowed to hold together in carrying it, with a common understanding for the apportionment of traffic and maintenance of rates, a virtual monopoly will survive and the consumers will have to pay the price. *Is there no help for it?*

It certainly does not seem as if any prompt or real help were going to come from a succession of lawsuits.

The Resurrectionist

AS a matter of record, the Circuit Court adjourns twice a day during its stay at Belo. As a matter of fact, it never adjourns at all, for when the judge leaves the bench the proceedings are merely transferred from the floor of the court-house to the lobby of the Reeve House, where lawyers, witnesses, litigants, and jurors fraternize in continuous session until the reopening of the official tribunal. Indeed, that antiquated, if not ancient, hostelry, the Reeve House, is quite generally regarded by Fraser County in the light of an annex to the Court, and some even profess to believe that it is the more important forum of the two. Certainly the village cynic is not alone in championing it upon the ground that cases are really settled there, whereas in the Court they are merely kicked up the stairway of appeal. But public opinion in Belo rather frowns on remarks of that character, as Dick Poinder learned to his cost when he announced, after one of his exasperating experiences in Gedney's case, that the lobby dispensed justice and the Court dispensed with it. In fact, that travel-stained witticism was in some danger of being taken too seriously until the Bar laughed it away by subjecting its perpetrator to a mock trial for plagiarism during the hilarious wind-up of the Christmas term.

On the evening that the Resurrectionist first appeared upon the scene the lobby was sitting as a sort of Court of Appeal, reviewing the day's work just completed at the rival tribunal on the opposite side of the road. Every chair in the circle that ringed the huge stove was occupied; half a dozen unclaimed trunks had been dragged from a corner to serve as settees; the writing-table had been utilized as a gallery; even the proprietor's sanctum had been invaded and robbed of its solitary high stool, and Old Man Reeve, thus deprived of his favorite throne, had perched himself on the office desk, with his feet dangling over the front, from which post of vantage he seemed to be presiding over the assemblage with all the commanding calmness of a judge upon the bench.

Old Man Reeve had undoubtedly once been young, but his youth probably antedated the period of the yellow, cracked, and fly-blown lithograph of the Bar of Fraser County which had served as the sole ornament of the lobby since the early seventies. At all events, those who knew him in that distant day asserted that he was an old man then. But if he had aged prematurely, time had dealt kindly with him on the whole, for his round, clean-shaven face had suffered no change for many a season, and no one thought any more of his years than of the fact that he always wore low black shoes and white socks, and never condescended to a collar. His neighbors in Belo, it is true, reported that his vitality often seemed to wane during vacations, when the county seat relapsed into its normal

rôle of a retired inland village; but each advent of the Court apparently gave him a new lease of life, and he invariably welcomed the returning Bench and Bar with all the vigor and heartiness of a man in the prime of life.

Certainly there was no keener observer in Fraser County than Peter Reeve as he sat on his improvised rostrum, pipe in hand, beaming a benediction on his assembled guests. He knew every man in the place and just what had brought him there; he could name every juror who had sat on any case of importance during the past thirty years, and give the inside history of his verdict; he was generally familiar with the claims of the litigants long before they reached the court-room; and there were not many lawyers who could tell him anything he did not already know concerning the private affairs of their clients.

For instance, as he peered through the gathering haze of tobacco smoke, he knew exactly what was troubling the frail little man who, note-book in hand, was hovering on the outskirts of the wide circle surrounding the stove. David Gedney and he had been friends since the day when the firm of Gedney & Son first started in business just across the State line, and he had seen that business expand and prosper until it began to threaten the gigantic Farm Supply Company with a competition as unwelcome as it was unprecedented. It was not surprising, therefore, that he was familiar with every detail of the bitter trade war that had followed, the upshot of which was a litigation which had crippled his friend's resources and was now menacing the very existence of his firm. For five terms—more than a year—he had witnessed Gedney's struggle to bring his enemies to bay in the court-room, but thus far the Supply Company had managed to postpone the day of reckoning by all the shifts and evasions known to its attorney, Mr. Artemus Peck, one of Fraser County's most expert defeaters of the law.

Gedney had long since reached that dangerous period in the pursuit of justice when clients are neither laymen nor lawyers. In fact, Dick Poinder, his counsel, had been obliged to protest against his over-anxious interference time and again, reminding him that his business demanded his whole attention and that by neglecting it he was positively imperiling his cause. But Gedney, with his property all tied up and his credit exhausted, was beyond advice, and term after term he had haunted the lobby, note-book in hand, interviewing lawyers, buttonholing court clerks, imploring other litigants to concede him the right of way on the jury calendar, and generally working himself into a nervous condition bordering on insanity. Indeed, on this particular evening there was a really dangerous gleam in his tired eyes as he completed his tour of the lobby, and, sinking down on one of the crowded trunks, whispered to his nearest neighbor that he held the top of the calendar at last and that hell itself couldn't prevent his case from being heard in the morning.

The young farmer to whom this incomprehensible remark was addressed glanced apprehensively at the speaker and promptly vacated his seat on pretense of seeking a light for his cigar.

"Who's the crazy old guy with the note-book, Pete?" he inquired as he reached the desk.

Old Man Reeve, listening to the tag end of a story from his side of the circle, disregarded the question for a moment, and then, striking a match on his trousers and shading the flame with his hands, proceeded to relight his pipe.

"Reckon your Paw'd feel kinder set up, Eph, if he believed you'd ever be as crazy as Dave Gedney," he replied, between puffs.

The youth laughed uneasily and shot a swift glance at his recent neighbor.

"Gosh! Is that Gedney of Gedney & Son?" he exclaimed. "No wonder I didn't recognize him. He's changed something terrible, and as for talk—"

"You can't always tell about a man by his talk, Eph," interrupted Reeve. "For instance, if I sized you up by what you've just let on as to Gedney, I'd kinder suspect *you* weren't all intellect. But maybe you're a better judge of outsides, my boy," he continued, "and if so, you can tell me what's coming in at the door right now. Blamed if I ever saw the like of it afore in Fraser County."

The individual to whom the old man thus called attention was certainly an unfamiliar type to the denizens of the Reeve House, for all conversation had instantly ceased as he crossed the threshold, and every eye was centered upon him as he closed the door and stood looking inquiringly about him. Perhaps his huge stature, pompous bearing,

GENERALLY WORKING HIMSELF INTO A NERVOUS CONDITION BORDERING ON INSANITY

massive head, and strong, hard face would have attracted more than a passing notice in any company, but it was not his face or his physique at which the habitués of the lobby stared in fascination. It was his high silk hat, his fur-lined, broadcloth overcoat, his chamois gloves, patent leather shoes, and mouse-gray spats that held them spellbound. But if the stranger was aware of the sensation he was creating he did not betray it as he leisurely unbuttoned his greatcoat, and, shaking the powder of snow from its broad folds, glanced superciliously over the room. Then he strode directly to the desk and paused before its occupant.

Old Man Reeve did not stir from his perch as the visitor approached, but nodded a greeting and glanced through his big-rimmed spectacles at the card which was offered him. Then he looked up with a comical, question-

ing expression and, cocking his head, apparently invited explanation. The lobby strained its ears to catch some echo of the conversation that followed, but the newcomer spoke in low tones and the proprietor confined himself to monosyllables, accompanied with a wide-eyed stare of amused astonishment and punctuated by an occasional nod or shake of the head. As the dialogue continued, however, it was apparent that the visitor was becoming irritated, and finally, when he turned away with a muttered exclamation of disgust, and, striding across the room, banged the door behind him, a chorus of inquiry broke forth.

"What's the matter, Pete? . . . Didn't his nibs like our looks? . . . Who's his Royal Highness, old man? . . . Say, Pete, do you charge extra for shows like that? . . . Why didn't you tell us you knew the Prince of Monte Cristo, Grandpa? . . . That wasn't any common Prince, Mr. Reeve. That was a New York chauffeur! . . . No, it wasn't! It was a soap advertisement. What's his brand, Pete?"

Old Man Reeve glanced at the card in his hand and smilingly shook his head at the storm of questions.

"You kin search me, boys," he answered. "He didn't tell me what he was, but only what he wanted. Bet you'd never guess what it was, though. A suit of rooms *and* a bath!"

A roar of laughter greeted this announcement, in which the host of the Reeve House joined so heartily that he was obliged to remove his spectacles and wipe the moisture from his eyes.

"He allowed," he continued, chuckling, "that he telegraphed for that suit day afore yesterday, and was madder than hops when I told him we didn't have anything but lawsuits ready for him. I'm going to have that telegram framed ef Bill Watson ever gits time to send it over from the depot. Reckon it'd kinder give a stylish tone to the House, eh, boys?"

"Where's he gone, Pete?" inquired Brundage, the State's attorney.

"I sent him down to Miss Prescott's. She turned one of her bay windows into a bathroom last summer, and maybe she kin fix him up. He'll be in hot water, though, if he puts on any airs with Ellen. O Lordy, yes!"

"What alias is the Great Mogul using just at present?" drawled Poinder, tipping back his chair against one of the columns supporting the lobby ceiling.

"This bit of pasteboard is labeled 'Wallace Dunham,'" responded the old man.

Poinder's chair bumped the floor as he leaned eagerly toward the speaker.

"Wallace Dunham!" he exclaimed. "Not Wallace Dunham, the Resurrectionist? Yes, by George, it is! I knew I'd seen his face before."

"What did you say the gentleman was, Dick?" inquired Brundage. "An Insurrectionist?"

"No, the 'Resurrectionist.' At least that's what they used to call him in the city fifteen or twenty years ago."

"Is he a minister?"

"No," whispered Hixon, the *enfant terrible* of the Bar. "He's the undertaker that's going to bury Gedney after the trial to-morrow. Eh, Poinder?"

The lawyer frowned and cast an anxious glance at his client's careworn face.

"Shut up, Hixon," muttered Brundage. "That's a rotten kind of joking. Did you say your friend was a minister, Dick?"

"No, indeed," returned Poinder, smilingly. "He's a lawyer with a practice as big as a Trust. What the dickens is he doing in Belo, I wonder."

"Why do you call him the Resurrectionist?"

"Oh, that's just a nickname. His specialty is reviving cases that are generally considered dead and done for. At least that's what he made his reputation on, and it was well earned, too, for I once knew him to bring a dead man back to life."

"Oh, come now! That's too much, even for the Munchausen of the lobby," protested a voice from the other side of the circle, and Poinder, glancing in that direction, observed that his opponent Artemus Peck had risen.

"Well, it may be too much for you, Baron," he drawled. "But truth is stranger than even your fictions, as I can show you if you'll wait a minute."

"Sorry I can't stay, but I've never had any reason to doubt the strangeness of your truths, Poinder. Come on, Bob, if you're coming."

Hixon rose as Peck passed out of the front door, and for some moments after he had followed his friend the lobby was uncomfortably quiet. There was always too much bitterness in Poinder's and Peck's repartee for the Bar of Fraser County. It invariably

smacked of a family quarrel disagreeably embarrassing to all within earshot, but Old Man Reeve usually came to the rescue, as he did on this occasion.

"Go on and tell us about your Revivalist, Mr. Poinder," he suggested.

"Resurrectionist, Pete," corrected the lawyer. "Revivalist is much too mild a term. Well, maybe some of you remember that I served my legal apprenticeship in the office of the State's Attorney in the big city more years ago than I like to confess. Anyway, it was there I first met Wallace Dunham. He wasn't so fat and prosperous as he is now, and he didn't despise criminal business when it knocked at his door. But he never was the kind of fellow that practices for love or fame, so I was astonished when he appeared as the counsel for Buck Denslow, who had neither money nor friends. Buck was just a common ruffian who had betrayed one of his gang to the police and then shot another pal who discovered his treachery and threatened to expose it. He was caught red-handed, and I suppose it was because the case was absolutely indefensible that its prosecution was intrusted to me, for I was nothing but a novice at the time. Well, I venture to say that no tyro at the Bar ever received as rough an initiation into the ways of the law as came to me out of the case of the *People vs. Denslow* from the moment Wallace Dunham appeared upon the scene.

"He began proceedings by moving to set aside the indictment on the ground that it did not state that Denslow's victim, Ben Limond, was a human being, and that no one could be indicted for murder unless he had killed a human being. As a matter of fact, Limond was more of a brute than a man, and at first I regarded Dunham's point as a joke. Anyhow, I never dreamed that the courts would listen to it. Did you say they wouldn't, Corning? All right, my boy! I'll give you verse and chapter for that case and you can follow it as I did, all the way up to the highest tribunal in the State. You'll do it quicker than I did, however, for by the time the last court disposed of his arguments Dunham had consumed the best part of a year, and all this time his client had been enjoying the hospitality of one of our most comfortable jails—a fact which was beginning to attract the attention of the press. Of course I wasn't to blame for that, but I had no desire to be criticised, and I pressed the case to trial with the utmost vigor. Indeed, I rushed it so furiously into court that Dunham nearly broke my heart when he tripped me with a dictionary."

"Tripped you with a dictionary!" interrupted Corning. "That's a joke, isn't it?"

"Indeed it was no joke. The day before the case was set for trial Dunham called at my office to advise me—out of professional courtesy, he said—that there was an error in that part of the indictment which described Limond's wound as being in his breast. 'Well, it *was* in his breast,' I asserted. No mistake about that. 'But not in his b-r-e-s-t,' he persisted, showing me the mistake in typewriting the word. I laughed, but he retorted by pulling down one of the law reports from my shelves and pointing to a decision that declared that such misspelling in an indictment rendered it fatally defective. Maybe you think there is no such case, Corning. Oh! You *have* seen that one, have you? Well, I didn't thank Dunham for showing it to me. The old fox merely wanted to save himself the trouble of drawing up papers, and knew this pretended courtesy would serve him equally well. And it did. I consulted with my chief, of course, but he decided it was not safe to proceed in the face of that decision, and we began our proceedings all over again.

"By this time you can readily believe that I had grown somewhat wary, and I tell you every *t* was crossed and every *i* dotted before my new papers were filed. Indeed, they must have been pretty strongly drawn, for Dunham was plainly worried, and he fairly deluged me with motions to inspect the minutes of the grand jury, to change the place of trial, to determine the sanity of the prisoner, to stay the trial pending the arrival of missing witnesses, to do anything and everything that would delay the proceedings or free his man by hook or crook. I've got the documents that were printed at the State's expense in the various appeals before a jury was even as much as summoned in Denslow's case, and I give you my word they fill two volumes, each as big as an unabridged dictionary.

"But we got to trial at last, and though the case was simplicity itself, I prepared it with the utmost care. Not too carefully, however, for Dunham poured exceptions into the record in a steady stream, and strung out the testimony day after day until he'd accumulated such a mass of stuff that two assist-

THE LOBBY STRAINED ITS EARS TO CATCH SOME

ECHO OF THE CONVERSATION THAT FOLLOWED

ants of mine had to work nearly a month with the stenographers' notes when it became necessary to print the papers on appeal. . . . Oh, yes, of course I convicted Denslow. But that isn't the point of my yarn. You don't suppose I'd bore you fellows if I'd nothing more to offer than the old, old story of the law's delays. As a matter of fact, I convicted Buck four times.

"I don't know that the details of that long game of 'last tag' would interest you, but some of them were a bit out of the ordinary. After the first verdict the appellate court ordered a new trial because of a technical objection which Dunham had interposed to the method of drawing jurors. It was a perfectly absurd quibble, but there was no help for it, so I put him on trial again, and, avoiding the previous pitfall, obtained another conviction. Did it stand? It did not. The jury had agreed late at night, and the judge had ordered them to render a sealed verdict which the foreman had recorded in due form, except that he had written that the prisoner was guilty of murder in the first *decree* instead of the first *degree*. That was Dunham's chance, and, with the aid of his old reliable dictionary and the learned reviewing court, his client received a new lease of life and another new trial.

"New trials for old was the order of the day with me now, so I was rather surprised to get through two appeals after the next conviction without mishap. But the court of last resort came to Denslow's rescue just in the nick of time with an opinion declaring that the judge who sentenced the prisoner had erred in failing to ask him the formal question as to whether or not he knew of any reason why sentence should not be pronounced against him. . . . I'll show you that masterpiece of judicial erudition some day, if you haven't already come across it in the books.

"Well, practice makes perfect, and the next time I brought my man before a jury I sustained his conviction through all the courts, and the day set for his execution was just five years after the commission of his crime, which up to that date had cost the State nearly twenty thousand dollars."

"I know another case that took even longer than that," observed one of the audience, as Poinder paused.

"Of course you do," he admitted. "The law books of this country are filled with them. But you won't find the climax of *this* case in the records, my friend. . . . Perhaps I needn't tell you that long before I convicted his client for the fourth time Dunham and I had become pretty bitter enemies. I don't believe I'd spoken a word to him outside the court-room for three years, and my office associates, who had begun by joking me about the case, had ended by sympathizing with me and sharing my feeling toward the Resurrectionist. The final decision of our highest courts was accordingly welcomed as an office triumph, and I was congratulated accordingly. But the congratulations were premature.

"It was about this time that electrocution was substituted for hanging in our State, and Dunham appealed to the Supreme Court of the United States on the ground that the new law violated the Constitution. No one supposed that that tribunal would interfere, and, as a matter of fact, it made such short work of the contention that Denslow merely gained a few months' respite. There was then only one move left for his counsel, and of course he took it by petitioning the Governor for clemency on behalf of his client. But I knew that if the Executive interfered to save that cold-blooded murderer he might as well sign a commutation in blank for all assassins, and I had no fear of the result. Nevertheless, it was not until I filed away his brief memorandum denying the petition that I regarded the case of *People vs. Denslow* as officially closed, and felt justified in dismissing it from my mind."

"I should think you'd have nicknamed Dunham the Obstructionist instead of the Resurrectionist," observed Foster.

"Well, we might," resumed Poinder, "if he'd displayed nothing more than commonplace jugglery with the law. But though Denslow was, figuratively speaking, at the end of his rope, his lawyer wasn't, and a few days before the date set for Buck's execution this was impressed on my mind in a really startling fashion.

"I had arrived at my office somewhat earlier in the morning than usual, and was surprised to find a visitor already waiting for me in the anteroom, who introduced himself as Dr. Emile Atwood. He's dead now—God rest his soul!—but I'll say right now that that wasn't his right name, and I'm not going to tell you what it really was. Naturally, the name he used suggested nothing to me, but he appeared to be a highly intelligent, cultured gentleman, and I begged him to state

"NO LESS THAN THREE JURIES HAVE CONVICTED THE MAN OF THAT CRIME. WHAT DO YOU MEAN BY SAYING THAT YOU ARE GUILTY OF IT?"

his business, which he did by remarking that he had called to talk about the case of Buck Denslow.

"'Good Lord!' I exclaimed. 'I thought I was through with that case. Well, what about it?'

"'I want to ask you,' he inquired, 'if there is still any chance of a reprieve or commutation of Denslow's sentence?'

"'Certainly not,' I replied. 'He ought to have paid the penalty of his crime five years ago. He and his lawyer have cost the State nearly twenty thousand dollars already, and I think it's about time they stopped cheating the law at the public's expense.'

"'The defense has been quite as costly,' he observed, reflectively.

"'Nonsense!' I retorted. 'Denslow hasn't a cent and Dunham has spent comparatively little.'

"'He spent nothing,' he replied. 'But still, if it is any satisfaction to the State to know it, the defense has been costly. I know it, because I supplied the funds myself.'

"There was a time in my professional career when that reply would have astonished me, but I had long since schooled myself against surprise.

"'I see,' I responded, quietly. 'You thought Buck innocent?'

"'On the contrary,' he replied with equal calmness, 'I knew he was guilty. A more contemptible murderer never lived.'

"'Then why, in the name of common sense, my dear sir, did you spend money to defend him?' I demanded.

"'Merely to appease my conscience,' he replied. 'I killed Ben Limond myself.'

"All my years of training were not proof against the exclamation of incredulity that escaped me. And yet there was something

in the doctor's hard, matter-of-fact tone—something in the way he looked at me as he removed his glasses and calmly polished the lenses in his handkerchief—which convinced me that he believed he was speaking the truth.

"'You must be out of your mind!' I asserted. 'Denslow and nobody but Denslow killed Limond. There were two eye-witnesses of the murder. No less than four juries have convicted the man of that crime. What in the world do you mean by saying you are guilty of it?'

"The doctor readjusted his glasses and settled back in his chair.

"'I have no wish to be melodramatic,' he observed, dispassionately. 'I hate all posing of that sort, and the facts are very simple.'

"I did not trust myself to speak, but merely nodded approvingly.

"'Limond was brought to the Emergency Hospital where I was the visiting surgeon immediately after Denslow shot him,' he explained, in the cold professional tone of statement. 'He was not dead, but I saw at a glance that his wound was probably fatal. However, the proper thing to do was to attempt an operation, and he was put under ether at once. It seemed a hopeless task, but as I worked the thought crossed my mind that here was a magnificent opportunity for an experiment I had long desired to make in an operation of this kind but had never quite dared risk. There was no time to debate the question of professional ethics or legal responsibility—the temptation was overwhelming, and I simply could not resist it. All I wanted to do I could effect very quickly. Moreover, Denslow was virtually moribund, and my greatest fear was that he would die before I could make my experiment. . . . Well, he must have been even nearer death than I supposed, for his life went out under my instrument like a candle under one's thumb and finger.'

"The doctor paused and snapped his fingers together.

"'Just like that,' he commented, musingly.

"I stared at the speaker with unfeigned amazement, wondering whether I had to deal with a lunatic or a sane man. He speedily resolved my doubts, however.

"'At the time I felt no compunction whatsoever for my act,' he continued. 'Limond might have lived anywhere from an hour to a day had I not interfered, but no longer. I did not, in any real sense, feel guilty of his death. Indeed, what I did was such a slight matter that the coroner entirely overlooked it, and it was not until a few weeks later, when an operation successfully performed on a similar case showed me just where I had made my mistake, that I gave the matter any further thought. Then, of course, I began to be disturbed by the situation. Perhaps I would have done better had I sought the advice of some lawyer. But I did not. I thought the whole thing out for myself. If I confessed exactly what had happened at the hospital, I fancied that I might be indicted as a criminal and I knew my reputation would be ruined, and I was just on the threshold of a highly successful career. Had there been the slightest doubt of Denslow's guilt I would not have hesitated a moment to sacrifice myself. But, as you know, the man was a cowardly murderer, richly deserving his fate. It was madness to think of blighting all my prospects in his behalf. Nevertheless, the matter preyed upon me, and I finally compromised with my conscience by secretly furnishing Denslow with the means of retaining Dunham and indirectly supplying him with funds to keep up the fight in the hope that he would find some way of at least saving his client's neck. That was all I wanted. But I now see that he has merely succeeded in making a mockery of the law, and money out of me.'

"You may imagine with what feelings I listened to this extraordinary statement, but despite my exasperation and disgust I could not but feel some sympathy for the fellow. When I spoke, however, my tone was brutally harsh and forbidding.

"'Well, why do you consult me, Doctor?' I demanded.

"'To ascertain if there is anything I can do, short of confession, to save Denslow's life,' he answered, suavely. 'You are the public prosecutor in this case. Perhaps if you made the proper representations to the Governor he would commute the sentence.'

"'I shall do nothing of the sort, sir,' I retorted, sternly. 'You'd better get your full money's worth out of your friend Dunham and go to him for advice.'

"'That will not be necessary,' he asserted, complacently. 'I have laid the facts before the public authorities. If they do not choose to act upon them, that proves that they think the law should be allowed to take its course

and shows me that I have given myself a vast deal of unnecessary anxiety and expense for nothing. In any event, I wash my hands of all further responsibility in the matter, and wish you good-morning, sir.'"

"Well, that fellow was certainly a cool proposition," commented Brundage. "What the dickens did you do, Poinder?"

"What could I do, Tom? As a prosecuting official, you know I couldn't suppress the facts; and as a man and a lawyer, you know that they didn't really affect the question of Denslow's guilt at all. He and not the doctor really killed Limond. . . . Oh, of course I know there *are* decisions freeing murderers because the surgeons who sought to save their victims were careless or incompetent, and I was equally well aware that all that bad law would be grist to Dunham's mill, for what has fooled judges can be used to fool juries. . . . However, there was no escape, and I actually had to supply the fellow with the ammunition for demanding another trial on the ground of this newly discovered evidence. Indeed, I've always thought it must have been this humiliating duty that precipitated the nervous breakdown which incapacitated me for the next twelvemonth. Anyway, when I recovered and returned to the office the *People vs. Denslow* gave me no further concern. In my absence it had been turned over to one of the most hopeless blunderers on our office staff, who permitted one of his eye-witnesses to be smuggled out of the State under his very nose, and got his whole case so sidetracked that before it was reached the other eye-witness died. You can fancy what kind of a showing he made on the trial against Dunham and his corps of surgical experts. No wonder the jury acquitted the innocent Buck!"

"Gee whiz!" ejaculated Eph Bisland. "Got off scot free after all! Eh?"

"Yes, as far as *the law* was concerned," drawled Poinder. "But one of Limond's friends shot him the day he left the jail, and the police never caught his executioner."

"And this is a government of law!" muttered Gedney.

"No, sir—of lawyers," laughed Brundage.

The little man rose to his full height and glared angrily at the speaker.

"You laugh, sir!" he burst forth, fairly trembling with rage. "You dare to laugh at such mockeries of justice! It is infamous, sir! infamous that a public officer of the law should treat such scandalous outrages as a joke, and consent to giggle at evils that are undermining our government, debauching our consciences, and shaming us before our neighbors and the world. Sir, your imbecile laugh will sound the doom of this country—if—"

"Come, come, Mr. Gedney," interrupted Poinder, soothingly. "You mustn't get excited. We've got a hard day before us to-morrow, and you and I must go upstairs to prepare for it. Brundage and I will discuss the whole subject with you dispassionately some other day, won't we, Tom?"

The Prosecutor nodded understandingly.

"Certainly," he responded; "and I sympathize with your views more than you suspect, Mr. Gedney," he added, soberly. "Good-night, sir."

"Good-night."

The little man was already on his way toward his room as Brundage spoke, and his response was uttered without turning his head, as, accompanied by his counsel, he mounted the creaking stairs.

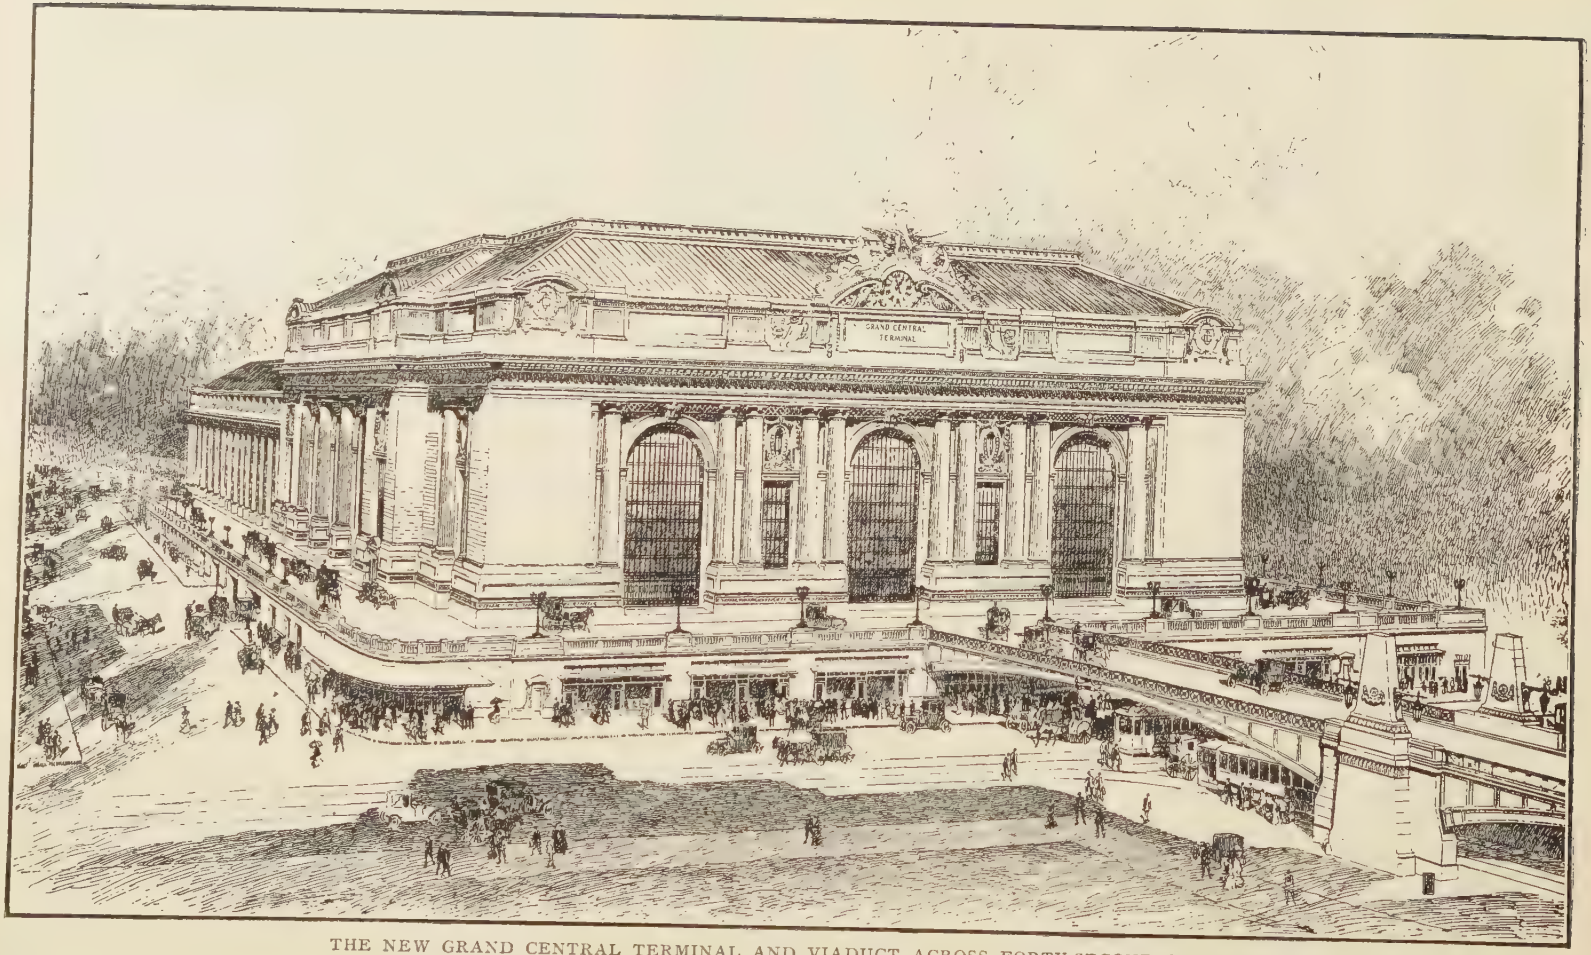
For a moment there was a dead silence in the lobby, its occupants apparently listening to the sound of the retreating footsteps. Then the front door opened and young Hixon, knocking the snow off his shoes, resumed his seat in the circle.

"Where's Poinder and Gedney?" he inquired, glancing about him.

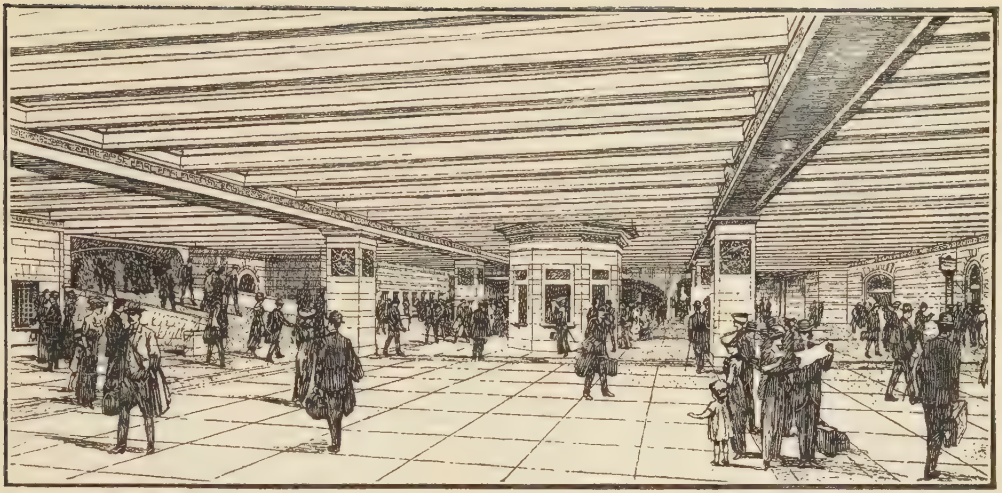
"They've gone upstairs," answered Brundage. "Their case goes on to-morrow, you know."

"I bet it doesn't," asserted Hixon. "Witnesses-in-the-case-of-the-Supply-Company-vs.-Gedney will return to-the-court-this-year—next year—sometime—never!" he chanted. "The Supply people have retained Poinder's friend the Resurrectionist. That's what he's in Belo for. Wow! What a pleasant little surprise for Poinder! And, say, Pete, I guess you'd better get a padded cell ready for Gedney! . . . Shut up yourself, Brundage! I'll talk just as much as I like!"

The second Tale, entitled "The Top of the Calendar," will appear in The Outlook of January 25, 1913



THE NEW GRAND CENTRAL TERMINAL AND VIADUCT ACROSS FORTY-SECOND STREET



THE SUBURBAN CONCOURSE

The Greatest Railway Terminal in the World

BY EDWARD HUNGERFORD

A FAR-SEEING New Englander who comes down to New York each autumn to buy his Christmas stock looked out of the sleeping-car window one early morning, some six or seven years ago, as the night train from his town came to a slow, grinding halt, and said:

"Jiminy whiz! What are they doing here to the New York Central's old Grand Central? It looks like a mining camp."

The railroader who sat on the leather-cushioned seat of the smoking-compartment hardly took the cigar out from between his lips as he replied:

"They are building the greatest railway station in the world."

The New Englander laughed. You might tell that to the country folks, but not to him. He traveled. He had been in Europe long enough to laugh inwardly at the boasting ways of his own land. We had everything "the greatest in the world"—bridges, public buildings, department stores, hotels, even railway terminals. No wonder Europe smiled at us when our backs were turned! The greatest railway station in the world. Well, he had been to Boston a good many times, and they had told him that about the South Station. And he had been to the last of the big World's Fairs, and they had boasted in self-same fashion about the wide-spreading train-shed vault of the Union Station in St. Louis. And here America was at it again. As if it could dream of the mighty London terminals—of Waterloo, of Liverpool Street, of London Bridge! Why, a real traveler from the Far East had told him of the wide-spreading train-shed of the station at Calcutta, the most modern thing seemingly in that dank and steaming land of long agos. The greatest railway terminal in the world! America could boast.

But as season after season passed, and as the tremendous hole in the rock foundations of Manhattan grew a little larger each season, the New Englander was forced to admit that the renaissance of the Grand Central was "some job." Men laid tracks only to rip them up again; they built great brick and iron structures only to tear down and throw into the scrap-heap; they shifted passengers and baggage and express here and there and everywhere; and all the while the cheery song of the compressed-air drill echoed answering choruses to the rat-a-tap of the riveters and the toilings of the steam-shovels.

Meanwhile the New Englander came and went with little or no delay to himself or his belongings. Out of seeming confusion there was underlying system, the sort of system which moves unseen and accomplishes much.

This last autumn he came to New York again. The great rock-cut excavation, extending some sixteen city blocks, was almost hidden. Above its center had risen one of the typical modern creations of the inspired type of American architect—a superb and symmetrical thing in enduring marble. The man from New England found his way through the myriad hallways of the building in a straight and simple path, just as the designers of the building had intended he should find it. But he caught glimpses of the vast reaches of the structure, the really wonderful proportions of its waiting-rooms and its concourse. It was all simple, and it was settled, and it seemed as if the new Grand Central had been bending to its great work for long years. Yet the man knew that the songs of the air-drill and the riveters and the steam-shovels had hardly ceased within the twelvemonth.

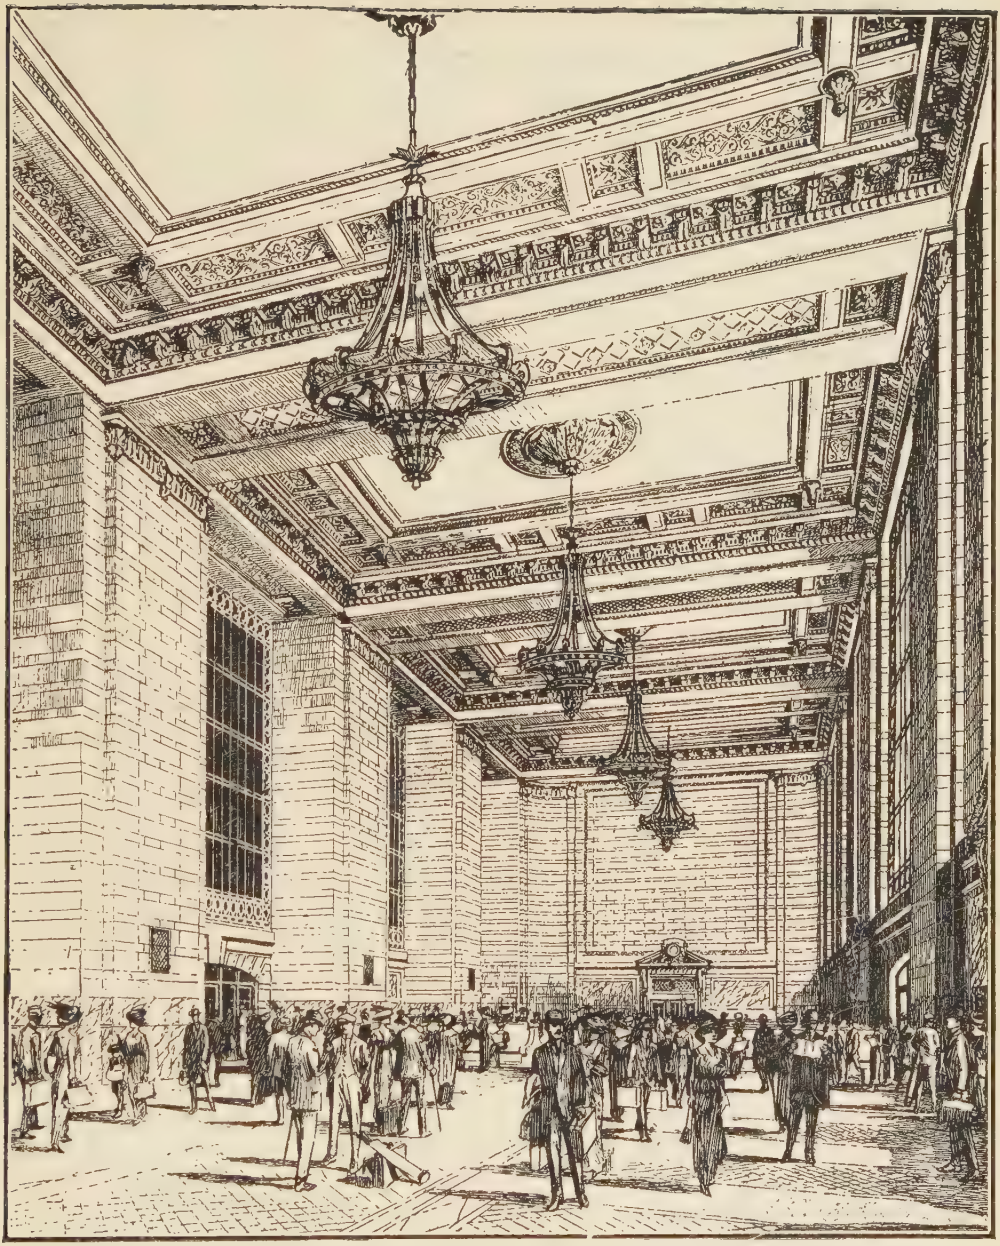
He went out of the station and straight to a near-by hotel. In the lobby of that modern and glorified tavern he met a chance acquaintance. Politics, business, a myriad things, hung pendent and unseen within the very atmosphere, but the man from New England had but one comment to make to his acquaintance.

"I have just arrived in New York through the greatest railway station in the world," he said.

To understand first the immensity of the problem that faced the builders of the new Grand Central one must go back to the very beginnings of the terminal station problem in the city of New York. The New York and Harlem was the first line to place its rails upon the island of Manhattan—away back in the year 1834. Its station, if one might call it such, first stood at the corner of Chambers and Centre Streets, within a stone's throw of the City Hall. As the town grew, reaching all the while farther north, and the railway also grew, the road retreated from its original terminal. In a little while it was starting its trains from White Street; a little later from Broome Street and the Bowery; then came the day when the railway to New Haven was also completed, and it began sharing with the Harlem road a brand new station at Fourth Avenue and Twenty-sixth Street, the site of the present Madison Square Garden. That was a three-story affair of brick, inclosing an open yard into which the cars came and from which they went, some to go even as far as Albany and Boston. But after a little while the town was growing closely around about Twenty-sixth Street, and citizens were demanding that the locomotives be barred from Fourth Avenue, through which the trains reached the station. Commodore Vanderbilt was beginning to dominate the New York railway situation, and he finally built an engine-house in a vacant lot alongside a cross-road which was to become Forty-second Street. After that the locomotives did not often venture below Forty-second Street. Horses, four and six and eight to each dusty yellow railway coach, took the cars from Twenty-sixth Street up through the long tunnel to the engine-house and the waiting locomotive. It was a sight to see the morning express start for Boston, a regular cavalcade rolling up through Fourth Avenue.

Meanwhile the Hudson River Railroad had been completed, and its stations were on the west side of the town—the down-town station at Chambers Street, and the up-town or outer station at Thirtieth Street and Tenth Avenue. About war time a horse communication was established between the inner and outer stations of the Hudson River road, a practice which was common among the larger cities along the Atlantic seaboard, and which in the case of the Harlem road from Twenty-sixth Street down to the City Hall gave birth to the first distinctive railway in the world.

War time, with its brave and martial show of regiments coming and going through New York, first demonstrated the inefficiency of the early passenger terminals of the town. New York was growing. So was the country. Commodore Vanderbilt, whose strategy had begun with the acquisition of the Harlem road, had in turn taken over the Hudson River line and the chain of prosperous little railways from Albany to Buffalo—all as the nucleus of the first great railway system that America was to know. He first planned a railway freight station, on the site of what had been for many years St. John's Park, in Varick Street. You can still see St. John's Park, as the railroaders have known that freight station for almost half a century, down in the lower west side of New York, the bronze effigy of Commodore Vanderbilt



THE MAIN WAITING-ROOM

rising from a remarkable bas-relief of steamboats and railway trains on its dusty façade.

But that settled only half the problem. The passenger business of the railways of the land was beginning to be a considerable thing. Americans were getting the travel habit. Even the genus of the commuter had been born. And the so-called railway terminals of New York City were dirty and inadequate arks. The first of the railway Vanderbilts saw all these things. He decided to solve them all at a single stroke, to bring all the three roads entering Manhattan Island into a single terminal, and to abolish the hauling by horses of a multiplying number of heavier railway coaches through the streets of the biggest town of the land.

And so a little later he was driving his

friends down the back street that was called Forty-second, stopping beside the engine-houses there and telling them that he was going to build the greatest railway station in the world upon that site. His friends laughed at him. It was still well outside the city. On one side of Forty-second Street the engine-houses sent up their pall of smoke; on the other gangs of horses worked in treadmills cutting wood for hungry fire-boxes. People would never come up to Forty-second Street to take the cars for Boston or for Albany or Buffalo, and they all told Commodore Vanderbilt that.

But they did not know Vanderbilt. They did not know the prophetic vision of a keen-headed Dutchman who had purchased a chain of railways from the Atlantic to the Lakes, at reasonably high prices for those days, because he had foreseen that the time was coming when business economics would demand but one line from New York to Buffalo, one line from New York to Chicago. Analyzed, there was not so much prophecy about that vision as cool-headed reasoning power. New York had been coming steadily north on Manhattan island for three-quarters of a century. The City Hall was completed a century ago, and its builders, with a thrifty economy, fashioned its rear wall of sandstone because they felt that the town would never get north of that old structure. Vanderbilt's judgment was different. He put himself in touch with the engineers and architects, and in the fall of 1871 a giant structure had arisen at Forty-second Street and Fourth Avenue, and boastful New York was talking of its Grand Central Depot. New York was in ecstasy about the building. It was the finest thing in town. Its ornate and graceful train-shed spanned thirteen tracks, and even if our fathers did wonder where the cars could come from to fill so spacious an apartment, they had to marvel at its beauty. And Commodore Vanderbilt was sure that it would serve his fine and growing railway for a full century.

In forty years the last vestige of the Grand Central Depot, a building which to a considerable portion of this land was second in fame only to the Capitol at Washington, was gone. Workmen had torn it stone from stone and brick from brick and carted it off as waste to scrap-yards. The majesty of that lovely vaulted train-shed had been reduced to a pile of rusty and useless iron. It had been outgrown and discarded.

In fact, within a dozen years the wonderful depot was overtaxed. Even Vanderbilt's prophetic vision could not grasp the growth that was coming, not only to New York, but to the great territory he served, and in a dozen years workmen were clearing a broad space to the east of the main structure for an annex train-shed of a half-dozen tracks to relieve the pressure upon the original station. Another twelve years and the laborers were again upon the Grand Central, this time adding stories to the original structure and trying to simplify its operation by new baggage and waiting rooms. Within the third dozen years the workmen were busy with air-drill and steam-shovel digging the great hole in the rock that was the first notice to the Grand Central that its short lease of busy life was ending. And in the fortieth year of its age they were tearing down the old station—grown old within the span of two generations, old because it had been outgrown. To such proportions can the traffic of the north gate of a real city come.

The problem of the new Grand Central was both engineering and architectural. As in the case of all railway terminals of any real size, it was first necessary to solve the engineering problem. That meant first that the passenger traffic into New York from the north and east for another fifty or a hundred years must be discounted—not an easy matter, when in the case of a single famous trunk-line railway it has been found that the passenger travel has doubled each ten years for the past three decades. When the statisticians put down their pencils, the engineers whistled. To fashion a station for the traffic of 1960, even for that of 1935, meant such a passenger station as no railway head, no engineer, no architect, had ever before dreamed of building. At a low estimate, it meant that there would have to be some forty or fifty stub-tracks in the train-shed. In the great train-shed of the Union Station at St. Louis there are thirty-two of these stub-tracks, and the span of that shed is 606 feet. That would have meant in the case of the new Grand Central a train-house with a width of nearly a thousand feet. The engineers shook their heads. They knew their limitations. The Grand Central was hedged in by the most expensive real estate in New York. On the open lot where Commodore Vanderbilt had seen the horse-treads cutting the wood for his locomotive stood a modern

hotel twenty stories in height, while Forty-second Street had come into its own—one of the greatest thoroughfares in a city of great streets. To buy any large quantity of adjoining land for the new Grand Central was out of the question.

Fortunately there was a way out. There generally is. The electric locomotive had come into its own. For the operation of the congested four-track tunnel under Park Avenue from the very throat of the Grand Central's station yard up to Harlem it represented an almost ideal form of traction, largely because of its cleanliness and freedom from smoke. For the engineers who were giving their wits to the planning of a new terminal it was the solution of their hardest problem.

They would cut their train-shed of fifty tracks about in half—and then place one of these halves directly above the other. That would make a fairly logical division between the through and the suburban traffic of the terminal. In that way the new Grand Central has been planned. That one thing represents its first great demarcation from the other great passenger stations of the land. It also is the thing that pointed the way to the most wonderful development of New York's most wonderful terminal, the thing that is infinitely greater than the station itself.

If you remember the old Grand Central, you will remember the spreading railway yard at its portals—that broad, black-breasted thing which had its throat at the narrow entrance of the Park Avenue approach tunnels and widened fanlike both to the nineteen train-shed tracks of the old station and the various service sidings that led to the one side or the other. It was always an impressive place; by night, with its flashing signals of red and green and yellow, its glare of dominant headlights and the constant unspoken orders of swinging lamps; by day, a seeming chaos of locomotives and of cars, turning this way or that, slipping into the dark, cool train-shed under grinding brakes, or else starting from that giant cavern with gathering speed, to roll half-way across the continent before the final halt. To the layman it was doubly fascinating, because he knew that the chaos was really order on a scientific and tremendous scale, that the alert little man who stood at the levers of the inconspicuous tower amid-yard was the clear-minded human who was directing the working of a great terminal by the working of his brain. But to the thinking railroader that railway yard, like every other railway yard in the heart of a great city, was a waste that was hardly less than criminal.

The coming of the electric locomotive has ended that waste in the hearts of our American cities. Concretely, in the case of the new Grand Central, it has made a splendid solution of a single growth problem in the largest city of our continent. For while the new Grand Central service and approach yards will be on a single level, considerably larger than the old—some sixty acres, all told—they will apparently have disappeared. In that thing alone a great obstacle to the constant uptown growth of New York has been removed. Sixteen precious city blocks have been given back to the city for development. And right here the new Grand Central reaches its apotheosis of terminal importance.

If it was easy to operate clean tunnels by electricity as a tractive force and to place one train-shed upon another, it is equally easy to create and operate a roofed-over yard—and that is precisely what has been done in the case of the new terminal. Both its main approach yard and the slightly smaller network of tracks that serve the low-level suburban platforms now lie well below the established street surfaces of Manhattan. Streets that have been closed for half a century have been given back to the city, while upon them has already begun to rise the most important single building development that New York has ever known—important because it represents a single main "up and down" avenue of Manhattan on which great new buildings for eight blocks are being brought to even height and harmonious construction under the direction of one firm of architects. What that may represent as an inspiration to the city's growth and development only future generations may really know. It is already certain that it has made the new Grand Central more than a mere railway station or wide-spreading passenger terminal. And incidentally it has made it the most practical railway station from the point of view of its owners that America has yet seen.

Mr. W. G. McAdoo, the creator of the rapid transit tunnels under the Hudson River, blazed the way when he found a terminal for his tubes in the enormously high-priced real estate of the extreme southern tip of Manhattan Island. To have set aside a great tract exclusively for such a terminal would

have been a real burden upon not only his company but every one of its patrons. Mr. McAdoo builded twin sky-scrapers over his underground terminal, and from them brought a revenue that not only met his carrying and operating charges for the station, but brought his company something of a profit in addition. On a larger scale, the New York Central will reap the benefits of the same sort of far-sightedness. The greatest railway station in the world will be, in the long run, the least expensive to operate. And the city of New York gets at a fell swoop a civic center such as is the aim and hope of every progressive American town of to-day. There are some pretty big indirect benefits to be charged to the coming of electricity.

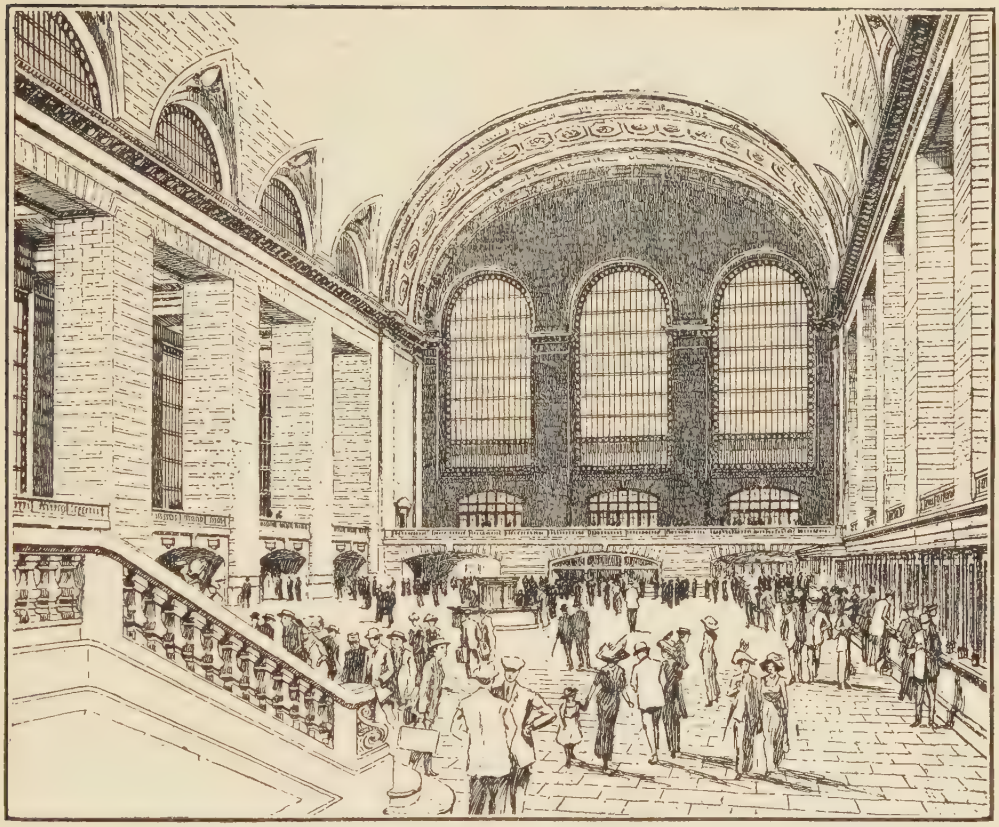
With the main scheme for the new terminal settled, there arose before its builders the larger problem. It was one thing to have planned a station with forty-nine main tracks and a capacity for handling more than one hundred thousand persons a day at the outset, and to have done it on something like half the site ordinarily required for such a terminal. But when that site was already occupied by the railway station doing the second largest volume of business in the country and showing a steady increase of traffic each year—a business that could not be moved and must be accommodated at all times—that was the larger problem. The solving of it became as exquisite a bit of engineering work as has yet been accomplished in this country.

It was decided that the work could be accomplished only by successive steps—the engineers called them "bites"—and that there could be mighty few missteps. There were mighty few of these. American engineering has come to be a thoroughly developed science. In the first place, the railway agents quietly acquired some little necessary surrounding real estate for the development of future storage tracks at the northeast corner of the yard, and then, as they began demolishing houses on this tract along Lexington Avenue, they began building a substantial brick and steel building on the small city square at Madison Avenue, Forty-third and Forty-fourth Streets. That building cost a quarter of a million dollars, was built fireproof, thoroughly equipped with elevators and other modern building conveniences, and yet its builders knew that it would serve only a temporary purpose, for less than a decade.

Its temporary purpose was important. Among the other property along the west side of Lexington Avenue that the New York Central—the owner road of the new terminal—purchased was the so-called Grand Central Palace, an ancient ark, given to the holding of public balls, mass-meetings, and expositions of a smaller sort. It had helped house the important post-office sub-station at the north railway gate of New York—a function that had to be accommodated continuously along with other features of the terminal. To move the post-office and a group of railway offices into the temporary building on Madison Avenue, at the far west of the tract, was but a matter of detail. After that the old "Palace" was made into an auxiliary railway station, and the Annex on Forty-second Street, which had been serving incoming trains since 1884, was torn down.

It has all been like a mighty puzzle—moving here, replacing there, moving again there—but the men who have been making the moves have looked keenly ahead into the future. No step has been meaningless. The Annex razed, the steam-shovels that had begun boring into the east edge of the tract in August of 1903 were brought to its site and began their great task of making the excavation below the level of the lowest of the suburban tracks, some fifty feet below the sidewalk of Forty-second Street. More than three million cubic yards of earth and rock, mostly rock, have been taken out of that great hole that has disappeared under the structure of the new Grand Central. If three million cubic yards of rock makes no great impression upon your mind, know then that it would fill a solid train reaching from New York to Omaha—some fifteen hundred miles. And it has taken nearly a million pounds of dynamite—an almost incomparable force—to loosen the rock.

The job was a titanic one, albeit it was worked in delicate precision of detail. It was necessary at all times to give the operation of the terminal the right of way. That operation meant an average daily use of the station by four hundred regular trains, with nearly as many more empty. An army of seventy thousand persons—about equal to the population of Utica, New York—passed through its portals each working day of the year. Not for a single hour, day or night, during the ten years of construction was that great machine of operation halted. Passengers sometimes had to go in roundabout



THE MAIN OUTBOUND CONCOURSE

fashion and through strange places to reach their trains, but their trains were there, and were being despatched according to schedule.

And all the while the work of preparing for the new terminal progressed. Engineers made cool calculations upon their blue-prints and reported so much per cent excavation, so much per cent construction, accomplished, and each week those percentages increased in decimals. The work moved steadily forward from the east edge of the tract toward the west. Between the completed levels that the chattering air-drill and the protesting steam-shovels left behind them and the ragged edge of the familiar old yard there was for six years a strip from 150 to 200 feet in width that the terminal engineers called the "construction zone." In that long, narrow strip were the drills and shovels. In the deep hole the casual travelers peering down from the long runways that were held stilt-fashion over them could see the workers making a little progress—not much—all the while.

But their progress was certain all the time. Finally they were at the east edge of the great train-shed that had been the pride of Commodore Vanderbilt and the builders of the old station. To take down that construction, weighing almost two thousand tons, without endangering or obstructing the constant traffic underneath was no easy problem. But by this time the engineers of the terminal were used to "stickers," and they welcomed this new one.

They solved it, of course. The engineer emulates the bright lexicon of youth in having blue-penciled "failure" from his vocabulary. They built a timber structure as high as a theater and two hundred feet in width, and mounted it upon wheels and rails. They called it a "traveler," and as it slowly moved south toward the head-house and the famous waiting-room of the old station, the workmen who swarmed upon it tore away the heavy train-shed piece by piece. When it was gone, the traveler was dismounted and the old Grand Central was without its most distinctive feature. And a very little while later the rock-drills and the steam-shovels were eating

at the rock beneath the site of that famous shed.

The zone of construction moved steadily westward. Slowly the operation retreated from the old high level, to gain new tracks at the completed levels at the temporary station under the old "Palace" in Lexington Avenue. Sometimes the workers took but one track, rarely more than two. And all the while they adjusted themselves to the situation. Now it was the summer rush coming to a vast ebb tide on the 3d of July, to flow back in a mighty rush on the day after Labor Day; this time it was some special occasion—thirty special trains to take the boys and girls up to the Princeton game at New Haven, a Christmas rush of traffic, perhaps. At all times the situation was met and the terminal in chaos of reconstruction accommodated the demands that were made upon it. The engineers found the way—patiently, for patience is a consummate virtue in the developed science of engineering. Slowly they gained upon the tracks of the old train-shed until but six, then four, then three, then two were left.

After that the last of the officers of the railways had to move from the pretentious and high-ceilinged rooms of the old Grand Central to the first of the new group of terminal structures which the builders had just finished at the Lexington Avenue rim of the tract, just north of the Grand Central Palace. Then the wreckers fell upon what remained of Commodore Vanderbilt's masterpiece and tore it to the ground and out from below the ground. The steam-shovels moved west again, and again and again, until the temporary structure on Madison Avenue had to go—the post-office having been moved to its fine permanent quarters on Lexington Avenue. When they had satiated their hunger with the last mouthful of those three million cubic yards of mother earth—remember that gravel express stretching all the way from New York to Omaha—the foundation men came in upon their heels. Above the subterranean recesses for storage tracks they began building the footholds for a twenty-story hotel; for the new terminal is going to follow a foreign fashion and have a great hostelry as one of its many functions.

So, in brief, was the work accomplished. Now come for an instant and see it as accomplished, bending for the first months to the work for which it was builded. If we approach it from Forty-second Street, we shall see it as a dominating influence from afar, and that despite its low-set dignity among a group of sky-scrapers. But the influence of a mighty railway terminal, the north gate of a mighty city, stretches for blocks; to seeing folk, in the nature of the traffic within the streets, in the very character of the shops, big and little, that line them. Let us make ourselves part of that traffic for the moment. We might pretend that our very wealthy great-aunt had just died, and so we can afford the luxury of a New York taxicab just once and ride to the new terminal across the low-swung bridge that spans Fourth Avenue, Forty-second Street, and their mass of traffic from the high levels of Murray Hill, and drive along the terraced front of the new station to its stately carriage doors. But perhaps we are thankful that "Auntie" is very much alive, and so perhaps we come to the station doors in a plebeian green Fourth Avenue car, or the equally plebeian red chariot that traverses Forty-second Street. Those doors will open just as wide for us as the ones on the carriage level above, and we can be very thankful that we do not have to press forward through a maze of automobile traffic. They open as wide for the man bound for Harlem or the Bronx as for the man who is bound for San Francisco and does not care who knows it. And for the transcontinental traveler, his path from the street is as easy as that of a barrel rolling down hill. His train is straight ahead of him.

"Downstairs," you correct. You remember what we said about all the tracks being now below the street levels of Manhattan.

You are wrong. Stairs have been eliminated from the new Grand Central, at least where passengers are concerned. In their place are what the engineers call "ramps"—long, easy inclines that take a man up and down without his ever having a chance to realize it. The new station is going to be a boon to invalids, a paradise to a tired man with arms filled with packages or baggage. And in this single feature it has proclaimed itself one of the great as well as one of the distinctive railway stations of the world.

The path from the street level leads straight to the floor of the concourse, the chief architectural feature of the head-house, and situated at the level of the subway mezzanine, from which it is expected that the station will draw eighty per cent of its traffic. That concourse is the very heart of the new Grand

Central, and you are silenced at first sight of it.

"This room is 272 feet long, 120 feet wide, 125 feet high to its vaulted ceiling," mumbles your guide. "It is lined with Botticino marble—"

But you do not hear him. You are remembering. A man who helped to build this station told you something about this very room. You have seen the New York City Hall, that most treasured building within the metropolis. It is a sizable structure, even if it has come to the dignity of old age, with its two high stories, its basement, and its attic, all surmounted by a lovely dome. The man told you that you could set the New York City Hall within this concourse, tower and all, and have a comfortable margin of room to spare.

But the concourse is something more than the architect's expression of the heart of the terminal. Around it are ranged facilities for travelers: ticket windows, parcel-checking stands, baggage wickets, waiting-room, information bureaus—all the paraphernalia that go to make travel easy. Even size may be bended to convenience, and that very thing seems to have been accomplished within the new Grand Central.

You want to go to the train-shed, and say so. Your guide smiles at you.

"There is no train-shed," says he, and forthwith leads you with a magic password past one of the vigilant ticket examiners at a train door. He is right. You are within a low apartment, much pillared and with ceilings low-vaulted—seemingly much lower after the vaulted magnificence of the concourse. In the long barrels of this place are the trains, silently moving into place or slipping out upon their work.

In the first instant a vague sense of disappointment creeps over you. A railway passenger terminal without a lofty and smoke-filled train-shed seems like a Sunday-school without a Christmas tree. You used to like to stand in the open concourse of older great stations of this land and gaze into the fascinations of the train-shed; long trains departing with a mighty effort as their locomotives caught the rail, panting and shouting through the echoes of the girded roof, equally long trains slowing to a stop beside stretching platforms—platforms clean swept the one instant and the next black with in-bound humans. To look up into the front of the steam locomotive—a far more beautiful thing than the electrical engineer has yet devised—and then to see the folk detrain, all the little human comedies and tragedies upon that concourse—

"By the way, are the incoming people here?" You ask that of your guide.

"Oh, they have a considerable station to themselves," he tells you. Then he explains more fully how traffic at the new Grand Central is thoroughly divided; first the through from the suburban by the two levels, then the incoming from the outgoing, finally the passengers from the baggage. It comes to you that you have not had to dodge a single baggage truck since you first entered this station.

Now you are getting the fullness of the terminal. You are seeing the economic wisdom of the passing of the train-shed. Up overhead, in what would have been the vaulted arch of an old-fashioned train-shed—smoke-filled, poisonous-aired, and a tremendous waste of space—are plenty of necessary adjuncts to the terminal: a baggage-room with a floor capacity nearly equal to Madison Square Garden, a cab-stand, and some hundreds of valuable offices. And your guide will tell you that the foundations are so built that these offices can be eventually carried to twenty-five or thirty stories in height without ever disturbing the work of the terminal.

Here, then, is size, economy, efficiency, beauty—the result in steel and stone and concrete of years of hard thinking by competent engineers and architects. All together have gone toward making the first of the passenger terminals of a new sort, the structure which, when taken from every point of view, can easily be called the greatest railway station in the world.

"Isn't there a train-shed down there under this?" you venture to inquire.

Bless your heart, of course there is. We retrace our steps across the vast expanse of the main concourse and toward the subway ticket offices. A branch ramp shows itself. We follow that easy incline, merging ourselves with an ebb tide of commuters, for the day is already drawing to its close. We follow them past waiting-rooms, which on both levels have been set apart distinct from the concourses, and a very comfortable restaurant, into a concourse which save for height might almost be called a replica of the great hall on the upper floor. Within it the single stream of commuters divides itself into many lesser streams—folk going home

to Yonkers or Ossining, to Bronxville and to Goldenbridge, to New Rochelle and Coscob. These folk represent the bulk of the traffic that goes to making an incoming crest tide in the morning, an outgoing one at night. But their comfort has been as carefully considered as that of the through passengers on the upper level. And they are relieved of the necessity of stairs.

And now you may wish to go "behind the scenes." It is quickly enough arranged. You express a desire to see how those many, many trains are sent in and out of their long waiting tracks beside the loading and unloading passengers. Easily enough. Here is one center of activity—Tower B, the largest switch-tower in the world, and located more than thirty feet below the level of the streets of New York. Perhaps you were fortunate enough to have entered at some time the switch-tower of the old Grand Central, in its own generation the largest ever built. If so, the memories of that long, sun-filled, high-set room, with its row of switch levers gleaming like gun-barrels, have never gone from you. You can easily recall the towermen in their shirt-sleeves watching the trains pull out from the shadows of the big shed or the long bores of the Park Avenue tunnels, and how they measured the course of thousand-ton trains across the switch complications of the yard by thrusting the levers in and out—all at the word of another shirt-sleeved man who took the operation of the yard from his commanding point of observation as a part of a day's work.

The shirt-sleeved man in command is in Tower B, but there is no observation from his towers. Its windows merely look out into a shadowy forest of pillars and of indistinct lights. Sunshine does not penetrate here, and still the boss towerman knows the movement of every train that comes fearlessly through that thirty-acre basement.

"There's the five-ten Croton local," he tells you, and then calls "Eleven—thirty-nine—four," just as if he were giving signals on a football field. Instead he is giving signals on a railway field for the nine men who stand at the signal-box, very much like the box of an old-fashioned square piano, only much elongated. They turn their levers, pulling them out or driving them in with a quick thrust of the fingers. Modern science has already done away with the long-arm levers. It took some muscle to pull one of the old-time levers and set a switch a quarter of a mile distant; nor was that labor lessened under the stress of hard winter weather, when all the working parts of switch and signal mechanism had a constant tendency to clog and freeze. Here in Tower B a five-year-old boy could operate the levers half a day without fatigue.

"Eleven—thirty-nine—four." It is all as simple as A B C to the men facing those four hundred levers. That means that the train leaving platform track eleven in the suburban station will take route thirty-nine through to track four of the Park Avenue tunnel. The towermen must know the proper half-dozen or dozen of the levers to adjust. That is the trick of their trade, and they turn it remarkably well.

"That five-ten will draw past here in just thirteen seconds," says the boss towerman. You fix your eyes upon the punctilious little regulator-clock that stands upon his desk and time the accuracy of that remark. He is accurate even to the minute fraction of a precious second. At the beginning of the thirteenth second the nose of a big electric locomotive is opposite Tower B, and before the fifteenth has lapsed off into eternity you are glancing down at the monitor windows of the solid steel cars and seeing the commuters at their cards and evening papers.

That precision of the thirteenth second is the precision of the greatest railway station in the world. It is the thing that keeps its operation through the nightly strain of the evening rush hour from being an unmannerly chaos that would be a tangle of hours.

"We keep our minds on our knitting," says the boss towerman afterwards. "There's thirty thousand commuters come out of here each night, and if these three towers weren't up to the job—well, if we were to tie up these business men getting home at night or getting in to work in the morning for even fifteen minutes, it would cost them nearly ten thousand dollars in valuable time."

The boss at Tower B does some fine mathematical calculating in his busiest minutes.

The Grand Central Station, even the roomy new terminal, has not yet quite touched the business of Liverpool Street, London, the busiest railway station in the world. Liverpool Street, with a far smaller trackage, still handles the astonishing total of 990 trains, some 176,000 passengers, every twenty-four hours. But New York is not yet London, either in size or in congestion, although she

progresses. The Grand Central has been built to meet a considerable degree of progression. Which brings to our minds the question of ultimate capacity. When you ask from the guide of the railway, the man who has taken you through all those glowing public rooms and even "behind the scenes" to the mysteries of Tower B, as to those things, he shakes his head.

"You'll have to see Mr. Harwood," he says.

We do see Mr. Harwood. He is the engineer in charge of the rearing of the terminal, and, in touch with the architects and the consulting engineers, he has followed the weaving of its details with infinite care.

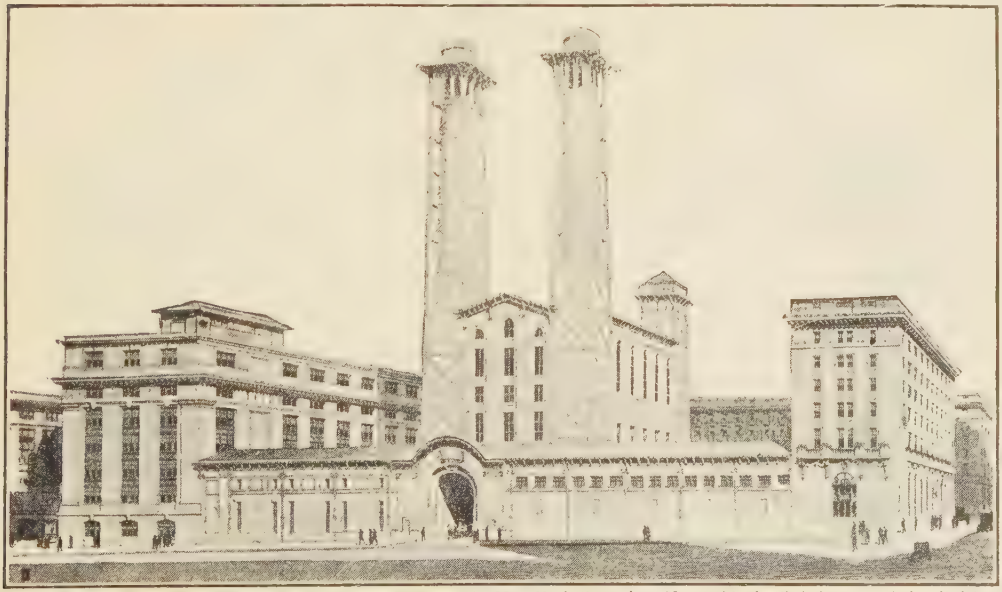
"We have figured at the beginning," he says, "at doing something better than taking care of the maximum business of the station as we feel it at high-tide times, the great outbound summer rush just before the Fourth of July, the home-bound wave at Labor Day. That means that not only can we take care of 500 regular trains, in addition to empty train movements, in the course of a day, handling, let us say, some 80,000 persons, but that we can store, clean, and restock the cars needed for handling them.

"When the Grand Central comes to the pinch, it can do far better. It can return to the plan it followed for some recent years, since we first felt the hard pressure upon the old station, and take care of these storage and service facilities somewhere uptown. With that done and the loops at the south end of the terminal brought into full service, the capacity of the new Grand Central becomes overwhelming. It would be about equal to the capacity of a six-track railway. In other words, with trains spaced in the Park Avenue tunnel as they are spaced on the viaduct a little farther north, we could handle about a train a minute. With ten-car trains I have figured that the station could then handle up to two million passengers in twenty-four hours, if ever such a traffic should come to its doors."

But even as experienced a terminal engineer as Mr. Harwood can hardly dare to predict the future passing through the north gate of a city like New York. He dare not laugh at possibilities. He can only see the town creep up Manhattan, span the rivers that sought to encompass her, remember that the old Grand Central, builded for a century, came to ashes in less than half that time, and, with all the resources that stand behind him, build at least for this generation and the few that are to follow a passenger terminal that can truthfully be called the greatest railway station in the world.

"And when this one becomes inadequate?" you dare to venture.

"Then there will come engineers competent to meet the problem," he says, with the confidence that is inborn in his profession.



THE REAR OF THE NEW YORK CENTRAL TERMINAL

Nature Month By Month

BY ERNEST INGERSOLL

January: Nature's Resting Hour

INTER, in the old simile, is likened to the sleep of the year, and January is its midnight. Nature is resting, well blanketed from outer cold. The crust of frost closes the pores of the soil, preventing the escape of its interior heat and moisture, a roof of ice is laid across the ponds, and over all is spread a warm coverlet of snow—not a "winding-sheet," as the poets say—for the earth is not dead. Summer sleeps beneath winter's shelter. Now and then there comes a warm spell, when the snow, which has held down the fallen leaves and sere herbage, melts and gives the ground a drink of the nourishment their dissolving affords. The roots of the trees take none of this nourishment now, for their tiny pumps are out of gear. Each plant has been through a season of tremendous exertion. Its myriad leaves, its flowers and fruit, the building cells that have laid new wood beneath the bark or pushed out countless rootlets, the cells that have

assimilated and adapted the materials of life and increase, have been ceaselessly active for many months. They cannot keep up the pace forever. Repairs must be made, waste products got rid of. The winter is their opportunity.

Among these quiet roots lurk innumerable little sleepers, as inert but as vital as they. Children often ask what becomes of the summer insects. Where do all the butterflies and mosquitoes and creeping things go in winter? Almost all are dead long ago, we tell them, and January seems to affirm our words completely. Yet it is certain that insects will throng about us next summer, amusing and annoying us, as is their wont. How is this? The soil beneath the snow, the mud and water under the ice, the crumbling shreds of rotten logs, could tell us. There lie the young of the insects, placed in a safe-deposit by careful parents, themselves about to die, and often with a store of food ready for them when they awake in the spring.

Nothing in the realm of nature is more astonishing than the instincts concerned in this act. Some of these young are merely eggs, as those of the grasshoppers and crickets, thrust deeply into the soil before it froze; but you may find insect eggs now in all sorts of places—even within the bodies of the dormant larvæ of other insects, destined to be eaten when they hatch. More are half-formed young. Beetle grubs inhabit holes in the soil below the frost-line, whither also the earthworms have sunk out of harm's way, or are curled up within chambers gnawed in logs and tree-trunks. The tiger-beetle's young tenants the pitfall where its parents lay in wait for prey; and in the warm silken nest of the trap-door spider a large family of spiderlings are clinging to their mother.

Among these wintering eggs and grubs little change takes place, but for the higher insects the cold season gives a chance for the slow and gentle development of the chrysalis into the perfect adult. Many moths and butterflies undergo this metamorphosis within clayey cases underground, or at least beneath the carpet of leaves and snow; but others lie in warm cocoons fastened to bark, or in crevices of rock, or swinging like cradles from the leafless twigs. Everywhere birds and shrews and field-mice find insect food, even in January.

Life, too, is going happily on within every pond and quiet stream, roofed over with its glassy canopy like a natural hothouse. Peer down through the clear ice, and you will see that the plants are green, though small, and fishes are gliding about, but the rings on their scales show that they grow very little now; there is enough to eat, but the appetite is weak. The land-snails spin storm doors athwart the opening of the shell, and, creeping into some secure crevice, become dormant; but the pond-snails move about as usual, yet build no new shell. The small aquatic creatures still creep lazily over the fermenting mud or ensconce themselves in its depths. The water-spider is wrapped in a glistening bubble of the air he took down with him.

All these small people of nature's underworld are at ease. There is no call now for activity, little need for hunting or fleeing. Hunger is stilled, no energy need be expended in producing eggs, or in the distress of molting; and so, like the plants, the animals lie still, recuperate from the waste of one summer and gather strength for the next.

Life Stories of the Other Half

BY JACOB A. RIIS

Author of "How the Other Half Lives"

THE SECOND INSTALLMENT

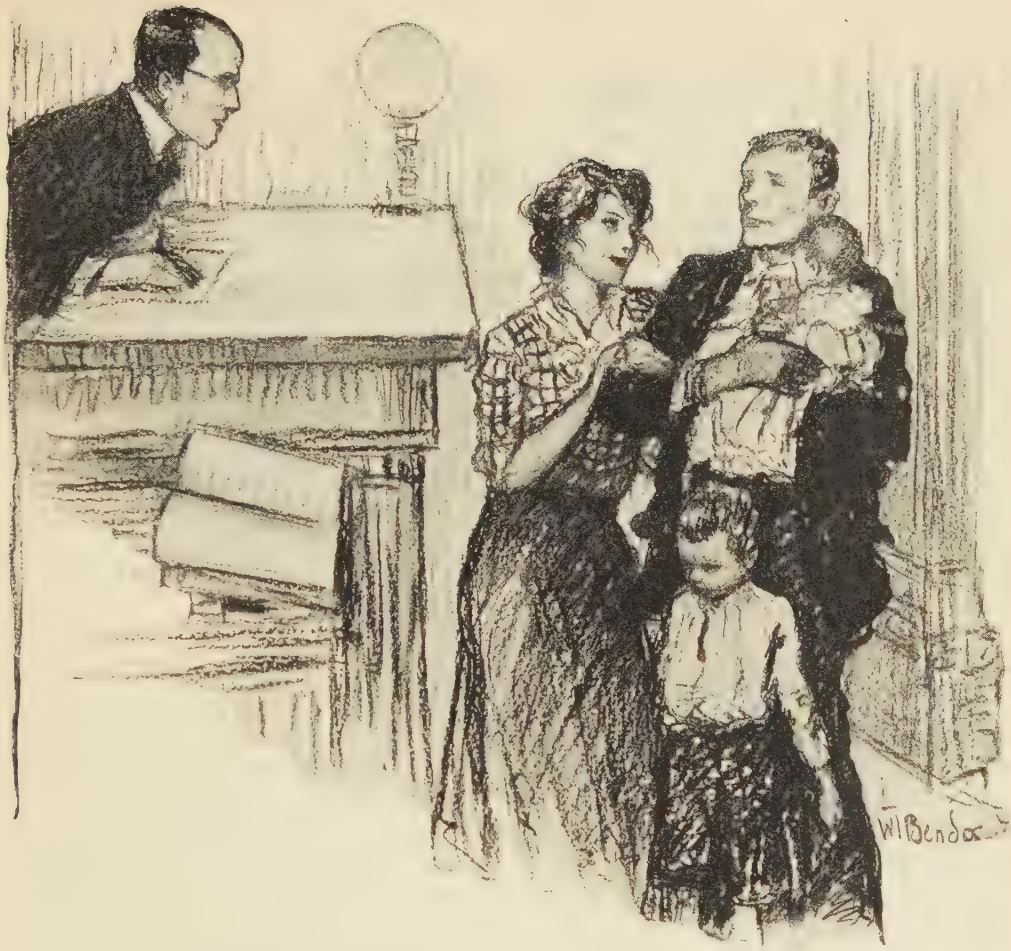
WITH DRAWINGS BY WLADYSLAW BENDA

The Wars of the Rileys

IT was the night before Washington's Birthday that Mr. Riley broke loose. They will speak of it long in the Windy City as "the night of the big storm," and with good right—it was "that suddint and fierce," just like Mr. Riley himself in his berserker moods. Mr. Riley was one of the enlivening problems of "the Bureau" in the region back of the stock-yards that kept it from being dulled by the routine of looking after the poor. He was more: he rose to the dignity of a "cause" at uncertain intervals when the cost of living, underpay and overtime, sickness and death, overpopulation, and all the other well-worn props of poverty retired to the wings and left the stage to Mr. Riley rampant, sufficient for the time and as informing as a whole course at the School of Philanthropy. In between, Mr. Riley was a capable meat-cutter earning good wages, who wouldn't have done a neighbor out of a cent that was his due, a robust citizen with more than his share of good looks, a devoted husband and a doting father, inseparable when at home from little Mike, whose baby trick of squaring off and offering to "bust his father's face" was the pride of the block.

"Will yez look at de kid? Ain't he a foine one?" shouted Mr. Riley, with peals of laughter; and the men smoking their pipes at the fence set the youngster on with admiring taunts. Mike was just turned three. His great stunt, when his father was not at hand, was to fall off everything in sight. Daily alarms brought from the relief party of hurrying mothers the unvarying cry, "Who's got hurted? Is it Mike?" But only Mike's feelings were hurt. Doleful howls, as he hove in sight, convoyed and comforted by Kate, aged seven, gave abundant proof that in wind and limb he was all that could be desired.

This was Mr. Riley in his hours of ease and domesticity. Mr. Riley rampant was a very different person. His arrival was invariably heralded by the smashing of the top of the kitchen stove, followed by the summary ejection of the once beloved family, helter-skelter, from the tenement. Three times the Bureau had been at the expense of having the stove top mended to keep the little Rileys from starving and freezing at once, and it was looking forward with concern to the meat-cutter's next encounter with his grievance. For there was a psychological reason for the manner of his outbreaks. The Rileys had once had a boarder, when Kate was a baby. He happened to be Mrs. Riley's brother, and he left, presuming on the kinship, without paying his board. As long as the meat-cutter was sober he remembered only the pleasant comradeship with his brother-in-law, and extended the hospitality of a neighborly fireside to his wife's relations. But no sooner had he taken a drink or two than the old grievance loomed large, and grew, as he went on, into a capital injury, to be avenged upon all and everything that in any way recalled the monstrous wrong of his life. That the cooking-stove should come first was natural, from his point of view. Upon it had been prepared the felonious meals, by it he had smoked the pipe of peace with the false friend. The crash in the kitchen had become the unvarying signal for the hasty exit of the rest of the family and the organizing of Kate into a scouting party



"SHE TURNED A PROUDLY HOPEFUL LOOK UPON HER HUSBAND"

to keep Mrs. Riley and the Bureau informed about the progress of events in the house where the meat-cutter raged alone.

Mrs. Riley was a loyal, if not always a patient, woman—who can blame her?—and accepted the situation as part of the marital compact, clearly comprehended, perhaps foreshadowed, in her vow to cling to her husband "for better for worse," and therefore not to be questioned. In times of peace she remembered not the days of storm and stress. Once indeed, when her best gingham had been sacrificed to the furies of war, she had considered whether the indefinite multiplication of the tribe of Riley were in the long run desirable, and had put it to the young woman from the Bureau, who was superintending the repair of the stove top, this way: "I am thinking, Miss Kane, if I will live with Mr. Riley any longer; would you?"—to the blushing confusion of that representative of the social order. However, that crisis passed. Mr. Riley took the pledge for the fourth or fifth time, and the next day appeared at the office, volunteering to assign himself and his earnings to the Bureau for the benefit of his wife and his creditors, reserving only enough for luncheons and tobacco, but nothing for drinks. The Bureau took an hour off to recover from the shock. If it had misgivings, it refused to listen to them. The world had turned a corner in the city by the lake and was on the home-stretch: Mr. Riley had reformed.

And, in truth, so it seemed. For once he was as good as his word. Christmas passed, and the manifold temptations of New Year, with Mike and his father still chums. Kate was improving the chance to profit by the school-learning so fatally interrupted in other days. Seventeen weeks went by with Mr. Riley's wages paid in at the Bureau every

Saturday ; the grocer smiled a fat welcome to the Riley children, the clock man and the spring man and the other installment collectors had ceased to be importunate. Mrs. Riley was having blissful visions of a new spring hat. Life back of the stock-yards was in a way of becoming ordinary and slow, when the fatal twenty-second of February hove in sight.

The night before, Mr. Riley, quitting work, met a friend at the gate, who, pitying his penniless state, informed him that "there was the price of a drink at the corner" for him, meaning at Quinlan's saloon. Now this was prodding the meat-cutter in a tender spot. He hated waste as much as his employers, who proverbially exploited all of the pig but the squeal. He didn't want the drink, but to have it waiting there with no one to come for it was wicked waste. It was his clear duty to save it, and he did. Among those drinking at the bar were some of his fellow-workmen, who stood treat. That called for a return, and Riley's credit was good. It was late before the party broke up ; it was 3 A.M. when the meat-cutter burst into the tenement, roaring drunk, clamoring for the lives of brothers-in-law in general and that of his own in particular, and smashed the stove lids with crash after crash that aroused the slumbering household with a jerk.

For once it was caught napping. The long peace had bred a fatal sense of security. Kate was off scouting duty and Mrs. Riley had her hands full with Pat, Bridget, and the baby all having measles at once—too full to take warning from her husband's suspicious absence at bedtime. Roused in the middle of the night to the defense of her brood, she fought gallantly, but without hope. The battle was bloody and brief. Beaten and bruised, she gathered up her young and fled into the blinding storm to the house of a pitying neighbor, who took them in, measles and all, to snuggle up with his own while he mounted guard on the doorstep against any pursuing enemy. But the meat-cutter merely slammed the door upon his evicted family. He spent the rest of the night smashing the reminders of his brother-in-law's hated kin. Kate, reconnoitering at daybreak, brought back word that he was raging around the house with three other drunken men. The opening of the Bureau found her encamped on the doorstep with a demand that help come quickly—the worst had happened. "Has little Mike broken his neck?" they asked in breathless chorus. "Worse nor that," she panted; "do be comin', Miss Kane!"

"Oh, what is it? Are any of the children dead?"

"Worse nor that; Mr. Riley has broke loose!" Kate always spoke of her father in his tantrums as Mister, as if he were a doubtful acquaintance. Her story of the night's doings was so lurid that the intimacy of many a *post-bellum* remorse felt unequal to the strain, and Miss Kane commandeered a policeman on the way to the house. The meat-cutter received her with elaborate inebriate courtesy, loftily ignoring the officer.

"Who is he?" he asked, aside.

She tried evasion. "A friend of mine I met." She was sorry immediately.

"Is he that? Then he is no friend of mine. Oh, Miss Kane," he grieved, "why did you go for to get him? You know I'd have protected you!" This with an indignant scowl at his fellow-marauders, who were furtively edging toward the door. An inquest of the house showed the devastation of war. The kitchen was a wreck; the bedroom furniture smashed; the Morris chair in which the family of young Rileys had reveled in the measles lay in splinters. "It was so hot here last night," suggested the meat-cutter, gravely, "it must have fell to pieces." In the course of the inspection Mrs. Riley appeared, keeping close to the policeman, wrathful and fearful at once, with a wondrous black eye. Her husband regarded it with expert interest and ventured the reflection that it was a shame, and she the fine-looking woman that she was! At that Mrs. Riley edged away toward her husband and eyed the bluecoat with hostile looks.

Between crying and laughing, "the Bureau lady" dismissed the policeman and officiated at the reunion of the family on condition that the meat-cutter appear at the office and get the dressing down which he so richly deserved, which he did. But his dignity had been offended by the brass buttons, and he insisted upon its being administered by one of his own sex.

"I like her," he explained, indicating Miss Kane with reproving forefinger, "but she's gone back on me." Another grievance had been added to that of the unpaid board.

The peace that was made lasted just ten days, when Mr. Riley broke loose once more, and this time he was brought into court. The whole Bureau went along to tell the story of

the compact and the manner of its breaking. Mr. Riley listened attentively to the recital of the black record.

"What have you to say to this?" scowled the Judge. The prisoner nodded.

"It is all true what the lady says, your Honor; she put it fair."

"I have a good mind to send you to Bridewell to break stone."

"Don't do that, Judge, and lose me job. I want to be wid me family." Mrs. Riley looked imploringly at the bench. His Honor's glance took in her face with the family group.

"Looks like it," he mused; but in the end he agreed to hand him over to the Bureau for one more trial, first administering the pledge in open court. Mr. Riley took the oath with great solemnity and entire good faith, kissed the Bible with a smack, reached up a large red fist for the Judge to shake, and the clerk. Then he pledged lasting friendship to the whole Bureau, including Miss Kane, whom he generously forgave the wrong she had done him, presented little Mike to the Court as "de foinest kid in de ward," took the gurgling baby from Mrs. Riley and gallantly gave her his arm. Leaning fondly upon it, a little lame and sore yet from the fight and with one eye in deep mourning, she turned a proudly hopeful look upon her husband, like a rainbow spanning a black departing cloud. And thus, with fleet-footed Kate in the van proclaiming the peace, and three prattling children clinging to their hands and clothes, they passed out into life to begin it anew. And bench and Bureau, with sudden emotion, hopelessly irrational and altogether hopeful and good, cheered them on their way.

The Answer of Ludlow Street

"YOU get the money, or out you go! I ain't in the business for me health," and the bang of the door and the angry clatter of the landlord's boots on the stairs, as he went down, bore witness that he meant what he said.

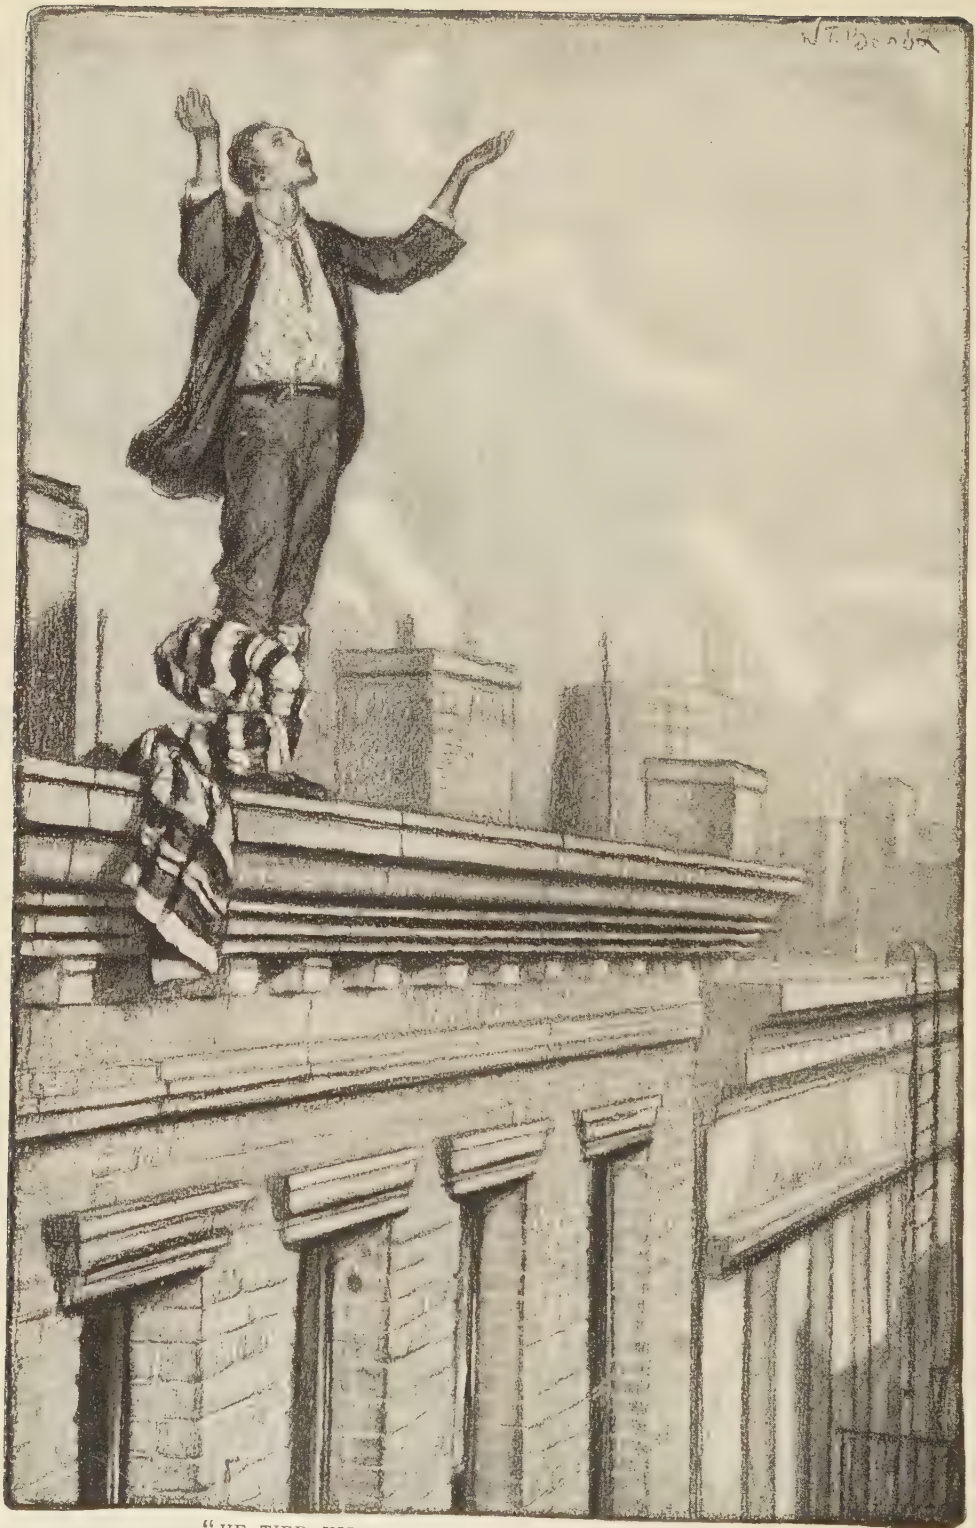
Judah Kapelowitz and his wife sat and looked silently at the little dark room when the last note of his voice had died away in the hall. They knew it well enough—it was their last day of grace. They were two months behind with the rent, and where it was to come from neither of them knew. Six years of struggling in the Promised Land, and this was what it had brought them.

A hungry little cry roused the woman from her apathy. She went over and took the baby and put it mechanically to her poor breast. Holding it so, she sat by the window and looked out upon the gray November day. Her husband had not stirred. Each avoided the question in the other's eyes, for neither had an answer.

They were young people as men reckon age in happy days, Judah scarce past thirty; but it is not always the years that count in Ludlow Street. Behind that and the tenement stretched the endless days of suffering in their Galician home, where the Jew was hated and despised as the one thrifty trader of the country, tortured alike by drunken peasant and cruel noble when they were not plotting murder against one another. With all their little savings they had paid Judah's passage to the land where men were free to labor, free to worship as their fathers did—a twice-blessed country, surely—and he had gone, leaving Sarah, his wife, and their child to wait for word that Judah was rich and expected them.

The wealth he found in Ludlow Street was all piled on his push-cart, and his persecutors would have scorned it. A handful of carrots, a few cabbages and beets, is not much to plan transatlantic voyages on; but what with Sarah's eager letters and Judah's starving himself daily to save every penny, he managed in two long years to scrape together the money for the steamship ticket that set all the tongues wagging in his home village when it came: Judah Kapelowitz had made his fortune in the far land, it was plain to be seen. Sarah and the boy, now grown big enough to speak his father's name with an altogether cunning little catch, bade a joyous good-by to their friends and set their faces hopefully toward the West. Once they were together, all their troubles would be at an end.

In the poor tenement the peddler lay awake till far into the night, hearkening to the noises of the street. He had gone hungry to bed, and he was too tired to sleep. Over and over he counted the many miles of stormy ocean



"HE TIED HIS FEET TOGETHER WITH THE PRAYER SHAWL, AND LOOKED ONCE UPON THE RISING SUN"

and the days to their coming, Sarah and the little Judah. Once they were together, he would work, work, work—and should they not make a living in the great, wealthy city?

With the dawn lighting up the eastern sky he slept the sleep of exhaustion, his question unanswered.

That was six years ago—six hard, weary years. They had worked together, he at his push-cart, Sarah for the sweater, earning a few cents finishing "pants" when she could. Little Judah did his share, pulling thread, until his sister came and he had to mind her. Together they had kept a roof overhead, and less and less to eat, till Judah had to give up his cart. Between the fierce competition and the police blackmail it would no longer keep body and soul together for its owner. A painter in the next house was in need of a hand, and Judah apprenticed himself to him for a dollar a day. If he could hold out a year or two, he might earn journeyman's wages and have steady work. The boss saw that he had an eye for the business. But, though Judah's eye was good, he lacked the "strong stomach" which is even more important to a painter. He had starved so long that the smell of the paint made him sick and he could not work fast enough. So the boss discharged him. "The sheeny was no good," was all the character he gave him.

It was then the twins came. There was not a penny in the house, and the rent money was long in arrears. Judah went out and asked for work. He sought no alms; he begged merely for a chance to earn a living at any price, any wages. Nobody wanted him, as was right and proper, no doubt. To underbid the living wage is even a worse sin against society than to "debase its standard of living," we are told by those who should know. Judah Kapelowitz was only an ignorant Jew, pleading for work that he might earn bread for his starving babies. He knew nothing of standards, but he would have sold his soul for a loaf of bread that day. He found no one to pay the price, and he came home hungry as he had gone out. In the afternoon the landlord called for the rent.

Another tiny wail came from the old baby-carriage in which the twins slept, and the mother turned her head from the twilight street where the lights were beginning to come out. Judah rose heavily from his seat.

"I go get money," he said, slowly. "I work for Mr. Springer two days. He will give me money." And he went out.

Mr. Springer was the boss painter. He did not give Judah his wages. He had not earned them, he said, and showed him the door. The man pleaded hotly, despairingly. They were hungry, the little kids and his wife. Only fifty cents of the two dollars—fifty cents! The painter put him out, and when he would not go, kicked him.

"Look out for that Jew, John," he said, putting up the shutters. "We shall have him setting off a bomb on us next. They turn Anarchist when they get desperate."

Mr. Springer was, it will be perceived, a man of discernment.

Judah Kapelowitz lay down beside his wife at night without a word of complaint. "To-morrow," he said, "I do it."

He arose early and washed himself with care. He bound the praying-band upon his forehead, and upon his wrist the tefillin with the Holy Name; then he covered his head with the tallith and prayed to the God of his fathers who brought them out of bondage, and blessed his house and his children, little Judah and Miriam his sister, and the twins in the cradle. As he kissed his wife good-by, he said that he had found work and wages, and would bring back money. She saw him go down in his working clothes; she did not know that he had hidden the tallith under his apron.

He did not leave the house, but, when the door was closed, went up to the roof. Standing upon the edge of it, he tied his feet together with the prayer shawl, looked once upon the rising sun, and threw himself into the street, seventy feet below.

"It is Judah Kapelowitz, the painter," said the awed neighbors, who ran up and looked in his dead face. The police came and took him to the station-house, for Judah, who living had kept the law of God and man, had broken both in his dying. They laid the body on the floor in front of the prison cells and covered it with the tallith as with a shroud. Sarah, his wife, sat by, white and tearless, with the twins at her breast. Little Miriam hid her head in her lap, frightened at the silence about them. At the tenement around the corner men were carrying her poor belongings out and stacking them in the street. They were homeless and fatherless.

Ludlow Street had given its answer.

THE PEACE OF GHENT

One Hundred Years of Peace[1]

BY HENRY CABOT LODGE

PART ONE

THE last war between Great Britain and the United States began in June, 1812. There has been no war between the two countries since the Treaty of Ghent was signed on Christmas Eve in 1814. Strictly speaking, the absence of war constitutes peace, and therefore we may describe these hundred years just passed as a century of peace between the United States and Great Britain. But in the larger and better sense of the word it must be confessed that the relations between the two countries during that period have been at times anything but peaceful, and often far from friendly. Indeed, there have been some perilous moments when war has seemed very imminent. To describe this period, therefore, as one of unbroken good will merely because there was no actual fighting would be wholly misleading. If a review, however brief, of the relations between Great Britain and the United States since 1812 is to possess any value, it can only be through showing how, by slow steps, with many interruptions and much bitterness on both sides, we have nevertheless finally attained to the genuine friendship in which all sensible men of both countries rejoice to-day. This fortunate condition has been reached only after many years of storm and stress, which it seems to posterity, always blessed with that unerring wisdom which comes after the event, might have been easily avoided.

To understand the present situation aright, to comprehend the meaning and effects of the War of 1812 and of the ninety-eight years of peace which have followed its conclusion, it is necessary to begin with the separation of the two countries, by the peace of 1782, when the connection between England and the United States ceased to be that of mother country and colonies and became the more distant relation which exists between two independent nations. Just now there appears to be a tendency among Englishmen to regard that separation of the eighteenth century as a small matter, especially so far as their own country is concerned, a view which, however comfortable, is hardly sustained by history; and we may well pause a moment at the outset to consider just what the war resulting in the treaties of Paris meant, for on that decisive event rests ultimately all that has since come to pass.

As an illustration of the attitude of mind to which I have referred, let me take the recent case of a well-known writer and very popular novelist. Some years ago Mr. H. G. Wells came to this country, and on his return to England, like many of his countrymen, he wrote a book about the United States. Unlike many of his countrymen, however, he wrote a very pleasant and friendly book, enlivened by some characteristic remarks in favor of Socialism and of converting the Niagara Falls into horse-power. He made, however, one comment which struck me at the time, and which, I think, has been made since by others of his countrymen. This comment was in connection

[1] Copyright, 1912, by the Outlook Company.

with his visit to Boston, as I remember, and criticised us good-naturedly for the extreme care with which we marked all spots connected with the Revolution, and for the apparent importance which we attached to that event. Mr. Wells, unlike Sir George Trevelyan, the most brilliant of living English historians, seemed to think that this American feeling about the Revolution which resulted in the independence of the United States was provincial, if not parochial. In view of the sound system of British education, which has a great deal to say about English victories great and small, and is curiously reticent as to English defeats, it is perhaps not surprising that the importance attached to the incidents of the American Revolution in this country should surprise the average traveler from Great Britain. But, putting aside the partiality which Americans feel toward the Revolution, owing to the fact that they were victorious, and the lack of interest with which the British regard it, because they were defeated, it is perhaps not amiss to point out that the war for American independence really was an event of high importance, and was so considered then, as it has been ever since, by dispassionate persons.

The revolt of the American Colonies in 1776 agitated the world of that day far beyond the parish limits of the United States. That Revolution divided parties and overthrew Ministries in England. It involved France and Spain in war with Great Britain, and created the armed neutrality of the northern Powers, events which are rarely caused by trifling or provincial struggles. But the American Revolution was something much more even than this. It broke the British Empire for the first, and, so far, for the only time. It took from England her greatest and most valuable possession. With the American Colonies she lost a population equal to about a fifth of the inhabitants of Great Britain at that period, as well as the ownership of the best part of a great continent. The independence of the Colonies was the foundation of the United States, and, whether one approves of the United States or not, there can be no question, I think, that they constitute to-day a large and important fact in the existing world. It was an Englishman, I believe, who said that, after all, England's most considerable achievement was the United States. Finally, and this is something which I feel it would hardly be possible to describe as parochial, modern democracy began with the American Revolution. When Emerson, with the insight of the poet, declared that the shot which the embattled farmers fired at Concord Bridge was heard "round the world," he told the exact truth. At that bridge, in that little New England village, the first drum-beat of democracy broke upon the troubled air, and there the march began. That same drum-beat was heard a little later in France, when several things happened which Mr. Wells would not, probably, regard as provincial, and which caused some stir at the time. Looking over the world to-day, it may be fairly said that no greater event could be commemorated than the first uprising of democracy which swept over the Governments of the nineteenth century, and which is still pressing onward, crossing even now into the confines of Asia.

Yet, very characteristically, this American Revolution, which Mr. Wells smiles at gently as a little provincial incident, but which seems not to have been without its effect on the history of civilized man, turned on a question of law. That two great branches of the same people, speaking the same language, holding the same beliefs, and cherishing the same institutions, should go to war about a question of legal right in the imposition of taxes is indeed very typical of the race and breed. It is also one reason why the War of the Revolution, as a whole, was sullied by few acts of cruelty or ferocity, for, as Macaulay pointed out long ago, the character of a civil war is very largely determined by the amount of oppression which one side has suffered at the hands of the other. The government of the English colonies in America had been, on the whole, easy and liberal. Sir Robert Walpole, with his wise indifference which allowed the dust to gather upon American despatches, and the elder Pitt, who had the faculty of arousing the enthusiasm of the colonists by appealing to their patriotic impulses and by treating them as friends and equals, had made the bonds between the mother country and her children very strong. But a very dull and narrow-minded King, served by Ministers of slight capacity or of judiciously pliant natures, soon undid the work of the two great Ministers and forced on the war which had in it at that moment nothing of the inevitable. The Revolution thus generated was fought out through seven long years, and the Colonies won. There was, of course, bitterness of feeling on both sides, but none which could not have been quickly and easily overcome

if right methods had been pursued. The Americans, it is true, did not carry out the treaty properly in regard to the Loyalists, and the British, on their side, failed to observe it in regard to the relinquishment of the Western posts which were an absolute threat not only to the expansion but to the very existence of the United States. One of the greatest achievements of Washington's Administration was the Jay Treaty, and to make this settlement with England he sacrificed the French alliance, but he removed forever the Western menace and cleared the frontier of the United States from a danger which in time of war might have proved fatal. The French Revolution, which destroyed the American alliance, divided public opinion in the United States, as it did in England, and the immediate result was virtual, although not declared, war with France, a situation that gave England an opportunity to bind her former colonies closely to her, which unfortunately did not seem to English statesmen a thing worth doing. Then came the great struggle with Napoleon, and again England might easily have made her former colonies her close friends and allies. This policy, indeed, was so obvious that it is hard to understand why even English Ministers failed to adopt it. Jefferson, with all his eulogy of France and denunciation of England for political purposes, was more than ready to unite with England against Napoleon if she would only have allowed him to do so, but after the death of the younger Pitt and the dissolution of the Ministry of "All the Talents," the English Government fell once more into the hands of some very inferior men. Ministers of the caliber of Perceval, Castlereagh, and Lord Liverpool, united with extreme Tories like Lord Eldon, whose ability was crippled by their blind prejudices, were utterly unable to see the value of friendship with the United States, and preferred to treat their former colonists with a comfortable contempt. The one very clever man not in opposition in those days was Canning, and he did more than any one else, perhaps, by his unfortunate attitude, to drive the United States away from England. It was he who said that the navy of the United States consisted of "a few fir frigates with a bit of bunting at the top." For the sake of this not very humorous alliteration he paid rather heavily in the loss of a good many English frigates at a later day.

It is not pleasant to Americans to recall the years which preceded our second war with England. There was no indignity, no humiliation, no outrage, that England on the one side and Napoleon on the other did not inflict upon the United States. Our Government submitted and yielded and made sacrifices which it is now difficult to contemplate with calmness, until at last a party arose composed of young men who were profoundly convinced that anything was better than such conditions, and that if we were to have a national existence worthy of the name we must fight. They did not care very much with whom we fought, but they were determined to fight some one in order to vindicate the right of the United States to live as a nation without dishonor. The unscrupulous dexterity of Napoleon and the marvelous stupidity of England resulted in our fighting England instead of France, and thus we came to the War of 1812.

We had no army and a very small navy. The political group which had forced war upon us, although right in their reasons for going to war, were utterly wrong in the ignorant boasts with which they proclaimed our readiness for battle. Wholly unprepared, we suffered many defeats on the Canadian frontier, which were redeemed only by the two battles of Lundy's Lane and Chippewa. On the seas and lakes we had almost unbroken victory, and finally, at New Orleans, after peace had really been made but before it was known, Jackson defeated the veterans of Wellington's Peninsula campaigns with a thoroughness and a severity which were so marked that the battle is hardly alluded to in British histories, and must therefore be relegated to the provincial class of historical events. So the war came to an end before it had lasted three years, and when the Treaty of Ghent was signed that instrument did not contain the settlement of a single one of the questions which had made the war unavoidable and for which the United States had fought. Yet, none the less, the war had settled all those questions. Never again did England attempt to stop an American man-of-war or an American merchantman and take seamen, whom she claimed as deserters, from their decks. Never again did she attempt to interfere with American commerce. Whatever losses the United States might have suffered in the war, however much her pride might have been wounded by the destruction of the Capitol at Washington, the real victory was with the Americans. They

had fought, and they had gained what they fought for. They sacrificed nothing—not an inch of territory—by so doing. The only losses suffered by the United States were in men and money, and by those losses we had put an end forever to the humiliating treatment which had been meted out to us during the first decade of the century. As the years passed by all this became apparent, and it is now perfectly plain that the War of 1812 achieved the result for which it was fought, by establishing the position of the United States as an independent nation and restoring the national self-respect. Although the Treaty of Ghent did not show it, we have but to look behind the curtain which the hand of time has drawn aside in order to learn that the men of that day in England recognized what had happened, although they might not admit it to themselves, much less to the public. They confessed the truth in many ways, none the less clearly because the confession was indirect.

Take, for example, this letter from Mr. James, the naval historian, to Mr. Canning:

MR. W. JAMES TO MR. CANNING

"Perry Vale, near Sydenham, Kent: Jany. 9, 1827

"The menacing tone of the American President's message is now the prevailing topic of conversation, more especially among the mercantile men in whose company I daily travel to and from town. One says 'We had better cede a point or two rather than go to War with the United States.' 'Yes,' says another, 'for we shall get nothing but hard knocks there.' 'True,' adds a third, 'and what is worse than all, our seamen are half afraid to meet the Americans at sea.' Unfortunately this depression of feeling, this cowed spirit, prevails very generally over the community, even among persons well informed on other subjects, and who, were a British seaman to be named with a Frenchman or Spaniard, would scoff at the comparison."[1]

The words of Mr. James show the effect upon the public mind in England of the American naval victories, which so profoundly interested Napoleon. They penetrated so deeply that they actually reached the intelligence of the Liverpools and the Castlereaghs. Even they felt the meaning to England's prestige as a naval power of losing eleven out of thirteen single-ship actions and two flotilla engagements on the Great Lakes. Their alarm can be measured by the honors they conferred on Captain Broke, who commanded the Shannon when she defeated the Chesapeake—higher honors than Nelson received for his brilliant service in the battle of Cape St. Vincent. Nor was this all. Despite their contempt for the Americans and their loud assertions of satisfaction with their successes, as the war drew to its close the Ministers became so frightened that they proposed to send Wellington to America to command their armies on the very scene of the victories which they so loudly proclaimed. The Duke's letters in regard to this proposal are most instructive, and reveal the real results of the war, for Wellington was never the victim of illusions. He had the great faculty of looking facts in the face.

On the 9th of November, 1814, he wrote from Paris to Lord Liverpool as follows:

"I have already told you and Lord Bathurst that I feel no objection to going to America, though I don't promise to myself much success there. I believe there are troops enough there for the defense of Canada forever, and even for the accomplishment of any reasonable offensive plan that could be formed from the Canadian frontier. I am quite sure that all the American armies of which I have ever read would not beat out of a field of battle the troops that went from Bordeaux last summer, if common precautions and care were taken of them.

"That which appears to me to be wanting in America is not a General, or General officers and troops, but a naval superiority on the Lakes. Till that superiority is acquired, it is impossible, according to my notion, to maintain an army in such a situation as to keep the enemy out of the whole frontier, much less to make any conquest from the enemy, which, with those superior means, might, with reasonable hopes of success, be undertaken. I may be wrong in this opinion, but I think the whole history of the war proves its truth; and I suspect that you will find that Prevost will justify his misfortunes, which, by the by, I am quite certain are not what the Americans represented them to be, by stating that the navy were defeated, and even if he had taken Fort Mason he must have retired. The question is, whether we can acquire this naval superiority on the

[1] "Canning Correspondence." Edited by E. J. Stapleton. Vol. II, p. 340.

Lakes. If we can't, I shall do you but little good in America; and I shall go there only to prove the truth of Prevost's defence, and to sign a peace which might as well be signed now. There will always, however, remain this advantage, that the confidence which I have acquired will reconcile both the army and people in England to terms of which they would not now approve.

"In regard to your present negotiations, I confess that I think you have no right from the state of the war to demand any concession of territory from America. Considering everything, it is my opinion that the war has been a most successful one, and highly honorable to the British arms; but from particular circumstances, such as the want of the naval superiority on the Lakes, you have not been able to carry it into the enemy's territory, notwithstanding your military success, and now undoubted military superiority, and have not even cleared your own territory of the enemy on the point of attack. You cannot then, on any principle of equality in negotiation, claim a cession of territory excepting in exchange for other advantages which you have in your power.

"I put out of the question the possession taken by Sir John Sherbrooke between the Penobscot and Passamaquoddy Bay. It is evidently only temporary, and till a larger force will drive away the few companies he has left there; and an officer might as well claim the sovereignty of the ground on which his piquets stand, or over which his patrols pass.

"Then if this reasoning be true, why stipulate for the *uti possidetis?* You can get no territory; indeed the state of your military operations, however creditable, does not entitle you to demand any; and you only afford the Americans a popular and creditable ground which, I believe, their Government are looking for, not to break off the negotiations, but to avoid to make peace. If you had territory, as I hope you soon will have New Orleans, I should prefer to insist upon the cession of that province as a separate article than upon the *uti possidetis* as a principle of negotiation."

And again, on November 18, 1814, he wrote to the Earl of Liverpool:

"I have already told you that I have no objection to going to America, and I will go whenever I may be ordered. But does it not occur to your Lordship that, by appointing me to go to America at this moment, you give ground for belief all over Europe that your affairs there are in a much worse situation than they really are? And will not my nomination at this moment be a triumph to the Americans and their friends here and elsewhere? It will give satisfaction, and that only momentary, in England; and it may have the effect of raising hopes and expectations there which, we know, cannot be realized."

Despite the "military successes," Wellington did not think that England could make any demand for territory or compensation, which shows that the "successes" had been as barren as they were trivial. The invincible troops from Bordeaux were badly beaten by Jackson, and Pakenham, one of Wellington's favorite generals, was killed, so that he did not capture New Orleans, as the Duke expected.

The result was a treaty of peace that on its face only brought peace, which the Duke evidently thought was all England could expect. There need not have been any war between England and the United States in 1812 if England had only seen fit to make the United States a friend instead of a foe. But England did not so will, and the war taught her that the United States could no longer be bullied and outraged with impunity. Thus the War of 1812 brought, after all, a peace worth having, and laid the foundations for that larger peace which has lasted for a hundred years. During that time, through many vicissitudes, the relations of the two countries have so improved that we are now warranted in believing, what all reflecting men earnestly hope, that another war between England and the United States has become an impossibility.

These larger results of the war, so plainly to be seen now, were not of course immediately apparent. The old attitude was still too fixed, the old habits still too strong, to be abandoned in a moment. We made a brief treaty of commerce and navigation with England in June, 1815, six months after the conclusion of the Treaty of Ghent, but this treaty disposed of none of the outstanding questions as to which the Treaty of Ghent had been silent, and some of these thus passed over were of a nature which imperatively required settlement. A British officer, unconscious apparently that a war had been fought, undertook to search some of our vessels upon the Great Lakes, a little eccentricity which was not repeated. Despite

the agreement of the Ghent Treaty, England held on to Astoria and the posts in the extreme Northwest, and, what was still worse, she also attempted to take the ground that our fishing rights, determined by the Treaty of 1783, had been extinguished by the war. Acting on this opinion, British cruisers seized American fishing vessels, and the condition of affairs on the coasts of Nova Scotia, Canada, and Newfoundland became serious in the extreme. Mr. Adams, then Minister of the United States in London, brought these questions to the attention of Lord Castlereagh, urging upon him the necessity of further treaties to settle these disputes, to extend the commercial convention of 1815, and to make some agreement in regard to the slaves who had been carried off after the conclusion of the war, as well as with reference to the disputed northwestern boundary. His discussions with Lord Castlereagh, which are detailed at length in his diary, were fruitless, and the British Cabinet declined at that time to enter upon further negotiations. It may be inferred that they did not think it worth while to take any steps toward improving their relations with the American people. Soon after these conferences with Lord Castlereagh Mr. Adams returned to the United States in order to take his place in President Monroe's Cabinet on the 4th of March, 1817, and Mr. Rush succeeded him as Minister at London. Once more an effort to come to a further agreement on some, at least, of the outstanding questions was made, and Mr. Rush was instructed that, if England would assent, Mr. Gallatin, who was our Minister at Paris, would be joined with him in the negotiations. Then it was that the effects of the war began to be really apparent. The exasperation caused by the seizure of our fishing vessels and by the refusal to carry out the provisions of the Treaty of Ghent on the northwest coast made it evident that if something was not done the two countries would again be involved in hostilities. This danger, which would have made no impression upon the minds of the British Ministers ten years earlier, was now effective, and England's action showed that she was no longer ready to go to extremes. The Ministry changed its attitude and assented to a new negotiation. The result was the Treaty of 1818, by which England admitted in principle the American contention that the fishing rights conceded in 1783 were final in their nature and could not be abrogated by war. Mr. Rush and Mr. Gallatin, moreover, succeeded in obtaining larger concessions in this respect than their instructions called for, and the American fishing rights within the three-mile limit, and also the right to dry and cure on the coast, were recognized as to certain portions of Newfoundland, Nova Scotia, and Canada. The treaty also disposed of the boundary from the Lake of the Woods to the Rocky Mountains, and from there westward to the ocean the country was left open to the occupation of the subjects and citizens of both Powers for a term of ten years. The commercial convention was extended, and provision was made for the settlement of American claims on account of the slaves who had been carried away by referring the whole matter to the decision of some friendly sovereign. Nothing was said about the subject of seamen's rights, which had been so largely the cause of the war. The Treaty of 1818 was as silent on this topic as the Treaty of Ghent, but this question had in reality been settled by the war itself, for England, having found that the theme was one upon which the United States was ready to fight, quietly allowed her claims in this direction to die away.

Four years after the Treaty of 1818, and in accordance with the fifth article, the question of compensation for slaves or other property carried away after the war was referred to the Emperor of Russia as arbitrator, and the Emperor's award decided that the United States was entitled to just indemnification for all such private property taken by the British forces, and more especially for all such slaves as were carried away from the places and territories for the restitution of which the treaty stipulated. The adoption of the Treaty of 1818 was also the signal for the restoration to the United States of Astoria and the other points on the coast of the extreme northwest. In this way the Treaty of 1818, and the award of the Emperor of Russia which grew out of it, brought the relations of the two countries into a better condition than they had enjoyed since the close of the American Revolution; and these treaties may be said to have constituted the first step toward the improvement of those relations which were destined to grow better, although with many checks and hindrances, for one hundred years to come.

The two countries were also drawn nearer together by holding the same attitude in regard to the revolting colonies of Spain in

South America, and by their common dislike and distrust of the principles of the Holy Alliance. When Canning broke away from the somewhat musty Toryism which thought everything was to go on just as of old, and as if the French Revolution had never happened, he not only powerfully aided the South American republics, but he greatly strengthened the position of the United States. Canning did not at all approve of the extended form which his policy took on in the Monroe Doctrine, but his work could not be undone, and a common sympathy and a common policy in the South American struggle for freedom drew Great Britain and the United States closely together in the eyes of the world, and also, although to a less degree, in their own estimation.

After the award of the Emperor in regard to indemnity for the slaves carried off by the British forces in the War of 1812, there was, with the exception of the conventions of 1827, renewing and extending the Treaty of 1818 and providing for an arbitration of the disputed northeastern boundary, no international transaction involving serious differences, and no treaty between the two Governments of Great Britain and the United States, for twenty years. The marked effect which the War of 1812, as I have pointed out, had produced upon the attitude of England toward the United States was, however, very largely confined to the intercourse of the two Governments. That intercourse had become what in diplomatic parlance is termed "correct," and the old tone, so familiar in British despatches before the War of 1812, when the Ministry treated the United States as if it were a collection of African tribes, and therefore not entitled to the ordinary good manners of international relations, wholly disappeared. Officially we had forced our way into the family of nations, and had secured the customary courtesies which international intercourse demands. Yet this improvement, which was of the first importance, did not go very far toward altering the feeling which existed among the peoples of the two countries toward each other. Our intercourse with Great Britain after the Treaty of 1818 entered upon another phase quite outside the scope of governmental action, which in its result did more lasting harm to the cause of genuine friendship between the two countries than all the best efforts of diplomatists or public men on either side could remedy or undo. Prior to the War of 1812 many books and much writing in reviews and newspapers appeared in England which treated of the United States in the most unfavorable manner, and in a spirit which at times might fairly be called malignant. This systematic defamation was carried on so generally and so persistently that it gave rise to a fixed belief in the United States not only that it was part of a deliberate plan, but that some of the writers, like Moore, Ashe, and Parkinson, were actually in the pay of the British Government, and that they wrote for the purpose of inflaming English hostility toward everything American, and of preventing emigration to England's former colonies. During those early years of the century the people of the United States seem to have had the good sense to treat these criticisms with indifference; and when the controversy between the countries culminated in war, in the presence of real fighting attacks made in print fell unnoticed from the press. After the war, however, and after the settlement of the commercial relations of the two countries by the Treaty of 1818, the habit of depreciating and libeling the United States, either in books or in more ephemeral publications, entered upon a new phase. Any one who will take the trouble to examine what was written in England about the United States during the period from 1820 to 1850 will find it difficult to avoid the belief that the assaults upon the American people were systematic in their nature.

Those who are curious in such matters can find an admirable summary in Mr. McMaster's history, in which the English comments upon the United States from 1820 to 1840 are vividly described. It seems almost incredible that such things could have been said and written by one ostensibly friendly people about another people who spoke the same language and inherited the same political traditions. There were, without doubt, many things in the United States of that day which were open to just criticism. No successful defense, for example, could be entered before the tribunal of the civilized world in behalf of Negro slavery. But the English critics did not confine themselves to that which was deserving of criticism. Everything in the United States was to them anathema. The great reviews gave many pages to depicting what the United States was as they beheld and interpreted it. Robert Southey in the "Quarterly" and Sydney

Smith in the "Edinburgh" were only two of the most distinguished among the many writers great and small who devoted themselves not merely to criticising but to slandering the United States. They were not ashamed to effect their purpose by telling the most absolute falsehoods, and the lengths to which they went seem now well-nigh incredible. The men of America were said to be "turbulent citizens, abandoned Christians, inconstant husbands, unnatural fathers, and treacherous friends." The men who had whipped English vessels in eleven single ship fights out of thirteen were accused of having run away shamefully when they could not fight to advantage. As they generally fought to advantage at sea, they had not often run away. "In the Southern parts of the Union," says another calm thinker and judicious critic, "the rights of our holy faith are almost never practiced; one-third of the people have no church at all. The religious principle is gaining ground in the northern parts of the Union. It is becoming fashionable among the better orders of society to go to church." It is interesting to consider this picture of church-going becoming fashionable among the descendants of the Puritans, but the writers had forgotten, probably, that New England was settled when it was a wilderness by people who went there, as Carlyle puts it, because they wanted to hear a sermon preached in their own way. "The supreme felicity of a true-born American is inaction of body and inanity of mind," is another description of the people of the United States, and the reproach of inactivity is one of the most comic ever addressed to Americans even at that time. Then, of course, the British critics had a great deal to say about our total lack of literature and the entire absence among us of any men of distinction.

Franklin, we were informed, had elicited some useful discoveries, but that was because he had lived in England for some time. It might be suggested that there were many other persons dwelling in England whose residence in that favored island had failed to make them capable of eliciting Franklin's useful discoveries. It was also predicted that he would not be remembered for fifty years. Prophecies of fame are always perilous, and it is to be feared that Franklin is a good deal better remembered to-day than Sydney Smith or Southey—the most considerable of our critics in those days—and more read, too, if we may judge from the fact that every civilized nation not long since sent eminent representatives to Philadelphia to celebrate the two hundredth anniversary of his birth, a ceremony which seems to have been omitted in the case of Southey and Sydney Smith when a century had elapsed after their coming into the world. Robert Fulton, it was asserted, stole his invention from seeing the sailing ships which ran on the Clyde with steam power in 1787, although no mention is made elsewhere of the persons who performed that feat, which does not seem to have traveled beyond the Clyde, and which is just as veracious as the statement, also made at that time, that Fulton was born in Paisley in Scotland, when in reality he had the misfortune to be born in Pennsylvania.

These instances give a very faint impression of English criticism upon America at that time, although such stuff is hardly to be dignified by the name of criticism. It was in reality childish and rather ignorant abuse. But now, contrary to what had happened in the earlier years, the Americans, unfortunately, were roused into taking it up and making elaborate replies. They had not much difficulty in controverting the false statements and misrepresentations so freely made, but they did not stop there. They naturally availed themselves of the *tu quoque* argument, and it was not at all difficult in the history of England to find facts which, with appropriate twists and bendings, made the English people appear in a very unenviable light.

This warfare of books and magazine articles continued and was much emphasized and embittered when it was taken up on a large scale by popular writers like Mrs. Trollope and Captain Hall; but everything else sank into insignificance compared to the effect of one book, much more temperate than any of the others, but written by a great genius who saw fit later to sharpen what he had said in a book of travels by carrying his animosity into the realms of fiction. Charles Dickens came to the United States in 1841. He was received with an outburst of affectionate and admiring enthusiasm which has rarely been seen anywhere in the case of a man of letters. He went home and wrote a book about us called "American Notes," and then he immortalized certain types of American character in "Martin Chuzzlewit." He said a great deal that was very true and entirely deserved. The characters of the novel were unfortu-

nately in many respects only too real, and, deeply angered as we were at the time, it may be safely said that Elijah Pogram and Jefferson Brick and Hannibal Chollop, General Choke and Mrs. Hominy, have an immortality more assured among the American people than anywhere else, for the anger has long since died away, while the truth of the satire and the comicality of these beings created by the magic touch of genius still remain. But at the time the resentment was intense. Whether what was said was just or unjust, true or untrue, there was a widespread feeling in the United States that, whoever else might find fault with and ridicule us, Charles Dickens, after the reception which had been given him, was debarred by every rule of loyalty and good manners from doing so. That this feeling was natural and that the rule was one which could be both accepted and observed was made visible to all men not long after the visit of Dickens.

A few years later another great English novelist came to the United States; came twice, in fact, and delivered lectures. No doubt, with his keen and penetrating observation, he perceived many things which lent themselves to criticism, to ridicule, and to satire, of which no living writer was more capable than he. He was by temperament very sensitive to just those shortcomings which are common and repellent in a crude and unformed society. He was urged in every way and tempted with the promise of great profits to write a book about America, but he declined. He had been cordially received in the United States; he had lived in our houses; he had accepted our hospitality; only kindness had been shown him. Others might write what they pleased about America, but he would not. Let me recall what he himself said in a "Roundabout" paper:

"Yonder drawing was made in a country where there was such hospitality, friendship, kindness, shown to the humble designer that his eyes do not care to look for faults or his pen to note them. . . . How hospitable they were, those Southern men! In the North itself the welcome was not kinder, as I, who had eaten Northern and Southern salt, can testify!"

How kind and generous it all is, and how pleasant it is now, to every one who loves the memory of the genius that created Becky Sharp and drew the character of Colonel Newcome, to know that he was, above all things, loyal and true. We had on our own side, too, a distinguished man of letters whose conception of his duty toward the two nations who read his books was to cherish friendship and kindliness and not to seek for faults and embitter feelings. Let me describe him in Thackeray's words, for they both thought alike in this great matter which involves nothing less than good will among men:

"Two men, famous, admired, beloved, have just left us, the Goldsmith and Gibbon of our time. . . . One was the first Ambassador whom the New World of Letters sent to the Old. He was born almost with the republic; the *pater patriæ* had laid his hand on the child's head. He bore Washington's name; he came amongst us bringing the kindest sympathy, the most artless, smiling good will. His new country (which some people here might be disposed to regard rather superciliously) could send us, as he showed in his own person, a gentleman who, though himself born in no very high sphere, was most finished, polished, easy, witty, quiet; and, socially, the equal of the most refined Europeans. If Irving's welcome in England was a kind one, was it not also gratefully remembered? If he ate our salt, did he not pay us with a thankful heart? Who can calculate the amount of friendliness and good feeling for our country which this writer's generous and untiring regard for us disseminated in his own? His books are read by millions of his countrymen, whom he has taught to love England, and why to love her. It would have been easy to speak otherwise than he did; to inflame national rancors, which, at the time when he first became known as a public writer, war had just renewed; to cry down the old civilization at the expense of the new; to point out our faults, arrogance, shortcomings, and give the republic to infer how much she was the parent state's superior. There are writers enough in the United States, honest and otherwise, to preach that kind of doctrine. But the good Irving, the peaceful, the friendly, had no place for bitterness in his heart, and no scheme but kindness."

Unfortunately, the example of Irving and Thackeray had but few imitators. Everything which these two said and wrote or omitted to say and write was forgotten in the clash of men who took a precisely opposite course, to the great detriment of all concerned; and the bitterness was concentrated

around the "American Notes" and their author, whom the American people had loved and honored and taken to their hearts. It was this feeling that the man whom they had admired and cheered and feasted had proved disloyal which made Dickens's criticism and ridicule rankle more than that of all others. But if we leave the personal equation aside, Dickens was only the culmination of the general commentary which England then made and apparently thought it well to make upon the United States. Both people spoke and read the same language. In those days they were still closely akin. We read English books, copied English fashions, and looked up to English standards in society and in literature, and therefore all that was said in England of the kind which has just been indicated went home and made Americans very angry and very sore. We were a new people, or rather we were the offspring of an old people settled in a new country, and we were young, very self-conscious, very sensitive, and we felt attacks which would be no more noticed to-day than the rattle of a dead autumn leaf fluttering before the wind. We replied to the criticisms in a savage and intemperate manner. Sometimes we wounded; generally we produced no effect. What we felt most was the injustice of painting everything black.

As I have already said, there was a great deal in America to be criticised. Dickens's wrath about copyright was wholly justifiable. Our own literary possessions were still meager, and so we stood like highwaymen along the roadside of literature and robbed the passers-by, the very men who "helped us to enjoy life or taught us to endure it." It was utterly indefensible and wholly dishonest. The default on the State bonds, especially upon those of Pennsylvania, which edged the blade of Sydney Smith, who was a personal loser, was not only indefensible, but most discreditable. To the great reproach of slavery there was, of course, no reply, no excuse to be made. But those dark spots were not the whole picture, and yet, by gross misrepresentation and even by actual falsehood, the effort was made to prove that everything was black. For instance, in "Martin Chuzzlewit" the impression is sedulously and strongly given that the entire United States west of the Alleghanies is one huge swamp breathing forth fever and ague. No doubt such spots existed then, and exist now, but as a description of so large a country as the United States it was not strictly accurate. Yet such was the prevailing tone. Everything was bad—land, people, institutions. The result naturally was that the just criticism had no effect and was merely lost in the cloud of invective and abuse. Many of the deficiencies were those which time alone could supply, but this was not stated, any more than it was admitted that there was also in America much that was good and not a little that was great. In the days when we were still colonies Edmund Burke and the elder Pitt pictured the people of America and what they had achieved in language to which Parliament listened then, and which the world has heeded ever since. In the first half of the nineteenth century the American people were engaged in the conquest of a continent; they were bringing a wilderness within the grasp of civilized man, and at the same time they were making a great experiment in government, and had established religious freedom and individual liberty on a scale never known before. Their political example had affected the entire Western world, and this was really the underlying reason for the attacks upon them, because their success alarmed the ruling classes of England and of Europe, which were likewise the vocal classes, in command of the press and the platform. None the less, these were things quite as worthy of note as our crude manners, our rough ways on the Western frontier, our lack of the luxuries of wealth, and of the many other lesser things in which we fell short of the European standards. But the good was never noticed and the bad was exaggerated beyond the bounds of truth. With the exception of what Dickens wrote, everything then said and written in regard to the United States and its people is quite forgotten, except by the historian, and is as dead to the world as the nun who has taken the black veil.

But looking back over that time, the period of the English commentators on America, one can see very plainly now the infinite mischief which was done. In point of taste and good feeling there is little to choose between the English attacks upon the United States and those of Americans upon England, although we had the great disadvantage of feeling much more keenly about it than our adversaries. Yet England herself was sensitive enough when Emerson and Hawthorne, two really great writers, ventured, in the most perfectly proper and temperate

way, to point out that in certain respects the English people were, after all, merely human. Emerson and Hawthorne, of course, are still read and remembered, quite as much as Dickens, but they do not come within the class that I have been trying to describe. They were later, and their tone was larger and more modern, their criticism more subtle, their praise ample, and their temper fair. During the time which I have attempted to portray the harm done was very great. Englishmen gave comparatively little attention to us or to what we thought or said, but the attacks of her writers upon the United States, running through a long period of years, bred a bitter hatred of England among the American people, which has gradually and fortunately turned into a cold indifference, and this, in turn, it is to be hoped, will become something more and better than occasional friendship between individual members of the two nations. The regret which one feels as one looks back over the writings of that period brimming over with bitterness and anger is enhanced by considering the good which might have been done by more serious works conceived in a different spirit. We have two conspicuous examples of such books ready to our hands and possessed of an enduring reputation denied to those who wrote of the United States only to decry and wound. De Tocqueville is of the same period. His famous book is by no means filled with undiluted praise. He both warned and criticised, but he took America seriously and he was studied and admired. In our own time a distinguished English statesman has written a book upon our body politic and our methods of government. He has seen what was good as well as what was evil in our politics and our political system. He is a severe but just judge. Far from resenting his strictures, Americans regard his book with admiration and as high authority. It may be truly said that no Englishman has ever been more popular in the United States than James Bryce, the author of the "American Commonwealth."

Part Two will appear in The Outlook for January 4, 1913

A Crisis in the Woman Suffrage Party

THE annual Convention of the National Woman Suffrage Association in Philadelphia last month was naturally the most important and stirring of all such conventions. In the first place, there was to be celebrated the substantial political victory which the cause of the Association had won at the polls in November through the votes of men who believe in that cause. Four States have been added to the six where women already vote. These were Michigan, Kansas, Oregon, and Arizona—although even on the 1st of December there seems to be still some uncertainty as regards Michigan. A map of the United States showing in black the ten woman suffrage States gives to the eye a picture of what would be, were it not for Nevada, a solid block of far Western States, with Wyoming and Colorado stretching eastward in a smaller block ; Kansas, like a vanguard, stretching still farther eastward ; and Michigan, like a solitary advance sentinel, far to the northeast. It is estimated that through the November election the number of women voters has been just about doubled, and that it is now not far from three millions. Great interest was expressed at the Convention in the question as to what direction the future campaign should take. It seems certain that Pennsylvania will be the Eastern anti-suffrage citadel now to be stormed with the utmost vigor, and Mrs. Ida Husted Harper, one of the Eastern leaders, declares that the principal object in bringing the annual Convention to Philadelphia was to inaugurate a big campaign at the capital of the State, and to urge the Legislature at Harrisburg to submit the question to a popular referendum through a proposed Constitutional amendment. In the Middle West Iowa seems to

MISS JANE ADDAMS
Vice-President of the National Woman Suffrage Association

DR. ANNA SHAW
President of the National Woman Suffrage Association

be the most promising field for new activity, while North Dakota and Montana are also considered probable converts.

But the real center of interest at the Convention was not the victories gained or the plans for the future. For the first time in American political history a great National party has made woman suffrage one of its fighting issues. The ranks of the suffragists were, as a matter of course, divided as to their liking and trust in political parties. There was a strong difference of opinion as to the right of the officers of the National Woman Suffrage Association to act with any party. There was also a division of feeling between the Eastern and Western sections of the suffrage movement. As we understand it, the position of the Association in the past has been that, while individual members have a perfect right to work with either of the old parties (having always in mind the ultimate object of equal suffrage), the officers of the Association must not by their actions as officials commit the Association to anything like affiliation with a political party.

Concretely and personally this crisis revolved around the action of Miss Jane Addams in going to Chicago as a delegate to the Progressive party's Convention and her splendid work in aid of the Progressive cause during the campaign. It was really to stamp Jane Addams's course with disapproval that an amendment was proposed by Mrs. O. H. P. Belmont which would make the constitution of the organization positively forbid the officers of the Association to affiliate with any political party. The result was an overwhelming victory for Jane Addams and a personal indorsement of her motives and actions such as few leaders, men or women, have ever received. The President of the Association, Dr. Anna B. Shaw, who controlled and guided the debate with fairness and moderation, is quoted as describing the result of the vote in these words: "The Association has simply gone on record for Progressiveness, and that is all there is to it. We were always that, only some were not quite sure of it." Mrs. Harriet Stanton Blatch, daughter of Elizabeth Cady Stanton, said: "How wrong it would be for any party

MRS. O. H. P. BELMONT

MRS. JOSEPH T. BOWEN

MRS. HARRIET STANTON BLATCH

of women to bind themselves by a constitution that would prevent us from accepting assistance from any political party. There will be deviation from the will of the majority of the Convention. Honest differences of opinion will always creep up in an organization of this sort, and we will always be able to settle them safely and with fairness to the minority as well as to the majority of the Association." There was some fear that a split in the ranks of the Association might result, but apparently the decision was accepted loyally by all.

The personal triumph of Jane Addams—and every delegate knew that Miss Addams cared nothing for personal triumph, but everything for the opportunity to aid the broad cause of social justice and equal opportunity—was emphasized by the vote through which she was re-elected Vice-President. Out of four hundred and twenty-four votes cast she received all but ten. Dr. Anna Howard Shaw was again chosen President without serious opposition, and thereby recognition was given to her ability, tact, and power of leadership. Other officers whose work has been appreciated by the members of the Association the country over and who were re-elected to the offices they had already held were Mrs. Mary Ware Dennett, of New York, the Corresponding Secretary, and Mrs. Susan W. Fitzgerald, of Boston, Recording Secretary. Officers now newly chosen were Mrs. Katherine Dexter McCormick, of Chicago, as Treasurer, and Mrs. Charlotte A. Whitney, of California, as Second Vice-President; while the Auditors elected are Mrs. James L. Laidlaw, of New York, and Mrs. Joseph T. Bowen, of Chicago.

The whole result of the discussion was thus described by a man observer quoted in one newspaper report: "In the present temper of women, and the country at large, any line of cleavage that puts Miss Jane Addams on one side is going to put a great many other people on that side. 'Get on Miss Addams's side first, and find out what it's all about next, is my way of looking at the matter.'"

Another matter of some consequence,

MRS. KATHERINE D. McCORMICK

although by no means so exciting as the discussion already described, had to do with the unit rule. Heretofore the delegation sent by a State to the National Convention voted as a unit, no matter how many members of the delegation there were. Hereafter the delegates will follow the "one-woman-one-vote" rule just adopted. The trouble has been that while the States could send delegations proportionate in number to the size of the State (forty-nine for New York, for instance), they did not always actually send the full number permissible, and sometimes a few delegates actually present cast, it was thought, too large a vote—thus ten women from New York might cast the whole forty-nine votes.

One of the most interesting features of the Convention was the addresses of Baroness von Suttner, of Germany, a foremost advocate of world-wide peace, winner of the Nobel peace prize of 1905. She urged the women to take it as their first task, when they have obtained the ballot, to wipe out war, which, she declared, was being kept up by the reactionary element in all nations as a means of maintaining the power of wealth and the enslavement of the races. She added: "There is a tie between the suffragist and the pacificist. Both are working for more justice, more liberty, and more happiness in this world. We have the same friends and the same enemies. All those who are for progress are for us, and those who are calling themselves conservatives or retrogrades are against us. They look to the past. We look to the future, and we demand what the future has in it for us."

Mrs. Carrie Chapman Catt, International President of the Woman Suffrage Movement, just returned from a two years' trip around the globe, urged the women of America to a realization of the need of a fight to death against traffic in human life, which, she said, threatened the very foundations of civilization the world over.

MISS ALICE CARPENTER
One of the foremost Progressive leaders

To those who have read the debates at the Philadelphia conference and who have noticed the lines of cleavage and the personal make-up of the two opposing divisions, it is evident that behind the questions immediately discussed there lies a fundamental difference in the motive and purpose for which woman suffrage is sought. The number is growing less of those women who are fighting for suffrage in an angry and injured attempt to get something for themselves. But there are still those whose tone and temperament are indicated by one woman who once said, "We don't want to vote, but we want to get the right to vote." The theory of a natural right withheld is a wrong theory; the desire to offer service is the right theory. No one has exemplified this last so finely as Miss Addams. She believes that suffrage is coming for women and will continue to come just precisely as every other extension of democracy has come—because those already exercising all the privileges of citizens are coming to feel that the common good can best be reached through a common effort not limited by the line of sex distinction. All Miss Addams's efforts in the recent Progressive campaign show that this is what is uppermost in her mind, and in all her speeches the sentiment of striving for definite, positive, concrete reforms completely outweighed any note of agitation to obtain privilege. One passage may be quoted: "Women know now that government is not a sublime and awful and mysterious thing outside themselves, so deep and profound they may not understand it. It is not for war and diplomacy alone. It is an intimate thing impossible to separate from individuals. It is like unto the kingdom of God—it is within you and not without. Government is in the air we breathe, the water we drink, the food we eat, the diseases that enter into our homes. It has to do with the education of our children and the living conditions of our men and women."

A FORESTER'S CABIN IN OREGON

Shall the States Own the Forests?

BY HENRY S. GRAVES

THE FORESTER OF THE UNITED STATES

DURING the last three years the proposal to turn over the National Forests to the States has been urged with increasing insistence. It has been advocated at frequent gatherings in the West, by a portion of the press, and by various members of Congress. Legislative measures proposing such a transfer have been framed. Debate on one of these measures clearly showed an astonishing amount of support to the idea that transfer to the States would be the ultimate disposition of the remaining public lands, the National Forests included.

Whether the State or Nation should own and administer these public resources is a question thus definitely presented to the American people. A more fundamental question underlies it: Shall the National Forests be broken up and parceled out to individuals and corporations, and Forest Conservation, as a public policy, be abandoned?

The National Forests contain 187,000,000 acres of land adapted primarily to the production of timber and protection of water. They are mainly rugged, mountainous areas in the Rocky Mountains, the Cascade and Sierra Nevada ranges, and portions of the Coast ranges. They include the head-waters of every important stream in the western two-thirds of the United States. Their standing timber aggregates 600,000,000,000 feet, easily one-fifth of the country's total supply. Their undeveloped water power approximates 12,000,000 horse-power. The waters which they maintain are vital to present and future irrigation development in the West, and to the navigability of all its larger streams. An exact valuation of these resources is impossi-

ble. As tangible assets they are worth not less than $2,000,000,000. A greater value, which cannot be measured by dollars and cents, is the stability which they insure, by continuous production of timber and water, to the industrial life of the Nation.

The National Forests have been repeatedly charged with blocking the development of the West. Nothing could be further from the facts. Lands chiefly valuable for agriculture are available for settlement. Approximately 1,250,000 acres of such lands have been classified and listed for entry by the Forest Service, to the benefit of 12,000 settlers. Prospecting and bona-fide mining on the National Forests are unrestricted. Sales of mature timber are encouraged by every possible means consistent with businesslike administration. Over fifty-six hundred timber sales are made yearly, ninety-five per cent of them of small amounts for local use. Free timber is granted annually to over forty thousand settlers and prospectors for developing homes or mines. Water power development is encouraged as far as practicable under the present inadequate laws. Some two hundred power companies are now using or developing sites within the National Forests. The only restrictions imposed upon this widespread use of the National Forests are those required to maintain the permanency and value of the resources and to prevent monopoly.

The National Forests are the most significant and concrete expression of the principle of Conservation. That principle has been very commonly misrepresented as a policy of present non-use for the sake of future generations. Its true purpose is twofold—to prevent monopoly of public resources, and to secure their greatest use, both present and future, by scientific development. The stewardship of the Forest Service seeks, as to the National Forests, first, use of present resources; second, permanency of such resources; and, third, greater and more valuable resources for the future.

The creation of the Forests was at first opposed by almost all those who had profited by the use or acquisition of public resources on a large scale. The large timber operator, the water power company, and the large live stock company found the extension of their hold upon the public domain blocked by the new principle of public control. Some of these interests have now come to advocate National Forests, because they have seen that public control, combined with intelligent regulation of use, enhances productiveness and works to the advantage of their industry as well as of the general public. Others have consistently opposed the National Forest policy. The opposition first sought to abolish the Forests. It has repeatedly attempted to cripple their administration by reductions in appropriations. It has restricted the authority and discretion of the Executive in adding to the Forest areas. It has sought to break up the Forests by indiscriminate land eliminations. Failing in direct attacks upon public control, the same interests now seek the same end by transferring ownership to the States.

For the vast forest-bearing, mountainous areas embraced in the National Forests public control is essential to obtaining the maximum return in public benefits. Lumbering in the United States to-day is the exploitation of timber, not its production. Its result is steady diminution both in actual supply and in the productiveness of timberlands. The country is now consuming or losing through fire every year over three times the amount produced annually by growth on its entire forested area. The problem of timber production has not been solved by private ownership in foreign countries. It will not be in the United States.

The first great National interest in these public forests is that of a future timber supply. Our present economic structure has totally eliminated the localized production of staple commodities. This is as true of timber as it is of wheat, corn, cotton, or mutton. For many years the National center of lumber production was in the Lake States. It has now moved to the pine-producing States of the South. The present generation will see it cross the Continental Divide to the coniferous forests of the Northwest. If the same methods of exploitation are permitted in the West, it will be but a question of years before there are no more centers to draw upon.

The production of timber, however, is not the only function of the National Forests. The forest cover on these mountainous areas protects, and in large measure even creates, the sources of water indispensable to the industrial life of the Nation. The irrigator, the developer of hydro-electric power, and the municipality seeking an adequate supply of water for its citizens have one interest; the manufacturer of lumber and the lumber consumer, a different interest. To despoil

one resource in utilizing the other would be the height of National waste.

The National Forests contain vast quantities of forage. On lands adapted to timber production grazing interferes to a greater or less extent with the renewal of the forest, and must be adjusted or restricted so that this primary function will not be impaired. Elsewhere range use must be strictly regulated in the interest of water protection. Large areas covered with brush or scattered trees have been put in the Forests at the request of the Reclamation Service or of local irrigation interests, not to grow commercial timber, but to grow anything that will check erosion. Many small areas through the National Forests are of great value for power sites. Sites for manufacturing plants in connection with lumbering, for reduction or milling plants in connection with mining, for irrigation reservoirs, and for hotels and sanitaria, are already in demand; such uses will grow. Many areas will undoubtedly serve their highest function as camping and recreation grounds for the public. These possible forms of use often conflict. Power or irrigation works on a large stream may block the utilization of billions of feet of standing timber on its head-waters. Each acre of ground must be put to its highest use in the light of scientific knowledge of all its possibilities. To such an adjustment public control is a fundamental necessity.

Many of the uses to which specific areas are best adapted can be attained only by an initial outlay which no individual or private owner could afford. Seven and one-half million acres of burned and denuded land in the National Forests capable of producing timber are idle, and will remain so until reforested by artificial means. In private hands this would never be done. The ultimate productiveness of many of the stock ranges can similarly be improved.

Further, there are broad public interests to be safeguarded. Protection of the navigability of the larger streams and the control of floods which are often more than Statewide in their extent and injury are matters of National concern. With the seriousness of the flood problem in many parts of the United States, with the financial burden now imposed upon the country for artificial control of floods and the artificial deepening of navigable rivers, with the acute problem of cheap interior transportation—with all of these vital questions of National welfare demanding action, it is inconceivable that the surrender of public control of these great storage reservoirs, which feed and regulate the river systems of the West, should be seriously considered by the public at large.

Once public ownership is surrendered, the three great resources of the Forests—timber, water, and forage—are readily monopolized for private advantage.

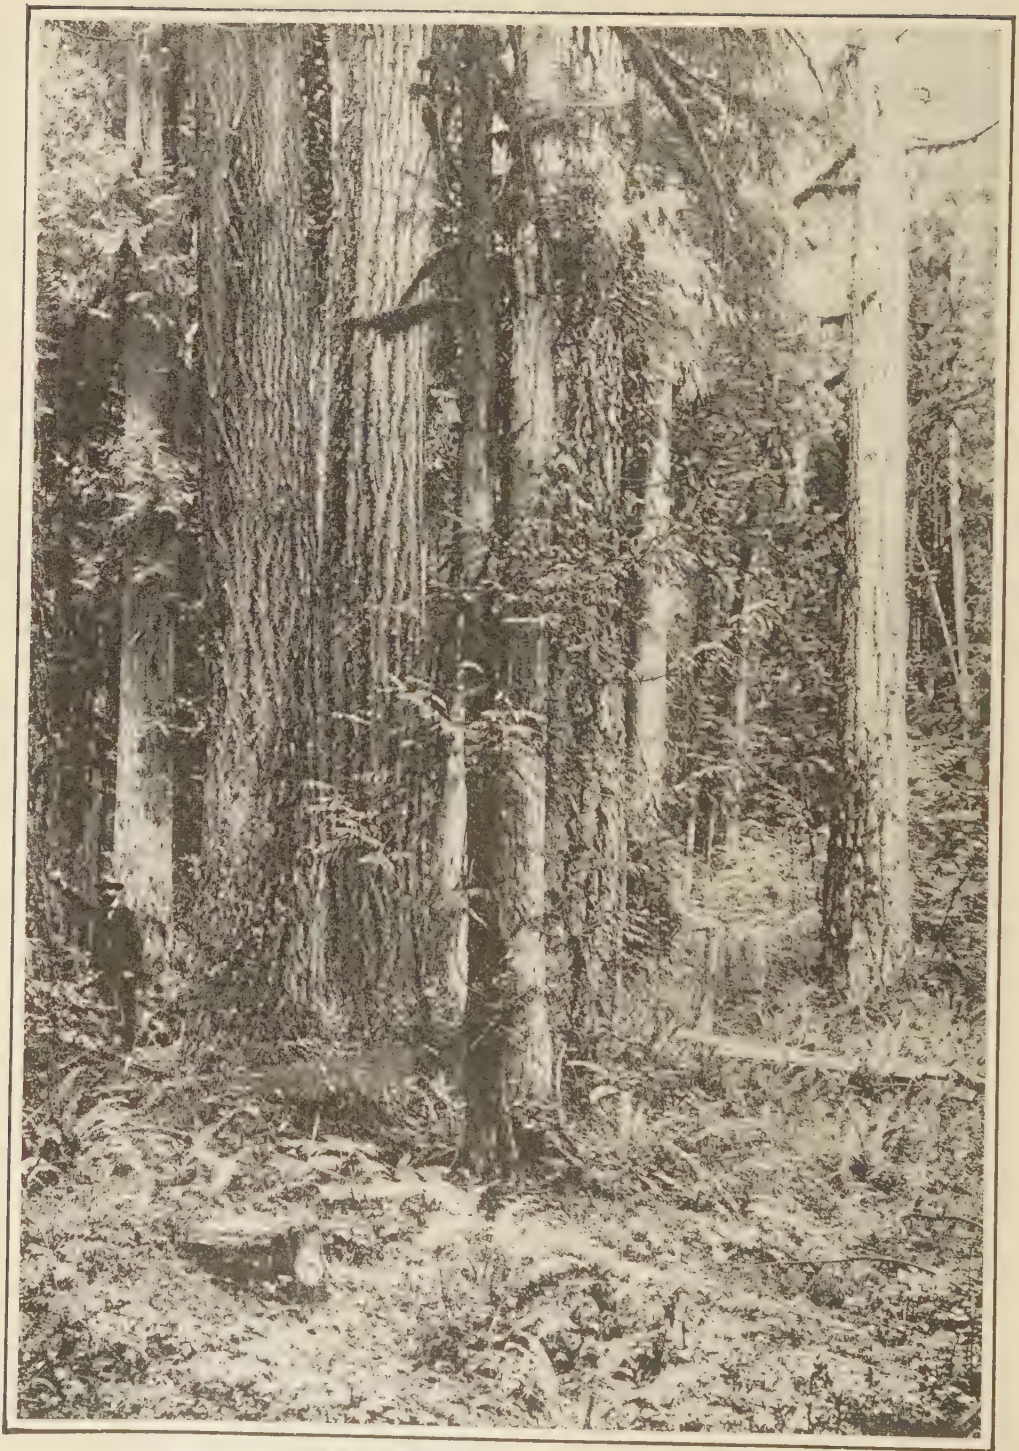
The Commissioner of Corporations has shown[1] in a recent report on the standing timber of the country that there is a concentration of ownership in a relatively few large holdings, and that there has been a vast speculative purchase and holding of timberland far in advance of its use.

The concentration of uncut forests in a few hands is most marked in the Pacific Northwest. This region contains five-elevenths of the privately owned timber of the country. During the last forty years three corporations have acquired nearly a quarter of this amount, eight corporations a third of it, and thirty-seven corporations or other owners one-half of it. This identical region contains over two-thirds of the timber in the National Forests. The result of relinquishing public ownership of these areas is written in the history of what has already occurred.

In 1901 705,000 acres of heavily timbered land was eliminated from the Olympic National Forest, Washington. Members of Congress and local interests had claimed persistently that this area was chiefly valuable for agriculture, and that its inclusion in the Forest was blocking development. When eliminated, it was of course obtainable from the Government only in small holdings. Ten years later 523,720 acres had passed into the hands of owners who were holding it for its timber. Three companies and two individuals held 178,000 acres. One owner held 81,630 acres. Of the area originally timbered only about 600 acres were under cultivation.

While outside the National Forests the timber of the West is passing into a few hands, within the Forests thousands of independent operators, large and small, are now obtaining public stumpage. Their number is increasing yearly. Not only is opportunity thus afforded the independent manufacturer to establish himself in the lumber trade; competition in the manufacture and sale of lumber is assured.

[1] Summary of Report of the Commissioner of Corporations on the Lumber Industry, Part I, Standing Timber, February 13, 1911.



THE RED FIR AND RED CEDAR TREES, WITH TYPICAL MOSS, FERN,

VINES, AND MAPLE GROUND COVER, IN THE STATE OF WASHINGTON

In the report of the Commissioner of Corporations on Water Power Development in the United States[1] ten corporations are shown to control 1,821,000 horse-power of developed water power, about sixty per cent of all the commercial power in the United States. The same interests control 1,449,000 horse-power of undeveloped electric energy. There are clear indications of relationship between certain of these corporations. The ramifications of the power monopoly are shown by the fact that the water power or allied companies own or control and operate street railways in 111 towns, electric lighting plants in 669, and gas plants in 113. Twenty officers and directors of the General Electric Company and its three subsidiaries control twenty-four corporations which operate hydro-electric plants, over fifty public service corporations, a number of railways and factories, and over fifty banks and financial houses. Local concentration of water power control is still more marked. Eighty-six per cent of the developed water power of California is owned by six corporations. Seventy per cent of the developed power of Washington is owned by two corporations. Similar conditions exist in Colorado and Montana.

A large part of the undeveloped water power in the Western States is within the National Forests. It is now being developed and utilized under lease. It is available to the independent operator. The terms of the lease forbid its transfer or assignment to any other company or corporation. It cannot be monopolized. Many attempts have been made by the power interests to acquire these sites—by mineral locations, entries under the Forest Homestead Act, wholesale eliminations from the Forests, and special grants from Congress. To the extent to which these powers are allowed, through ownership of the land, to pass from public control, private monopoly of water power will be strengthened. The ability of the public to regulate or control such monopolies will be correspondingly reduced.

It would be as shortsighted to surrender public ownership of resources which, like water power, have a natural monopoly value, as it would be to repeat the mistakes made when public service corporations were given franchises of great value for nothing and for all time.

Monopoly of the Western stock ranges, should public control of the Forests be relaxed, is possibly less menacing than that of timber or water power. Yet unregulated grazing of the public lands produced, in most parts of the West, large sheep and cattle companies which, through ownership of water, or shrewd location of claims, or pure force, controlled enormous areas of range.

On the National Forests there is a wide distribution of grazing privileges. To make room for the new settler, the larger herds of old users have been cut down. In no more concrete or practical way has the doctrine of equal opportunity, the antithesis of monopoly, been applied.

The second great National interest in the Forests is their protection of navigable rivers and inter-State streams. Fully seventy per cent of their total area is on watersheds of these two classes. Federal control of navigation has long been an established principle of this Government. Its most significant application in recent years is the protection of head-waters of navigable streams through direct purchase by the United States. The Weeks Act, passed March 1, 1911, appropriated $11,000,000 for the purchase of forested lands on the head-waters of navigable rivers. Every Eastern State within which the establishment of National holdings for this purpose was proposed has asked the General Government to enter its borders for this object. For the Government to part with title to mountainous, forest-bearing land on the watersheds of a navigable stream in the West, while drawing upon the Federal Treasury to buy similar land in the East, would not only be the extreme of inconsistency, but would reject the results of prolonged and costly experience in the parts of the country where private ownership of such areas has had the longest and best opportunity to demonstrate its results upon navigation.

The simple fact that a great majority of the important navigable streams cross several States or have head-waters in different States precludes the States from discharging the function of adequate protection. The Rio Grande River has its sources in Colorado. It traverses New Mexico, and later becomes the boundary between Texas and old Mexico. During much of its course it supports, or will support, extensive irrigation and power development. The protection of the sources of that stream is a question of the most vital importance to three States and one foreign nation. No single State can perform this duty. It belongs to the Nation. The same

[1] March 14, 1912.

is true of the Colorado River, which affects six States; the Snake River, which affects four; and the Missouri, which affects seven States before its confluence with the Mississippi. The whole problem of protecting inter-State streams for the prevention of floods and the benefit of all industries and uses dependent upon them is as distinctly National as the reclamation of arid lands, the construction of inland waterways, or the digging of the Panama Canal.

The States have many legitimate interests in the National Forests. The administration of the National Forests recognizes fully all of these interests. As a matter of fact, the greatest direct benefits of public control are received by the communities nearest to them. The Forest Service is committed to the settlement of lands in the Forests chiefly valuable for agriculture. The timber needs of local residents, communities, and industries are amply provided for by free use privileges and local sales. No timber is sold for shipment to the general markets of the country unless there is more than enough to supply both present and future local needs. A similar policy governs the distribution of grazing privileges and the use of Forest lands for water development. Charges for any of these resources are made only when the use is distinctly commercial in character.

As rapidly as it can the Forest Service is opening up the inaccessible mountainous regions which make up the bulk of the National Forests. Many settlements have been helped to secure an outlet to town, railway, or market by trails, roads, bridges, and ferries built by the Forest Service. Much of this work has been done in co-operation with counties or communities of settlers. The appropriation act this year made available ten per cent of the gross receipts from the National Forests for building roads and trails needed for the development of the country. This is aside from the regular appropriation for permanent improvements needed primarily for the protection and administration of the Forests. Under the new clause, $200,000 is available for the current year.

The Forest Service recognized at the start that its local personnel must not only be familiar with the regions in which they worked, but must also be in sympathy with the problems and interests of the people. An early provision of law required the selection of supervisors for the respective forests from residents of the States concerned as far as practicable. This has been scrupulously followed. Furthermore, the regulations governing the National Forests provide for the adaptation of administrative measures to the varying needs in different localities.

Loss of local taxes to State and county has been met by legislation giving the county road and school funds twenty-five per cent of the National Forest gross receipts. This is entirely distinct from the ten per cent already mentioned. On the more inaccessible and undeveloped Forests the returns to the State under this provision are not yet great. From other Forests the amounts now received by the counties form no inconsiderable part of their revenue. During the year ending June 30, 1911, the Bitter Root National Forest, Montana, paid $15,000 into the county treasury; the Deer Lodge National Forest, in the same State, $19,400; and the Coconino National Forest, Arizona, $12,800. The revenue derived from the Deer Lodge by Montana is greater than if the entire area were taxable and assessed as timberland of the first class under the Montana laws—a class which, in fact, would include less than a third of the area. The returns in these instances indicate what is approaching on all of the Forests as the demand for their resources becomes more general.

Of still greater moment to the National Forest communities, however, is the development and maintenance of stable industries. The National Forests are capable of producing indefinitely over six billion feet of timber each year. This may be increased to eight or ten billion. Every thousand feet of such timber which is cut pays to the community at least $8 in wages and $2 or more for merchandise. When market conditions make it possible to utilize the full annual yield of these areas, the industries which it will support will distribute at least sixty million dollars every year for labor and supplies in the communities in and near the National Forests. Furthermore, this industrial development will be permanent.

Oftentimes local communities are practically the sole beneficiaries of this policy. The sparsely timbered Forests of southern California are maintained almost exclusively for the protection of streams used for local irrigation and power development. This protection is known to the people of that region to be vital to the maintenance of the water upon which practically their entire agriculture

and horticulture depend. Many areas are held in the National Forests, at the request of local communities, primarily to protect municipal water supplies. On some of them the sparse forest growth is being extended by artificial planting. The broad principle of public control of resources to accomplish objects which could not be accomplished under private control is being applied.

It would seem, therefore, that all of the legitimate needs of the Western communities are provided for, and that the transfer of ownership of the Forests from the Government to the several States cannot be justified on the ground of discrimination against the latter or injury to their interests.

The various grants of public land to the States total nearly 185,000,000 acres. The largest grants have been made to promote education, as vital to the maintenance of democratic government and free institutions. Other grants have been made for public buildings and penitentiaries, still others to promote military training and the construction of post roads. The eleven States west of the one hundredth meridian, which contain most of the National Forests, have received nearly 77,000,000 acres. The average grant to the National Forest States is therefore 6,985,000 acres, against 2,920,000 acres to each of the other States. The western-most States have received sixty per cent of the land granted for education, maintenance of public institutions, and other special purposes, and all of the land granted under the Carey Act for the promotion of irrigation. Aside from the swamp land grants, which benefited particularly the Southern States, the National Forest States have received, State for State, nearly six times as much public land as their Eastern sisters.

Without begrudging this liberal use of public resources to aid the development of the Western States, it must be emphasized that the aim of every grant has been to promote the public welfare, judged not only from a local but also from a National standpoint. The transfer of the National Forests would be a further gift of 187,000,000 acres, chiefly to the same States.

The protection, administration, and development of the National Forests involve financial burdens which the individual States cannot carry. The regular expenditures on the Forests during the fiscal year 1911 were over $3,400,000. The receipts for the same year were about $2,000,000. Few, if any, of the National Forest States would have been willing to appropriate the amounts necessary to cover the regular expenditures. To meet the additional burden of emergency fire protection would have been impossible. In Montana the emergency expenditure was over $400,000, in Idaho $350,000, and in Oregon over $100,000. If the amounts needed had not been available at the time of critical danger, a vast part of the public wealth in the Forests would have been lost.

The foregoing does not include any overhead charges. The National Forest States are grouped in six districts, each with a supervising and inspecting staff. The splitting of the six administrative units into twenty would double, if not treble, the overhead charge. In the same way there would be waste and ineffectiveness in the conduct of scientific work. Good forestry, like good farming, must apply scientific knowledge. This knowledge the Government is now gathering in connection with National Forest administration. In developing American forestry it has built up a strong technical staff and instituted far-reaching studies and experiments. That the States would sufficiently provide for the cost of such work is improbable. If they did, the cost would be greater, the results smaller, and poorer forestry would result.

Moreover, the Forests are still largely undeveloped wilderness. Although nearly 10,000 miles of trail, 7,000 miles of telephone lines, and over 1,000 cabins and other structures have been built, 80,000 miles of trail and 40,000 miles of telephone line are still needed to complete the primary fire protective system. These improvements will cost not less than $8,000,000.

These expenditures are not excessive for an area equivalent to the New England States, New York, New Jersey, Delaware, Pennsylvania, Virginia, West Virginia, and Ohio, in the most rugged and inaccessible parts of the West. The present cost of administering and protecting the Forests, supervision included, amounts to little more than two cents an acre annually; or, as insurance on the property protected, two mills on the dollar. It is less than a number of lumber companies are now expending solely for protecting their lands from fire. It is less than one-third the cost of the public forests of British India, which are administered far more cheaply than those of any other foreign nation. But the States are not ready to assume such financial burdens. If they

attempted it, the Forests would either be inadequately protected and administered or they would be managed with a view to greater immediate money returns. Destruction of the Forests by fire or trespass or unrestricted and unscientific methods of cutting, rapid depletion of their timber by overcutting, and private exploitation of their resources at much less than their actual value would be the inevitable results. Few of the States have as yet met their responsibilities in the protection of forest lands now owned by them or their citizens.

Administration by the Federal Government means greater stability of policy. Stability in the policies governing the use of the National Forests is a necessity of axiomatic character. Their water powers can be developed only under plans made for long periods. Much of their timber can be utilized only under contracts for cutting and removal extending over fifteen or twenty years. Sudden shifts or changes in the policy or methods of administration would be fatal. In the administration of the National Forests a clear-cut, uniform policy has been developed and applied by the Nation Its results are known. It has been in force for years. Transfer the Forests to the States, and twenty separate and distinct policies must be developed, tested, and tried out.

It must be conceded, furthermore, that the Federal Government has higher and more stable standards of civil service. The management of the National Forests under its direction has been free from political consideration. Every position on the rolls is under the Civil Service Law. It is fair to raise the question whether similar standards of civil service and similar freedom from political considerations could be expected under twenty different State Governments. The people of one of the great Eastern States have so distrusted its governmental machinery and have been so fearful of political manipulations that fifteen years ago they forbade the cutting of any timber in the State forests. The more far-sighted citizens and officials of many Western States have been sorely handicapped in their efforts to bring about conservative, businesslike handling of the lands which those States now own. Political considerations are openly of controlling weight in the organization of the land and forestry departments of a number of the States. Few of them have stable

A FOREST OF WHITE PINE, PITCH PINE, AND GRAY BIRCH IN HAMPDEN COUNTY, MASSACHUSETTS

civil service regulations governing their employees. The temptation to use patronage for political purposes is the dead weight to-day on the administration of the game laws in very many of the States. With its broader responsiblity, its more stable civil service regulations, and its openness to more searching public scrutiny, the Federal Government is a far safer custodian of the public interests involved than would be provided by a large number of individual States.

The States cannot resist the influence of great business interests, either in making or executing laws, as effectively as the Central Government. The difficulty of even the strongest States in withstanding the constant pressure of such interests through long periods of years has been demonstrated over and over again. Many States have been absolutely dominated by them. Monopolies of National scope have been developed or are in the making through the opportunities which such interests formerly had to acquire public resources. Each additional foothold obtained by them in the National Forests of a single State would strengthen such monopolies. But its effect upon the prosperity and happiness of the people would not be confined to the State immediately concerned.

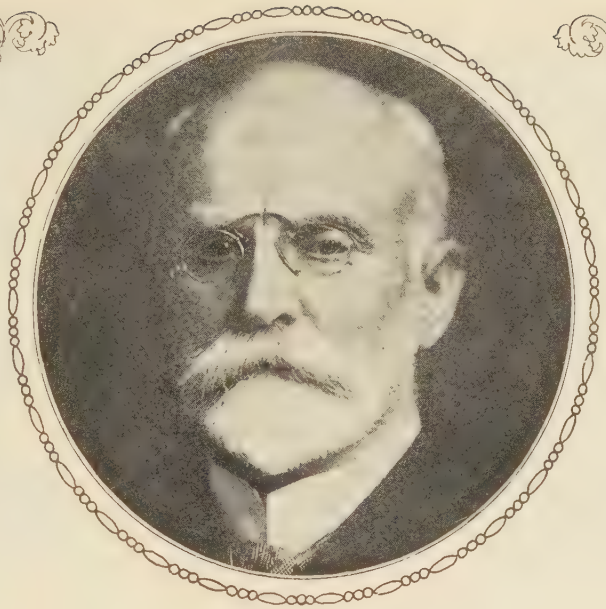
After everything else has been said, the fundamental fact remains that public control of the resources contained in the National Forests can be assured only under Federal ownership. The transfer to State ownership is now, in purpose, and would prove in effect, the breaking up of public control of any kind.

The amendment offered to the last Agricultural Appropriation Bill provided that, after the National Forests are acquired by the States, "thereafter the lands so conveyed shall be the property of such State, and shall be held, administered, settled, and disposed of by such State in accordance with the laws of such State." And, further, "that after the transfer of such lands to the State, they shall be opened to settlement and sale under the laws of said State." In plain terms, the abandonment of public control altogether and opening the Forests to acquisition by individuals is proposed. And the significant fact is that this disposition of the Forests appeared to have the support of a majority of the Senators who discussed the bill.

The history of the movement for State ownership supports this belief. Its most earnest advocates are the very interests whose unrestrained exploitation of public resources was stopped by the creation of the Forests. The water power corporations have been its foremost champions. Their acknowledged representative spoke in its behalf at the Conservation Congress at St. Paul in 1910. The Public Lands Convention, which met at Denver in October, 1911, composed of the elements in the West which have always fought the reservation of these areas from private acquisition, went on record in support of State control. The forces which opposed the National Forests at their inception now attack by this means, not any given agency of administration or any theoretical usurpation of local rights by the Central Government, but the fundamental principle of public control in any form.

A number of the Western States themselves, by official acts, have shown the same purpose toward the resources contained in the National Forests. The Legislature of the State of Washingtion passed a resolution in 1903 requesting that 58,240 acres of very heavily timbered land, set aside for forest reservation purposes, be thrown open to entry. In February, 1911, the Legislature of that State, by joint resolution, requested Congress and the President to open to entry 114,000 acres in the Columbia National Forest unfit for agriculture. On February 15, 1911, the Legislature of Idaho requested the President to eliminate 46,000 acres from the Cœur d'Alene National Forest in that State, which contained scarcely one hundred acres of agricultural land. The same State requested on March 3, 1911, the elimination of portions of three townships containing similar land in the Pend Oreille National Forest.

The movement for State ownership is thus largely, if not wholly, a movement for the abandonment of public control. It is a thinly disguised attack upon the integrity of the Forests, and, through them, upon the whole Conservation policy. Whether private acquisition of these resources is proposed by all advocates of State ownership or not, such would be its practical effect. It is believed that the people have not changed their conviction that public control is necessary. The question becomes, then, simply, What governmental agency is best equipped to exercise this control for them? There can be but one answer to this question. For the strongest, most stable, and most effective administration of these resources for their own good the people must continue to look to the Federal Government.



BRONSON HOWARD

American Plays Old and New

BY HAMILTON W. MABIE

BRONSON HOWARD once said that in every country there is one theme that interests a great company of playgoers. "In France," he declared, "this perennial topic is marital infelicity; in England it is caste; in the United States it is business." The moment that dictum is read the exceptions come crowding in; and, if one studies the drama produced in this country, he sees that, while what is called "business" is a theme of universal interest, the word gets a wider meaning the moment the thing or things it connotes rise into the region of art. More than this: he sees that business is, in a true sense, the real thing with which art must deal in this country if it is to justify itself; and that business is, in fact, the one thing from which art has least to fear. For the most dangerous foe of art is convention that has hardened into formalism with its blighting influence on invention, individuality, passion—the elemental qualities and forces. It is rigid convention—literary, artistic, academic, social—which is the mother of imitation, of the conformity that shapes an expression, not to a man's thought, but to another man's way of saying things; of that spirit of repetition which uses the old tools without the old skill, and repeats the old truths without the old conviction. When the process of conventionalizing an art, a society, a religion, has gone far enough, there comes, not a reaction, but a revolution; not a voice crying in the wilderness, but a volcanic eruption. No one can understand Ibsen until he gets back of the dramatist into the chemist's shop in Grimstad and into the Scandinavian world in which Ibsen was born, where the old heroes, blind and impotent, were grinding at the mills and turning out pretty or formal patterns in religion, in poetry, in social life. The drama came to life again on the Continent when Ibsen—a great surgeon rather than a great observer, a great interpreter of life, or a great poet—put his broad shoulders to the old imitation temple and pulled it down amid clouds of dust and a mighty chorus of imprecations.

Art has everything to fear from the creeping death of convention—that is to say, from forms and facts and interpretations that have

become purely historic and traditional—and nothing to fear from life. Life is often crude and impatient, sometimes violent; it tries to take the kingdom of art by storm; but it always means the opening of another spring of vitality; it brings fresh feeling, contact with reality, the courage which made Euripides, Marlowe, Calderon, Molière, Schiller, Hugo, Ibsen—despite his narrow intensity, perhaps because of it—such powerful agents of liberation. If we are going to do real things in art in this country, we must lose our timidity in the presence of business; we must look through it and behind it and prophesy for it as Emerson did. For it is not a preconcerted absorption in practical affairs, a national agreement that our function is to make money; it is an instinctive, inevitable, and tremendous outpouring of human energy, a great and vital expression of the human spirit; before we condemn it—we who are afflicted with the special kind of blindness which infects libraries, colleges, and skilled professions, and is so insidious that it destroys the faculty of sight before the victim is aware of it—let us try to understand it.

Business is *not* mere shopkeeping or trading. It is not only a commerce of things but of ideas and forces. "*It came to them business, it left them poetry.*" This is what happened in Pittsburgh when Mr. John Alexander painted the walls of the Carnegie Institute. Instead of giving us nymphs and goddesses, he challenged the business of Pittsburgh to yield its human significance, and he got, what the creative man always gets, the human relationship, the human quality, the tremendous human force at play; he caught the thrilling vision of the elemental struggle which it is the business of art to present and represent and interpret. This is what they cared for—those thousands who thronged the marble benches to hear the story of Agamemnon as Æschylus told it; not then a classical tradition shaped by a classical model, but a first-hand study of a living view of fate in the world, in a form which had grown stem by stem and flower by flower out of the common earth under their feet. This was what they sought—the noisy, turbulent throng that stood in the Globe Theater to hear what Shakespeare had to say in his own vivid, stirring, sometimes devil-may-care way about the fortunes of men with the light of nineteen additional centuries' full glow upon them.

This seems like a digression; but so far the American drama has been a digression save when it has dealt with the particular and special work of the American spirit, and the relations, tragedies, spiritual impoverishments and spiritual prosperities that grow out of it. When we run away from what we call "business" and try to hide ourselves in earlier ages, as Mrs. Edith Wharton did in "The Valley of Decision" and Powers did in "The Greek Slave" (on the propriety of which a committee of Cincinnati clergymen was called upon to pass, as if the pretty, graceful, lifeless thing could harm anybody), we have produced refined and charming books, pictures, statues; when we have faced and challenged it and made it give us its life, we have set a column of living men marching, as we did in the Shaw memorial, or we have clothed a great, awkward, appealing figure with immortality, as we have done in Lincoln Park, Chicago. When Fenimore Cooper wrote his first novel, provincial that he was in a provincial age, he turned timidly to England and gave the world a second-hand picture of English manners; when he opened his eyes and looked about him, he stayed in Westchester County and wrote our first real story. Curiously enough, this was the theme of the first American play produced by a professional company—"The Contrast," written by Royall Tyler and presented in New York on April 16, 1787; the contrast was between those who imitated foreign manners and those whose manners were home-made. It was a poor affair, but it had the saving grace of reality; and because the breath of life was in its meager, misshapen body, one of its characters, Jonathan, has not only survived but has become typical. There were other earlier plays politely described by the literary historians as reading-plays—though it is doubtful if they achieved even that degree of attention. William Dunlap wrote a "History of the American Theater" so far back as 1832, and was the reputed father of some sixty plays, none of which need detain us. Of the plays of the long interval between the time when Edgar Allan Poe's mother was winning friends in Boston by the sweetness and charm of her personality and the later dramatic movement there is little to be said from the point of view of dramatic art. A few plays were lifted into prominence by the genius of the individual actor. John T. Raymond made Colonel Sellers in "The Almighty Dollar" a type of the American dreamer in finance, and Joseph Jefferson,

AUGUSTUS THOMAS

EDWARD SHELDON

of fragrant and lovable memory, lifted a mediocre play into the region of art by the appeal of humor and pathos—a striking illustration of the touch of vitality which brings the dead to life. "Hazel Kirke," "The Old Homestead," and "Shore Acres" were dependent for success on fine acting. One name stands out in the lost list of mechanical playwrights—George H. Boker, a Philadelphian, and a man of fine literary feeling and training, whose "Francesca da Rimini" is still played to interested audiences; a genuinely poetic play, of which Stedman said that it waited twenty-five years for an actor and manager who could divine its possibilities, and which has recently found in Mr. Otis Skinner an intelligent and accomplished interpreter. Boker's friend, Bayard Taylor, out of the abundance of his vitality, wrote dramas of ambitious scope and not lacking in eloquence, but his gift, like that of the other American poets of his time and earlier, was lyrical rather than dramatic.

Our stage has never been without the witness of American courage, but the plays that have had a flitting or even a prolonged life have been mainly prophetic. The vital movement in American drama may be said to have begun with that expert playwright and charming man, Bronson Howard, whose failures were few and whose successes were many. If Irving was our earliest man of letters by profession, Mr. Howard was our earliest professional playwright, who put all his fortunes into the making of acting dramas. He came to his life-work through the newspaper office, the laboratory in which dramatic incident and action are studied at first hand. His plays were American to the core. This does not mean that they were provincial; it does mean that he portrayed the society and personated the people he knew best. This element of reality gave his plays sincerity and value in an age of adaptations from the French which were forgotten as soon as they were withdrawn from the stage. There was an absence of the flamboyant and a presence of quiet authority in Mr. Howard's dramas which evidenced their authenticity as real plays and not mere pieces of stage dexterity. The spirit of comedy—elusive, playful, clear-eyed—pervaded his work from "Saratoga" to "Kate." He was well equipped for the writing of comedy, for he had inventiveness, vivacity, humor, keen insight, and knowledge of contemporary society. He knew the stage intimately, as did Shakespeare and all the writers of acting dramas. This is the stone of stumbling in the path of the so-called literary dramatist—he does not understand the difference between the literature that is to be read and the literature that is to be acted; so radical and deep-going is this difference that a play that is first and last a play to be acted cannot be fully understood off the stage. Sir Henry Irving's exposition of Shakespeare's expert stagecraft, read at Princeton several years ago, is perhaps the most illuminating contribution to our knowl-

CLYDE FITCH

edge of the great playwright in a generation of learned and many unlearned treatises. In James A. Herne's rural play, "Shore Acres," in which he acted the chief part, the most effective touch was not in the text, but in the actor—the winding of the clock by the old man after everybody had gone to bed, and the sense of loneliness that came, charged with pathos, over the footlights as he lingered solitary on the stage. Mr. Brander Matthews has called attention to the poetry in action in the funeral scene in "Shenandoah," "where the soldier father, all unknowing, walks reverently behind the body of his erring son, who has been redeemed by a heroic death."

A play is not a piece of writing: it is the transfer of the play-maker's thought, not to the reader but to the spectator, by words, by painting, by the modulation of the voice, by the expression of the face, by gesture, and by action. Does not the irony of the Greek play, which lies largely in the spectator's knowledge and the actor's ignorance of the swift approach of doom, penetrate our imaginations more powerfully in the pauses of the action than in its progress?

Of that indefatigable play-writer Clyde Fitch it may be said that, although he had put more than forty plays on the stage, he died at forty-four, and there was in him the promise of stronger and more enduring work. Success met him early and stayed with him to the end. His reputation was wider and his financial returns were greater than those of any other American play-writer. He was a man of brains and of education, but he was more than anything else a stage-manager; he was a master of stage effects, and he caught his audiences by the concrete and definite realities he put before them. Everybody remembers the disturbing vividness of the rolling deck of the ocean liner in "The Stubbornness of Geraldine." He put the department store and the automobile on the stage so effectively as to give his audiences the sense of hot air and fatigue from the one, and of rush and hideous masks from the other. He became so enamored of the power of the external facts of life that he lost interest in the inner forces in which resides the real and finest spell. The stage of a modern up-to-date theater is a wonderful congeries of mechanisms, complicated beyond the comprehension of the layman. On this vast and delicate machinery Fitch played with a cunning hand. It was like playing a game with the public. He knew all the devices and could command all the illusions. That knowledge was a short cut to popularity and fortune; but it was not a highway to work of lasting power or to fame, which is often at the other end of the world from popularity. He fell a victim to ingenuity, to technical skill; exquisite machinery sang its siren song to him as it sings to the rest of us in religion, in art, in education, in politics.

Mr. Fitch had immense cleverness, but he lacked genius. His work was often shrewd in its character study, but it was not penetrating. He knew the minor facts of life, but

BOOTH TARKINGTON

GEORGE ADE

he seemed never to come to close quarters with the major facts, and it is in dealing with the major facts that the drama finds its great opportunities. Mr. Gilbert K. Chesterton says somewhere that when one breaks the little laws the big laws begin to operate. Fitch never broke through the minor facts. The moral situation is rarely faced in his plays, and when it arises one rarely feels the compelling, irresistible, unescapable pressure of the moral energy of life; a life in which, as Mr. John Morley has said, morality is not *in* the nature of things—it *is* the nature of things. The author of "Beau Brummel" and "The Climbers" was a fresh and keen observer of surface details; his range was wide and his characters were brought together as clever men often collect their materials, not by the working of an inward and vital power of selection, but arbitrarily and casually. He was an immensely clever note-taker rather than a profound observer; his women are truer to life than his men, but they often have some inconsistent weakness of character; and a shrewd critic has said that the people in Mr. Fitch's plays are little people.

He had, however, a genuine dramatic instinct and he had the comic spirit; he was almost always interesting and entertaining. He worked with almost incredible rapidity, as did Mr. Marion Crawford, and the charge of writing for money was often made against them both. In neither case was that charge true; both were possessed by a fury of work and a kind of automatic creativeness. Mr. Fitch had a mind of lightning-like rapidity, and slow-witted people always think that a sure sign of mental or moral disease. Crawford, like Balzac, lived in an imaginary community, the members of which were born, grew up, married, begot children, quarreled, intrigued, died, without the conscious aid and beyond the control of the man who, in spite of his great productiveness, could never keep up with the growth of the children of his brain. Clyde Fitch loved his work, lived in and for it, and could not do otherwise. For him life was a spectacle of inexhaustible interest; but it was not a tremendous moral process in which character was the word of fate and fortune, and the sum and substance of the drama.

The charming rococo play of Mr. Booth Tarkington, "Monsieur Beaucaire," is one of those achievements of skill which register the interest of American novelists in the play as a literary form and the dexterity of technique which the quickest of them acquire after a very brief apprenticeship. Work of this immensely clever sort is significant of tendency, and is to be taken seriously, not for what it accomplishes, but for what it predicts. The comedies of Mr. George Ade, on the other hand, are not only amusing, but touch with a light hand phases and aspects of our society and manners and interests of the moment; they play on the surface of things like fugitive summer lightning, but they reveal real things. On one hand, we have this light and witty handling of the

dramatic form; on the other, we have a presentation of realities held too close to our eyes. In the first group of plays the emphasis is on technique; in the second it is on material. In the second class belong such plays as "The Fourth Estate," by Joseph Medill Patterson and Harriet Ford, in which the editorial machinery, the clang and clatter of the composing-room, are so directly brought to bear on us that we are stunned rather than illumined. In plays of this order life is presented, but not represented; the raw material is given us, but the art which would arrange, interpret, and dramatize it is lacking. Hence we have melodrama rather than tragedy. Such plays as Mr. Edward Sheldon's "The Nigger" and "Salvation Nell," by a young graduate of Mr. George P. Baker's courses at Harvard, share the same defects; they bring things so close to us that there is no perspective; we come away with the feeling of having seen things, but not of having seen through them. There is far more promise, however, in pieces of this sort than in the most finished pieces of the academic quality; here at least is life, and life holds the fullest potentialities of art.

The interval between the acting play—the play, that is, that can be successfully presented to the eye and ear in the theater—and the so-called literary play has been successfully bridged by Mr. Augustus Thomas, a skillful playwright who knows the theater by heart, so to speak, who has definite ideas and charming literary skill. "The Witching Hour" and "The Harvest Moon" are delightful examples of the drama of happily combined elements of success: a real motive, skillful construction, entertaining dialogue, and that touch of poetry to which even the sluggish imagination responds. There are, too, a kindliness in Mr. Thomas's wit, a sympathy in his work, which take it out of the hard and unhuman atmosphere which envelops so many plays of the day. A little autobiography will throw light on the tone of Mr. Thomas's plays—the spirit that radiates from them:

After Farragut ran the New Orleans blockade my father took direction of the St. Charles Theater in New Orleans, then owned by Ben DeBar. When he returned to St. Louis in 1865 I was in my seventh year, and my earliest recollections are tinged with his stories of Matilda Herron, John Wilkes Booth, and others who played in that theater. Father was an orator of considerable ability, and I remember him, for the amusement of my mother, reciting long speeches from Kotzebue, Schiller, and Shakespeare. In his association with the theater he took me very early to plays, and I have always been an attendant; consequently dialogue seemed the most natural literary vehicle. I found later that this impression was justified when I discovered that the most telling things in Homer and later Greek poets and philosophy were in dialogue—that this was true of Confucius and of Christ.

I began writing plays when I was about fourteen years of age. When I was sixteen and seventeen, an amateur company that I organized played in certain railway centers on the old North Missouri Railway for the benefit of local unions of the workingmen. In 1882 I made a dramatization of Mrs. Burnett's "Editha's Burglar." With this as a curtain-raiser and a rather slapstick farce called "Combustion," I made a tour of the country with a company that I organized, and with which I ran in debt several thousand dollars. In 1889 a four-act version of "The Burglar," arranged by me, was played in New York and was successful, and since that time my royalties have enabled me to give my attention on the business side exclusively to play-writing.

You ask why everybody who knows me is my friend? I might answer laconically that it was because they didn't know me thoroughly, but, dismissing that defensive assumption of modesty and making such self-inquiry as I can, I think I have a capacity for companionship from the fact that I was painfully poor as a kid. My consecutive schooling stopped when I was ten. I gave up all attempt to attend school, even irregularly, when I was thirteen. Between that age and my twenty-second year I worked in various sections of the freight departments of railways. Most of the midday meals of that time I took from a tin bucket. This meal was in the company of freight-handlers on the platform, men recruited almost exclusively from the Irish at that time in the Middle West; or the meal was with the brakemen in the switch shanties, these brakemen generally Americans rather near the soil; or was with the engineers and firemen in their cabs, or on the running-boards of box cars with trainmen. Without knowing it I acquired the ability of getting the other fellow's point of view, and when I got old enough not to be overwrought by sympathy that was inclined to be too partisan, I found an immense intellectual enjoyment in watching the interplay between temperament and environment. I think this answers your question. I have retained a gossip's ability to be interested in most anybody else's affairs.

If I might add one other factor that I think has had some weight, it would be this: So many years ago that I forget its source I read somebody's statement that the surest cure for the blues was to promptly and actively do something, not for one's self, but for some other; and I believe that I have occasionally won the good will of people in a rather selfish application of this panacea.

Mr. Thomas's plays have their cohesive principle in the working out of significant and interesting ideas rather than in the evolution of character. It is evidence of the

PERCY MACKAYE

WILLIAM VAUGHN MOODY

keen sense of the greatness of the forces that play through life in our time that the contemporary novel of real power and the contemporary play of vital quality are concerned with general conditions and powerful tendencies rather than with the unfolding of character. Our most vital writers are dealing with the time (for the time is always the concurrence of certain ideas and forces) rather than with manners—the way we carry ourselves in relation to one another. Behind "The Harvest Moon" there is a formative idea of the deepest interest, and again and again in the play there are those spurts of poetry which are as welcome on the stage as oases in a desert, and as refreshing.

Mr. Boker's poetic plays waited long for worthy successors, but have at last found them, and in numbers so large as to constitute a kind of fulfillment of ancient prophecy. For it is a curious and interesting fact that, while many of our old-time critics at home and abroad gave us the most positive assurances that idealism and art would find their grave on this continent, and, above all, that the dramatic instinct would perish under the prosaic conditions of our life, there have always been those who have steadfastly announced a notable revival of the drama in America and have discerned in our tidal activities the specific elements out of which the play is compounded.

The drama is clearly, one might almost say irresistibly, laying its spell on men and women of sensitive imagination. It is reported by professional readers that a stream of plays in poetic form flows by them with increasing volume and rapidity—a stream, for the most part, of wasted but not insignificant effort. For what the sensitive respond to with inadequate power the strong feel and express. The poetic plays that get into print to-day form a literature of such magnitude that it can be represented in an article of this kind only by selection and chiefly by quotation.

Of the drama in England a well-known critic has said:

> The truth is, our dramatists have long since forgotten that the English language is still the medium of the English drama, and that no branch of literary art is worth a word of praise that wantonly divorces itself from literature. The foolish dramatist who was once loquacious concerning what he was pleased to call "the literary drama" condemned his own craft in a single phrase. No doubt, prosperity being essential, the audience of our theaters must share the blame with their favorites. Too idle to listen to exquisite prose or splendid verse, they prefer the quick antics of comedians, and in their ear, as in Mr. Pinero's, "theatrical" has a far more splendid sound than "dramatic." To sum the matter up, that poets have failed upon the stage is no compliment to the professional playwrights, who believe themselves the vessels of an esoteric inspiration. It merely means that literature and the drama travel by different roads, and they will continue to travel by those roads so long as the actor is master of the dramatist, so long as the merits of a drama are judged by the standard of material prosperity. After all, to get your puppets on and off the stage is not the sole end of drama, and modesty might suggest that it is better to fail with Tennyson than to succeed with the gifted author

who is at this moment engaged in whitewashing Julia.

While there is truth in this statement, there is also a misleading inference; for the play must be primarily a play, and not a piece of beautiful writing. Its literature, in other words, must reside not solely in diction, as does d'Annunzio's, but in structural quality and character, in power of moral interpretation, in vitality of motive, in force of imaginative reproduction. The literature in Shakespeare is not in eloquent speeches and beautiful phrases chiefly; it is in the central conception which shapes and irradiates the drama and makes it living tissue instead of a tissue of eloquent language like some passages in "Modern Painters." That a play is a fine piece of composition is no evidence that it *is* to be a classic; that it moves a mass of people to tumultuous applause is no evidence that it is *not* to be a classic. The essential thing is that it shall live; and live not in detached passages, but from the heart outward to the stage directions.

JOSEPHINE PRESTON PEABODY

The new school of playwrights in this country who are inspired by the dramatic feeling rather than by the fascination of stagecraft, and the emphasis of whose work is therefore rather on the literary than on the acting side, naturally draws its practitioners from the ranks of the younger men and women. If you want to know what is coming, go to the young; only make sure that you go to those who have youth of imagination and feeling, and not simply impressionable inexperience. Many of these young dramatists come to the drama by way of the lyric.

This is the artistic history of Mr. William Vaughn Moody, whose early work gave promise of lyrical power, not without suggestions of the blight of the academic influence. There was a moment of life in the "Ode in a Time of Hesitation" which brought joy to the heart of people who are eager—especially eager just now—for the living voice of poetry, and not for cultivated references to the Muses. There came later the impressive dramas which dealt, not imitatively, but with a certain degree of freedom, with the myth of Prometheus; dramas which rose now and again to such dignity of phrase that one felt the Miltonic influence. These pieces, like others of their kind, are dramatic poems, and are likely to have their place in our literature; but they are not plays. Mr. Moody's plays are "The Healer" and "The Great Divide," both at the farthest possible remove from the academic exercise or the writing that flows with a pleasant musical sound from a generous culture. These are real flesh and blood plays, which respond daringly to American conditions, open great horizons, bring characters of elemental energy and audacity on the stage, and by their breath and freedom make us feel that they are very possibly the giants that go before the gods and announce their coming. "The Great Divide" is, at bottom, as elemental as if its action had taken place in the stone age. That is what makes it significant and hopeful. It evokes the passions that sleep under our conventions like the earthquake forces under the gardens of Sicily. It is the old struggle of the man and the woman, the sources of which are found in the deepest recesses of nature, and will always issue thence wherever there are great natures; subdued and directed but not extinguished by the intelligence of the woman outraged and sinned against, and yet big enough and with enough of the elemental surviving in her to understand whence flow the poetry, the creative energy, the romance, of life. One can put his hand on a dozen faults in this play; but they are more than atoned for by its vitality. The breath of life is in it:

I know what you're saying there to yourself, and I guess you're right. Wrong is wrong, from the moment it happens till the crack of doom, and all the angels in heaven, working overtime, can't make it less or different by a hair. That seems to be the law. I've learned it hard, but I guess I've learned it. I've seen it

written in mountain letters across the continent of this life. . . . Done is done, and lost is lost, and smashed to hell is smashed to hell. We fuss and potter and patch up. You might as well try to batter down the Rocky Mountains with a rabbit's heart-beat!

(*He goes to the door, where he turns.*)

You've fought hard for me; God bless you for it! . . . But it's been a losing game with you from the first! . . . You belong here and I belong out yonder . . . beyond the Rockies, beyond . . . the Great Divide!

But she goes with him!

Half a dozen plays stand to the credit of Mr. Percy MacKaye, and he is still a young man. From the beginning he has revealed an imagination of epical grasp—the power of seeing things on a large scale—and the command of the lyrical note; much of his verse, despite a certain roughness of diction, has a fine poetic quality. His robust humor, breadth of manner, and easy rise into the region of pure song were disclosed in "The Canterbury Pilgrims," one of his earliest plays, in which the springtime mood and atmosphere of Chaucer invest the very free treatment of the material with an inspiriting sense of poetry:

Chaucer:

Boy, let me hug thee!

Squire:

Noble sir!

Chaucer (embracing him):

A hug!
Spring makes us youths together. On such a day
Old age is fuddled and time's weights run down.
Hark!

(*A cuckoo sounds; they listen*)

The meadow is the cuckoo's clock, and strikes
The hour at every minute; larks run up
And ring its golden chimes against the sun.

Squire:

Sir, only lovers count the time in heaven.
Are you in love, too?

Chaucer:

Over head and heart.

Squire:

Since long?

Chaucer:

These forty years.

Squire:

Nay, is your mistress
So old?

Chaucer:

She's still kind.

Squire:

Kind, yet old! Nay, what's
Her name?

Chaucer:

Hush, she will hear thee.

Squire:

Hear me?

Chaucer (mysteriously):

Hush!
Mine own true mistress is sweet Out-of-doors.
No Whitsun lassie wears so green a kirtle,
Nor sings so clear, nor smiles with such blue eyes
As bonny April, winking tears away.
Not flowers o' silk upon an empress' sleeve
Can match the broidery of an English field.
No lap of amorous lady in the land
Welcomes her gallant as sweet Mistress Earth
Her lover. Let Eneas have his Dido!
Daffydowndilly is the dame for me.

It is in "Mater," however, one of the latest of Mr. MacKaye's plays, that one recognizes his capacity for invention, his courage of insight, the potentialities of original work in him. Here is a bold and confident grappling with American conditions and the play of a perfectly fresh and untainted temperament through them, the opening of a spring of pure joy in the monotonous grayness to which a less vigorous nature would succumb. How like a ray of sunshine "Mater" plays through that overwrought home—as indifferent apparently to moral issues as nature on a spring day when there is a riot of joy in the woods and fields. How her temperament sets the contrast between its spontaneity and the feverish strain of overheated, self-conscious righteousness when she breaks into the rigidity and rigor of it:

Michael. "Something doing." It's the quack showman's motto of the age! Under that banner, we harvest a million acres of wheat to fill a hundred millions of mouths, and we rear up the mouths to be filled with the wheat. Under that banner, we move a continent of freight cars to consume steel rails, and we disembowel the continent for steel to move the freight cars. Under that banner, we fell mountains of forest to feed a myriad presses with Sunday editions, and we set up a myriad presses to devour the wood pulp. "Something doing!" Motion, my friend. *Motion* is the God of such as you, and, so far as you can, you make yourselves in his image.

He's a glorious Titan—your *Motion!* His brow is of gold and his bowels of brass; his biceps of iron and his thighs of silver. His beard is black smoke. His heart is pure steel. Within his head he has a billion wheels, and when he opens his mouth to speak through his beard, the clang of his voice is the noise thereof.

Look in the morning above the cities, and you shall see his hair obscuring the day, and his eyes like arc lights. In the palm of one hand he holds the great god Pan—no taller than a pygmy; and in the other fist he clutches a worm called Man. "Behold me!" he cries to the heavens; "even from this worm have I arisen, and even to this stature have I grown beyond this pygmy. Behold me, you sun and moon! Am I not Busy? Am I not Big? I am the Lord of Hosts—I am Prosperity! I am—"

Mater (*entering*). Button! Button! Who's got the button?

Michael. (*glaring desperately as she approaches with his coat*). Mater, Mater, how you do interrupt!

Mater. Boy, you carried off the button in your pocket. (*Feels in his pockets and finds it.*)

Michael. Damn the button!

Mater. Shh! Remember this afternoon! You can't address the Reform Club with a whole heart—and one button missing.

The whole play is, in a phrase,

"The best of love is laughter;"

but what a liberating phrase in our tumult of work, our clanging of machinery, our violent endeavor everywhere to bring everything out of its hiding in our natures and make it articulate and rational! In our desperate attempt to force everything to explain itself, to abolish mystery, to believe only in the little superficial part of life we can understand, there is no criticism so stinging, so pungent, so penetrating as laughter. It *is* the best of love—the soul of which is not in what it can give us, but in its power to set us free; for love is not the musician who makes a harmony *for* us, but the musician who makes a harmony *in* us.

The poetic play is helped by a background which the past age alone can furnish, and we find Mrs. Olive Tilford Dargan's very interesting "Lords and Lovers," with a single exception, laid in a remote past in which the materials that most readily yield romantic effects are found. Here are plots which Shakespeare might have handled largely developed in the Shakespearean manner, and often, in paragraphs and sentences, suggesting the master's construction and diction. The plays abound, however, in flights of fancy, in figures and images, in turns of phrase, which are not only modern but feminine, if one may venture to suggest a difference not in degree but in kind, which it is becoming ungallant if not dangerous to recognize. So Kent says:

"It was not you, my heart. But say it were,
Should I pull down my heaven because a bird
Makes flying blot against it? 'Tis the doubts
That darkly flitting show love's constant sky
Forever radiant.

. . . . . .

Dearer than life, good-night.
I leave my prayers like candles set about you,
And as they fail think of me on my knees
Renewing them from heaven."

Shakespeare himself would not have scorned lines so finely compounded of the stuff of imagination and the magic that hides in words such as these:

"Her princess feet like well the solid earth.
She is a flower that sips of sun and dew,
But feedeth most from root-cups firm in ground;
While you are made of music, love, and air,—
A being of the sky—a lover's star,
Although he be a king. The grace of heaven
About your beauty plays, and drops as soft
Upon my eyes as light from the lark's wing."

One hears the Shakespearean tone in such lines as these:

"Methinks were I the King,
Or Pembroke with his power in my mouth,
Each English road should be ablaze to-night
With swift flint-striking hoofs.

. . . . . .

Yet England sleeps, with one lone heart at watch."

Mrs. Dargan has dramatic feeling, and at times dramatic fire; her plays are eloquent, which means that she is still in the lyrical mood; but such a drama as "The Shepherd," a Russian drama of seven years ago, opens into a fresh field and perhaps indicates the road that will lead her into the heart of her own time.

There is much to be hoped from Mrs. Marks, whom we know better as Josephine Preston Peabody, whose "Marlowe," published several years ago, was an ambitious and interesting, if not wholly successful, drama. Her later play, "The Piper," attempts less and accomplishes more. It has action, passion, atmosphere, poetry; and the old legend of Hamelin town—dear to childhood these centuries—takes on the dignity of a real character study and a dramatic collision of the free spirit with the dull stupidity of a conventionalized life. Hamelin is not the city of destruction, but it is the city of the dead; only the children and two or three of their elders are alive. Frugality has become avarice, order has become rigid conformity, love is a mere habit of association. Burgomeister and syndic and sacristan, cobbler and butcher and smith, are mere shadows of living men, and the city is a gray, monotonous prison. Out of such a joyless place children are bound to flee when the first note of freedom rings in their ears, and the Piper is the restless spirit from beyond the mountains whose alluring call we all hear at times. Barbara, the Burgomeister's daughter, hears it because the spirit of adventure, the spell of the immortal romance, is stirring within her; and they all go to their several fates as men and women will go to the end of the story, and for that reason we call it a

story. Beside the old well—Barbara and he alone—the Piper puts the soul of the legend in a few phrases:

Piper:
Weep not, I say. First, loose you, heart and shoes,
From Hamelin. Put off now, the dust, the mold,
The cobble-stones, the little prying windows;
The streets that dream o' *What the Neighbors Say*.
Think you were never born there. Think some Breath
Wakened you early—early on one morning,
Deep in a Garden (but you knew not whose),
Where voices of wild waters bubbling ran,
Shaking down music from glad mountain-tops,—
Where the still peaks were burning in the dawn,
Like fiery snow,—down into greenest valleys,
That do off their blue mist only to show
Some deeper blue, some haunt of violets.
No voice you heard, nothing you felt or saw,
Save in your heart, the tumult of young birds,
A nestful of wet wings and morning-cries,
Throbbing for flight! . . .
Then—for your Soul, new wakened, felt athirst—
You turned to where that call of water led,
Laughing for truth,—all truth and star-like laughter!
Beautiful water, that will never stay,
But runs and laughs and sparkles in the heart,
And sends live laughter trickling everywhere,
And knows the thousand longings of the Earth!
And as you drank it then, so now, drink here.

From this rapid survey of a few representative plays out of many that are worthy of extended comment these facts and tendencies in recent American play-writing reveal themselves:

A rapidly widening interest and activity in the field of dramatic writing;

A copious production of acting plays dealing with American society and with the situations which arise out of our National life;

The existence of an increasing number of plays in poetic form and of poetic charm, bearing witness to the endeavor of the imagination to gain command of dramatic expression;

A deepening of that sense of life which is the moving impulse of art;

A sanity of interest and attitude which evokes from art its ancient service of joy and reconciliation;

That restraint of speech which evidences neither cowardice in the presence of the facts of life nor the prudishness which betrays the knowledge of corruption, but the endeavor to deal with dirt not as dirt but as the soil out of which the spiritual climbs and grows and makes the perishing earth significant and explicable.

A new sense of liberation from artificial conventions and deadening routine, and from the sterility of energy divorced from love and human sympathy;

The birth of a larger and more inspiring idea of life, rising above toil and wealth and resting in a full and free development of the human spirit.

THE RIDERLESS HORSE

BY HAROLD TROWBRIDGE PULSIFER

Close ranks and ride on!
Though his saddle be bare,
The bullet is sped,
Now the dead
Cannot care.
Close ranks and ride on!
Let the pitiless stride
Of the host that he led,
Though his saddle be red,
Sweep on like the tide.
Close ranks and ride on!
The banner he bore
For God and the right
Never faltered before.
Quick, up with it, then!
For the right! For the Light!
Lest legions of men
Be lost in the night!

BY THE WAY

"There are houses on Cape Cod that have the actual slant and curve of the ship's cabin," says Miss Anne Hathaway in the "Country Gentleman," writing of these products of the retired ship captain's fancy. The remodeling of such a house into a most attractive modern cottage, while yet retaining its quaint touches, was done at a cost of less than $1,000.

A new North Atlantic service is to be inaugurated early next year by the Norwegian-American Line, two fine steamships having been built especially to ply between Bergen, Christiania, and New York. Bergen is only about the same distance from New York as Liverpool, and a State railway has been built which will connect the seaport with the interior of Norway and with Sweden. Both tourists and emigrants are expected to patronize the new line.

A new method of securing pure drinking-water for schools, factories, and domestic use has been introduced in France. It consists of a device for sterilizing water by the electric current. A commercial college of Paris is reported to purify in this simple way the drinking-water for 200 students; and the North Railway Station has also installed the apparatus in its waiting-room.

The fickle nature of popular crazes is shown in the almost total cessation of bicycle-riding as a pastime in this country—and the renewed interest in bicycle-riding as a professional sport. A week or so ago Madison Square Garden in New York City was jammed to its capacity almost every night during a six-day professional bicycle race. It looks as if an increasing number of Americans were willing to take some of their exercise by proxy, especially when this is accompanied by the excitement of strenuous competition.

A few years ago the enterprising advertising manager of a Pittsburgh newspaper offered a free box in a theater to every advertiser who took a page in his paper. This practice grew until almost every advertiser demanded a free theater ticket. Now the Pittsburgh papers have got together and abolished this form of premium. They also declare that henceforth they will not accept free passes from the theaters.

This is certainly the age of the specialist. The daily papers announce that an artist who makes a specialty of painting the portraits of dogs has just come from Europe to make pictures of the bird-dogs belonging to the owner of a great estate in North Carolina.

"The will to live" kept Charles Wolcott, aeronaut, alive for seventeen years after falling 3,000 feet from a balloon and receiving terrible injuries. In 1895 he jumped from his balloon, and his parachute refused to open till he was within 200 feet of the ground. His feet, pelvis, left arm, and many of his ribs were fractured, his knees and hips were dislocated, and his spine was injured; but he refused to die, and eventually recovered and resumed his profession! His case is said to be without parallel.

The widow of one of the Titanic's victims is setting an example that other grief-stricken women might well follow. She is devoting herself to helping crippled children, 250 of whom were her delighted guests lately at a performance of "Cinderella." "Sometimes," this lady, Mrs. H. B. Harris, is reported as saying, "I think that my own trouble is more than I can bear. But when I look at those poor little creatures I find something outside of myself and my memories to think of."

Among hobbies which are on the decline is that of the collecting of manuscripts of famous books, for the reason that almost all books are now printed from typewritten copy. To fill the gap thus left, however, another field offers interesting possibilities; namely, the collecting of photographs of historical personages. This might be combined with the collection of autographs, which avocation now fills the leisure of many persons with the joy of pursuit and of possession.

Ninety per cent of the patrons of the Trans-Siberian Railway, according to a writer in the "National Geographic Magazine," are English-speaking; but very few of the railway men speak English, and the station signboards are in Russian only. In this latter respect China and Japan are less insular; the railways there placard the stations' names both in English and in the native language.

The aviators are trying to equal the record of the balloonists in reaching high altitudes. Roland Garros recently drove a monoplane to a height of 19,032 feet near Tunis. The balloon record is 34,500 feet, but in this case the balloonists became unconscious when that great height was attained.

Theodore Watts, says Charles Rowley in his book "Fifty Years of Work Without Wages," tells a good story against himself. A nature enthusiast, he was climbing Snowdon, and overtook an old Gypsy woman. He began to dilate upon the sublimity of the scenery, in somewhat gushing phrases. The woman paid no attention to him. Provoked by her irresponsiveness, he said, "You don't seem to care for this magnificent scenery?" She took the pipe from her mouth and delivered this settler: "I enjies it; I don't jabber."

An ideal spot for a newspaper man's vacation, if a writer in "Travel" is correct, is the tiny republic of San Marino. No newspaper is published within that little country's limits! It is probably the only republic in the world (except the other tiny republic of Andorra) which can lay claim to such a distinction.

The Great White Way of New York City sees nightly during the height of the season, according to an estimate in the New York "Evening Post," $50,000,000 worth of limousines. This assumes that there are 10,000 such cars, each costing $5,000, engaged in transporting their users to theaters, operas, etc. The estimate as to both number and cost of the cars is liberal, but the parade of these limousines certainly constitutes one of the sights of the metropolis.

Mrs. Belva Lockwood, once candidate for President on the suffrage ticket, recently celebrated her eighty-first birthday. She is still actively engaged in the practice of the law. She is certainly one of the oldest practicing lawyers in the world.

INDEX TO VOLUME 102 OF THE OUTLOOK

SEPTEMBER 7 TO DECEMBER 28, 1912 (FOUR MONTHS)
